Design change should close through a control test rather than a promise. The audit names the failed control, owner, corrective action, test case, affected-person review, deployment date, monitoring period, and condition for reopening. A changed identity rule, release screen, staffing model, or signal label is not complete until the City verifies that it reduces the original failure without creating a new exclusion or surveillance burden.

Control begins with humility about the limits of control. The City cannot make the whole internet fair or prevent every hostile actor, screenshot, bot, or bad-faith reading. It can refuse to amplify harm, design against foreseeable abuse, preserve lawful evidence, support affected people, correct public meaning where it has authority, and remember failure. Its promise is not invulnerability but honest burden bearing at the point of public contact.

Post-incident repair needs an affected-person route as well as a technical one. The City should identify who carried the burden, offer safety and privacy support, correct false public meaning where it has authority, restore queue position or access when error excluded legitimate users, address staff overload, preserve claims for external remedy, and state what cannot be repaired. A system is not restored merely because abusive content disappeared.

Chapter 28 — Diplomacy, Travel, and Government Settings

The City begins as a place, but public power moves through airports, vehicles, hotel rooms, diplomatic tables, emergency scenes, government offices, private briefings, encrypted channels, foreign jurisdictions, and informal pauses where influence is hardest to see. A design answerable only inside its perimeter has solved the easiest problem.

Movement can restore hidden influence: a road meeting becomes private, hospitality becomes leverage, a new network opens a device, or another institution owns the room. Yet security, medical emergency, family crisis, and diplomacy can also make immediate publication dangerous. Each condition needs an authority, purpose, record status, protection, review clock, and route back to accountability.

Travel reopens the central burden question. Treating movement as wholly private leaves the public with guesswork, while exposing every route in real time can endanger counterparties, staff, families, security personnel, and nonparticipants. Diplomacy becomes reckless when partial opacity is treated as scandal and naive when the word diplomacy erases the record. Mobility design must join lawful protection to a credible route back to explanation.

The Chapter rejects both heroic expansion and frightened retreat. The City does not travel as though other institutions await its transparency, and it does not remain home merely because law, security, diplomacy, and jurisdiction are difficult. It moves only under lawful authority, a named purpose, clear status, protected handling, record continuity, review, and a genuine power to refuse.

Diplomacy is the hardest case because some opacity protects legitimate work and vulnerable people. Negotiation may need time, counsel privilege, security delay, and humanitarian confidentiality. Dissidents, interpreters, patients, children, staff, and counterparties can be harmed by a record regime they never chose. Protected spaces therefore need lawful owners and review, not forced transparency by proximity. (United Nations, 1961; Berridge, 2015; Pozen, 2010)

Travel is also technical. Routes create records, vehicles create custody, hosts create dependencies, borders create device and data risk, and foreign law changes what may be captured or released. Serious mobility design therefore names review owners, exception rules, security thresholds, accessibility needs, and lawful stop points before departure.

Every journey changes the affected-person set. Drivers, local staff, interpreters, hosts, security personnel, family members, patients, witnesses, hotel workers, and foreign publics may enter records by proximity rather than consent. Data minimization, role masking, delayed disclosure, and lawful noncapture keep participant continuity from becoming exported burden.

The Chapter's operating object is a continuity file with expiring secrecy exceptions. It identifies the journey or event, lawful purpose, jurisdiction, command chain, City practice paused or modified, protected custodian, device protocol, counterparty safeguards, hospitality and access, oversight notice, review clock, expiry, restoration, and after-action closure. The file records the existence and governance of an exception without copying privileged, classified, diplomatic, clinical, or third-party

substance into a City archive. It closes only when the exception ends or is lawfully renewed. (FEMA, 2024; NIST, 2025b; Pozen, 2010)

The argument then widens to reciprocal hosting, government transparency environments, and the City as a node. A node can receive, send, host, learn, and be corrected without becoming a capital. That modest posture prevents a beautiful institutional language from masquerading as authority above ordinary law.

Reciprocal hosting needs compatible law and practice, not merely compatible vocabulary. Each site must preserve local labor standards, records authority, accessibility, security, independent refusal, and affected-person challenge. Archive interoperability lets records be located, interpreted, transferred, or closed under declared rules; it does not require duplicate custody or central command. (Acuto, 2013; Slaughter, 2004)

Chapter 28 studies mobility under humility. Public-power formation may cross law, danger, cooperation, technology, and visibility only when authority, purpose, notice where possible, protection, review, and refusal remain explicit. That sequence makes movement responsible rather than heroic.

The City is a bounded civic institution, not a sovereign atmosphere. Its active record rules do not spread to strangers by proximity. When movement brings a participant among people who did not choose the Vow, the record must narrow, mask, delay, summarize, or stop before the participant's burden becomes another person's exposure.

Travel can hide misconduct, but a record institution can also misread the purpose of other institutions. Diplomacy is not failed publicity, security is not failed openness, legal privilege is not failed memory, and emergency withholding is not always deception. Credibility depends on distinguishing protective opacity from captured opacity without claiming every protected space.

Ownership remains exact. Government controls diplomacy, official travel, public money, protected records, security, and remedies; constitutional and international law govern authority and rights; material capacity and security remain with their owners. The City contributes continuity for its own interface and withdraws when law, safety, or consent cannot be preserved. Successful travel would show operational feasibility, not scientific proof or sovereignty. Before departure, the interface file should name the authority that can terminate City participation if those boundaries conflict.

A worked hypothetical follows an officeholder to a foreign capital where local law bars the City's ordinary capture practice, the host requests a confidential meeting, and security officials require managed devices. The continuity file records the lawful purpose, authority that owns the meeting, City practice paused, protected record custodian, device protocol, oversight notice, review date, and condition for later disclosure. It does not copy the confidential substance, expose the counterparty, or pretend that City rules travel as extraterritorial law. (United Nations, 1961; NIST, 2023b; European Data Protection Board, 2021) A pretravel

test should confirm that staff can identify which device, record, and disclosure rules change at each jurisdictional boundary.

The decisive work begins after the meeting. The exception expires or is lawfully renewed, access credentials close, devices are reviewed, gifts and hospitality are accounted for, and the authorized public record explains what can safely and lawfully be explained. Restoration distinguishes continuity from a permanent hidden channel. A travel practice that cannot close its exceptions is not ready to travel. Post-travel closeout should verify that temporary credentials, exceptions, and retained copies actually expired or were lawfully reassigned.

28.1 — Diplomacy in a Partly Opaque World

Diplomacy tests whether the City can respect another institution while preserving its own burden discipline. A participant may enter a room where the City controls neither law, record, security posture, disclosure expectations, nor the safety of the other side. Maturity consists in naming that limit, protecting nonparticipants, preserving what can lawfully be preserved, and refusing to let legitimate confidentiality become an unmarked route of influence.

Section 28.1 treats opacity as a governed category rather than a single moral failure. It distinguishes protection, abuse, external constraint, and information the City simply does not possess. Status labels, protected review, delayed explanation, counterparty safeguards, and domain humility can make a participant's relation to diplomacy answerable without pretending that the City owns diplomacy.

Diplomacy begins where ordinary institutional confidence ends. A City can govern its own rooms, labels, access bands, record stages, and public interfaces. It cannot govern every room into which public power travels. Foreign ministries, embassies, court-adjacent negotiations, mediation rooms, humanitarian contacts, intelligence-adjacent briefings, international conferences, consular contexts, and security-controlled spaces may be partly opaque for reasons that cannot be dismissed as corruption.

Partial opacity is not answered by theatrical purity. A participant who demands full public exposure of every diplomatic exchange may endanger people who never took the Transparent Vow. A

participant who accepts indefinite secrecy may recreate the private formation of power the City exists to challenge. The ethical center is narrower and more demanding: identify the opacity, name its authority, protect its legitimate beneficiaries, and preserve review of the public-power burden that still belongs to the participant.

Diplomacy appears here as an encounter between record regimes. The City carries role-bound active-period record discipline. Other actors may carry state secrecy, negotiation privilege, professional confidentiality, source protection, local privacy law, safety protocols, or institutional refusal. The record must name the meeting of those regimes rather than pretending one has erased the other.

The practical object is a diplomatic status packet. Before a participant enters a partly opaque setting, the packet should identify the governing authority, participants, protected persons, subject matter, confidentiality category, public-relevance reason, allowed record method, release horizon, oversight route, and failure path. This does not make diplomacy simple. It makes the burden visible enough to govern.

Diplomacy in a partly opaque world asks who is protected by nondisclosure, who bears its costs, who can review the protected record, when delay must be reconsidered, what safe explanation can be given, and what the City must admit it cannot know. Those questions turn humility into procedure. They let the interface respect legitimate protection while keeping hidden influence open to later challenge. (United Nations, 1961; Berridge, 2015; Pozen, 2010)

28.1.1 — External Opacity Reality

External opacity is the fact that the City does not own every environment in which public power is formed, negotiated, challenged, or exercised. A participant may enter a foreign office, security facility, court-adjacent room, mediation space, humanitarian channel, consular setting, medical context, or international conference governed by rules outside the City. The record must begin with that fact rather than treating external control as a defect to be overcome by rhetoric.

The City needs an external opacity label before it can judge conduct inside the setting. The label should state whether opacity arises from law, security, negotiation, professional duty, counterparty safety, platform limitation, emergency, local custom, or institutional refusal. These categories carry different burdens. Medical privacy is not diplomatic secrecy. Diplomatic secrecy is not donor concealment. Platform limitation is not lawful privilege. Classification prevents both reckless exposure and lazy forgiveness.

The affected persons are not only the participant and the public. They include counterparties, interpreters, staff, drivers, aides, security personnel, local officials, dissidents, family members, journalists, victims, or bystanders who may appear in a record because a participant is present. External opacity can be a shield for them. It can also be a shield for hidden influence. A fair record keeps both possibilities alive until review distinguishes them.

The route of review should be set before the encounter when possible. A pre-contact note can state who may inspect the

protected record, what external authority controls it, what cannot be captured, what can be captured under seal, and what public label will appear if immediate release is impossible. This reduces after-the-fact improvisation, which is where powerful people often turn uncertainty into exemption.

Failure occurs when external opacity becomes a total explanation. A sentence such as the meeting was confidential is not enough. City governance should ask which part was confidential, why, for whose protection, under what authority, and with what review clock. If no answer can be given, the proper response may be restricted participation, an oversight referral, a public status label, or a determination that the City cannot support that movement under its own standards. (United Nations, 1961; Berridge, 2015)

The deeper point is that the City does not conquer the world by naming burden. It carries a disciplined question into a world that remains legally plural, politically uneven, and sometimes dangerous. External opacity is neither proof of wrongdoing nor proof of innocence. It is a condition that must be classified, bounded, reviewed, and remembered.

External encounters remain jointly bounded rather than absorbed into City norms. When a participant meets a foreign minister, refugee advocate, tribal authority, security official, private mediator, or international agency, the City owns the participant's preparation, conduct, gifts, follow-up duties, and later explanation. The other party retains its own law, records, safety judgment, and duty to its people. Precision at that boundary allows rigor without institutional arrogance.

A serious diplomatic system therefore needs an opacity taxonomy before it needs a transparency demand. It should be able to mark a setting as open, delayed, protected, counterpart-controlled, legally privileged, security-restricted, or unavailable to the City. Each status has a different owner and a different remedy. An open setting may be released through ordinary record channels. A delayed setting may need a review clock. A counterpart-controlled setting may need only a public notice that the City did not own the room. A legally privileged setting may need sealed handling. An unavailable setting may need cancellation, narrower participation, or a statement that continuity could not be preserved.

The practical result is a public record that can say, without panic, this part of the world was not under City control. That sentence matters. It keeps citizens from assuming perfect knowledge and keeps the participant from using the foreignness of a setting as an excuse. The City does not need to see everything to remain honest. It needs to name the conditions under which it could not see, and to show what it did to keep the public-power burden from disappearing.

28.1.2 — Confidentiality Need

Confidentiality is legitimate only when it protects a named interest. It may protect negotiation, life, lawful security, a victim, a dissident, legal counsel, a patient, a child, a vulnerable community, a source, or a public interest that would be damaged by immediate publication. It should not protect prestige, embarrassment, convenience, private leverage, donor access, or

image management. The City's first duty is to separate protection from avoidance.

A confidentiality need should carry an owner. The owner might be a government authority, court, counsel, clinician, mediator, security officer, human-rights organization, or independent oversight office. A participant cannot be the only person who names and renews the need, because the participant is also the person whose burden is being delayed from public view. Self-certified secrecy is too close to the old world.

The record object here is a confidentiality stub. A stub does not expose the protected content. It records that material exists, what general category governs it, who authorized withholding, what the scope is, when review occurs, who can challenge abuse, and what kind of public summary may later appear. This protects the public from unexplained absence without exposing the protected person or protected negotiation.

The need should also be narrow. A confidential negotiation does not make travel, hospitality, gifts, device exchange, surrounding meetings, staff interactions, or post-meeting conduct confidential by default. Each extension of the confidentiality boundary should require its own reason. Narrowness is the difference between a shield and a fog.

Confidentiality should have a time structure even when it cannot have a short expiration date. Some material may remain protected for years because life, law, or security require it. Other material may become safe after a negotiation concludes, a threat passes, a party consents, a legal process ends, or a public office changes

hands. A credible design cannot promise release that law forbids, but it should require periodic reconsideration rather than permanent burial by default. (Pozen, 2010; Thompson, 1999)

When confidentiality is handled well, it becomes a burden of explanation. The public may not see everything now, but the institution can show that withholding has a lawful category, a protective purpose, an accountable owner, a review route, and a failure remedy. When confidentiality lacks those features, it is not a civic safeguard. It is a return to private power under a gentler name.

Confidentiality that protects a process must be distinguished from secrecy that protects reputation. Negotiation space, counsel, asylum-related contact, security planning, emergency medical care, and active threat response may justify protection. Avoiding embarrassment, hiding inconsistency, preserving a campaign image, or shielding a patron from scrutiny does not. The participant under the Vow carries the burden of showing why confidentiality served a legitimate public or human purpose, not merely why exposure would have been inconvenient.

A confidentiality request should therefore be recorded as a structured claim rather than accepted as a mood. The requester, legal basis, operational purpose, protected persons, expected duration, review owner, and later disclosure possibility should be named in the protected record. Where naming the requester itself would create danger, the record can use a sealed identifier and an oversight route. What matters is that the exception has an accountable shape even when the public cannot immediately see its contents.

A confidentiality category should expire unless renewed by reason. If the reason changes, the status should change. If the protected person becomes safe, the summary can widen. If the security issue remains active, the record can stay sealed with renewed explanation to oversight. Time is part of fairness because indefinite confidentiality transfers uncertainty to the public without letting anyone know whether the transfer is still necessary.

28.1.3 — Counterparty Protection

A counterparty is any person or institution that encounters a participant without taking on the participant's role-bound active record. Counterparties include diplomats, officials, staff, interpreters, lawyers, clinicians, security personnel, local residents, journalists, civil-society actors, family members, and private citizens. Their presence near public-power formation does not convert them into City subjects.

The counterparty protection rule should be built into invitations, agendas, meeting notices, visitor materials, travel packets, and transcript policies. A person should know whether a meeting is recorded, what may become part of a public bundle, what may remain sealed, how their identity may be masked, and how they can object to wrongful exposure. Consent to meet is not consent to public display.

Counterparty protection also guards democratic trust. If people learn that meeting a participant automatically exposes their voice, face, location, weakness, or institutional position, only the reckless, powerful, protected, or performative will engage. The

City would then lose the very knowledge it needs from ordinary actors and vulnerable communities. Protection broadens participation by reducing inherited burden.

Counterparty privacy must be distinguished from counterparty influence. A counterparty may be shielded from raw exposure while still being identified by category, role, or institutional source if that role materially shaped the participant's judgment. The public may not need to see a person's private detail to know that a foreign official, lobbyist, clinician, local advocate, agency staffer, or security adviser influenced a decision path.

The review route must include affected-person standing. A counterparty who believes they were exposed, mischaracterized, over-summarized, translated badly, or made publicly identifiable should have a complaint path, correction path, and emergency shielding route. This architecture must not make collateral persons wait for the participant to defend them. (United Nations, 1961; United Nations, 1963)

Counterparty protection is not a loophole for hidden influence. It is a precision tool. The City protects the person while preserving the public-power relevance of the encounter. The human being remains shielded where needed; the participant's burden remains reviewable where power was shaped.

Protection also means refusing to convert another person's vulnerability into evidence for the participant. A dissident's fear, a local official's caution, a clinician's warning, a family member's plea, a translator's risk, or a victim's account may be relevant to public judgment, but raw exposure may punish the wrong person.

A credible design should use masking, sealed identifiers, protected summaries, delayed release, or exclusion where the public-purpose value can be preserved without handing a hostile audience someone else's life.

Counterparty protection begins with notice whenever notice is safe and lawful. A counterpart should know whether the participant is under a role-bound active record, what kinds of notes or metadata may exist, what material may later be summarized, and what protection routes exist for sensitive information. Notice should be translated into the counterparty's practical situation rather than delivered as institutional jargon. In some diplomatic or emergency contexts prior notice may be impossible, but that impossibility should itself be logged and reviewed.

The same protection should apply to counterpart institutions. A court, ministry, clinic, humanitarian group, tribal body, school, or newsroom may have its own duties and vulnerabilities. City governance cannot make those institutions appear evasive simply because they do not operate under the Transparent Vow. Respecting their boundaries does not weaken the City's record. It prevents the City from making its own burden into someone else's involuntary exposure.

28.1.4 — Delayed Accountability

Delayed accountability is the discipline that allows necessary opacity without surrendering public-power review. It recognizes that immediate publication may be unlawful, dangerous, or unfair, while permanent concealment may be corrupting. Delay is

not forgiveness. Delay is a different allocation of burden: the public waits, oversight carries more responsibility, and the institution records why the wait is justified.

A delayed accountability record should include five elements: the protected material category, the reason for delay, the authority responsible, the review date, and the release or summary condition. These elements may themselves be partially protected in extreme cases, but the oversight record should exist. The worst version of secrecy is not a sealed record. It is no record at all.

A useful public label is plain, specific, and non-sensational. It may state that a diplomatic negotiation record exists under protected review until a named condition is met, while withholding details that would endanger people or lawful work. The public can then see that the event has an owner, a status, and a clock rather than disappearing into vague silence.

Delayed accountability also needs an escalation route. If the delay is renewed repeatedly, if the reason changes, if the participant's conduct becomes contested, if a counterparty complains, or if oversight discovers abuse, the record should move to a higher review level. Extension without escalation is one way institutions normalize exceptions.

Not all delayed records will become raw public records. Some may become protected summaries, categorical disclosures, ombuds reports, court-reviewed statements, or historically delayed releases. The governing rule is not eventual spectacle; it is answerability to law, review, and public meaning wherever possible. (Roberts, 2006; Berridge, 2015)

Delayed accountability is where the City shows whether it really believes in burden. Instant exposure can be a kind of cruelty. Permanent secrecy can be a kind of theft. The City's harder ethic is to hold the burden until it can be explained without transferring harm to those who never accepted the role.

Delay should also have a memory of its own misuse. If a participant repeatedly invokes protected diplomacy to avoid scrutiny, if a staff unit overclassifies material out of caution, or if a partner institution uses secrecy to gain unreviewed access, the pattern becomes a governance problem. The institution needs the capacity to report aggregate exception patterns without exposing protected material. Citizens should be able to see whether opacity is rare, justified, reviewed, contested, and eventually resolved.

A delayed-accountability record should contain enough structure to prevent rumor without implying guilt or safety. It should identify that a protected event occurred, the category where lawful, the reason for delay, the responsible reviewer, the review clock, the next status, and what public material may later appear. Delay differs from concealment because it has an owner, a reason, a clock, and a binding route back to review.

28.1.5 — Government, Legal, and Transition Boundary

The City's diplomatic discipline must not become foreign policy. It may prepare public-power seekers to move under record, build status labels, document influence, and preserve accountability under lawful conditions. It does not negotiate treaties, confer diplomatic recognition, grant immunity, declare protected

premises, operate intelligence channels, authorize international rollout, or decide when a country is ready for adoption.

The government boundary matters because office and statecraft belong to lawful public authority. A government may decide that certain meetings require secrecy, certain records are classified, certain persons need protection, or certain channels cannot be public. The City may create its own review and status labels around a participant's conduct, but it cannot override lawful authority by calling itself transparent.

The legal boundary matters because enforceability belongs to legal architecture, courts, statutes, constitutions, contracts, regulations, and rights frameworks. The City can propose interface design and record categories. It cannot make those categories lawful by assertion. When this chapter speaks of corridors, zones, sealed access, oversight, or reciprocal hosting, it describes candidate institutional design subject to legal review.

The transition boundary matters because network sequence, country readiness, certification timing, pilot expansion, decertification, and international relay belong to the transition domain. The City book can state what would be required for movement not to betray the Vow. It cannot state that a country should join, that a network must expand, or that refusal reveals moral failure.

This boundary should appear in verbs. The City hosts, supports, labels, documents, refers, pauses, restricts, and reviews its own role. Government authorizes, enacts, classifies, protects, negotiates, and commands through lawful channels. Legal

systems validate or reject enforceability. Transition governance sequences pilots and networks. The reader should never need an appendix to know who owns which power. (Cooper et al., 2013; Bjola and Holmes, 2015)

At every external movement, a written interface protocol should identify the issuing authority, resolve conflicts among host-government, security, legal, and City instructions, and record which arrangements may be repeated. Training should reward correct handoff and refusal as much as initiative.

A successful visit shows only that one bounded interface worked under stated conditions. It neither enlarges the participant's lawful authority nor proves the Law, validates science, enacts constitutional doctrine, or authorizes wider diplomatic or transition claims.

28.2 — Travel as a Continuity Problem

Travel turns record continuity into logistics. The participant leaves spaces designed for the Vow and enters systems owned by carriers, hotels, border agencies, hosts, security teams, public streets, private homes, foreign law, weather, language, and chance. Mobility design begins by mapping those dependencies rather than treating travel as an afterthought to formation.

The burden question becomes practical: who sees the participant, who moves the participant, who pays, who hosts, who controls the device, who can interrupt the route, who can request private time, and who reviews the gap afterward. A travel system worthy of the City does not promise seamless visibility. It creates enough continuity, classification, and remedy for citizens to understand how movement shaped public power.

Travel is where the City's record discipline meets airports, trains, hotels, cars, border crossings, borrowed rooms, public streets, private lounges, and networks not governed by City infrastructure. These settings do not become City property because an active participant enters them. They also do not become exempt from public-power accountability because they are ordinary places.

A participant on the move carries multiple roles at once. They are a body needing rest and safety, a public-power seeker under the Vow, a traveler subject to local law, a guest under someone's hospitality, a device user exposed to technical risk, and a person whose presence may expose others by proximity. Travel design has to hold these roles apart.

The central danger is continuity collapse. The City may know what happens in a classroom, office suite, deliberation hall, or record site. It may know much less about who drove the participant, who paid for dinner, who entered the side room, what device connected to which network, what conversation happened during a layover, or which local rule limited recording. The old hidden pipeline can return through logistics.

Continuity does not mean total exposure. It means the record can explain the path of public-power burden. This architecture should know the purpose of travel, the authority approving it, the expected record state, the known protected zones, the staff responsible, the host obligations, the device posture, the planned public label, and the thresholds that require pause or return.

Travel as continuity problem therefore asks whether the City can support movement without becoming a mobile surveillance regime. The answer is a chain of bounded records, not a live feed. The City records what matters for public-power burden, protects those who did not accept that burden, and admits when law or safety prevents the City from operating in a setting. (NIST, 2023b; European Data Protection Board, 2021; European Union, 2016)

28.2.1 — Movement Record Risk

Movement record risk begins with the simple fact that moving bodies create gaps. A participant leaves a known space, enters a vehicle, crosses a threshold, changes network, loses visual continuity, encounters strangers, or arrives in a jurisdiction whose rules differ from the City's own. Each moment may be harmless.

Together they create the possibility that influence moves faster than accountability.

Movement records should capture status rather than voyeuristic detail. A movement record should identify purpose, departure window, arrival window, route category, responsible staff, approved contacts, anticipated protected zones, emergency fallback, and review owner. It does not need to expose bodily minutiae, private distress, family contact, or nonparticipant identities unless those facts become role-relevant under a protected review rule.

Movement deviations change the burden even when they are innocent. An extra stop, unlisted vehicle, private elevator, borrowed device, changed hotel, unscheduled dinner, off-agenda host, or unexplained gap may arise from ordinary adjustment, technical failure, safety response, or intentional evasion. Classification allows the record to distinguish those conditions before rumor or convenience supplies the meaning.

Movement records need a gap notice. If a segment cannot be captured or logged as planned, the notice should state the time, context, known cause, responsible role, immediate remedy, and later review route. A gap notice prevents rumor by naming absence. It also prevents abuse by making absence itself reviewable.

The remedy for repeated movement gaps should be practical, not theatrical. The City may require route redesign, staff retraining, local counsel review, device replacement, host restriction, travel pause, or narrower role authorization. If repeated gaps indicate

evasion, the matter can move to complaint, investigation, or exit review. If repeated gaps indicate infeasible conditions, the honest answer may be that the participant cannot perform that function under the City's standards. (NARA, 2023; ISO, 2016a)

Movement record risk is not about suspicion as a mood. It is about continuity as public trust. When the City can explain how power moved, why gaps occurred, and who reviewed them, travel becomes answerable. When it cannot, travel becomes one of the oldest hiding places for public burden.

The travel record should also distinguish planned gaps from accidental breaks. A planned gap might involve a secure facility where devices are surrendered under law. An accidental break might involve lost connectivity or an unexpected vehicle change. A misconduct break might involve a participant leaving the route to meet privately. These events should not receive the same public label. Fairness requires classification that protects safety, avoids rumor, and still lets hidden power be named when it returns.

Movement risk should be mapped in layers: itinerary, custody, communications, meeting access, hospitality, device posture, staff accompaniment, nonparticipant contact, emergency alternatives, and post-trip reconciliation. A trip may fail at one layer while remaining intact at another. For example, a route may be logged while a device incident compromises communication; a meeting may be properly noticed while hospitality creates new leverage. Layered review prevents the City from calling a trip clean simply because one visible channel remained intact.

For citizens, the important question is not whether the trip looked orderly. It is whether the trip changed access, dependence, information, or obligation in a way that later shaped public power. Movement records should therefore link travel events to later decisions where relevant. A private detour may be harmless; a detour followed by policy attention to the host's interest may need explanation. The record should preserve enough continuity for such patterns to be seen.

28.2.2 — Hospitality Risk

Hospitality is one of the oldest languages of influence because it can look like kindness while creating dependence. A ride, meal, room, conference invitation, private tour, translator, security support, cultural honor, local guide, donated workspace, or emergency shelter may be genuinely necessary. It may also create gratitude, access, obligation, or soft capture. The institution should treat hospitality as a record category, not as a moral accusation.

The hospitality rule should begin with source and purpose. Who offered the support, why, at whose request, under what terms, with what alternatives, and with what public-power relevance? A bottle of water during a delay is not the same as a private jet. A local family's emergency shelter is not the same as a donor-owned resort. Precision protects generosity from paranoia and power from disguise.

Hospitality risk also includes asymmetry. A participant may feel socially required to accept a host's schedule, introductions, photographs, private time, or preferred narrative. Staff may feel

pressure to avoid offending local officials or donors. Counterparties may assume access because they provided convenience. City governance should train participants to accept necessary care without accepting implied authority.

Gift and access logs should travel with the participant. The log should record material hospitality, unusual access, repeated invitations, valuable services, host constraints, and any contact that could shape future judgment. The log should also include refusals where refusal matters, because the power to say no is itself evidence of reduced leverage.

When hospitality becomes unavoidable, the remedy is not always rejection. The City may use preapproved neutral vendors, reimbursement, pooled host funds, staff review, public labels, alternate lodging, or post-trip disclosure. In emergencies, the City may accept help first and reconcile the record later. Care before record still applies when life or safety is at stake. (OECD, 2024b; Berridge, 2015)

Courtesy should remain human without becoming debt. A fair City lets people travel as humans, receive ordinary help, and respect local custom without letting material comfort or honored access purchase silence, loyalty, or future preference.

Repeated small hospitality deserves as much attention as dramatic gifts. A pattern of preferential seating, private drivers, quiet upgrades, informal meals, staff favors, translation support, or repeated introductions may matter more than one expensive object. The record should capture patterns of dependency without reducing every host to a suspect. The purpose is to let later readers

see whether comfort, access, or gratitude shifted the burden of judgment.

A good hospitality protocol should be specific enough to spare participants from improvising virtue. It should define ordinary courtesy, reportable support, prohibited gifts, emergency assistance, reimbursable aid, and influence-bearing access. It should also say who decides when a cultural honor is a meaningful civic event rather than a private benefit. Without such categories, participants may either accept too much because refusal feels rude or refuse ordinary kindness in a way that turns the City into a cold visiting machine.

Hospitality should be assessed with cultural humility. Some communities express respect through food, ceremony, procession, or symbolic gifts. A City participant should not insult a host by treating all custom as corruption. The safeguard is proportional handling: receive what civility requires, refuse what creates obligation, reimburse where appropriate, record material value, and explain the boundary before the relationship becomes strained. Fairness must be legible to the host as well as to the archive.

28.2.3 — Private Meeting Risk

Private meetings are not always corrupt. Legal advice, security briefings, mediation, medical contexts, protected humanitarian contacts, family emergencies, and diplomatic negotiations may require privacy. The risk is that private meeting becomes a general container for unreviewable influence. The institution

must not ban every private room. It should make private rooms carry a reason, category, authority, and review path.

A meeting record should distinguish planned private meetings from unexpected private contact. Planned privacy can be reviewed before it occurs. Unexpected privacy should produce a post-event notice. The notice should state who initiated the contact, why public or ordinary recording was limited, who else was present, what category of protected handling applies, and what review will determine whether a public summary is needed.

Privacy must also be distinguished from solitude. A participant may need rest, medical care, protected family contact, counsel, worship, grief, or decompression. Those are not private meetings in the influence sense. They may require protected handling but should not be turned into suspicion merely because they occur away from public interface. The record should protect human need while tracking public-power access.

Private meeting risk is highest when access bypasses ordinary channels. A donor, party strategist, security official, foreign representative, corporate actor, religious leader, media figure, or personal friend may attempt to gain informal time outside the schedule. A credible design should treat side-channel access as material even when nothing dramatic occurs. The burden is not only what was said. It is who got the chance to shape the participant without equal review.

Remedies include access denial, staff presence, agenda reconstruction, protected summary, contact restriction, influence log entry, ombuds referral, or temporary travel pause. In severe

cases, repeated unauthorized private meetings may indicate that the participant is unwilling or unable to carry the public-power burden of the City. The answer may be correction, narrower role, or exit. (Pozen, 2010; United Nations, 1961)

The City's standard is not that every conversation must be public. The standard is that public-power access must be governable. A private meeting becomes legitimate when privacy protects a valid interest and the burden of influence remains reviewable. It becomes dangerous when privacy becomes a place where power can be formed without witness, label, or repair.

A private meeting does not prove capture, and a polished public meeting does not prove independence. The relevant question is whether material influence entered a public-power pathway and whether any lawful route exists for later understanding. Depending on purpose and law, the answer may be a protected summary, an influence log, independent oversight, or no City record. Privacy remains legitimate when its boundary can be distinguished from hidden formation.

Private meeting review should begin before travel when a sensitive meeting is foreseeable. The participant, staff, counsel, security, and archive office should know the meeting category, access limits, note handling, protected summary standard, and escalation route if the meeting changes. A private room should not require improvisation of the City's ethics at the doorway. The harder the setting, the more pre-authorization matters.

The private meeting rule should also protect people who approach the participant with harm. A whistleblower, survivor, local critic,

or vulnerable official may need privacy to speak safely. A credible design cannot force such a person into public exposure in the name of record purity. The meeting can be categorized, protected, and reviewed without making the vulnerable person pay for the participant's public burden.

28.2.4 — Device and Data Risk

A traveling participant carries more than a body and a calendar. They carry devices, credentials, communication channels, authentication tokens, message histories, location traces, draft documents, record fragments, and sometimes protected material concerning nonparticipants. Travel turns these tools into risk surfaces. A phone or laptop can become a corridor no map shows.

Device risk begins before departure. The travel protocol must specify which devices move, what data they carry, what is isolated or encrypted, what is disposable, which access is disabled, which communications are permitted, and what follows if a device is lost, seized, searched, infected, or coerced open. These decisions should belong to a security and privacy protocol, not the participant's improvisation in an airport line.

The border and foreign-law problem requires particular humility. The City cannot promise that devices will be treated as they would be treated inside its perimeter. A jurisdiction may have search powers, data-localization rules, encryption restrictions, surveillance risks, or platform controls the City cannot override. The travel packet should say when the proper answer is a clean device, remote access limitation, delayed communication, local counsel, or cancellation of a function.

Device and data risk also involves counterparties. A meeting note, contact list, photo, location record, translation file, or voice memo can identify someone who never accepted the Transparent Vow. Nonparticipant data should not travel in raw form when a safer category, summary, token, alias, or local custody method can preserve the public-power purpose without exporting collateral exposure.

When device incidents occur, the record should classify them without panic. Loss, seizure, malware suspicion, credential misuse, unauthorized connection, failed encryption, accidental exposure, and compelled disclosure are different events. Each requires containment, notification, replacement, review, and public labeling appropriate to its risk. More data after a breach is not the remedy. Correct handling is. (NIST, 2023b; European Data Protection Board, 2021)

A City that ignores device risk will eventually let hidden power enter through a pocket. A City that overreacts will turn travel into a technical prison. The fair path is prepared device posture, minimal necessary data, incident logging, human oversight, and willingness to refuse travel when the technical conditions make the public-power burden impossible to carry.

Travel produces abundant external traces: location history, biometric data, tickets, hotel and vehicle logs, visitor badges, network metadata, and images from other systems. Continuity does not require absorbing all of them into the City archive. The record plan identifies what is necessary, what belongs to another custodian, what implicates nonparticipants, and what should be summarized, sealed, or excluded. Integrity depends on governed

selection rather than maximal appetite.

A travel device protocol should be boring by design. Clean devices, minimized files, segmented credentials, limited access windows, secure backup, incident contacts, and post-trip inspection should be ordinary preparation rather than dramatic spycraft. A record institution that ignores device custody will eventually let its memory be shaped by whoever controls the channel.

Artificial Intelligence tools add another layer. A machine summary of a diplomatic conversation, emergency movement, or hostile contact should be treated as assistance under human review, not as official memory by itself. Travel is already distortion-prone; automation should not add a hidden interpreter.

28.2.5 — Jurisdictional Variation

Jurisdictional variation means that the same act can carry different legal meaning, public risk, privacy duty, labor obligation, record rule, or security consequence depending on where it occurs. A corridor that is lawful in one place may be unlawful in another. A data transfer that seems ordinary may violate another legal regime.

Jurisdictional variation belongs in a pre-travel gate. Before travel, the packet should identify host law, privacy constraints, public-record implications, labor and staff conditions, device rules, accessibility conditions, emergency services, protest context, media environment, and any local authority required. A participant should not discover the governing law only after a conflict occurs.

Local counsel and local civic knowledge matter because formal law is not the whole environment. Custom, language, political pressure, security practice, disability access, gender norms, local conflict, community memory, and media culture can alter burden. The burden question must be translated, not exported unchanged. Pre-travel review should record which local conditions materially changed the proposed plan and which local sources or advisers informed that assessment. Where credible local advisers disagree, the file should preserve the disagreement and identify the assumption or precaution governing the decision.

Jurisdictional variation can require limiting a role. A participant may attend a public event but not conduct protected negotiations. If none of those limits preserves the burden, the City should have the courage to say no. Any limitation should appear in the travel authorization so the participant, staff, host, and later reviewers know which activities remain permitted and which require fresh approval. A narrower lawful role is a successful safeguard when it preserves the purpose of the visit without crossing a boundary the City cannot responsibly govern.

Compatibility and failure need different labels. When a jurisdiction cannot support role-bound record continuity without violating law, endangering people, or transferring unfair burden, the accurate status is not currently compatible. (European Union, 2016; Council of Europe, 2018b) That status should identify the specific condition that failed and what would have to change before reconsideration. Naming the failed condition keeps incompatibility from becoming either a vague institutional veto or a permanent judgment about the place.

Respect for jurisdictional variation restrains imperial ambition. The City must meet law, place, language, safety, history, and human vulnerability wherever it moves. When those conditions cannot be honored, the responsible decision is to narrow or refuse the journey. A refusal should preserve the reason and any safer alternative considered, allowing future reviewers to distinguish principled restraint from convenience or avoidance. The ability to narrow or decline a journey is part of what keeps a portable institution answerable to the places it enters.

Cross-jurisdiction error demands a corrective record rather than a diplomatic shrug. The continuity file records failure, remedy, and the test for renewed authorization, while the public account identifies the incident category without exposing protected substance. (NIST, 2025b; European Data Protection Board, 2021; Council of Europe, 2018b)

A written protocol offers little protection where local institutions cannot or will not honor it. Travel review should therefore identify the remedy available if law fails in practice and the person or body able to invoke it. Where meaningful remedy is absent, the role narrows, the encounter moves to a safer channel, or the trip does not occur. Review should also test whether the remedy can actually be reached under the conditions in which it may be needed, including time pressure, language barriers, disability access, or loss of an expected contact. A remedy that exists only on paper should not be counted as available protection.

28.3 — Transparent Corridors and Secure Movement

A transparent corridor is a governed passage, not symbolic territory. It links purpose, route, host, security, gifts, devices, staff, record status, and review into one bounded chain while leaving the surrounding place under its own law and ordinary life. The corridor exists so movement can remain narrow enough to explain and stop.

The corridor remains subordinate to local law and is never a zone of sovereign privilege, immunity, diplomatic status, or portable City authority. It is a candidate operating protocol for a defined movement purpose, with visible limits, host refusal, reviewer stop authority, security review, record continuity, and counterparty protection.

The corridor exists because public-power burden does not end at the campus gate. A participant may need to attend a hearing, inspect an agency function, visit a host community, meet officials, respond to emergency need, or travel between accredited sites. If each movement is improvised, the Vow leaks. If each movement is exposed, people are harmed. Corridor design is the middle discipline.

The word transparent can mislead if it is read as public spectacle. In this chapter, transparency means accountable structure. The public may see the purpose, status, categories, and later explanation. Oversight may see more. Affected persons may have challenge rights. Security may protect sensitive details. Nonparticipants may be masked. The corridor is transparent

because its authority and burden are legible, not because every detail is consumed.

Secure movement also has two meanings. It protects the participant, staff, counterparties, devices, and records from harm. It also protects the public from hidden influence. A corridor that only protects the body but ignores gifts, side meetings, records, and data is not secure in the City's sense. A corridor that only protects records but endangers people is not fair.

Corridor purpose, route logging, host disclosure, gift and access records, and security review are treated as distinct mechanisms. Together they allow the City to move without becoming a spectacle, a fortress, or a foreign policy actor. The corridor is lawful humility in motion. (FEMA, 2024; NIST, 2024a; ISO, 2019)

28.3.1 — Corridor Purpose

A corridor begins with purpose. The participant moves because the role requires a specific encounter, inspection, meeting, hearing, emergency response, educational exposure, host-community contact, office interface, or reciprocal visit. Purpose is not a slogan. It should be narrow enough to tell staff which records matter, which people are affected, which protections apply, and which deviations require review.

The purpose statement should answer why the movement cannot be replaced by remote participation, delayed meeting, written exchange, local delegate, or protected summary. Sometimes presence matters because the burden is embodied, local, urgent, relational, or institutionally specific. Sometimes travel is only

prestige. The protocol must distinguish those categories before the trip begins.

A corridor purpose also sets the public relevance boundary. If the purpose is a legislative hearing, the public-power relevance differs from a clinical consultation, family emergency, diplomatic negotiation, site inspection, or sister-City exchange. The record should not drag every surrounding fact into public meaning. Purpose helps decide what is captured, what is sealed, what is summarized, and what is irrelevant.

The purpose should have an owner. A participant may request movement, but a City role office, oversight body, host coordinator, legal reviewer, security reviewer, or office interface may need to approve it. Purpose without approval becomes self-directed opacity. Approval without purpose becomes bureaucracy. The City needs both.

If the purpose changes, the corridor changes. A public meeting that becomes a private dinner, a site visit that becomes a donor introduction, or an educational visit that becomes a campaign moment should trigger a status update. The correction need not be punitive, but it must be recorded. Purpose drift is one way hidden formation reappears under respectable logistics. (FEMA, 2024; ISO, 2019)

A corridor is therefore not defined by distance. A ten-minute walk to a private office may require corridor discipline, while a long public train ride may not require more than basic movement logging. The question is not how far the body travels. The

question is how public-power burden moves through the encounter.

Every corridor needs a refusal clause with practical consequences. Disproportionate security risk, inadequate protection for nonparticipants, uncertain device custody, unlawful host conditions, or private access disguised as public duty should trigger cancellation, delay, narrowing, or a safer remote channel. Reversibility is part of the safeguard, not evidence that planning failed.

A corridor should begin with a written purpose narrow enough to be falsifiable in practice. 'International engagement' is too vague. 'Attend a public hearing, meet a specified oversight body, visit an accredited sister City, or respond to a defined emergency' gives the corridor a shape. Purpose determines route, staff, devices, record categories, public notice, security posture, and after-action review. Without purpose, the corridor becomes a prestige lane.

The purpose statement should be public where safe, and protected where necessary. A citizen should be able to tell whether the participant traveled for a hearing, inspection, emergency, formation exchange, office duty, or private matter converted into protected review. Vague travel labels invite myth. Specific labels let the public understand why movement was necessary and why particular safeguards were chosen.

28.3.2 — Route Logging

Route logging is the record of movement sufficient to preserve accountability without turning geography into voyeurism. It identifies departure, arrival, route category, responsible staff,

expected contacts, protected zones, and deviations. It does not need to publish exact security-sensitive paths, private addresses, room numbers, real-time locations, or vulnerable-person whereabouts.

Route accountability does not require live public tracking. Real-time location can endanger participants, staff, drivers, hosts, protesters, nearby residents, families, and counterparties. The useful record is often delayed, aggregated, or status-labeled around planned route, material deviations, custody changes, access events, and later explanation; contemporaneous notice belongs only where a lawful public event specifically requires it. The public interest is accountability, not the ability to follow a moving person through space.

Route logging also protects staff. Drivers, aides, security personnel, interpreters, and coordinators should not be blamed later for unrecorded deviations if the system gave them no workable protocol. The log should state who had custody of the route, who approved changes, what communication channel was used, and when control shifted between City staff, host staff, government staff, or emergency actors.

Route deviations should be classified. A detour for safety is not a hidden meeting. A medical stop is not a private influence channel. A host-requested side visit may be either harmless or material. Classification lets the City respond with remedy rather than rumor. The log should record deviation category, reason, affected persons, and review owner.

The public should receive enough route information to understand the burden without receiving exploitable detail. A public release might state that a participant traveled under approved corridor status to a government hearing, with one security-related route change held under delayed release. Oversight can inspect more. Affected persons can challenge exposure. The record remains layered. (NIST, 2024a; NARA, 2023)

Route logging is a humble form of memory. It does not claim to know the inner life of the traveler. It shows how the body carrying public-power burden moved through the world, where custody changed, where risk increased, and where later review is needed. That is enough to matter.

A route log should also protect service workers. Drivers, security staff, hotel employees, interpreters, maintenance workers, airport staff, and local aides may appear in movement records by proximity. Their identities should not become public unless a specific public-power reason requires it and protective review has been completed. Travel should make hidden influence visible without converting everyone along the route into civic evidence.

A delayed route log should be compared against the purpose statement. If the stated purpose required one meeting and the movement record shows many private stops, the discrepancy becomes reviewable. If the route changed because of protest, weather, threat, medical need, or government instruction, the status label should say so. Route logging is useful only when it can explain divergence without either sensationalizing danger or erasing it.

28.3.3 — Host Disclosure

Host disclosure asks who receives the participant and under what conditions. A host may be a government office, university, civic organization, hotel, family, security service, sister City, agency, court-adjacent institution, international body, or private person. Hosting is not neutral because hosts control rooms, schedules, introductions, comfort, access, local interpretation, and sometimes security.

A host statement should identify the host's role, authority, financial relationship, relevant affiliations, access to the participant, access to staff, record duties, and protected-person obligations. It should also state what the host refuses or cannot provide. Honest limits are better than false assurance. If the host cannot support corridor conditions, the City should know before the participant arrives.

Host disclosure protects counterparties too. A host should not be surprised that certain interactions become City-relevant records. Nor should the City assume the host has consented to public exposure of private staff, local residents, or protected visitors. Hosting agreements should separate participant burden from host and bystander protection.

The risk of host capture is especially high when the host controls scarcity. A rare meeting, emergency refuge, high-status venue, translation network, transport, or local credential can make the participant dependent. The record must capture not only what the host provides but what the participant would lose by displeasing

the host. Hidden leverage often enters through gratitude and access.

Host disclosure should include a complaint route. Staff, counterparties, local residents, and participants may need to report host pressure, unsafe conditions, privacy violations, gift pressure, schedule manipulation, or unauthorized access. The route should not require a participant to admit embarrassment or accuse a powerful host alone. The City's infrastructure should carry that burden. (OECD, 2024b; United Nations, 1961)

A fair host is not a servant of the City. A fair host is a local authority or partner whose own law, dignity, labor, and burden are visible. Host disclosure prevents the City from treating the world as scenery for its record discipline.

Disclosure should also include who was not the host. A visit may be announced under a public institution while the effective host is a donor, consultant, party intermediary, contractor, security actor, or informal patron. The record must map practical hosting as well as formal invitation. Hidden power often enters through the person who arranges the room, not the person whose logo appears on the program.

Host disclosure should name institutional role before personality. A public university, municipal office, civil-society group, ministry, court-adjacent body, conference organizer, private donor, family friend, business entity, religious institution, or security service creates different burdens. The record should let readers see not only who welcomed the participant, but what authority, interest, dependency, or vulnerability the host carried.

Host disclosure should include negative space: who was excluded by the hosting arrangement. A visit arranged through elite networks may bypass labor groups, opposition voices, disability advocates, local critics, or affected residents. The City cannot meet everyone, but it should know when a host's hospitality narrowed the world the participant saw. What a trip omits may become as important as what it includes.

28.3.4 — Gift and Access Logs

Gift and access logs exist because influence is often carried by what is offered and who is admitted. Money is only one form. Travel upgrades, private meals, translation help, security support, introductions, honorary treatment, early information, personal favors, venue access, photos, invitations, and informal time can all become public-power burden. The log makes material hospitality visible without accusing every kindness.

The log should distinguish small ordinary assistance from material support. A glass of water, public transit ticket, or standard conference badge does not carry the same burden as private lodging, expensive meals, exclusive briefings, personal security, donor-arranged travel, or repeated access. This architecture should avoid both paranoia and blindness by categorizing value, frequency, source, and role relevance.

Access matters as much as gifts. A person who receives private time with a participant, repeated informal contact, unreviewed introductions, or privileged response channels may shape judgment even without spending money. The log must capture

access that materially differs from ordinary public interface. Influence can be purchased with proximity.

Gift and access logs should include refusal and remedy. When a participant refuses a gift, redirects hospitality through a neutral route, reimburses a host, reports an attempted private introduction, or asks staff to reclassify a meeting, that action matters. It shows whether the participant can carry burden without becoming rude, captured, or theatrical.

The public release of gift and access information should be contextual. A hostile reader can turn a small cultural gesture into scandal or ignore a pattern of high-value hospitality if each item looks minor. The record site should show category, pattern, source, value range where appropriate, and role relevance, with protected details shielded when needed. (OECD, 2024b; ISO, 2016a)

The ethical point is simple: support should not become ownership, gratitude should not become obedience, and access should not become hidden rule. Gift and access logs keep hospitality from dissolving the Vow while leaving room for ordinary human generosity.

The log should also record returns and corrections. A gift may be declined, reimbursed, donated under policy, sealed for review, returned after legal advice, or accepted under emergency necessity. An access event may be converted into a public meeting, summarized, or restricted from future recurrence. The remedy tells the public as much as the original event. A City that

logs influence but never repairs it has only made corruption better documented.

A gift and access log should join material items with opportunity. A meal, lodging, honorarium, transport upgrade, private tour, privileged briefing, exclusive introduction, expedited entry, or repeated social access can all become influence. The log should not treat every courtesy as a scandal, but it should allow patterns to become visible. Readers can then ask whether access was ordinary, reciprocal, necessary, disproportionate, or tied to future favor.

Gift logs should not become public shaming instruments. The purpose is to trace leverage, not to humiliate hosts or participants. Where a culturally meaningful item has little material value but high symbolic importance, the record should state that context. Where a small object is part of a pattern of privileged access, the pattern should matter. Fair logging interprets value through power, not through price alone.

28.3.5 — Travel Security Review

Security review protects life, records, and accountability at the same time. It asks whether the movement exposes participants, staff, counterparties, families, devices, archives, public events, or local communities to foreseeable harm. It also asks whether the proposed security arrangement would itself create hidden power, intimidation, carceral atmosphere, or unreviewed control.

Protective security must remain distinct from sovereign security. Protective security manages threats to people and records. It does not authorize secret policy, private diplomacy, intelligence

collection, unlawful surveillance, or command over local authorities. Security staff can advise, escort, delay, reroute, and refer. They do not become a hidden government around the participant.

A security review should include route sensitivity, crowd conditions, protest rights, media pressure, emergency access, device risk, host reliability, staff workload, nonparticipant exposure, and jurisdictional limits. It should also include accessibility and health. A secure corridor that ignores disability access, medication needs, sleep exhaustion, or panic risk is incomplete.

Security detail can become spectacle if it is designed for grandeur rather than risk. An armored posture may be necessary in some circumstances, but the default City image should not be militarized movement. The public-power seeker is not a monarch in transit. Security should be proportionate, explainable, and reviewable without exposing operational detail that would endanger people.

Security failures need their own remedy route. A breach, threat, harassment event, device compromise, route exposure, unauthorized access, or overreach by security staff should trigger incident classification, care, containment, notification where needed, oversight review, and record correction. Security secrecy should not protect security abuse. (NIST, 2023b; NIST, 2025b)

Protective security remains answerable because it can shape access, questions, routes, meetings, and the existence of records. Constraints imposed by a security unit should be logged and

reviewed by an authority independent of the unit that made the decision. Strong protection and public accountability are compatible when command, necessity, duration, and review remain visible. Review logs should also distinguish restrictions requested by external hosts from those imposed by City security, preserving accountability for each source of constraint.

Security review should be independent enough to resist both thrill and fear. Participants may underestimate danger because the visit feels important. Security teams may overrestrict because control feels safer than openness. A fair protocol should require threat assessment, alternative routes, staff burden review, counterparty risk, disability access, emergency care, communication fallback, and post-trip review. The question is not how to make travel dramatic. It is how to make movement survivable and answerable. A route plan should record why the least restrictive workable option was chosen when safer alternatives carry different burdens.

Security review must include accessibility and care. A route that excludes disabled participants, overloads staff, exposes nonparticipants or counterparties, or hides lawful explanation has shifted burden downward. Safety is more than protection from attack; it must preserve dignity without using secrecy to conceal ableism, exhaustion, or family harm. Corridor discipline now has purpose, host record, device posture, gift and access treatment, and security review. A corridor earns continuity when those protections remain workable under delay, rerouting, fatigue, and unfamiliar host conditions rather than only on a planned itinerary.

28.4 — Emergency Mobility and Logged Secrecy Exceptions

Emergency mobility requires action before a complete public explanation is possible. The danger is that fear can expand institutional power at the moment review is weakest. The section therefore treats emergency as a narrow trigger for movement or temporary nonpublication, joined to life safety, lawful authority, logging, oversight, expiry, restoration, and later explanation.

The section builds a sequence: trigger, limited nonpublication, oversight notice, after-action disclosure, and abuse control. Each step exists because an emergency exception can validate itself if nobody outside the emergency circle learns enough to test it. The City must protect people first, but protection cannot become an unmarked archive of hidden power.

A humane City must be able to move in emergencies. Illness, fire, attack, evacuation, family crisis, infrastructure failure, cyber compromise, diplomatic danger, public-safety need, or sudden legal requirement may make immediate departure necessary. A rule that traps people for the sake of record purity would be immoral. Care before evidence applies to movement as much as to health.

But emergency is also one of the oldest words used to suspend accountability. The City must not let emergency become a vocabulary for unreviewed travel, private meetings, disappearing records, or influence under pressure. The answer is not to distrust every emergency. The answer is to log the exception from the first safe moment and to define the path back to review.

A logged secrecy exception is different from an off-record act. It admits that something happened, that immediate publication or ordinary capture was limited, that an authority invoked the exception, that a protected record or stub exists, that oversight has been notified, and that after-action review will determine what can be disclosed. Emergency may delay visibility. It does not erase obligation.

The exception must also protect people who do not carry the Vow. A family emergency may expose children. A medical evacuation may expose clinicians and patients. A security threat may expose routes and protective staff. A diplomatic crisis may expose counterparties. The emergency record should be structured so public accountability does not become collateral harm.

The sequence must protect nonparticipants, preserve evidence where lawful, and make misuse of emergency language subject to review and proportionate consequences.

A continuity file is not a travel diary and not a parallel diplomatic archive. It is a narrow control record showing when an ordinary City practice was paused, who had lawful authority to pause it, which custodian holds the protected substance, who received oversight notice, when the exception expires, and how the practice returns to normal. The file must be able to close without exposing counterparties, bystanders, hosts, interpreters, family members, security staff, or protected operations. (FEMA, 2024; NIST, 2025b; United Nations, 1961)

The continuity file succeeds when a later reviewer can tell what stopped, why it stopped, who owned the protected record, how

long the exception lasted, what oversight occurred, and whether the ordinary practice actually returned. If the file becomes a substitute for the official record, or if expiry depends only on the person who benefited from secrecy, the control has failed. (Boin et al., 2017; NIST, 2025b; Thompson, 1999)

28.4.1 — Emergency Trigger

An emergency trigger is the specific condition that justifies urgent movement or limited ordinary record handling. It may involve immediate threat, medical need, evacuation, infrastructure failure, cyber compromise, legal command, security warning, family crisis, public-safety duty, or diplomatic danger. The trigger should be named as soon as naming is safe. Vague urgency is not enough.

The trigger should identify authority. Who recognized the emergency, who authorized movement, who controlled the route, who held the record, and who will review after? In some moments, a clinician, security lead, emergency responder, government authority, or local official may have operational control. City governance cannot rewrite that fact later as though it alone governed the response.

Emergency triggers also need scope. A medical emergency may justify leaving a location and protecting clinical details. It may not justify a private political meeting on the way. A security threat may justify rerouting and delayed route publication. It may not justify accepting unlogged hospitality or disposing of devices without incident review. Scope keeps emergency from expanding beyond its reason.

The participant's condition matters too. Exhaustion, panic, injury, illness, grief, shock, or threat may impair judgment. The institution must not treat every emergency decision as evidence of character. It should ask whether the person was capable, supported, protected, and later able to participate in reconstruction. Care before classification protects both dignity and truth.

A false or exaggerated trigger is a serious failure because it steals trust from real emergencies. The remedy should include investigation, record correction, possible sanction, travel restriction, or role review. But the City should avoid creating a culture where staff hesitate to invoke emergency because they fear later suspicion. The trigger system should protect timely action and later accountability together. (Boin et al., 2017; FEMA, 2024)

A good emergency trigger is not dramatic. It is clear. It tells the institution why normal conditions changed, who carried responsibility, who may have been affected, what record category applies, and when review begins. Clarity is what keeps emergency human without making it sovereign.

The trigger should also name who may activate it. Some events require security authority, some medical authority, some legal authority, some operational authority, and some participant request. Where a participant requests emergency movement, the request should be respected when safety is at stake, then reviewed after stabilization. Where staff activate it over a participant's objection, the record should preserve the reason and the review route. Emergency should protect people, not erase their standing.

Embarrassment, crowd discomfort, press pressure, donor inconvenience, or a desire to avoid questioning are not emergency triggers; predeclared exclusions keep urgency from becoming discretionary cover.

An emergency trigger needs a record that can survive adrenaline. Staff need not write polished prose during an evacuation, but the first entry should capture time, decision owner, immediate reason, affected persons, and protective action. Later review can refine the facts and correct error. The initial record keeps emergency memory from becoming rumor, self-defense, or institutional mythology.

28.4.2 — Limited Nonpublication

Limited nonpublication means that some information is not immediately released because publication would create foreseeable harm or violate law. It does not mean the event is erased, that the participant is off record, or that the public has no future claim. The limitation should be narrow, named, and tied to a protected purpose.

The material withheld may include exact route, safe location, medical detail, child or family information, security tactic, diplomatic content, device incident, identity of a vulnerable counterparty, or timing that could endanger response. Nonpublication should extend only as far as the protective purpose requires. Surrounding facts that can be safely labeled should not disappear into the same sealed box.

A limited nonpublication stub should be created unless even the stub would endanger life or lawful operation. The stub can state

that an emergency movement occurred, the broad category of reason, the authority invoking protection, the oversight route, and the review horizon. If a stub cannot be public immediately, it should still be held for independent review.

Limited nonpublication is a governed status, not an admission of guilt and not an invitation to trust silence. A credible label identifies why access narrowed, who authorized it, which review applies, and when the status will change. The institution protects people and lawful work while preserving the public claim to later explanation.

Limited nonpublication needs a release ladder. Raw release may be impossible. A protected summary may be possible. A categorical statement may be possible. A later independent report may be possible. A historical review may be possible. The ladder lets accountability arrive in the safest available form rather than forcing an all-or-nothing choice. (Pozen, 2010; Thompson, 1999)

This mechanism is one of the chapter's central tests. If the City cannot protect life without losing memory, it is brittle. If it cannot protect memory without exposing people, it is cruel. Limited nonpublication lets the City keep both duties in view.

The public label should be honest about what is known, what is withheld, why it is withheld, who reviews it, and when the status will be reconsidered. It should avoid both false reassurance and sensational hinting. A simple status label can do more for trust than a dramatic explanation. A credible design cannot perform emergency transparency. It should preserve accountability under pressure.

Emergency withholding should be no broader or longer than the risk requires. Protecting a route need not erase every related decision; withholding names need not erase the event category; delaying release need not stop the review clock. Least-necessary nonpublication is harder to administer than broad secrecy, but it preserves the distinction between protection and convenience.

Limited nonpublication should also protect against performative martyrdom. Participants should not be rewarded for exposing dangerous details to prove courage, nor should staff be pressured to release material because critics are impatient. The City serves public trust by preserving life, law, and later review. Immediate exposure is not automatically bravery; sometimes it is another way to shift risk onto people with less power.

28.4.3 — Oversight Notice

Oversight notice should travel as early as safety allows and faster than public release. A defined independent review body, ombuds office, legal reviewer, security auditor, or emergency board should receive enough protected information to know that an exception occurred and falls within a recognized category, even before all facts are settled. Early notice prevents emergency discretion from becoming private memory controlled only by the people who used it.

The notice should include the trigger, authority, scope, time, persons affected by category, record held, publication limitation, current risk, and next review point. It should not reveal details to reviewers who lack clearance, professional role, or need.

Oversight itself must be layered so review does not become another source of exposure.

Oversight notice protects staff from impossible solitude. In emergencies, staff may make fast decisions under pressure. A notice route allows them to say what happened while memories are fresh, before institutional self-protection or public rumor hardens. It also lets reviewers support staff who acted properly but will later face suspicion.

The notice should be mandatory for certain categories. Emergency movement involving medical crisis, security threat, family or child exposure, diplomatic confidentiality, device compromise, use of external government authority, or interruption of record continuity should not be left to optional reporting. The more sensitive the exception, the stronger the notice duty.

If oversight notice fails, the remedy should distinguish unavoidable interruption, technical failure, negligent omission, and intentional concealment. A communications outage differs from deliberate silence; a security lead acting under a lawful immediate-threat protocol differs from a participant evading review. The record should preserve the distinction and the evidence supporting it. (U.S. GAO, 2025; NIST, 2025b)

Oversight notice is a quiet constitutional act inside the City. It says that someone else must know enough to ask whether the emergency was real, whether the scope was narrow, whether people were protected, and whether the path back to public meaning remains open.

Notice should also protect the people doing the notifying. Staff may fear retaliation if they question an emergency exception during a crisis. City governance should create protected reporting for staff who believe emergency secrecy is being abused, overextended, or mislabeled. The burden of integrity should not fall on one junior staff member whispering into a system that can punish them. Oversight is a labor protection as well as a civic safeguard.

Oversight notice should be tiered. Some reviewers need only category and timing; others need protected facts; legal counsel may need privileged material; security auditors may need route detail; affected-person advocates may need harm information. Tiering prevents the oversight system from becoming either blind or overexposed. It also keeps sensitive data from spreading through the institution merely because an emergency occurred.

28.4.4 — After-Action Disclosure

After-action disclosure is the bridge between protected emergency and public accountability. When danger passes, law permits, care stabilizes, or the relevant process closes, the City should reconstruct what happened in a form that preserves meaning without exposing protected persons. This reconstruction should be expected, not improvised.

The disclosure should distinguish timeline, decision, record status, protected material, mistakes, corrective action, and remaining limits. A vague statement that an emergency occurred will not suffice if the event materially affected public-power

burden. The public needs enough context to understand whether the exception was proportional, necessary, and bounded.

After-action disclosure should include the participant's own explanation where appropriate, but it should not depend only on the participant. Staff reports, host records, security notes, legal review, device incident reports, medical privacy constraints, and oversight findings may all shape the reconstruction. Public meaning should not be controlled by the person who benefited from the exception.

The disclosure may take several forms: public summary, protected appendix, ombuds report, status-label update, record-site note, correction log, or deferred release. The chosen form should be tied to the affected persons and legal constraints. A family medical crisis does not need the same public detail as a security-related travel gap that shaped official conduct.

After-action disclosure should include what changed because of the event. Did the route protocol change? Was a device policy revised? Was a host restricted? Was a staff role clarified? Was a participant counseled? Was a corridor suspended? Disclosure without correction turns memory into public relations. (NIST, 2025b; Roberts, 2006)

The purpose is to keep emergency from becoming mythology. A credible record states what happened, what could not be released, who reviewed the exception, what was repaired, when ordinary rules returned, and what remains protected. That account lets the institution move through crisis without making crisis sovereign.

The after-action process should also distinguish successful protection from successful accountability. A crisis may be handled safely while still revealing record weakness, poor staff preparation, unclear authority, excessive secrecy, or unequal burden on local responders. Conversely, a messy event may show strong integrity if the City names its errors and corrects them. After-action review exists to make future movement fairer, not to decorate the institution.

After-action disclosure should reconstruct the public-power pathway without exposing unnecessary detail. It should explain the trigger, authority, timeline, protected categories, material decisions, record gaps, review findings, corrective steps, and remaining withheld categories. It should not release tactical routes, medical detail, child information, counterparty vulnerabilities, or security weaknesses merely to prove sincerity. The public needs meaning, not every dangerous fact.

After-action review should include affected persons outside the City. Local responders, hosts, drivers, translators, neighbors, medical staff, protestors, family members, and counterparties may carry burdens created by emergency movement. If only the participant's record is repaired, the City has missed part of the event. The public summary can protect identities while still acknowledging whose labor and risk made safety possible.

28.4.5 — Abuse Control

Abuse control recognizes that every exception can be learned by those who want to evade burden. If emergency language makes records disappear, emergencies will multiply. If security labels

prevent questions, security labels will spread. If diplomatic confidentiality hides private influence, diplomacy becomes a corridor of capture. The City must design against strategic use of its own mercy.

Pattern review distinguishes one emergency from an institutional habit. Repeated exceptions around the same host, donor, meeting type, device, route, jurisdiction, or participant trigger higher scrutiny. The review avoids shaming illness or vulnerability while asking whether recurring conditions require redesign or whether recurring conduct requires correction.

The review should include independent authority where the stakes are high. A participant, staff lead, donor, host, security office, or political ally should not be the final judge of whether their own exception was abused. Ombuds review, legal review, inspector review, or outside expert review may be needed depending on category.

Abuse remedies should be graduated. They may include correction, retraining, public status update, host suspension, corridor redesign, device replacement, access restriction, participant warning, role pause, referral, or exit. Not every misuse is intentional. Not every mistake is harmless. The remedy should fit the burden created.

People who report abuse require protection. A staff member who questions an emergency route, a counterparty who challenges misuse of confidentiality, or a participant who admits pressure should not be punished for making the system more honest. Anti-

retaliation is part of emergency integrity. (Boin et al., 2017; ISO, 2019)

Abuse control completes the emergency architecture. The City can protect life because it knows protection is reviewable. It can delay publication because delay has a clock. It can trust staff because staff have routes. It can believe real emergencies without creating a sanctuary for hidden power.

Every emergency exception should leave an audit object with a unique identifier, trigger category, authorizing role, affected record classes, protected persons, start time, review time, expiry condition, oversight recipient, and after-action disposition. That object does not reveal protected substance; it makes the exception countable, reviewable, and capable of ending. Repeated missing fields, extensions without new reasons, or failed after-action closure should automatically escalate review. (FEMA, 2024; ISO, 2019; NIST, 2025b) Any extension should inherit the original exception identifier so renewed secrecy cannot hide the total duration of the same departure from ordinary practice.

Aggregate review should examine the institution's secrecy half-life: how many exceptions close on time, how many are extended, which categories recur, whose burdens remain invisible, whether staff objections change outcomes, and how often delayed material is eventually released or lawfully retained. Patterns may reveal genuine operational pressure, a weak corridor, or strategic avoidance. Category-level trends can support diagnosis and redesign without exposing protected operations. (Boin et al., 2017; FEMA, 2024; Pozen, 2010) Aggregate review should

distinguish necessary recurrence from repeated reliance on the same avoidable weakness, because the remedies are different.

The strongest abuse control is the possibility of losing the exception. Repeated misuse can narrow future travel, require external preclearance, expand oversight access, change personnel, or suspend the relevant function. A rule that cannot alter future authority is commentary rather than control. A fair exception leaves operational consequences when it is abused. Restoring a restricted exception should require evidence that the condition leading to restriction has changed, not merely the passage of time.

28.5 — Sister Cities and Reciprocal Hosting

Sister-City relationships can preserve continuity across distance, but prestige can turn them into weaker hosting, shared branding, or imagined network sovereignty. The practical case is narrower: reciprocal facilities, interoperable records, local translation, independent review, and a real power to refuse. Affiliation is legitimate only while local law and local authorship remain stronger than network identity.

A fair network must make disagreement possible between its own members. One City may decline to host another's participant, contest a record label, require local legal review, or refuse a function that exceeds its capacity. Those refusals are not embarrassments. They are signs that the network has not become a single institutional will. Reciprocity protects burden only when it includes independent judgment.

Sister Cities are not colonies of a central City. They are, at most, separately authorized institutions that may share standards, records interfaces, training protocols, host review, and decertification rules under local law. The phrase should never imply common sovereignty, diplomatic recognition, country ranking, or a global headquarters from which public-power formation is governed.

Reciprocal hosting matters because participants may travel between accredited sites for education, public interface, office activity, emergency relocation, or cross-jurisdiction learning. Without reciprocal standards, the weaker site becomes the loophole. With overcentralized standards, the network becomes

imperial. The design must hold continuity and local autonomy together.

Sister-City hosting is treated as a conditional answer to movement risk, not as a promise of international expansion. It belongs partly to the City's built interface and partly to governance, law, and transition domains. The City book may describe what safe hosting requires. It does not decide when a network exists, which countries are ready, or which government should authorize it.

The burden question follows the participant and the host community. Who carries the cost of hosting? Who protects nonparticipants? Who reviews staff load? Who translates law and culture? Who holds the archive handoff? Who can refuse? Who decertifies a weak host? A network that cannot answer those questions is not a fairness network. It is branding.

Sister-City discipline must therefore be modest: function, standards, interoperability, local translation, and no central empire. These mechanisms keep movement from erasing burden while preventing the City from imagining itself as the world's new capital. (Acuto, 2013; Jayne et al., 2011; Ostrom, 2010)

28.5.1 — Sister-City Function

A sister City function is practical continuity across distance. It may allow a participant to visit another accredited site, receive emergency refuge, continue a formation module, participate in a public interface, consult a local office environment, or maintain record custody while away from the original City. Function comes before symbolism.

The function should be stated for each movement. A sister-City visit for educational comparison differs from emergency relocation, diplomatic stopover, medical support, public hearing preparation, or office continuity. The host should not receive a participant under one purpose and quietly expand into another. Purpose drift across Cities is still drift.

A sister City should also clarify which institution carries which burden. The sending City may retain archive responsibility. The receiving City may handle physical access, staff support, local law, emergency response, and local records. Joint responsibilities should be named. Shared responsibility without named owners is a familiar way to lose accountability.

The function should include participant rights. A person traveling to another City does not become less protected because they are away from home. Complaint routes, medical access, counsel, protected nonvisibility, nonparticipant shielding, staff boundaries, and exit rights should travel with the role unless local law requires a stricter standard.

Sister-City function also requires host-community review. The receiving City is not a neutral platform. Its neighbors, workers, legal environment, infrastructure, climate, language communities, and political context carry burden. A visiting participant should not be treated as a prestige object dropped into a local ecology. (Acuto, 2013; Jayne et al., 2011)

The basic test is whether sister-City function reduces hidden burden or merely moves it. If movement between Cities makes records clearer, rights stronger, and local burden visible, the

function may be fair. If it lets participants shop for weaker rules, warmer applause, or easier hosts, it is a network failure.

The function should be narrow enough that a sister City can say no. A host may decline a visit, restrict a meeting, refuse a record transfer, require local legal review, or conclude that the participant's requested activity exceeds its authority. Refusal should not be treated as betrayal of the project. A network that cannot tolerate lawful refusal is already becoming empire.

A sister City should function first as a continuity host, not as a franchise. It may provide lawful lodging, orientation, staff support, record interface, translation, accessibility assistance, emergency routing, and local review when an active participant travels between compatible institutions. It should not claim shared sovereignty, shared legitimacy, shared political program, or automatic transfer of trust. The word sister should name reciprocal care under limits, not institutional bloodline.

The sister-City relationship should be modest in public language. It should not promise family unity, shared destiny, or moral alignment. It should promise practical hosting under law: rooms, records, interpreters, access routes, complaint pathways, staff coordination, emergency support, and correction if hosting fails. The more sentimental the language becomes, the easier it is for reciprocal support to drift into loyalty culture.

28.5.2 — Reciprocal Standards

Reciprocal standards prevent the network from becoming a map of loopholes. A participant should not be able to leave one City's strict record regime and enter another site with weaker

nonparticipant protections, less staff recourse, loose gift rules, unclear archive custody, weak complaint routes, or vague emergency exceptions. Reciprocity means minimum protections travel, not that every place becomes identical.

The standards should include record stage separation, participant rights, protected nonvisibility, child and family shielding, staff role-record limits, corridor rules, host disclosure, gift and access logs, device incident response, emergency secrecy review, and public-bundle status labels. A sister City that cannot maintain these minimums should not receive active participants under full continuity status.

Reciprocity should be audited from both directions. A wealthy founding City should not assume it sets all standards. A newer or smaller City may reveal blind spots in the original. Local disability access, language translation, climate resilience, community burden, indigenous or local land concerns, and labor conditions may teach the network what the first City missed.

Standards also need failure consequences. A weak host may receive warning, technical support, restricted hosting, suspension, public status label, or decertification. The remedy should protect participants and local people without turning decertification into moral shaming of a country or community. Institutional status is not human worth.

Reciprocal standards should avoid copy-paste imperialism. The same principle may require different architecture, record interface, staffing model, climate adaptation, legal contract, or

public access design. The standard is the burden protected, not the aesthetic reproduced. (Ostrom, 2010; OECD, 2022b)

A network becomes fair when standards are strong enough to protect people and flexible enough to respect place. Reciprocity is not sameness. It is mutual answerability under locally lawful form.

Standards should also account for unequal capacity. A newer City, a smaller host, a different legal environment, or a resource-constrained jurisdiction may not be able to offer every function. The fair response is scoped hosting, capacity support, delayed activation, or non-hosting. The unfair response is to pretend equivalence because the network wants growth. A sister standard is credible only if it can slow expansion.

Reciprocal standards should include a rights floor, nonparticipant shielding, staff protections, archive integrity, data minimization, access logs, complaint routes, public labels, emergency protocols, and decertification routes. Uniformity is not the aim. The aim is to ensure that a participant cannot move to a weaker site to gain easier conditions. Reciprocity should prevent burden shopping.

Reciprocal standards should be inspected by people who can say no to both sides. A receiving City should not rubber-stamp the sending City because they share a brand, donor, founder, or public mission. External review, local complaint routes, participant feedback, staff reports, and affected-person remedies should all be able to challenge the relationship. Reciprocity without independent criticism becomes mutual protection.

28.5.3 — Archive Interoperability

Archive interoperability is the ability of separate City record systems to communicate without merging into one uncontrolled dossier. It allows a participant's active-period record, corridor status, protected categories, correction history, and release labels to remain coherent across sites. It does not authorize universal search, centralized ownership, or background use for research or Artificial Intelligence training.

Interoperability should be purpose-bound. A receiving City may need to verify status, rights, current restrictions, emergency contacts, record categories, and hosting conditions. It may not need raw intimate records, unrelated protected material, family details, private medical content, or historical data irrelevant to the visit. The default should be minimum necessary continuity.

Metadata matters. The handoff should preserve source, custody, version, status label, dispute marker, correction log, protected category, release restriction, and review owner. Without metadata, a record moved between Cities becomes easy to misread. With too much raw material, the handoff becomes surveillance expansion. Interoperability must live between those errors.

Cross-border data transfer is legal and privacy work before it is technical work. Storage location, inspection authority, retention, transfer conditions, affected-person rights, and available remedy vary across jurisdictions. A credible design resolves those questions before interoperability or convenience creates a transfer path.

Interoperability also requires incident planning. If a receiving City suffers breach, tampering, access abuse, mistaken release, translation error, or data loss, the sending City, participant, affected persons, and oversight bodies need notice and remedy. A network is only as trustworthy as its weakest correction path. (ISO, 2017; W3C, 2013)

The archive lesson is the same as the City lesson: memory must not become possession. Interoperability helps public-power burden remain coherent across movement, but it must not create a single memory sovereign with authority over every participant, host, counterparty, staffer, and nonparticipant in the network.

Interoperability includes correction and failure, not only successful exchange. Lost metadata, incompatible status labels, unpropagated corrections, summaries mistaken for raw evidence, and bundles copied beyond release terms each need a remedy route. Technical compatibility becomes civic value only when ethical status, affected-person protection, and correction travel with the data.

Each transfer should travel as a minimum interoperability packet: object identifier; source and custodian; purpose and authority; version and schema; status and dispute labels; protected categories; permitted recipients; retention and deletion rule; correction, recall, and challenge mechanism; integrity evidence; and receiving-site acknowledgment. A transfer lacking a required field remains quarantined and cannot be treated as complete or public. (ISO, 2017; W3C, 2013; NIST, 2024a)

The archive should also preserve disagreement between sites. A

sending City may classify an event one way while a receiving City contests the label. The record should not erase that disagreement for the sake of a clean network history. Interoperability should allow disputed status, right of reply, local annotation, and correction requests. A mature network does not require one memory voice.

28.5.4 — Local Translation

Local translation is more than language. It is the translation of rights, law, culture, disability access, climate, land, labor, public records, security, family norms, protest practice, religious plurality, data protection, and civic meaning. A City that moves without translation exports burden under the guise of principle.

Every sister-City or reciprocal-hosting arrangement should identify which local conditions change the mechanism. A public interface in one country may need different language access, protest protection, archival law, child privacy practice, staff labor protections, media rules, or emergency services. Local translation prevents the original City from treating its first setting as universal.

Local translation adapts form without diluting protection. Child shielding, staff rights, gift controls, review of private meetings, rejection of public rank, human authority over Artificial Intelligence, and record-stage separation remain active across jurisdictions. The task is to distinguish legitimate local variation from a change that transfers burden or removes a right.

The translators should include local legal counsel, disability reviewers, host-community representatives, labor voices, privacy

specialists, security professionals, affected communities, and language experts. A translation conducted only by founders, donors, diplomats, or central staff will miss burden. The people who carry local cost must have standing before the system is copied.

Local translation should also create a public explanation. The receiving City should explain why a standard looks different locally, what burden it protects, which law governs it, and how affected persons can challenge it. A difference without explanation invites suspicion. An explanation without remedy invites compliance theater. (Acuto, 2013; Curtis, 2016)

The City's universal claim is not that one architecture fits all places. Its universal question is where the burden goes. Local translation is how that question becomes respectful enough to travel and strict enough not to disappear.

Translation should also be visible to participants and the public. A host should explain which City rules are identical, which are locally adapted, which are unavailable, which require legal review, and which remain Open Decisions. Without those labels, a visiting participant may assume continuity where there is variation, and citizens may assume difference where there is protection. Translation turns local complexity into usable public knowledge.

Every local adaptation should have a translation decision log naming the source rule, local condition, affected groups, reviewers, rights floor, changed text, evidence and dissent, review date, complaint route, and reversal condition. The log prevents

culture from excusing weaker protection or the founding City from treating difference as disobedience. The receiving site owns its local reasons and must be able to revise them after experience (Acuto, 2013; Curtis, 2016).

Local translation should be updated after experience. A host may discover that an access rule was culturally confusing, that a disability route failed, that local media misunderstood a status label, or that staff roles were misread. Those lessons should return to the sending City and to the network. Translation is not a one-time preface; it is a continuing burden of being received by real places.

28.5.5 — No Diplomatic City Empire

Network sovereignty excludes empire: a founding City may advise but cannot control records, certify legitimacy, rank jurisdictions, command governments, dictate transition, or moralize adoption. Words such as center, capital, headquarters, model, or moral home can pull authority inward. Jurisdictions may refuse for lawful, cultural, material, privacy, security, or democratic reasons without being branded corrupt or backward.

Network governance must be distributed, reviewable, and decertifiable, with conflict rules, local representation, appeals, transparent standards, expert review, and failure memory. It cannot become founder sovereignty, donor rule, technical monopoly, or spiritual hierarchy.

Any City may leave, suspend hosting, dispute the founding site, or reject standards that violate local law or rights. A network unable to survive lawful dissent cannot claim fairness (Slaughter,

2004; Ostrom, 2010).

Prestige can centralize power before law does. Local authorship, distributed review, correction, refusal, and decertification keep affiliation from becoming rank. A trustworthy network recognizes contribution without coronation. Chapter 34 sets out the accreditation, review, suspension, and decertification conditions that reciprocal hosting must satisfy. Civic formation also meets public authority outside City networks. Hosting agreements should record withdrawal and expiry conditions so network affiliation never becomes a permanent claim on a local institution.

28.6 — Government Transparency Zone Boundaries

Government environments contain lawful authority before the City arrives, which makes this the most sensitive interface. Support can easily be mistaken for command, record continuity for official control, or formation burden for legal legitimacy. A City may contribute to a transparency environment only where government lawfully authorizes the arrangement and keeps authority, custody, staff, money, and remedy in government hands.

Before a government environment borrows a City practice, an interface preflight should name the legal authority, staff employer and director, controlling record regime, funding and maintenance owner, complaint and remedy body, and the event that suspends or ends the arrangement. Answers that point back to the City rather than to lawful public institutions reveal a shadow-government design.

A government transparency zone is not the Transparent City; it is a separately authorized government environment governed by public law rather than City authority.

Transparency zones are high-risk because they can make the City look like a shadow government. If a government office adopts record rooms, public explanation windows, corridor labels, staff influence logs, or emergency secrecy clocks, readers may think the City now operates government. The sentence-level cure is authority labeling: who owns the room, who owns the record, who owns the decision, and who owns the remedy.

Government transparency environments require separate definitions, authority, record regimes, legal review, and operational review. This chapter does not settle their constitutional validity or governmental design. The Constitution of Fairness and The Government of Fairness develop those proposals elsewhere in the series; applicable law determines whether any arrangement is authorized. Here the City's task is to keep support distinguishable from command.

A government transparency zone should therefore be described as conditional, lawful, limited, and locally governed. If a government creates one, the City's role may be advisory, architectural, educational, hosting-related, or record-interface related. The government's role remains sovereign in the legal sense. The public should be able to see the difference in the verbs. (U.S. GAO, 2025; NARA, 2023; Council of Europe, 2018b)

28.6.1 — Environment Definition

An environment definition names the physical, digital, legal, and operational setting in which a transparency practice occurs. A City record room, a participant office suite, a government hearing room, a classified facility, a court-adjacent space, and a public-service office are not interchangeable. The definition should tell the reader what kind of place this is before any record rule is applied.

If separately authorized, the environment remains government-owned or government-designated. It may borrow particular City design principles, including access bands, record labels, protected summaries, staff influence logs, public explanation windows,

complaint routes, and delayed-release categories. Those tools operate under government law and authority, not City authority.

The definition should include physical boundary, digital boundary, legal authority, record owner, access classes, protected categories, oversight body, emergency rule, and public-facing label. Without these elements, a zone becomes a metaphor. With them, it becomes reviewable enough for lawyers, administrators, staff, journalists, and citizens to know what they are looking at.

Government spaces should not be named as extensions of the City. Extension language implies institutional reach. Interface language is safer. A City participant may move through a government transparency environment; a City-trained officeholder may work in one; City standards may inspire one. But the government environment remains legally distinct.

Environment definitions also protect ordinary citizens. A person entering a government service office should not be treated as entering the City. Benefits, schools, health, housing, policing, taxation, immigration, courts, and ordinary public services carry sensitive records and coercive power. They require their own privacy, rights, service, and remedy rules. City logic cannot be pasted onto them without legal and operational review. (Nissenbaum, 2010; Council of Europe, 2018b)

A precise environment definition is therefore a civil-liberties safeguard. It prevents the City from accidentally expanding through architecture. It tells everyone whether they are in a formation setting, an official government setting, a protected

professional setting, or an ordinary public setting where private life remains private.

The negative boundary must be explicit. Such an environment is not a City campus, a private City office inside the state, a substitute for public-record law, a shadow ministry, or a way to impose the Transparent Vow on ordinary officials or citizens. Its legitimacy comes only from the lawful system that creates and governs it.

Public law or valid institutional authority, not City aspiration, must define the environment. It might take the form of a courtroom-adjacent record setting, an administrative transparency room, a public hearing environment, a crisis briefing protocol, a cabinet-interface record process, or an official archive pathway. Government owns the authority; the City may offer design language or hosting support only where law permits.

An environment definition includes its beginning and end. It identifies when a person enters, which role and record regime apply, who can refuse or leave, which authority governs, and what happens when the arrangement closes. Without temporal and role boundaries, a transparency zone can leak into ordinary government work, public employment, citizen access, or private life. The zone is a bounded interface, not an atmosphere.

28.6.2 — Government Authority Remains External

Inside a government transparency zone, every consequential act must still identify the lawful office, governing record regime, personnel authority, public-money authority, and review path.

The City supplies formation continuity, not substitute jurisdiction.

The City can host office-support spaces only where lawful. It can document participant conduct, organize public explanation, preserve record continuity, support staff interfaces, and flag gaps. It cannot enact law, issue government orders, classify information, bind agencies, command police, direct diplomacy, control public funds, or override official secrecy rules by invoking transparency.

This distinction should be visible in examples. If an elected official works from a City-associated office suite, the official's government act is still a government act. The City may record the explanation, route public questions, protect nonparticipants, and maintain corridor labels. It does not become the decision-maker. The City is the burden architecture around the office, not the office itself.

Government remaining government also protects the public from private legitimacy. A participant who came through the City is not entitled to office. A City record is not a mandate. A readiness bundle is not election victory. A corridor label is not public authority. The citizen, the law, and the lawful institution remain decisive.

Lawful governments remain free to reject, modify, or limit proposed interfaces. A lawful government may decide that certain rooms cannot use City-style records, that certain data may not be transferred, that certain staff roles require different protections, or that certain public interfaces conflict with existing law. The City

can criticize hidden burden, but it cannot command adoption. (Mashaw, 2006; Roberts, 2006)

The phrase government remains government is not a decorative disclaimer. It is an operational rule for verbs, contracts, maps, captions, examples, record labels, office diagrams, and public speeches. Wherever the City touches government, the reader should know which institution has authority before the sentence ends.

This distinction matters most when a City-formed officeholder is involved. The officeholder may bring greater burden, explanation, and record continuity into the role, but the office itself is not absorbed by the City. Staff, documents, emergency powers, classified duties, official meetings, and legal obligations remain under the proper public authority. If that boundary is not repeated in institutional design, critics will rightly suspect a shadow government.

Each visible interface should display or link an authority card naming the public body, enabling authority, official decision-maker, staff employer, funding source, record custodian, oversight body, and remedy. The City appears only in a separate support field describing facilities, education, hosting, or record-interface services. An environment whose authority card cannot be completed should not open. (U.S. GAO, 2025; Mashaw, 2006)

The phrase government remains government should appear in documents, room labels, staff charts, and record interfaces. Official memoranda retain official custody; government staff remain within their lawful employment and command structures;

hearings remain public proceedings; and emergency orders remain government acts. Clear attribution prevents the moral aura of the City from obscuring ordinary public authority.

28.6.3 — Record-Regime Separation

Record-regime separation prevents the City's active participant record, government official records, public-service records, research records, Artificial Intelligence logs, donor records, civic-platform records, and ordinary citizen records from merging into one profile. A government transparency environment may produce official records. The City may hold participant records. Those systems need boundaries.

The separation should include purpose, owner, authority, access, release, retention, correction, appeal, and deletion or sealing rules. A record captured for public office explanation is not automatically research data. A City corridor log is not automatically a government file. A government record is not automatically public bundle material. A machine summary is not an official verdict.

Dossier collapse is a special danger in travel and government environments because many systems meet at once. A participant may carry City status, hold public office, travel internationally, enter a government room, meet counterparties, use devices, and appear in public commentary. Without separation, all of these traces can become one inferred trust profile. That would betray the City's no-score discipline.

Record-regime separation should be visible in interfaces. Labels should say whether material is City active record, official

government record, protected professional record, public bundle, oversight-only record, research-governed data, or external-institution record. Users should not need specialized knowledge to know what kind of record they are reading.

The remedy for record-regime confusion should include correction, reclassification, access restriction, public note, affected-person notice, and audit. If a City record is wrongly imported into a government system, or a government record is wrongly treated as City public memory, the error should not be invisible. Boundary failure is a record harm. (NARA, 2023; ISO, 2016a)

A fair City does not make all records stronger by combining them. It makes each record accountable to its purpose. Separation is not weakness. It is how the City prevents transparency from becoming total administration of the person.

Government-zone separation should prohibit automatic joins between official records and City archives or other project datasets. Any lawful bridge must name the purpose, fields transferred, custodian, retention rule, affected-person rights, and termination condition.

Record-regime separation should identify the owner of each record before anyone argues about release. A City active-period record, a government official record, a court record, a diplomatic note, a classified record, a staff personnel record, a public complaint, a health record, and a platform interaction may all describe the same event. They do not have the same authority, access rule, retention period, correction route, or release standard.

Record-regime separation also protects secrecy where secrecy is lawful. Classified material, protected investigations, judicial deliberation, legal privilege, personnel records, and public-safety information cannot be pulled into a City record site simply because a City participant touched the process. The City may need a status label and oversight route, but it must not launder restricted records into public exposure. The boundary protects law as well as privacy.

28.6.4 — Legal Review

Legal review is required wherever City movement, corridor design, reciprocal hosting, government zones, public-record labels, data transfer, protected summaries, emergency secrecy, or office interface could affect rights or authority. The City's design vocabulary cannot create legal validity. It can only propose forms that law may accept, modify, or reject.

Enforceability is determined by applicable law and the institutions authorized to interpret and apply it. The Constitution of Fairness develops the series' proposed legal architecture. A corridor may be well designed and still unlawful in a particular jurisdiction; a protected summary may be ethically sound and still insufficient under a records statute; a transparency environment may require legislation, regulation, contract, or constitutional interpretation.

Legal review should occur before activation, before travel, before reciprocal hosting, before government-zone use, and after significant incidents. It should include participant rights, counterparty rights, staff labor, privacy, data transfer, public

records, security, diplomatic constraints, disability access, family exposure, and remedy. A legal review that looks only at institutional permission is too narrow.

Legal humility keeps public language precise. Fairness does not itself make a system lawful, careful design does not predict court approval, and participation does not waive every right. Strong record duties and enforceable protections can coexist because authority comes from the governing legal order, not from the City's moral confidence.

Legal review also protects opponents and critics. If someone challenges a corridor, secrecy label, record release, host arrangement, or government zone, the City should not treat the challenge as hostility to fairness. Legal contestability is part of the architecture. A design that cannot be challenged will eventually borrow the authority of law without earning it. (European Union, 2016; Council of Europe, 2018b)

The City's legal sentence should be exact: this is a candidate institutional design subject to lawful authorization, review, and remedy. That sentence does not weaken the chapter. It makes the chapter credible to the people whose expertise can keep the City from becoming beautiful overreach.

The chapter should defer enforceability without becoming empty. It can name the legal questions and the kinds of safeguards that would be required. It should not claim that any jurisdiction already must adopt the model, that constitutional doctrine has been settled, or that City participation confers legal validity.

Legal humility lets the City be concrete and serious at the same time.

Legal review should occur before a government transparency environment is described as usable. The review should ask who has authority to create the environment, whose rights are affected, what records law applies, how privacy and public access interact, what due process routes exist, what labor protections apply, what emergency exceptions are lawful, and what remedies are available if the environment causes harm. A beautiful design without legal authority is not an institution. It is a drawing.

Legal review returns when conditions change. An arrangement suitable for ordinary administration may fail in crisis; a public-hearing rule may not govern diplomacy; a pilot authorization may be displaced by statute, judgment, executive order, labor agreement, or data law. Authority has a clock as well as a source. Renewed review keeps yesterday's permission from silently governing tomorrow's interface.

28.6.5 — Operational Review

Operational review tests the practical interface between City formation and public administration. It examines staffing, procurement, security, crisis management, service delivery, digital systems, official records, maintenance, and audit only to determine whether a proposed interface can operate without shifting burden downward. *The Government of Fairness* owns the full operating-government architecture; this Part retains the City-side hazards, acceptance conditions, and stop points.

Feasibility becomes concrete through named responsibilities. The review identifies who staffs the environment, trains reviewers, funds maintenance, protects records, handles outages, translates public explanations, supports disabled users, receives complaints, audits security, and controls vendor or procurement risk. Moral beauty cannot substitute for any of those owners, resources, or response paths.

Government-zone involvement is therefore handoff-sensitive. It may offer lessons from campus design, record staging, access bands, office interface, staff dignity, and public explanation. But agencies, courts, legislatures, service offices, crisis centers, and ministries require operating rules beyond the City's own scope. A government environment is not a City chapter scaled upward.

Operational review also determines whether transparency creates new hidden labor. A government transparency zone may demand moderators, archivists, counsel, accessibility staff, security, translation, technical support, and complaint handlers. If those burdens are not funded and protected, the visible official may look answerable while workers carry the cost in silence.

A failed operational review still produces useful action: redesign, narrower scope, pause, decertification of a zone, additional staff, technical rebuild, legal change, or refusal to operate. Government should not be pressed forward merely because the proposal sounds aligned with fairness. A buildable limit protects trust better than an unbuildable promise. (U.S. GAO, 2025; NIST, 2024a)

Operational review is the practical cousin of legal humility. Law asks whether the environment may exist. Operations ask whether it can exist without moving burden downward. The City's contribution is strongest when it knows the difference and hands off the rest.

The City's contribution is a bounded interface standard: role-based record clarity, nonparticipant shielding, lawful exception labels, archive integrity, affected-person remedies, and disciplined public explanation. Agency command, staff supervision, classification, budget allocation, and procurement return to Government and applicable law. The interface is strongest when its stop point is as clear as its aspiration.

Before activation, the operating public body should approve an acceptance bundle covering staffing, budget, procurement and vendor exit, training, records, privacy and security, accessibility, incident response, public communication, complaint and appeal, continuity, maintenance, and shutdown. City reviewers may test interface assumptions and identify transferred burden, but they cannot approve the government function or supply missing authority. (U.S. GAO, 2025; NIST, 2024a; ISO, 2019)

Operational review also asks whether a visibility measure increases burden or reduces service quality. Delay in emergency service, deterrence of vulnerable users, staff burnout, victim exposure, security weakness, or unusable record volume can defeat a design that looks morally attractive. Institutional honesty may favor narrower visibility, clearer status labels, or stronger professional channels when those choices protect the people the system exists to serve.

28.7 — The City as a Node, Not a Fortress

The City should function as a bounded node, not a fortress or capital. It can receive, send, host, learn, translate, repair, and accept correction while keeping authority external, records bounded, and local dignity intact.

The node image also lets the chapter close without triumph. The City may move, but only through named burdens. It may connect, but only through lawful interfaces. It may host and be hosted, but only with reciprocal review. It may inspire other sites, but not command them. Its dignity is not in spreading. Its dignity is in remaining answerable wherever movement takes it.

A fortress protects by separation. A capital rules by concentration. It must be neither. If it becomes a fortress, it turns visible formation into a guarded ritual cut off from the world where public power actually operates. If it becomes a capital, it gathers symbolic authority until connection looks like command. The safer image is a node.

The node concept matters because the City's success will tempt people to overread it. A working City may be admired. It may become a place people visit, study, criticize, imitate, fund, oppose, or mythologize. Admiration is not authority. Replication is not proof. Network growth is not transition authorization. A node survives admiration by keeping its own status modest.

The chapter closes with a distributed identity rather than a list of ambitions. The City remains one node under law, open to connection but unable to claim sovereignty, sanctuary, global capital status, or inevitable replication. Movement under burden

and network humility are what make connection compatible with answerability.

The burden question remains the same at the largest scale. When the City moves, who carries the cost? When it connects, who gains voice? When it becomes admired, who is silenced? When it hosts, who works? When it delays disclosure, who reviews? When it replicates, who can refuse? A node must answer these questions without pretending that connection itself is fairness. (Ostrom, 2010; Curtis, 2016; Slaughter, 2004)

28.7.1 — Node Concept

The node concept names a limited institutional posture. The City can be connected to courts, agencies, host communities, educational sites, emergency routes, sister Cities, public interfaces, and government environments without owning them. It can receive information, send participants, host observers, share standards, and learn from criticism. It remains one institution among others.

A node has inputs and outputs, not commands over the whole system. Inputs include burden reports, legal constraints, host-community concerns, expert review, staff complaints, counterparty protections, public questions, and operational failures. Outputs include records, summaries, corrected protocols, training lessons, corridor labels, and public explanations. The City becomes healthier when these flows are reviewable.

The node concept also protects the City from self-enclosure. A place that forms public power must encounter the world that power will affect. Host communities, ordinary citizens, critics,

journalists, disabled users, workers, diplomats, legal systems, public agencies, and international contexts all test whether the City's internal language can survive outside admiration.

Boundary markers make connection selective and reviewable. Inputs, hosts, government environments, sister Cities, and network arrangements enter only when authority, burden, safety, record custody, and remedy are sufficiently clear. Openness without selection dissolves integrity; isolation without exchange turns the City into a symbol rather than a working node.

The public should understand the node as corrigible. If a corridor fails, it can close. If a sister City weakens protections, it can lose hosting status. If a government zone confuses authority, it can be relabeled or refused. If an international setting cannot support record continuity lawfully, movement can pause. A node can change shape without losing identity. (Ostrom, 2010; Acuto, 2013)

The City as node is a disciplined answer to scale. It says that public-power formation can be connected without becoming central command. It can be serious without becoming sacred. It can move without claiming the world.

The node should also be reviewable by the network it joins. Other Cities, host communities, governments, participants, staff, critics, and affected persons should be able to challenge a node's practices. If one City becomes immune to correction because it is original, wealthy, famous, or symbolically central, the network has already betrayed its own burden logic. A node remains fair only while it can be corrected from outside.

A node owes duties to the edges that sustain it. Travel staff, hosts, interpreters, digital custodians, security workers, public-record reviewers, and affected communities make connection possible. Their labor and vulnerability should remain visible rather than disappearing behind the participant's story. Network accountability begins by tracing who carried the connection and who can seek repair.

28.7.2 — Not Isolated Sovereignty

Not isolated sovereignty means the City is not a self-contained moral state. It does not withdraw from law, politics, ordinary citizens, governments, courts, markets, media, families, religious life, public services, or foreign jurisdictions. Its participants remain human beings in a world of overlapping duties. Its institution remains subject to law and review.

Isolation would make the City easier to stage and harder to trust. A participant who only functions inside the City may look disciplined under controlled conditions while remaining untested by ordinary public pressure, legal complexity, travel, diplomacy, hostile criticism, public-service friction, and family life. Public power cannot be prepared entirely in a protected terrarium.

Controlled connections with the world beyond the perimeter remain necessary. Public interfaces, travel corridors, host review, office environments, educational exchanges, opposition settings, complaint routes, and media boundaries all prevent isolation from becoming a prettier form of hidden formation. Connection makes the burden harder and more real.

But connection does not mean the City becomes sovereign over its surroundings. Local law remains. Host communities remain. Ordinary citizens remain private. Government remains government. Counterparties remain outside the Vow. The City's discipline travels only through lawful arrangements and only to the role-bound burden of participants.

A non-isolated City must also be interruptible. If a jurisdiction refuses, if a court limits, if a host community objects, if staff conditions fail, if security cannot be maintained, or if nonparticipant burden becomes too high, the City should pause or redesign. A sovereign fantasy presses onward. A fair node listens to limits. (Curtis, 2016; Slaughter, 2004)

The City refuses isolated sovereignty because public power is relational. It also refuses expansionist sovereignty because public power is lawful. The space between those refusals is where the City can move without becoming what it was designed to correct.

The answer to isolation is not sovereignty. This architecture must not become a sanctuary from law, a gated republic, a privileged campus, or a private diplomatic actor. It should connect through lawful interfaces that preserve burden without claiming independence from ordinary authority. The participant may carry a heavier role burden, but the institution remains located, reviewable, and legally humble.

Isolation can look safer than connection because fewer interfaces mean fewer complications. But a City that refuses all travel, diplomacy, hosting, and government contact would form public power in artificial conditions. Public office is relational. It meets

disagreement, law, crisis, strangers, institutions, and places not designed for it. The City cannot prepare participants for that world by hiding from it.

Connection also prevents isolation from being romanticized as purity. Refusing contact can shift burden by avoiding real law, conflict, communities, and institutional consequences. The relevant question is what a connection costs, who pays, what value it creates, and whether the City can repair what contact reveals. Modesty requires engagement under limits rather than withdrawal from difficulty.

28.7.3 — Not Global Capital

The City should not become the symbolic seat of a new world order or be described as the capital of transparent politics, the sacred center of public trust, or the headquarters of a global civic destiny. That image concentrates admiration and turns proximity to the center into status: founders appear to command, local translation looks like dilution, and refusal looks like disloyalty. The City's no-rank discipline would be betrayed by geography.

The anti-capital rule belongs in visual design as much as in prose. Maps should show reciprocal nodes rather than a glowing center with lesser sites; diagrams should represent interfaces rather than command lines; captions should avoid shrine language; and donor materials should never sell proximity to a center as prestige. Visual topology can centralize authority before readers encounter a single qualification.

A City may become influential without becoming a capital. Its protocols may be studied. Its failures may teach. Its records may

inspire reforms. Its critics may sharpen its safeguards. Its graduates may run for office. Influence is not the same as command. The difference is whether others can adapt, refuse, criticize, and outgrow it without moral penalty.

The network should have many centers of competence if it ever exists. One City may lead on accessibility, another on climate resilience, another on multilingual public interface, another on staff governance, another on secure corridors, another on host-community review. Distributed excellence prevents symbolic monarchy. (Acuto, 2013; Curtis, 2016)

A global capital asks the world to look toward one place. A node asks each place to carry the burden honestly where it stands. The node, rather than the capital, must remain the governing image.

Public artifacts also need crop-resistant authority labels. A map, diagram, donor page, or social excerpt should name local law, reciprocal hosting, review, refusal, and decertification in the same visible frame as any claim of connection. The image should communicate what each node may do, who can say no, and where authority ends, so admiration cannot silently become a theory of world command.

The global-capital temptation is partly aesthetic. A beautiful campus, a famous archive, a symbolic plaza, international visitors, and polished public ceremonies can make the first City feel like the center of a new civic order. That image may attract attention, but it can also invite cult framing, country ranking, donor capture, and geopolitical suspicion. The City needs to look useful before it looks destined.

A non-capital City can still be beautiful. Its beauty can come from legibility, hospitality under limits, careful records, protected people, modest signage, accessible routes, and the absence of imperial symbolism. It needs no maps of expansion or architecture claiming the center of history. Beauty serves fairness when it helps people understand burden rather than worship a place.

28.7.4 — Movement Under Burden

Movement under burden is the chapter's governing phrase. It means that a participant does not shed the active role when leaving the campus, entering a car, meeting a host, crossing a border, invoking security, or stepping into a government environment. The burden changes form, but it does not vanish.

The burden includes more than record continuity. It includes protection of counterparties, staff dignity, device security, gift discipline, host-community respect, legal humility, travel health, accessibility, emergency care, and public explanation. Movement under burden asks the City to carry all of these without pretending that one perfect record solves them.

Movement under burden also limits public appetite. The public may need to know why a trip occurred, who hosted, what record state applied, what exceptions were invoked, what gifts appeared, what influence occurred, and what later review found. The public does not need live location, raw intimate details, protected family information, security-sensitive routes, or identities of vulnerable counterparties.

The participant's own experience matters. Travel exhaustion, time-zone disorientation, cultural stress, threat, illness, language dependence, and sensory load can affect judgment. The institution must neither overread every strained moment nor ignore repeated patterns. Movement under burden includes care, rest, and support because burned-out visibility is not public trust.

Movement may need to slow. If a participant cannot travel without repeated gaps, host capture, device compromise, unlawful exposure, or staff overload, the solution may be fewer trips, narrower purpose, remote participation, different host, clean device protocol, stronger support, or pause. Movement is not proof of seriousness. (NARA, 2023; ISO, 2019)

The moral image is simple: public power should not get lighter when it leaves home. The City's job is not to make every place transparent. It is to keep the participant's burden honest wherever lawful movement makes the burden travel.

A mobility burden register should be completed before and after each journey. It records purpose, affected people, staff hours, accessibility and health needs, host and community costs, counterparty protections, device and data risks, exceptions, unresolved complaints, and the decision to continue, narrow, substitute remote participation, or stop. The register prevents travel intensity from masquerading as public value and makes support labor visible.

Movement under burden means that the participant's public-power role remains answerable while the form of answerability changes. Inside the City, record continuity may be direct. On the

road, it may be delayed, summarized, protected, logged, or partially unavailable. In government environments, it may be divided among lawful record regimes. In diplomacy, it may be counterparty-sensitive. The constant is not total visibility; it is refusal to let burden vanish without label.

Movement under burden protects ordinary travelers as well as the participant. Airports, streets, hotels, and public buildings should not become surveillance environments for everyone nearby. The participant's chosen burden is carried by the participant and properly authorized systems, not by turning surrounding publics into incidental subjects. A fair travel protocol records public-power relevance and shields the ordinary life through which power passes.

28.7.5 — Network Humility

Network humility is the discipline by which the City refuses to confuse connection with destiny. A network may learn, share, host, critique, translate, and repair. It may not treat its growth as proof, its adoption as moral ranking, its first site as capital, its standards as law without legal authority, or its records as universal truth.

Humility begins with failure memory. A corridor may fail. A sister City may weaken standards. A host may create burden. A device protocol may be compromised. A government zone may overreach. A public artifact may imply empire. These failures should remain visible, not buried to protect the image of the network.

Humility also requires refusal routes. A community may refuse hosting. A government may reject a transparency environment. A participant may decline travel. A staff council may object to workload. A counterparty may require stronger protection. A local legal review may find incompatibility. These refusals should not be treated as obstacles to a promised future. They are part of the system's intelligence.

Network humility protects against donor capture. Wealth may prefer visible expansion, prestigious sites, international ceremonies, branded corridors, or map-based evidence of growth. Governance must resist funding that turns network scale into a trophy. A smaller, slower, more reviewable network is fairer than a grand one that exports burden.

When a corridor or host arrangement fails, the network should circulate a bounded negative-result packet describing the attempt, operating conditions, affected groups, failure category, protected details, corrective action, unresolved uncertainty, transfer limits, and restoration trigger. The packet supports learning without ranking sites or shaming people. Failure memory becomes infrastructure when context, limits, and the right to differ travel with the lesson. (Argyris and Schön, 1978; Ostrom, 2010)

Humility leaves open the possibility that some public-power roles cannot yet be carried through the City model in some settings. That conclusion applies rather than abandons the governing fairness question. When the burden would fall on people who never agreed, records no one can govern, or laws the City cannot honor, restraint is the fair response. The node waits, learns, and remains answerable. Network learning should preserve the

reasons a site declines a shared practice, because local refusal may reveal a safeguard the wider network has overlooked. Comparative review should preserve local reasons when similar outcomes arise from different causes.

Network review should compare failures without flattening them. Repeated record-transfer errors, secrecy overruns, host burden, staff overload, or accessibility breakdown may justify a shared safeguard; a single locally specific failure may require only local repair. The network should publish the rule it changes, the evidence class supporting change, the recorded dissent, the review date, and every site's right to adopt a stricter protection. A shared change should therefore remain revisable when later sites produce contrary evidence or face different legal and host conditions. Network learning is strongest when a failed arrangement can be retired without reputational bargaining.

The Chapter ends at the proper return point: power moves, burden follows, and authority stays named. Each corridor, host, exception, environment, and node should reveal where burden went and who can correct it. When that account cannot be produced without violating law or dignity, the fair response is to narrow or stop the connection. Humility becomes operational at the point of refusal. A narrow connection that can be paused cleanly is more valuable than a wider network whose dependencies make correction politically or technically impossible. A smaller network with clear correction routes may carry more public value than rapid expansion.

Part VIII — Governance, Failure, and Exit

A City that asks future holders of public power to become more visible has no right to let its own authority remain vague. The City cannot be a lantern pointed outward while its own rooms are lit only by trust, charisma, donor confidence, staff habit, or technical custody. Governance is therefore not a back-office chapter after the beautiful design has been admired. It is the point where the City proves whether it can bear the burden it asks others to carry (Bovens, 2007; Power, 1997; OECD, 2017b).

Part VIII turns the City inward without turning the book defensive. The earlier chapters established site, record, privacy, admission, daily life, education, public readiness, office interface, public contact, travel, and diplomacy. Those systems can all be well described and still fail if the City itself becomes hard to challenge. The question now is whether an institution built to expose the formation of power can expose its own formation of power as well.

Governance becomes most revealing when the City is wrong. A delayed complaint can leave a participant carrying institutional indecision; retaliation can leave a staff member choosing between livelihood and truth; a mishandled record can force a nonparticipant to repair an exposure they never accepted; a host community can discover that its objections were treated as public-relations friction; and an auditor can be made nominally independent while funding, access, or appointment quietly narrows the work. Institutional seriousness begins by locating each displaced burden, naming the authority that permitted it, and giving correction enough power to move the cost back toward those able and obligated to carry it.

Convenience is the City's first quiet capture route. Operators prefer speed, educators defend programs, archivists protect workflows, clinicians may be asked to translate care into readiness, security may turn precaution into jurisdiction, and auditors may grow socially dependent on the institution they inspect. None of these pressures requires bad intent. Governance exists because ordinary incentives can move burden before anyone names corruption.

For that reason, governance in this Part is not a single board on a chart. It is a stack of separated functions, published authorities, complaint routes, audit paths, external inspections, red-team tests, donor and vendor reviews, conflict rules, participant voice, staff voice, ombuds independence, and audit-of-auditors. The work is technical because rights need mechanisms. It is humane because mechanisms touch frightened people. It is beautiful only when it lets a person challenge power without becoming an exhibit (Ostrom, 1990; Provan and Kenis, 2008; GAO, 2024; IIA, 2024).

Part VIII does not settle the final legal form of the City. It does not decide incorporation, public charter, host-jurisdiction status, statutory authority, constitutional enforceability, procurement law, public-record doctrine, or government oversight design. Those matters belong to legal, governmental, and transition domains and remain subject to leadership-approved Open Decisions. The City book can still do indispensable work by showing what any acceptable form must make visible before it earns trust.

Mission exceptionalism begins when an ordinary control is treated as an insult to a good cause. Complaints wait, donor access

becomes gratitude, staff absorb shortages, security exceptions acquire no expiry, and an archive publishes only the version most useful to the institution. Self-questioning must therefore be built into decisions, records, budgets, appointments, and stop authority rather than left to reputation management.

The first chapter of this Part therefore asks who governs the City and who reviews those governors. The second chapter turns to the technical memory systems that could either protect truth or centralize power. The third chapter confronts failure, exit, reintegration, record breach, bystander harm, and posthumous dignity. Taken together, the Part refuses the fantasy that an institution becomes fair because it is organized around fairness.

A reader should notice the sequence. Governance appears before archive technology because technology without authority limits becomes a hidden constitution. Archive and Artificial Intelligence appear before failure because a failure cannot be repaired if the record of it is inaccessible, corrupted, misclassified, or converted into machine authority. Exit appears after governance and records because departure is not merely a personal decision; it is the test of whether the City owns people or releases them.

This Part also insists that criticism belongs inside the City rather than at its gates. External inspectors, civil-liberties reviewers, disability advocates, labor representatives, cybersecurity red teams, privacy lawyers, host-community representatives, and skeptical journalists are not enemies of the institution. They are part of the burden architecture that keeps the City from mistaking coherence for innocence. If criticism has to break in from the

outside every time, the City has already made self-audit too fragile.

The human stakes are direct. A participant needs to know that a mentor's influence can be questioned. A staff member needs to know that a supervisor, donor, or participant cannot punish a complaint. A nonparticipant needs a route when exposure was mishandled. A host community needs recourse when the campus externalizes cost. A public reader needs governance reports that reveal meaningful facts without turning private harm into spectacle.

The expert stakes are just as sharp. Public-administration scholars will look for separable authority and usable review. Nonprofit and governance lawyers will look for fiduciary clarity, conflicts, delegation limits, and open structural questions. Auditors will look for independence, scope, evidence, sampling, reporting, and remediation. Ombuds professionals will look for independence, impartiality, informality, and confidentiality. Labor reviewers will look for anti-retaliation, workload, bargaining, staff privacy, and protected reporting (GAO, 2024, 2025; IIA, 2024; International Ombuds Association, 2022; OECD, 2016).

Failure memory is one of the Part's quiet promises. A failed audit, a proven complaint, a paused program, a donor conflict, a vendor vulnerability, a security overreach, or a reintegration injury should not vanish after repair. It should become bounded institutional memory that helps the City refuse repetition. The aim is neither preserved shame nor institutional self-exoneration. It is to preserve the lesson, the burden route, and the change that followed where institutions are usually tempted to preserve only

image.

Part VIII therefore makes the City less glamorous and more credible. It slows the architecture long enough to ask who may stop an action, who may inspect the decision, whose ruling may be appealed and to whom, what may be published, how affected people are protected, and which authority can compel correction when the institution would rather move on. These are not minor administrative questions. They are the moral center of any institution that claims to make power answerable.

The City becomes worthy of public attention only if it can withstand public correction. This Part does not promise that it will. It designs the first set of conditions under which that promise would become inspectable. In the Law of Fairness series, applied coherence is not proof, beauty is not validation, and adoption is not authority. Governance earns trust only when burden has a route back to those who create it.

Chapter 29 — City Governance and Audit

Every institution develops a shadow when its own power is easier to use than to question. Sometimes the shadow is a founder whose language becomes law. Sometimes it is a donor whose generosity becomes access. Sometimes it is an operator who knows every exception, an archivist who controls memory, a security office that defines danger, an educator whose approval becomes discipline, or an auditor whose findings are written for comfort rather than correction. (Power, 1997; Hood, 2010; Scott, 1998) A Transparent City cannot defeat hidden public power by assuming hidden power lives only outside its walls. The City will admit, refuse, stabilize, house, educate, record, protect, audit, and sometimes release people who seek public authority. Those verbs are not neutral. Each verb can shift burden toward a participant, a staff member, a family, a host community, a nonparticipant, a critic, a donor, a vendor, or the public that must understand what happened.

Governance in this chapter is therefore not a ceremonial chart. It is the living pattern by which authority becomes action, action becomes record, record becomes contestable, contestability becomes remedy, and remedy becomes institutional memory. A board that cannot be challenged is not accountability. An ombuds office that cannot protect confidentiality is not recourse. An audit office that depends on the unit it audits is not independence. A public report that hides the hard numbers in inspirational language is not transparency (Bovens, 2007; OECD, 2017a, 2020b).

The chapter's central suspicion is that reform can create a new opacity while trying to cure the old one. A City created to make

public-power formation visible may still treat its own governance as technical detail, donor strategy, founding charisma, or internal professional matter. That arrangement would reproduce the hidden pipeline in a more attractive form. The people least able to see, challenge, or survive institutional error cannot be asked to carry the uncertainty of who governed, who knew, who could stop the harm, and why no one acted.

The City does need authority. It must keep people safe, protect archives, manage housing, discipline access, respond to emergencies, maintain records, operate programs, pay staff, enforce role conditions, investigate harm, and pause or end participation when continuation becomes unfair. The answer to hidden power is not an institution too weak to act. It is an institution whose actions have owners, records, review routes, limits, and consequences.

The governance architecture separates functions that institutions often collapse. Education must not become discipline. Operation must not become meaning. Audit must not become management. Care must not become readiness judgment. Archive custody must not become historical verdict. Security must not become sovereignty. Participant voice must not become public command. External inspection must not become brand validation (GAO, 2024; IIA, 2024; INTOSAI, 2019).

The field-expert pressure is high because governance failures are rarely theoretical. A labor lawyer will ask what happens when staff report retaliation. An ombuds professional will ask whether the ombuds office is independent enough to be trusted. A public administrator will ask whether authority lines and reporting duties

are legible. An auditor will ask whether evidence, scope, remediation, independence, and follow-up can be inspected. A civil-liberties reviewer will ask whether complaint routes protect vulnerable people before protecting the institution (OECD, 2016, 2020b; ILO, 1971, 1982; Venice Commission, 2019).

This chapter defines governance conditions without selecting the City's final legal form; unresolved implementation questions remain Open Decisions for lawful review.

The practical test is whether a person under pressure can use the system. A participant who believes a mentor is retaliating should not need to understand the entire constitution of the City. A staff member who reports harassment should not be routed only to the supervisor named in the complaint. A nonparticipant whose protected material was mishandled should have a remedy route that does not require public exposure. A host resident who experiences externalized burden should know where the complaint enters and how it is tracked.

Governance must also distinguish authority from influence. A donor may fund a building without owning access. An educator may shape a participant's understanding without controlling admissions. A clinician may care for a person without providing public verdicts. An archivist may maintain records without declaring meaning. An Artificial Intelligence system may help search and summarize under governance, but it cannot decide truth, readiness, risk, or worth.

The audit architecture must have teeth without becoming a new unreviewed power. Auditors need independence, access, scope,

expertise, conflict rules, and publication pathways. They also need review. A City that audits participants but never audits auditors has only moved the sovereign one step away from the center. Audit-of-auditors is not bureaucratic excess; it is the refusal to let oversight become the last hidden room (GAO, 2024; IIA, 2024; INTOSAI, 2019).

Participant voice matters because the people who carry the Transparent Vow can see burdens that charts miss. Staff voice matters because workers know where the institution actually shifts pressure. External inspection matters because insiders can become fluent in their own excuses. Red teams matter because systems reveal themselves under attack, stress, simulation, and adversarial review. Public reporting matters because citizens cannot evaluate a City that speaks only to itself. (Hirschman, 1970; Fung, 2006; OECD, 2022b) This chapter is not cynical. It is anti-cynical because it refuses the lie that institutions are either pure or corrupt. Institutions are living burden-routes. They can correct or protect themselves, listen or deflect, separate roles or collapse them, publish hard findings or sell reassurance. The City becomes credible when it builds correction into ordinary operation, not when it claims a better moral type.

The deepest line is the one against moral totalism. The City may judge conduct within role-bound public-power formation. It may decide whether a person can remain active, whether a record is accurate, whether a complaint requires remedy, whether a safety rule was violated, whether a program must pause, or whether an audit finding requires structural change. It may not judge the soul, rank the person, certify human worth, create civic caste, require

participation in the Religion of Fairness, prove the Law, or replace democratic and legal judgment (Tyler, 2006; Scott, 1998).

The governing limit becomes concrete at the point of injury. A credible mechanism locates the burden, names the actor who created or received it, records only what is needed, shields people who should not be exposed, gives the harmed person a usable review route, and makes remedy follow without requiring public humiliation. A mechanism fails when institutional ambiguity becomes a private ordeal for the person with the least power. Good governance returns burden to accountable authority and leaves a record of whether the return actually occurred.

By the end of this chapter, the reader should be able to draw the City's governance map. The map should show who decides, who operates, who teaches, who cares, who protects, who stores records, who audits, who reviews auditors, who receives complaints, who hears appeals, who reports to the public, who can pause a system, and who can say no when a powerful person wants an exception. If the map cannot be drawn, the City is not transparent enough to ask others for visibility.

The sections that follow test that map through role separation, complaint routes, external inspection, audit of auditors, and the boundary against moral totalism.

Consider a hypothetical external-inspection case. A donor finances a records-search platform and later urges the operator to suppress an audit finding about the vendor's retention practices. A staff analyst who identifies the conflict is removed from the project, and a host-community representative reports that the

platform is also capturing nearby residents in public event footage. The same executive office controls the contract, the analyst's supervisor, and the first draft of the public response.

The governance map in Section 29.1 prevents that concentration from becoming the answer. The staff analyst may use a protected complaint route that does not report through the operator. The ombuds function can protect navigation and identify retaliation risk without becoming the fact finder. The internal auditor must disclose any prior advisory role, and an external inspector receives the contract, access logs, retention rules, complaint record, and host evidence under a defined mandate.

During review, the operator argues that pausing the platform would damage transparency. The governing body cannot decide by mission rhetoric alone. It must consider the evidence, the rights of affected people, continuity alternatives, vendor exit costs, and whether the system remains within its declared purpose. A minority finding can be published if the body rejects the inspector's recommendation, and the affected people retain separate appeal and remedy routes.

The result is not institutional theater. The platform is paused, the vendor loses access to retained copies, the analyst is restored to protected status, affected people receive notice and correction routes, and the governing body publishes the inspector's findings, its own decision, dissenting views, and a dated follow-up plan. The donor receives neither a veto nor privileged access to the remedy process.

Most important, leadership loses the argument in public. That outcome demonstrates no moral purity. It demonstrates that the City's mission does not outrank its own controls. If the governing body had suppressed the finding or retaliated against the complainant, the same map would identify escalation, removal, and closure routes rather than asking trust to fill the gap (OECD, 2016, 2020b; GAO, 2024; IIA, 2024).

29.1 — Who Governs the City

Governance begins with functions rather than personality. Someone sets institutional rules, someone operates the campus, someone protects records, someone hears complaints, someone audits, someone safeguards health, someone guards safety, someone represents staff and participants, someone receives host-community concerns, and someone reports to the public. When those functions are unnamed, power still acts, but through habit rather than accountable delegation (Ostrom, 1990; Bovens, 2007; OECD, 2017a, 2020b).

This Section does not choose the City's final legal form, a decision that belongs to jurisdiction-specific legal review and the constitutional architecture developed elsewhere in the series. It identifies what any lawful form would need before it could merit trust. Whether the eventual vehicle is a nonprofit, public-benefit entity, public-private body, special authority, or another lawful form, the structural test remains the same: divide authority, make it reviewable and recorded, bound its reach, and give people carrying its burdens a usable challenge route.

Governance by aura is the immediate risk. An admired founder, brilliant operator, generous donor, beloved educator, trusted clinician, skilled archivist, feared security director, prestigious auditor, or celebrated technical system can become a center of gravity before anyone records the authority. Informal gravity is therefore a governance fact. A published chart does little when real decisions move through anticipation, access, gratitude, fear, or convenience.

A serious governance design makes the difference between authority and influence visible. Authority is what the City may lawfully decide. Influence is what shapes the people who decide. Both matter. The governing record should show not only who signed the policy, but which committees reviewed it, which staff warned against it, which participant council responded, which outside reviewer objected, which donor was recused, and which unresolved question remained open.

29.1.1 — Governance Bodies

The map below is the Chapter's mandatory governance object. It does not select the City's final corporate or legal form. It translates the no-single-sovereign principle into separable functions, prohibited combinations, independent review, and visible stop routes. Public-integrity, ombuds, internal-control, and audit standards converge on the need for defined authority, independence, evidence access, conflict management, quality review, and follow-up, even though no single template fits every jurisdiction (OECD, 2017a, 2020b; Venice Commission, 2019; GAO, 2024, 2025; IIA, 2024).

The governing stack should be simple enough for an anxious person to use and strong enough for experts to inspect. A participant should know where to complain. A staff member should know where to report retaliation. A family member should know where to object to collateral exposure. A host community should know where to challenge local burden. A journalist should know which public report is authoritative and which protected detail remains lawfully withheld. A future auditor should be able to reconstruct why a decision happened and why it was not

stopped (Ostrom, 1990; Provan and Kenis, 2008; OECD, 2017a, 2020b).

Every governance body needs a readable charter naming its jurisdiction, appointment route, conflict rule, record owner, and removal or renewal process. Those facts tell participants, staff, hosts, and outside inspectors whether the body can act or merely absorb responsibility.

Table 29.1. City Governance Separation and External-Inspection Map.

Function	Authority, separation, and review
Stewardship	Holds charter purpose, executive appointment, budget ceiling, risk appetite, and closure duties. It may not teach, investigate its own misconduct, control complaint intake, or certify its own audit. Publish conflicts, minority findings, and removal routes.
Operations	Runs staffing, facilities, contracts, safety, and delegated implementation. It may not rewrite authority, direct clinicians, suppress findings, or punish protected complaints. Maintain delegation, labor, safety, and appeal routes.
Education	Owens curriculum, teaching, feedback, and assessment of role-relevant work. It may not impose discipline, diagnose fitness, control housing, or decide complaints about itself. Use published criteria, source records, conflict disclosure, and independent review.
Clinical care	Provides independent care, accommodation, emergency support, and clinical judgment. It cannot serve intelligence, discipline, or screening.

Function	Authority, separation, and review
Records custody	Governs provenance, classification, access, correction, retention, sealing, and lawful disposal. It may not decide guilt, readiness, worth, motive, or policy meaning. Keep custody maps, access logs, correction dockets, and external inspection.
Security	Handles immediate safety, access control, threat response, incident containment, and essential continuity. It may not define dissent as threat, conduct open-ended intelligence, command education or care, or create permanent emergency authority.
Voice bodies	Carry participant, staff, and host input on lived burden, work conditions, host effects, and proposed changes. They may not become popularity courts or disciplinary tribunals. Protect minority reports, agenda rights, anti-retaliation, and reasoned response.
Independent ombuds	Provides confidential intake, navigation, informal resolution where appropriate, systemic reporting, and referral. It may not report through the accused actor, become management counsel, or replace formal appeal. Protect appointment independence and case firewalls.
Audit and inspection	Provides independent assurance over controls, rights, security, technology, donor influence, and closure readiness. Auditors may not operate what they audit or depend on future work from the audited unit. Protect scope, evidence access, conflicts, findings, and follow-up.

Function	Authority, separation, and review
Donor and vendor review	Examines money, gifts, contract leverage, technical dependency, lobbying, and access pathways. Funding, intellectual property, or service continuity may not buy governance influence or suppress exit. Maintain audit rights, recusal, and replacement plans.
Stop authority	Provides predeclared power to pause a program, suspend a system, protect people, remove delegated authority, or recommend closure. No single unreviewable sovereign may control it; state the trigger, evidence standard, temporary authority, appeal, expiry, remedy, and public notice.

A credible City governance stack needs at least several distinguishable functions. A stewardship or governing board holds charter-level responsibility. An operations body manages campus systems and service reliability. An education body governs curriculum and formation standards. A clinical and care office protects health and capacity decisions. An archive and records authority preserves custody and release integrity. An independent audit office reviews systems, records, and compliance. An ombuds office provides confidential, independent help. Participant and staff councils carry lived burden upward. External inspectors and red teams test the system from outside.

Those bodies should not be arranged as a pyramid of moral rank. They are different routes for different burdens. The board is not holier than the staff council. The audit office is not wiser than the ombuds. The archive is not more truthful than affected persons.

The operations body is not more real than care. The point of the structure is to prevent any one office from owning the whole meaning of City life.

The record of governance bodies should be plain. Each body needs a charter, authority scope, appointment route, term or review cycle, conflict register, meeting record where appropriate, protected-session rules, public-summary duty, and contact route for affected people. The City should not hide behind elegant titles. A person reading the chart should be able to tell which office can act, which office can only recommend, which office can pause, which office can investigate, and which office can overturn.

A familiar breakdown occurs when bodies multiply without power or power concentrates without a body. A complaint office that cannot obtain records is not a route. A participant council that cannot place items on a review agenda is not voice. A board that receives polished summaries but never hears dissent is not oversight. An audit office without access to raw evidence is not audit. The design must test whether each body has enough authority to perform its function and enough constraint to prevent capture.

Fairness becomes practical at the point of error because the body that acts should leave a record, the affected person should have a route, an independent body should be able to inspect, and correction should remain possible without treating the original decision-maker as infallible. The burden of a wrong governance decision should never become a mystery transferred to the person with the least power to explain it.

Governance bodies need a written allocation of reserved and delegated powers. Reserved powers include changing the City's purpose, appointing or removing the chief operator, approving the operating ceiling, accepting high-risk gifts, altering record regimes, authorizing closure, and amending the governance architecture itself. Delegated powers cover ordinary implementation within those limits. The distinction prevents daily operations from becoming constitutional revision by habit, while also preventing the governing body from micromanaging every schedule, purchase, and personnel choice. A delegation register should show who may decide, the legal or charter source, the duration, the review point, and the route for challenge (GAO, 2025; OECD, 2017a, 2020b).

The architecture also needs an emergency rule that cannot quietly become normal governance. Emergency authority should identify the triggering condition, the specific powers activated, who receives notice, what rights remain untouched, which records must be created, and when the authority expires unless renewed by an independent body. The person exercising emergency power should not be the sole judge of whether the emergency continues. Afterward, an external review should test necessity, proportionality, collateral burden, and whether the same result could have been achieved with less secrecy or coercion. Emergency competence is not measured by how much authority can be gathered, but by how quickly extraordinary authority can be returned.

A governance cycle should therefore include more than annual meetings. It should connect risk review, participant and staff

voice, host-community effects, open complaints, audit findings, unresolved conflicts, resource capacity, and closure readiness. The governing body should publish what it considered, what it decided, what it deferred, and which dissenting view remains material. This record creates a visible line from evidence to authority without pretending that visibility eliminates judgment. It also lets future reviewers distinguish a bad outcome reached through a serious process from a pattern in which inconvenient evidence never entered the room.

29.1.2 — No Single Sovereign

The no-single-sovereign rule should be tested by conflict, not by consent. When a donor wants an exception, when a founder wants a public message softened, when an archive office wants to withhold correction, when security wants broader authority, or when Artificial Intelligence produces a persuasive summary, the system must show which independent body can say no. A principle that cannot defeat a plausible pressure point is only rhetoric (Michels, 1911; Power, 1997; Scott, 1998).

No Single Sovereign is the governing refrain of the City. It means no founder, donor, board, operator, educator, clinician, archivist, security office, auditor, ombuds, vendor, Artificial Intelligence system, public crowd, participant council, or political ally may become the final owner of City meaning. Each can see something. None can see everything. Each can hold power. None can hold unreviewed power.

Founder sovereignty is the most obvious danger because founding language can become sacred even when nobody calls it religion.

A founder may have created the idea, carried early risk, and articulated the first moral architecture. That does not entitle the founder to decide future disputes by charisma, memory, private preference, or implied veto. If a founder remains involved, that involvement must be role-bound, recorded, conflicted where necessary, and reviewable like other influence.

Donor sovereignty is quieter. The City may need money, land, technical help, construction support, scholarships, and operating reserves. Gratitude can become governance if donor preference shapes admissions, design, staffing, curriculum, public reporting, vendor selection, or silence around mistakes. Donor influence must therefore be disclosed, capped, conflicted, excluded from individual cases, and separated from access to protected records or participant outcomes.

Archive sovereignty is subtler still. Because the City is built around record, the archive can appear to hold reality itself. It does not. The archive preserves evidence, status labels, versions, corrections, protected summaries, and custody. It does not own interpretation, personhood, worth, readiness, or soul. Its power must be divided among custody, release review, correction routes, affected-person rights, public-context design, and external audit.

Artificial Intelligence sovereignty must be blocked before convenience makes it normal. Technical systems may help search, flag anomalies, summarize bounded material, support accessibility, or detect integrity risk under human review. They may not decide complaints, infer trust, rank persons, certify readiness, define protected categories alone, or become the

hidden judge of meaning. Machine assistance must be labeled, challengeable, logged, and removable.

The no-single-sovereign principle is tested in a real conflict, not by agreement with a slogan. If the founder wants one result, the donor another, the operator cites logistics, the clinician cites care, the archive cites custody, the auditor cites evidence, the participant cites harm, and the public asks for explanation, no single center should be able to close the matter by status alone. The governing route must identify which authority decides which question, what evidence it may use, who reviews the decision, and when a stop or appeal can interrupt it.

29.1.3 — Operator Boundaries

Operator boundaries become real through ordinary artifacts: delegation matrices, escalation thresholds, exception registers, emergency powers, procurement logs, scheduling authorities, housing decisions, and complaint referrals. These are the places where administration either protects fairness or quietly shapes life. Making the ordinary administrative act reviewable matters precisely because most institutional power is exercised through routine rather than spectacle.

Operators keep the City alive. They schedule rooms, manage housing, maintain utilities, coordinate staff, handle procurement, assign work, respond to emergencies, implement policies, and keep daily systems from collapsing. Because operators are close to the machinery, they are often the first to know what is possible. That practical knowledge is indispensable, but it can become rule

if convenience is mistaken for authority (GAO, 2025; IIA, 2024; OECD, 2020b).

The operator boundary begins by distinguishing management from meaning. Operators may implement participation conditions, coordinate staffing, execute record-handling procedures, and manage campus logistics. They should not unilaterally decide readiness, interpret protected clinical material, resolve complaints against their own offices, alter archive status, override ombuds independence, suppress audit findings, or classify inconvenience as emergency.

Operator authority must be visible in ordinary actions. A schedule change that affects public interface windows, a room assignment that affects dignity, a staffing shortage that affects care, a technical delay that affects record continuity, or a visitor restriction that affects public access should leave a record proportionate to its burden. Not every logistical decision needs a public report, but decisions that move rights, visibility, safety, access, or remedy need traceable authority.

The hardest operator failures are often not dramatic. A form becomes impossible to navigate. A complaint sits in a queue. An exception is repeated until it becomes custom. A staff shortage is normalized. A protected room becomes unavailable because a donor tour needs space. A participant learns that certain managers can be asked for favors. Operator boundaries exist because small administrative choices can decide who carries the burden while everyone calls the result neutral.

The remedy is not to weaken operations. Weak operations move burden too. The remedy is bounded operations with escalation routes. Operators need emergency authority, but emergency authority must be logged and time-limited. Operators need discretion, but discretion must be patterned and reviewable. Operators need professional respect, but respect cannot become immunity from audit, staff complaint, participant challenge, or public explanation where appropriate.

A City that cannot operate fairly will not become fair by saying the right things. The operational record should therefore ask: what decision was made, under what authority, who was affected, which protected category was touched, what appeal exists, and what pattern would trigger review? This turns management from hidden power into inspectable burden routing.

29.1.4 — Governance Reporting

Public reporting is how the City tells citizens that its own power is not being hidden behind the privacy protections it rightly owes to individuals. The report is not the same as raw exposure. A mature public report describes authorities, decisions, conflicts, audits, complaint patterns, correction status, donor and vendor relationships, record categories, and unresolved questions without turning participants, staff, complainants, families, or nonparticipants into public material (Bovens, 2007; NARA, 2023; GAO, 2025).

The governance report should have regular layers. A charter layer states what bodies exist and what they may do. A conflict layer reports donor, vendor, founder, staff, and board conflicts in usable

form. A complaint layer reports volumes, categories, timeliness, outcomes, appeals, remedies, and retaliation concerns without exposing protected details. An audit layer summarizes findings, limits, unresolved disputes, and follow-up. A correction layer says what changed because the City was wrong.

Governance reporting also needs denominators and time. A complaint count means little unless readers can see the eligible population or activity volume, the share acknowledged within the declared window, median and tail resolution times, recurrence after remedy, reopened cases, and the number still awaiting action. The same discipline applies to appeals, correction requests, protected-access failures, donor or vendor conflicts, and retaliation reports. Where small cells could identify people, the public report should disclose the suppression rule and the independent reviewer who received the complete record. A City should not manufacture reassurance by publishing only closed cases, easy averages, or categories large enough to look orderly (GAO, 2024; OECD, 2020b; IIA, 2024).

A governance report fails when adjectives outrun evidence. Calling the City transparent, ethical, humane, or fair tells the reader almost nothing unless the report identifies the event, responsible office, evidence class, unresolved uncertainty, protected withholding, challenge route, remedy owner, and next verification date. The institution must be willing to carry the embarrassment of exact reporting rather than ask the public to accept a favorable self-description.

At the same time, public reporting must resist the appetite for total detail. There are lawful and humane reasons not to publish raw

complaint narratives, clinical information, intimate records, child-related information, security-sensitive material, staff private details, or nonparticipant data. The report should explain the category of withholding and the route for oversight review. It should not ask the public to accept a black box merely because the City has a noble mission.

Two distortions threaten the report: glow and spectacle. Glow buries hard facts in aspiration; spectacle exposes injured people to prove that accountability is real. A usable report is plain, structured, versioned, accessible to nonexperts, and explicit about confirmed findings, disputed claims, delayed material, protected summaries, open remedies, and unresolved questions. It protects the affected person without protecting the institution from scrutiny.

29.1.5 — Open Decision Status

Open Decision Status protects the City from pretending that this chapter settles questions it only frames. The final legal form, board composition, appointment method, host-jurisdiction interface, public funding model, inspection authority, complaint tribunal structure, and relationship to enacted law require future legal, democratic, operational, and expert review. A manuscript can define criteria. It cannot enact the institution by prose (Sabel and Zeitlin, 2012; OECD, 2020b).

The purpose of labeling an Open Decision is not hesitation. It is claim-status discipline applied to governance. When a structure is unresolved, the City should say so in its internal documents, public guides, diagrams, and future legal drafts. A reader should

be able to distinguish a locked principle from a proposed mechanism, a candidate route from a lawful authority, and a design requirement from a settled implementation.

The locked principles are clear even when implementation remains open. No single sovereign. Role separation. Participant and staff voice. Ombuds independence. Protected complaint. Appeal. Remedy tracking. External inspection. Red teams. Audit of auditors. Donor and vendor conflict review. Public reporting. Lawful limits. Authority over roles, not souls. These are not optional decorations. Any future legal form that cannot carry them fails the City's own burden test.

Open Decision Status also protects against premature imitation. A later city, donor, government, university, platform, or movement might take a diagram and declare a City exists. The label should block that. Until legal authority, host review, staffing, records governance, rights protection, and external inspection are in place, the structure remains a candidate design. Operational enthusiasm is not authorization.

Public artifacts can create authority by appearance. A governance chart may look final while remaining provisional, and titles such as board, council, inspector, or ombuds may imply lawful power before any such authority exists. Charts, captions, guide pages, and donor-facing descriptions should therefore distinguish working design, proposed institution, legal review required, and active authority. Visual precision is part of claim-status discipline.

Each Open Decision should have a short, versioned record: the

unresolved question, the body lawfully empowered to decide it, the advice and evidence still needed, affected-person participation, a review date, and the condition for closure or continued deferral. Closure requires a reasoned decision by the authorized body and an update to the public status. Expert advice informs that decision; a manuscript, diagram, or reviewer cannot supply missing legal authority.

29.2 — Separation of Educator, Operator, and Auditor

Institutional totalism can arise without announcing itself. It appears when the same people teach and discipline, manage and judge, care and publish, guard and punish, or preserve records and decide their meaning. A participant may experience one institution, but the institution should never reduce that participant to one object governed by one will (Power, 1997; GAO, 2024; IIA, 2024).

Role separation is the grammar of institutional humility. Educators see learning and response to correction; operators see reliability, timing, logistics, and load; auditors see evidence, patterns, exceptions, and control weakness; clinicians see health, capacity, distress, and care; archivists see custody, classification, versioning, and correction; security sees safety, threat, access, and de-escalation. Each perspective is partial, and none should become the whole person.

Remedy depends on knowing which authority acted. When one office teaches, evaluates, diagnoses, investigates, protects, disciplines, records, and releases, the participant cannot tell which rules govern the encounter, and appeal dissolves into fog because the same facts can be recast under whichever role best protects the institution. Staff carry the same burden when incompatible duties are hidden beneath one title, especially when professional confidentiality or safety judgment is expected to yield to operational convenience.

Role boundaries here must be permeable where coordination is necessary and firm where power could merge. Coordination may be required during crisis, care, audit, or record repair. But coordination does not erase boundaries. Each cross-role communication should have purpose, minimum necessary information, status labels, and review. A City that cannot coordinate will fail operationally. A City that cannot separate will fail morally.

Serious experts will look for independence, not merely separate names. A body is not independent because the chart places it in another box. It is independent if it has access, budget, authority, protection from retaliation, conflict rules, direct reporting routes, and a way to publish bounded findings. Role separation must survive the pressure of embarrassment, urgency, donor attention, public anger, and institutional fatigue (Brown and Treviño, 2006; Tyler, 2006; OECD, 2018).

29.2.1 — Educator Boundary

The educator boundary matters because formation carries unequal intimacy. A teacher sees confusion, talent, bias, fatigue, defensiveness, courage, and intellectual dependence before a public reader ever sees the record. That proximity must improve learning without becoming a hidden admissions veto, disciplinary channel, patronage route, public persona factory, or loyalty test.

Operationally, educators may teach law, public reason, administration, economics, ethics, media literacy, data interpretation, deliberation, conflict, institutional craft, and burden analysis. They may evaluate coursework, provide

feedback, identify learning gaps, and document formative evidence. Their authority stops before discipline, exclusion, clinical interpretation, protected-record classification, housing control, complaint adjudication, or any certification of human worth. The boundary protects learning by keeping intellectual dependence from becoming institutional dominion.

Education remains intimate even when it prepares someone for public responsibility. A participant under instruction reveals confusion, arrogance, fear, dependence, imitation, and revision. Those moments may matter to public-power formation, but they are not raw material for humiliation. Educators should help the participant become more answerable without turning every unfinished thought into permanent judgment.

Educational records should distinguish draft work, final work, feedback, correction, disagreement, and unresolved dispute. A participant's poor first answer should not be presented to the public as settled character. A pattern of refusing correction may matter. A moment of confusion may not. The educator's task is to build context, not to flatten learning into reputation.

The educator boundary also protects against ideological capture. Teachers may challenge participants, expose them to serious rivals, require public explanation, and test the burden of policy choices. They may not require loyalty to a founder, party, religion, movement, donor, public crowd, or worldview. A City of Fairness education is not indoctrination in the City. It is training in burden-aware public reason.

When an educator believes a participant presents risk, the response must move through a defined route. Educational concern can trigger review by the appropriate body, with notice, context, response, and appeal. It should not become informal discipline through schedule exclusion, ridicule, private warning networks, withheld recommendations, or coded summaries that follow the participant without challenge.

Educational independence is credible only if a participant can disagree with an educator, fail a draft, revise in public, and still know which route reviews the educational judgment. If disagreement becomes suspicion, or if teaching becomes a hidden gate into discipline, the City has reproduced the private credentialing power it was built to replace.

29.2.2 — Operator Boundary

The operator boundary is especially easy to underestimate because operations look neutral when they succeed. A calendar, housing assignment, visitor approval, room transfer, badge permission, technical exception, or staffing shortage can alter who has access, who rests, who is interrupted, and whose complaint moves. Operational power must therefore be bounded not because operators are suspect, but because their decisions reach bodies before theories do (GAO, 2025; IIA, 2024; OECD, 2020b).

Operational authority covers housing, facilities, schedules, staff coordination, procurement, logistics, access control, service continuity, emergency coordination, and daily administration. These functions decide whether the City is livable, so they require

clear delegation, reasons, records, review, and escalation. The authority to keep the institution running does not include authority to define what a participant's life means, reinterpret care as discipline, or convert convenience into a moral judgment.

Operators will often feel the burden first. They will know which rules slow care, which spaces are overloaded, which staff are exhausted, which participants strain systems, which records are difficult to classify, and which public events create pressure. That knowledge should shape governance through reports, escalation, and review. It should not become unilateral authority over rights, readiness, clinical protection, archive interpretation, or complaint outcome.

The operator record must separate ordinary implementation from burden-moving decisions. Routine room assignments may require simple logs. A room assignment that affects dignity, family shielding, disability access, security risk, public exposure, or protected nonvisibility needs a more serious record. The same distinction applies to schedule changes, visitor restrictions, service failures, staff shortages, and exception decisions.

Administrative inevitability is the operator's recurring excuse. A decision may be called necessary because there is no staff, space, time, budget, technical path, or precedent. Sometimes that constraint will be real; sometimes convenience will be presented as reality. Another office must be able to test the claimed impossibility before its costs are transferred to participants, staff, families, or the host community.

Operators also need protection from impossible expectations. If the City asks operators to carry too much with too little staff, the burden will appear as delay, irritability, workarounds, informal authority, and hidden exceptions. Governance must audit operational load, not only operational decisions. Understaffing is not an individual moral failure. It is an institutional risk.

The operator boundary is healthy when management can say no to unsafe demands and when affected people can challenge management without attacking individual workers. The question is not whether operators have authority. They must. The question is whether that authority is purpose-bound, reviewable, and prevented from becoming the City's unspoken government.

29.2.3 — Auditor Boundary

Auditor boundary rules should specify access, independence, evidence standards, conflict screening, report publication, and follow-up authority without letting auditors manage the units they review. An auditor who becomes a fixer can lose independence; an auditor who only observes can become irrelevant. The City needs audit strong enough to force correction and separate enough to avoid owning the outcome it later evaluates.

The auditor boundary protects independent review from becoming management and protects management from auditing itself. Auditors examine whether the City is doing what it claims, whether controls work, whether records can be trusted, whether complaints are handled, whether donor and vendor influence is bounded, whether rights protections operate, and whether

correction actually follows findings. They do not run the City they audit (GAO, 2024; IIA, 2024; INTOSAI, 2019).

Independence requires more than honest character. The audit function needs protected budget, direct access to governing authority, authority to obtain records under lawful safeguards, the ability to interview staff and participants without retaliation, a documented scope, conflict rules, public-summary duties, and a route for escalating obstruction. Without those features, audit becomes ceremony.

Auditors should not be allowed to become moral judges of persons. Their object is system performance, evidence integrity, control weakness, risk, compliance, and follow-up. They may report that a readiness bundle lacked required context, that complaint timelines failed, that donor conflicts were underreported, or that security exceptions were overused. They may not certify the soul, worth, loyalty, or civic rank of a participant.

The auditor boundary must also protect sensitive material. Auditors may need deeper access than the public, but access is not ownership. Audit access should be purpose-bound, logged, minimization-aware, protected by confidentiality, and separated from public release. The audit report should say enough to make the City answerable without publishing protected detail merely to prove the auditor saw it.

Audit failure often appears as politeness. Auditors may become too close to operators, too dependent on board access, too careful around donors, too impressed by founders, too deferential to

technical vendors, or too proud of their own authority. The City should assume audit capture is possible even among serious people. That is why audit of auditors later becomes essential.

Auditor independence is demonstrated when a reviewer can publish a bounded critical finding that embarrasses the City and still remain protected, answered, and reviewed. If audit can criticize only small failures while major power centers remain untouched, the City has created the appearance of accountability without the burden of it.

29.2.4 — Clinician Boundary

The clinician boundary protects both care and governance. Clinicians may identify risk, recommend de-loading, protect confidentiality, document care-related safeguards, and report safety concerns under lawful limits. They should not be converted into readiness judges, political interpreters, record narrators, discipline agents, or public validators of inner life.

The clinician boundary protects care from becoming evidence appetite. Clinicians may assess health, capacity, risk, overload, sleep, trauma response, disability accommodation, treatment continuity, de-loading needs, and return or exit questions. They may provide care or independent clinical review. They should not be treated as record interpreters for the public, reputation managers for the City, or hidden gatekeepers whose notes become disciplinary material by default (Beauchamp and Childress, 2019; World Medical Association, 2024).

Clinical independence matters because participants live under unusual burden. Visible role life can create hyperarousal, sleep

strain, anxiety, shame, conflict, and exhaustion. A participant who seeks help should not have to wonder whether care will become a readiness label, a public summary, a complaint defense, or an archive exhibit. Care before evidence must remain a governance principle, not a slogan left to a health chapter.

The clinician record should have protected handling. A clinical finding may inform capacity review, accommodation, pause, de-loading, emergency safety, or return planning, but the raw clinical detail should be sharply restricted. Where public-power relevance exists, the public may receive a protected status label or summary that indicates role consequence without exposing diagnosis, treatment, trauma history, reproductive health, intimate detail, or nonparticipant information.

The clinician boundary also prevents therapeutic authority from becoming moral sovereignty. A clinician can say that a person is overloaded, lacks current capacity for a specific burden, needs support, should pause, or requires care. A clinician should not decide that the person is morally unworthy, spiritually impure, politically illegitimate, or permanently defined by a clinical episode. Clinical caution is not human ranking.

Coordination with other offices must be narrow. Operators may need to know that a participant requires schedule relief. Educators may need to know that a deadline must move. Security may need to know that a crisis plan exists. Auditors may need to know whether clinical-protection procedures worked. They usually do not need raw clinical detail. Governance should design the minimum useful signal and the strongest protection around it.

Clinical independence becomes real when a person can seek care without being consumed by the City's record appetite. If clinical help becomes a route into public meaning, the City will teach participants to hide distress. That would move burden into the body, precisely where fairness should have carried it upward into care.

29.2.5 — Archive Boundary

The archive boundary is the City's answer to memory power. The archive can preserve provenance, custody, versioning, correction, status labels, and protected access. It cannot decide what a person is, certify a moral arc, resolve political meaning, speak for a soul, or let technical custody become institutional supremacy.

The archive office should not control education, operations, audit findings, readiness judgments, or governance merely because it holds the source record. Its authority ends at custody, provenance, lifecycle status, and governed release support.

Archive power is easy to underestimate because it feels procedural. A classification choice can decide what the public sees. A search design can make one pattern easy to find and another nearly invisible. A summary can make an event seem final. A delay label can calm suspicion or hide neglect. A correction log can restore context or bury it. The archive distributes public attention, and therefore it distributes burden.

The archive boundary requires separation among custody, release review, public-interface design, correction, affected-person access, research-use governance, and Artificial Intelligence training permissions. The same office that stores raw records

should not unilaterally decide public meaning, scientific reuse, model-training eligibility, or the moral significance of patterns. Custody is not sovereignty.

Archivists need independence against operators, donors, participants, public pressure, and technical vendors. They also need accountability to affected persons and external review. A participant or nonparticipant must be able to challenge inaccurate metadata, misleading context, overbroad release, wrongful withholding, or failure to mask collateral people. Public memory must be correctable without becoming endlessly malleable.

The archive boundary includes humility about interpretation. A record may show conduct, sequence, source, status, dispute, correction, and context. It does not show total inner life. It cannot infer final worth. It cannot prove the formal Law. It cannot replace democratic judgment. It cannot become a shrine to the City's success. It is memory under law and governance, not omniscience.

Archive custody is legitimate only if evidence can be preserved strongly while the archive refuses to rule persons. If public memory becomes unchallengeable, if machine summaries become verdicts, or if archive staff become the hidden interpreters of readiness and character, the City has rebuilt invisible authority inside the very instrument meant to expose it.

29.2.6 — Security Boundary

Security boundary rules should be written in verbs: screen, escort, separate, de-escalate, log, protect, suspend access, refer, and request lawful assistance where needed. They should not drift into

punish, confine, humiliate, interrogate, or rule. The City needs safety infrastructure, but security becomes dangerous the moment it treats visible formation as custody.

The security boundary protects safety from becoming captivity. Security staff may protect participants, staff, visitors, nonparticipants, records, infrastructure, public interfaces, emergency routes, and protected zones. They may screen, de-escalate, respond to threats, document incidents, and coordinate with lawful emergency services. They should not become the City's hidden disciplinary authority, private police mythology, or unquestioned sovereign of fear (Saltzer and Schroeder, 1975; NIST, 2020a, 2024a).

Security in a Transparent City will always be tempted by justification. Because the City handles public attention, records, controversy, political pressure, protest, and possible sabotage, security concerns will often be real. But real threat does not erase the burden question. A safety measure can protect one person while burdening another with humiliation, restricted access, surveillance, or fear. Security must account for both sides.

The security record should distinguish threat, protest, confusion, misconduct, mental-health crisis, technical incident, visitor error, and ordinary dissent. A critic is not automatically a threat. A frightened participant is not automatically a disciplinary case. A staff complaint is not automatically disloyalty. Security language should not be the quickest route to silence.

Security authority must be limited by de-escalation rules, use-of-force standards, access logs, incident review, complaint routes,

disability and trauma review, protest protections, nonparticipant shielding, and audit. Emergency exceptions should be time-limited and reviewed. A restricted movement decision should identify authority, reason, duration, affected persons, record status, and review route.

The security boundary also protects security workers from becoming absorbers of upstream design failure. Repeated conflict caused by poor public-interface design, inadequate staffing, confusing record procedures, or vague visitor rules should be repaired at its source rather than managed through constant improvisation at the point where institutional ambiguity meets human bodies.

Security remains bounded when safety can be protected without making the City feel like a prison. An office that everyone fears to question has become a sovereign behind a locked door. A humane City treats security as a limited protective function governed by law, rights, audit, de-escalation, and care.

29.3 — Participant Voice, Ombuds, Complaint, and Appeal

A City that makes participants visible owes them usable routes, not mere patience. Visibility without recourse becomes exposure, formation without appeal becomes obedience training, and records without complaint become institutional possession. A person living under City burden should be able to challenge it before harm becomes scandal, before journalism or litigation becomes the only route, and before exhaustion becomes silence (Hirschman, 1970; Venice Commission, 2019; OECD, 2016).

Participant voice is distinct from participant rule. Those inside the City may have incentives to soften standards, protect friends, resist correction, or seek status, so the institution cannot become a self-protective club. Yet participants carry burdens that outsiders cannot fully see from a chart. Excluding their voice would cause governance to mismeasure the cost of its own rules.

Ombuds support and formal complaint perform different jobs. An ombuds helps a person understand options, name a concern safely, navigate routes, identify patterns, and raise systemic issues without immediately converting every conversation into an adversarial file. A formal complaint requires intake, evidence, response, decision, appeal, and remedy. The City needs both, with firewalls that prevent either route from swallowing the other.

Complaint and appeal mechanisms should be designed for real people, not ideal complainants. A person may be tired, frightened, angry, ashamed, disabled, confused, undocumented in their concern, or afraid of retaliation. A staff member may be

dependent on employment. A participant may fear public interpretation. A family member may fear collateral exposure. The route must be plain enough for them to use when they are least able to perform institutional fluency.

29.3.1 — Participant Council

Structured participant voice gives people living under the Transparent Vow a governed way to identify recurring burdens and place them before decision-makers. The council should review proposed rules affecting daily life, staff interaction, record handling, public-interface pressure, schedule load, protected nonvisibility, and retaliation risk. It is neither ornament nor therapy, and it must not become a popularity tribunal. Its value lies in translating lived burden into reviewable institutional questions without displacing individual complaint, appeal, staff rights, or the standing of affected people outside the participant body.

A participant council should have a defined agenda path, access to nonprotected governance information, protected channels for raising systemic burden, and limits that prevent it from becoming a popularity tribunal. It gives voice to those who carry the Vow without giving participants ownership over other people's rights. Its legitimacy comes from structured input, not from representing a higher civic caste.

The council should be role-bound and limited. It may advise, report patterns, request review, propose changes, and protect minority concerns. It should not decide individual admissions, clinical findings, disciplinary outcomes, protected record release,

staff employment, audit conclusions, or readiness labels. Participant voice is essential because participants know lived burden, but lived burden is not the same as institutional sovereignty.

The participant council must route individual or protected concerns to the ombuds or formal complaint system without copying them into council records. Its access duty is systemic: identify recurring barriers, request correction, and leave confidential intake to the independent office designed for it.

The council's record should preserve issues raised, disagreements, minority reports, requests for review, and responses from governing bodies. It should not expose vulnerable participant stories without consent and protected handling. A council is most useful when it turns lived experience into governance evidence without turning the people who suffered into public examples.

The council can fail in two directions. The council can be ignored, becoming a pressure release valve with no authority. Or it can become too powerful, turning into an internal political class that governs by proximity to decision makers. Either failure moves burden. The first moves burden into participant frustration. The second moves burden onto quieter participants, staff, and nonparticipants.

Participant voice is credible when the council can obtain a serious institutional answer while people outside the council remain protected from council power. Voice is fair only when it lifts burden without becoming another source of it.

29.3.2 — Ombuds Independence

Ombuds independence depends on institutional design, not personality. The office needs a protected appointment and term, budget insulation, sufficient access to records and people, freedom from retaliation, and reporting routes outside the ordinary chain of command. Its public charter should preserve independence, impartiality, informality, and confidentiality while stating when safety, law, or professional duty requires escalation or referral rather than investigation. An office that quietly serves management intake or formal investigation under the ombuds name is not independent in function (International Ombuds Association, 2022; Venice Commission, 2019; United Nations General Assembly, 2020).

The ombuds route is deliberately informal and therefore powerful but limited. It can listen, clarify options, help a person prepare, mediate where appropriate, identify systemic patterns, and recommend process improvements without receiving legal notice, adjudicating facts, imposing discipline, or promising formal remedy. Users must be told that speaking with the ombuds ordinarily does not initiate a formal complaint, preserve a legal deadline, or substitute for emergency, safeguarding, labor, clinical, statutory, investigative, or court processes (International Ombuds Association, 2022; United Nations General Assembly, 2020).

Confidentiality must be honest. People using the ombuds should know when confidentiality is protected, when imminent risk or legal duty may require action, and how systemic trend reporting can occur without identifying them. False promises of

confidentiality are another form of hidden burden because the user carries risk they were not allowed to understand.

The ombuds office should be able to report patterns without exposing people. If multiple participants describe retaliation fear, if staff describe informal donor pressure, if families describe collateral exposure, or if applicants describe confusion around refusal, the ombuds can place a trend before governance. The City then carries the burden of systemic response rather than forcing each person to become a named case.

Ombuds access succeeds when a person can arrive before knowing exactly what the problem is and leave with clearer options, protected dignity, and no new hidden risk. If the ombuds becomes public relations, management intake, or institutional therapy for complaints the City does not want to hear, independence has failed.

Formal recourse needs more than one doorway. Plain-language forms, accessibility support, anonymous or protected initial contact where lawful, emergency escalation, third-party reporting, and visible status updates should all exist before a person is in crisis. Intake fails when someone must first demonstrate perfect terminology, emotional composure, or public courage before the institution will hear harm.

The office should be reachable through more than one route. A participant may need a private appointment outside the ordinary schedule; a staff member may need off-site or encrypted contact; a host resident may need language access; a person with a disability may need a communication accommodation; and a

family member may need to raise a systemic concern without entering the participant's record. Intake metadata should be minimized, separated from management analytics, and reviewed for patterns without turning complainants into risk profiles. Access is not real when the route itself exposes the person to the authority being challenged.

Systemic reporting is the bridge between confidential cases and institutional learning. The ombuds may report recurring barriers, delays, retaliation patterns, ambiguous rules, or concentrations of power without publishing protected identities or reconstructable details. Management should answer those reports in writing, and unresolved recommendations should remain visible to the governing body and external inspectors. The office should also be auditable for delay, conflict, accessibility, and misuse of confidentiality. Independence protects the complainant only when the ombuds itself remains answerable.

29.3.3 — Formal Complaint Intake

Formal complaint intake is a separate route from the informal ombuds service described in Section 29.3.2. It must be plain, accessible, trauma-aware, disability-aware, multilingual where needed, protected against retaliation, and able to distinguish urgent harm from ordinary administrative dissatisfaction. The ombuds may help a person locate this route, but the designated formal intake office receives notice and opens the case. A route that only a lawyer or insider can use will fail the people most likely to need it (Venice Commission, 2019; Tyler, 2006; OECD, 2016).

The intake system should ask enough to act and no more than necessary to begin. It should identify the affected person, the alleged burden, the office involved, the record stage, protected categories, urgency, requested relief, fear of retaliation, and whether ombuds support, counsel, clinical support, or immediate safety review is needed. It should avoid forcing exhaustive narrative before relief begins.

Complaint intake should create a bounded service clock. Urgent protection, acknowledgment, routing, preliminary review, evidentiary completion, decision, and remedy follow-up require distinct time standards because one global deadline hides the places where people actually wait. Queue reports should show age bands, transfers, returns for missing information, withdrawals, protective measures, and reasons for extension without exposing complainants. A case circulated among offices has not been handled merely because each office met its local target (Venice Commission, 2019; OECD, 2016; ILO, 1982).

Complaint categories should be specific enough to route correctly. Admissions error, record inaccuracy, protected nonvisibility breach, staff misconduct, participant misconduct, operator failure, clinical boundary issue, security overreach, donor influence, vendor failure, public reporting error, family or nonparticipant exposure, retaliation, and audit obstruction are different matters. If all complaints enter one undifferentiated inbox, the City will misroute burden.

Intake must also protect people who are not participants. Staff, applicants, rejected applicants, families, partners, children through guardians or protected representatives, host-community

members, visitors, experts, journalists, vendors, and bystanders may all experience City harm. The route should not assume that only active participants have standing to complain.

Intake most often fails when reputation comes first. The institution asks whether the complaint will look bad before asking whether the person needs relief, then treats tone as credibility, delay as investigation, or confidentiality as a way to keep patterns invisible. A sound intake begins with care, jurisdiction, authority, evidence preservation, and protection from retaliation.

Complaint intake is usable when a report can become action without becoming spectacle. A person should not have to publish, threaten, flatter, perform, or expose protected details to be heard. Intake is fair when it moves burden from the isolated person into a governed process that can be checked.

An appeal pathway must review substance, not only procedure. It should identify who made the first decision, what evidence was considered, what protected material cannot be publicly shared, what standard of review applies, and what remedies are available. Appeal becomes meaningful when it can change an outcome, correct a label, reopen a record, require protection, or expose a structural weakness.

29.3.4 — Governance Appeal Pathway

An appeal pathway gives people a way to challenge the first decision without begging the same authority to reconsider itself in private. Appeals matter because every office can be wrong: admissions, operations, education, archive, security, clinical interface, complaint handling, audit, public reporting, and remedy

administration. A City that admits fallibility must give fallibility a route (Tyler, 2006; OECD, 2020b; ILO, 1982).

Appeal rights should be stated at the moment of decision. The affected person should receive the decision, reason, evidence status, protected-material limits, deadline, appeal body, available assistance, retaliation protections, and possible outcomes. If the decision contains protected material, the appeal should include a way to review enough to contest without exposing others or violating law.

The appeal body must be independent enough to matter and informed enough to decide. Some appeals may go to a different internal office; others may require outside review, legal review, clinical review, archive review, or audit review. The appeal body should not be chosen for institutional convenience after the dispute arises. Predefined routes reduce the burden of uncertainty.

Appeal outcomes should include more than affirm or reverse. The City may need to correct a record, issue a protected summary, change classification, provide accommodation, reopen investigation, compensate, apologize, discipline, redesign a process, report a pattern, delay release, restore access, or refer a legal question outside the City. A narrow appeal menu can hide the actual burden.

Appeal fails when reasons are vague, deadlines are unusable, protected evidence cannot be meaningfully contested, retaliation is tolerated, or the process exhausts people into silence. A low reversal rate alone does not establish failure: it may reflect sound first decisions or barriers that prevented meritorious appeals.

Review should examine access, case mix, reasons, withdrawn cases, and independent samples of both appealed and unappealed decisions before judging the route.

A functioning appeal can correct both an individual decision and the burden route that produced it. If a participant wins an appeal but the same intake form continues to misclassify future complaints, the City has repaired a symptom while protecting the pattern. Appeal should feed correction, not merely file closure.

29.3.5 — Remedy Tracking

Remedy tracking prevents the City from confusing acknowledgment with repair. A complaint can be validated and still fail if no responsible body changes a practice, compensates injury where appropriate, corrects a record, protects a person, disciplines a misuse, reports a pattern, or checks whether the harm recurs. The public does not need every private detail, but the public does need evidence that remedy follows finding.

Remedy tracking ensures that a finding of harm does not disappear into the word resolved. A remedy may include correction, apology, compensation, shielding, release change, status label change, discipline, accommodation, de-loading, vendor repair, staff support, policy redesign, public notice, audit follow-up, or referral outside the City. Each remedy has a burden: someone must do it, verify it, and say whether it worked (UNODC, 2020; NARA, 2023; Sabel and Zeitlin, 2012).

Remedy effectiveness should be tested at three levels. The first asks whether the promised act occurred, such as a correction, payment, access change, restored status, or staff protection. The

second asks whether the act reduced the burden for the person affected rather than merely closing an administrative field. The third asks whether the underlying mechanism changed enough to prevent recurrence in comparable cases. Where safe and voluntary, the affected person should be invited to state whether the institution's description of repair matches lived consequence, but no one should be made responsible for validating the City's ethics. A remedy remains open when evidence shows that harm, exposure, retaliation, or misclassification continues (Sabel and Zeitlin, 2012; UNODC, 2020; Tyler, 2006).

A remedy tracker should identify the harm found, affected persons, responsible office, chosen remedy, due date, verification method, public-report category, protected-material limits, appeal rights, recurrence risk, and follow-up check. It should distinguish a remedy promised from a remedy delivered, and a remedy delivered from a remedy felt as adequate by the person harmed.

The tracker should also protect dignity. Public remedy summaries should not convert harmed people into proof that the City is ethical. A correction can be publicly necessary without naming every wound. The City should report its failures as duties accepted, not as performances of virtue. The burden of institutional learning must not be carried by the public exposure of the injured.

Remedy tracking should include staff and nonparticipant remedies. A staff member may need anti-retaliation protection, schedule repair, compensation, apology, or supervisor change. A family member may need shielding and correction. A host community may need infrastructure repair. A visitor may need

exposure remedy. If remedy tracking tracks only participant outcomes, the City hides collateral burden.

A case is not closed merely because the institution has finished processing it. Institutions often close a case when a letter is sent, a meeting is held, a policy is drafted, or a public statement is made. Fairness requires asking what changed in the burden route. Did the record become accurate? Did the person receive relief? Did retaliation stop? Did future people become safer? Did the office lose a power it misused?

Remedy tracking must permit a case to reopen when the original repair fails. Otherwise the remedy system repeats the first injury in administrative form. Tracking is not paperwork for its own sake; it is memory joined to an obligation to verify that relief worked.

Many institutions fail after saying the right words. An acknowledged complaint without repair becomes a second burden, an apology without change becomes reputation management, and a correction that never reaches the public record can leave a person permanently misread. The City needs evidence that relief was delivered, recurrence was reduced, and the person harmed is no longer carrying the institution's unfinished work (Fung, 2006; OECD, 2022b; Hirschman, 1970).

29.4 — External Inspection and Red Teams

External inspection is the City's refusal to serve as its own best witness. Insiders understand context, but they also adapt to normalized patterns; supporters may excuse risk, exhausted staff may stop naming design failures, participants may fear status consequences, and donors may prefer reassuring reports. Independent review supplies another set of eyes before harm becomes institutional culture (GAO, 2024; IIA, 2024; INTOSAI, 2019).

External inspection and red teams provide different forms of assurance. Inspection tests evidence, compliance, and governance against a mandate; red teams probe how serious failure could bypass the design. Neither is a hostile crowd, and neither may manufacture injury for theater. Competence, bounded access, protected-contact routes, finding categories, follow-up authority, and review of reviewer conduct belong to both.

Independence requires more than an outside name. Inspectors and red teams need competent personnel, protected scope, evidence access, confidentiality rules, safe contact routes, public-report duties, conflict controls, escalation when obstructed, and review of their own conduct. Access without protection can create new exposure; protection without access creates symbolic review. Both must be designed together.

The deepest public-risk value of external review is that it makes criticism normal. A City that treats every objection as attack will become defensive. A City that treats every critic as sovereign will become chaotic. The right posture is structured openness:

criticism enters through routes, is recorded, receives response, and can force correction, but it does not command by volume, fame, ideology, or outrage.

29.4.1 — External Inspectors

External inspectors bring outside review into the City without requiring public scandal first. They may include governance auditors, civil-liberties reviewers, privacy and records experts, clinical boundary reviewers, labor representatives, accessibility experts, cybersecurity reviewers, host-community observers, and public-administration specialists. Their task is not to admire the City. It is to test whether the City's own safeguards work under pressure.

External inspectors should be selected for competence and independence, not for admiration of the City. Their scope should reach governance, records, privacy, security, labor, accessibility, donor access, vendor dependence, host burden, and complaint handling. The City should not be able to substitute a friendly tour, a curated dashboard, or a ceremonial advisory panel for inspection that can actually find failure.

Inspector authority should be defined before inspection begins. The scope should identify which systems are under review, what records may be accessed, which protected categories require special handling, who may be interviewed, whether anonymous input is allowed, how findings will be classified, and how obstruction is reported. Undefined inspection creates either weakness or overreach.

External inspectors need safe contact with participants, staff, families, nonparticipants, and complainants where relevant. If all contact is mediated by the office under review, the inspection will inherit the institution's blind spots. Protected interviews, confidential submission channels, anti-retaliation rules, and independent scheduling help inspectors hear burdens that official reports may not contain.

Inspection access needs an evidence protocol as well as interview access. The mandate should identify preservation notices, sampling authority, protected-record handling, legal privilege, technical reproduction, chain of custody, rights of reply, contrary-evidence admission, and the point at which obstruction becomes a reportable finding. Inspectors should be able to follow a burden across offices when a narrow organizational chart would conceal the route, yet every expansion of scope should be logged and justified. This prevents two opposite failures: an inspector too weak to reconstruct the system and an inspector whose curiosity becomes a license to collect. The final report should distinguish verified fact, supported inference, unresolved conflict, and recommendation (GAO, 2024; IIA, 2024; INTOSAI, 2019).

Inspectors should not become operational managers. They can recommend, report, require response, flag serious risk, request follow-up, and escalate to the appropriate governance body or pause authority where authorized. They should not quietly take over admissions, records, discipline, clinical care, or daily operations. Inspection is a check on power, not a replacement for it.

External inspection loses its purpose when it becomes theater. A prestigious reviewer arrives, sees polished spaces, meets prepared participants, receives curated records, signs a report, and leaves. The City should design against that ritual by requiring raw-pattern review, adverse-case sampling, complaint-route testing, staff burden review, donor and vendor conflict review, and follow-up on prior findings.

External inspection earns confidence when a reviewer can find something the City did not want to find and make the institution respond. If inspection can only confirm the City's self-description, it has become a mirror. The City needs windows.

A worked inspection route shows why separation matters. Suppose a participant reports that an operator repeatedly reclassified complaints about a donor-supported technology as routine service requests, which kept them out of the governing body's risk report. The ombuds office protects the complainant's identity and refers the pattern to an external inspector because the operator controls the ordinary complaint queue and the internal audit team previously reviewed only aggregate closure rates. The inspector freezes the relevant deletion schedule, obtains the classification history and access logs, records the donor and vendor relationships, interviews affected staff through protected channels, and discloses any prior work for the City. The participant can submit a statement, correct factual misunderstanding, and request interim shielding without becoming the public face of the finding. No single body can close the matter: the inspector establishes evidence, the ombuds protects access, the governing body owns interim authority, the

auditor tests the control failure, and an independent appeal route remains available (Bovens, 2007; IIA, 2024; GAO, 2024; OECD, 2020b).

Closure in that case requires more than publication. The City restores each misrouted complaint to the correct status, notifies affected persons, pauses the classification rule, removes the operator's unilateral exception power, and compensates documented costs where the governing legal route permits. A bounded public notice explains the category of failure, the institutional contribution, the corrective action, and the follow-up date without exposing protected complainants or implying that every donor relationship is corrupt. The governing body then decides whether leadership change, contract amendment, discipline, or program suspension is warranted, while an audit-of-auditors asks why the earlier review missed the pattern. Follow-up testing must show that complaints now reach the right route and that staff can report interference without retaliation. The inspector's own independence, evidence handling, reasoning, and conflicts remain open to meta-complaint and quality review. This sequence lets leadership lose an argument, lose delegated authority, or lose office without converting audit into moral sovereignty or confusing City governance with public-law enforcement (OECD, 2017a, 2020b; Venice Commission, 2019; IIA, 2024; GAO, 2024).

29.4.2 — Red Teams

Red teams are useful only when they are allowed to make the institution uncomfortable within humane limits. They can test cybersecurity, record integrity, visitor access, donor pressure,

media manipulation, bot amplification, emergency exceptions, retaliation pathways, and public misinterpretation. They should not test people through cruelty, humiliation, trauma production, or deception that violates the City's own dignity rules (Zenko, 2015; NIST, 2023a, 2024b).

Red teams test the City by acting from the perspective of serious failure. They ask how a donor could capture influence, how a vendor could become indispensable, how a participant could evade record continuity, how a staff member could be silenced, how a public bundle could mislead, how a visitor route could expose a nonparticipant, how a machine summary could become authority, and how security could drift toward carcerality.

A red team should be authorized, bounded, and documented. It is not allowed to create real harm in order to prove imagination. It can simulate attacks, test procedures, review edge cases, examine policy gaps, attempt controlled social-engineering exercises where lawful and consented, test public-artifact misreadings, and pressure appeal routes. It should preserve safety, legality, dignity, and after-action review.

The City needs different red-team disciplines. A civil-liberties red team asks where ordinary privacy could be consumed. A cybersecurity red team tests breach, deepfake, sabotage, access control, and vendor dependency. A labor red team asks where staff carry hidden work. A clinical red team asks where care becomes evidence. A journalist red team asks how a hostile excerpt could distort the City. A governance red team asks who cannot be challenged.

Red-team findings should enter a correction route, not merely a report archive. Each finding needs severity, affected persons, office owner, protected categories, mitigation, deadline, verification, public-summary status, and follow-up. A red team that repeatedly discovers risks without changing systems becomes institutional entertainment.

Red-team work becomes abusive when cruelty or cleverness becomes the reward. Breaking systems, humiliating staff, surprising participants, or producing dramatic scenarios can repeat the misuse the City is meant to resist. Adversarial testing is justified only when it reduces future burden, uses the least harmful method capable of answering the question, and protects people during and after the test.

Red-team review has value when the City can thank challengers for exposing a painful weakness and then change. If the institution praises red teams publicly while privately minimizing their findings, criticism has been converted into brand. That is hidden power wearing armor.

Donor capture review must include money, land, construction, scholarships, software, research support, naming, board access, procurement preference, social proximity, and post-donation influence. Capture often appears as gratitude before it appears as command. The City needs review that can identify when a gift has become a governance route.

A serious red team begins with a written mandate rather than a license to improvise accusations. The mandate names the systems, decisions, and failure modes under review; the evidence

channels the team may use; the protections owed to people drawn into the exercise; and the difference between a verified finding, a plausible scenario, and an unresolved suspicion. A governance red team may test whether a complaint can be suppressed, whether a donor can route influence through an intermediary, whether a security exception can persist without review, or whether a public summary conceals material dissent. A technical red team may test identity, access, provenance, model behavior, and recovery. The two functions may cooperate, but neither should borrow the other's authority or report confidence it has not earned (Zenko, 2015; NIST, 2023a, 2024b).

The exercise also needs protected participation. Staff and participants should be able to describe weak controls without becoming targets for having revealed them. Observers should distinguish a person's error inside a simulation from misconduct in ordinary work. Scenarios involving trauma, harassment, exposure, or clinical vulnerability require scope limits and independent review before use. The City gains little from a theatrical attack that produces fear, prestige, or a dramatic public video while teaching nothing about the actual control environment. The useful red team is often quieter: it discovers that one mailbox has no backup owner, one emergency label has no expiration rule, or one reviewer can see both a protected record and the public summary generated from it.

A finding becomes institutionally useful only when it enters a closure route. Each accepted finding should receive an accountable owner, a due date, a risk classification, an interim control where delay would expose people, and a test that shows

whether the repair worked. Management may reject a recommendation, but it should state reasons and accept an independent follow-up. The red team's unresolved dissent should remain visible in the inspection record rather than disappearing into a consensus paragraph. This converts adversarial review from performance into learning and allows the public to see not merely that the City invited criticism, but whether criticism changed authority, design, staffing, or practice.

29.4.3 — Donor Capture Review

Donor capture review tracks how money, land, buildings, services, endowments, scholarships, technology, public introductions, and prestige can shape the City without issuing a formal order. The City may need resources, but resources can carry preference. The fact that a donor means well does not dissolve the burden created when gratitude, dependence, or fear of withdrawal changes governance behavior (OECD, 2017a, 2020b; Ebrahim, 2010; Ostrower, 2007).

The review must map donor relationships across admissions, governance appointments, facility naming, curriculum emphasis, vendor selection, staff hiring, participant support, public events, media access, research requests, record-site design, and reporting tone. A donor may not purchase loyalty, silence, participant access, protected records, religious participation, political allegiance, research consent, Artificial Intelligence training permission, or influence over complaint outcomes.

Donor conflict rules should be public enough to be trusted and private enough to protect legitimate personal data. The public

should know categories of funding, governance recusal, restricted gifts, naming limits, procurement implications, and whether donor-related concerns have been reviewed. Protected details may be summarized, but the existence of donor influence cannot be hidden merely because disclosure is awkward.

Funding should favor pooled, rule-governed arrangements over personal sponsorship. A participant stabilized by the City should not owe gratitude to a named benefactor. A staff member should not know that their job depends on pleasing a donor. A public report should not soften a finding because the donor funded the building where the problem occurred.

Donor capture often begins as anticipatory obedience. Nobody asks the donor what to do because everyone already knows what would please the donor. That is why review must examine patterns, not only written instructions. Meeting invitations, seating, naming, access, silence, timing, and repeated deference can reveal capture before a prohibited command appears.

Donor limits are real when the City can disappoint a funder in public because fairness requires it. If the City cannot publish a bounded critical finding, refuse a donor preference, remove a donor name, reject a restricted gift, or investigate donor-related pressure, then the donor has become a governor without bearing governance accountability.

Vendor capture belongs to governance rather than procurement housekeeping. A vendor controlling search, cameras, storage, authentication, cybersecurity, summaries, access logs, or public interfaces may shape what the City can know about itself.

Interoperability, tested exit, documentation, audit rights, continuity planning, conflict disclosure, and independent review keep technical service from becoming private sovereignty.

Donor review should follow influence rather than only money. A contribution may arrive through a foundation, sponsored program, donated service, travel arrangement, naming opportunity, advisory appointment, or promise of future support. The review therefore asks who initiated the relationship, what restrictions accompany it, which officials communicated with the donor, what policy or staffing interests were discussed, and whether refusal would threaten an essential service. A public donor register should distinguish a lawful gift from the right to shape curriculum, admissions, records, appointments, public messaging, or inspection scope (OECD, 2017a, 2020b; Ostrower, 2007).

Independence requires the capacity to say no after money has been accepted. Agreements should contain termination rights, return or wind-down terms, protection against donor access to protected records, and a prohibition on using the City's name to imply endorsement or scientific validation. Essential care, housing, archive continuity, and staff wages should not depend on a single benefactor's continuing approval. A reserve and replacement plan turns anti-capture language into an operational choice rather than a moral posture available only while donors remain agreeable.

The strongest donor review includes counterfactual questions. Would the same proposal be accepted from a critic? Would a smaller donor receive the same access? Would the governing

body publish the relationship if the project failed? Could a participant or staff member challenge the donor's influence without losing support? These questions reveal whether gratitude has become governance. The purpose is not to treat philanthropy as inherently corrupt, but to prevent financial generosity from acquiring a private route into public responsibility.

29.4.4 — Vendor Capture Review

Vendor capture review tracks how technical and service providers can become hidden authorities. A vendor may operate record infrastructure, search tools, cybersecurity systems, facility systems, identity verification, public interfaces, clinical scheduling, accessibility tools, data storage, or Artificial Intelligence assistance. In a City built around records, a vendor can become powerful without ever appearing in the governance chart (NIST, 2022; ISO/IEC, 2022; Sculley et al., 2015).

Vendor review must begin before procurement. The City should ask whether the function is necessary, what data the vendor touches, whether protected records are involved, whether the system can be audited, whether exit is possible, whether interoperability exists, whether model training is prohibited without separate permission, whether security standards are enforceable, and whether the vendor can influence release, search, summary, or classification.

Contracts should include audit rights, security requirements, data-use limits, breach obligations, incident cooperation, source or configuration escrow where appropriate, portability, deletion and retention rules, subcontractor limits, conflict disclosure,

accessibility standards, and termination paths. The City should not discover at failure that the vendor owns the only map of its memory.

Vendor influence can also be cultural. A technical team may say a safeguard is impossible, too expensive, too slow, or not supported. Sometimes that will be true. Sometimes it will be a design choice. Governance must be able to obtain independent technical review so vendor convenience does not become City policy.

Vendor dependence becomes capture when lock-in is mistaken for sophistication. A platform becomes too complex to audit, too embedded to replace, too proprietary to question, or too admired to challenge. Staff begin to adapt their judgment to what the tool can show. Public summaries begin to follow the tool's categories. The vendor has then become a silent participant in governance.

Vendor exit is credible when the City can leave without losing public memory, rights protection, or operational continuity. If exit is impossible, the vendor is not a supplier. It is infrastructure sovereignty, and the City has failed its own no-single-sovereign rule.

Public reporting of inspection should distinguish raw findings, protected findings, corrected findings, disputed findings, and findings withheld for lawful safety reasons. The report should not make harm into spectacle or reduce oversight to public applause. It should let citizens see whether the City accepted correction, resisted it, delayed it, or changed structure because of it.

Vendor capture often begins with ordinary convenience. A platform becomes the only place where records can be searched; a security provider controls the threat model; a cloud contract makes export costly; or a model vendor alone can explain why an output changed. The review should therefore map not only the contract but the dependency: data formats, identity systems, encryption keys, configuration knowledge, model documentation, subcontractors, update rights, incident obligations, and the staff competence needed to leave. A low purchase price can conceal a high constitutional exit cost (NIST, 2022; ISO/IEC, 2022; ISO/IEC, 2023).

Procurement boundaries should preserve the City's ability to inspect and replace. Contracts need audit rights, security and privacy requirements, provenance duties, breach notification, accessible export, tested restoration, deletion verification, transition assistance, restrictions on secondary use, and consequences for obstruction. No vendor should be able to invoke trade secrecy to prevent the City from understanding a system used to affect access, records, safety, or public explanation. When a technical detail cannot be publicly released, an independent reviewer still needs sufficient access to test the claim.

A vendor review should end with an exercised exit path, not a clause stored in a contract. Periodic drills can test whether data export is complete, whether an alternative service can ingest it, whether staff can operate during transition, and whether records preserve provenance across systems. The City should record the time, cost, missing dependencies, and risks revealed by the drill. This converts resilience from an assertion into evidence and

prevents infrastructure continuity from depending on the goodwill of the party whose control is being limited.

29.4.5 — Inspection Findings Publication

Public reporting of external inspection and red-team findings turns outside review into public accountability without turning protected people into exhibits. The report should say what was reviewed, who reviewed it, what standards or criteria were used, what major findings emerged, what was corrected, what remains disputed, what is protected, what follow-up is scheduled, and which office owns response (Bovens, 2007; GAO, 2024; NARA, 2023).

The report should distinguish types of findings. Confirmed failures, candidate risks, unresolved disputes, protected categories, delayed findings, red-team simulations, and rejected allegations should not be collapsed into one dramatic narrative. Status labels protect both accountability and fairness. They let the public see institutional risk without being invited to overread every concern.

Public reports should include obstruction and limitation. If inspectors lacked access, if a vendor delayed cooperation, if protected law limited disclosure, if evidence was incomplete, if a finding awaits legal review, or if a body disagreed, the public should know the limit. A report that hides its own limits teaches the public to trust presentation rather than evidence.

The report also needs accessibility. Citizens should not need audit training to understand whether the City is healthy. Summaries should be plain, structured, and context-rich. Technical

appendices may exist for experts, but the main public record should explain the burden, the route, the finding, the response, and the remaining uncertainty.

Inspection findings lose value when converted into branding. A favorable review is evidence about particular systems at a particular time, not proof of purity; a critical review is not proof of corruption. Public reporting should identify scope, methods, unresolved findings, limitations, and follow-up so trust rests on specificity rather than halo.

A skeptical reader should be able to use the inspection report to ask better questions. If the report merely reassures, it has failed. If it merely shocks, it has failed. Public oversight reporting succeeds when it makes the next review more precise and the next harm less hidden.

Reports should neither publish protected detail to prove seriousness nor hide serious findings behind privacy. The burden of precision belongs to the City (GAO, 2024; INTOSAI, 2019; IIA, 2024).

29.5 — Audit of Auditors

Audit of auditors recognizes that oversight is itself power. An office able to demand records, interview staff, shape public findings, influence sanctions, and embarrass governing bodies can also injure people or distort the City when left unreviewed. The watchdog therefore remains inside the burden question (Power, 1997; GAO, 2024; IIA, 2024).

Oversight bodies face human incentives of their own: reputation, access, influence, dramatic findings, quiet relationships, future contracts, ideological victory, technical prestige, and public applause. They may avoid hard findings for fear of destabilizing the City, exaggerate to perform independence, or protect peers through professional solidarity. These risks do not discredit oversight; they explain why it must be designed rather than idealized.

A mature City grants auditors independence and then places that independence under transparent constraints. Operators may not punish critical findings, donors may not retaliate against inconvenient inspectors, and public anger may not force disclosure of protected detail. Meta-oversight exists to keep review answerable to its own standards without taming it into obedience.

Audit-of-auditors mechanisms include independence review, conflict disclosure, rotation, peer review, quality assessment, public summary of audit performance, complaint routes against auditors, review of sampling and evidence standards, investigation of obstruction, and follow-up on whether findings

produced correction. These are governance tools, not suspicion rituals.

29.5.1 — Oversight Risk

Ordinary readers need to see the assurance problem in concrete terms. Imagine an auditor mishandles a protected complaint by summarizing too much detail in a public report. The participant should not have to choose between accepting injury or attacking the whole audit function. A meta-complaint route should review the auditor's conduct, correct the report, protect the participant, and preserve the audit office's legitimate independence for future cases (Power, 1997; Hood, 2010; O'Neill, 2002a).

Oversight risk begins when watchdogs become prestige offices. Inspectors may grow close to the people they review, auditors may prefer measurable issues over painful ones, ombuds offices may become conflict-avoidance channels, and red teams may become performance rituals. Treating oversight as fallible power allows those patterns to be detected before they harden.

An assurance map is more useful than accumulating watchdogs by instinct. It should show which body reviews each risk, what evidence it can reach, where mandates overlap, where no reviewer has standing, and how findings travel into correction. It should also record the burden oversight places on participants, staff, protected persons, and small teams, because repeated interviews and duplicative requests can become institutional extraction. Coordinated reliance may reduce duplication, but no reviewer should inherit another's conclusion without understanding scope and limits (IIA, 2024; GAO, 2024, 2025).

Oversight risk names the danger that watchdogs become unreviewed power. An auditor can overreach. An inspector can misread context. A red team can create fear. An ombuds office can become too close to management. A participant council can become a faction. A public-report committee can hide under status labels. A governance body that reviews others can still move burden onto people with less power.

Oversight risk is not an argument against oversight; it is the reason oversight must be governed with the same precision as the powers it reviews. Without oversight, the City can become self-protective through secrecy, hierarchy, and habit. With unreviewed oversight, it can become self-protective through inaccessible expertise, permanent appointments, selective scope, and the prestige of the watchdog. The answer is neither trust nor suspicion as a permanent posture, but authority, evidence access, conflict rules, quality review, appeal, and a route for inspecting the inspectors.

The burdens created by oversight can be subtle. A staff member may fear speaking because the audit interview is not protected enough. A participant may be publicly identifiable in a report. A clinician may be pressured to reveal too much. A vendor may weaponize technical complexity against reviewers. An auditor may select evidence that proves a theory rather than tests it. Oversight can shift burden while claiming to remove it.

An oversight-risk register makes this vulnerability inspectable. It should track conflicts, repeated reviewers, access patterns, complaint patterns against oversight, public-report disputes, missed follow-up, findings reversed on appeal, protected-material

incidents, and reliance on a small circle of experts. These are not attacks on the reviewers. They are evidence that oversight itself is an institution.

Oversight becomes dangerous when scrutiny itself is treated as sacred. Once a reviewer is treated as the voice of truth, affected persons may be unable to challenge the reviewer without seeming anti-accountability. That is the point at which oversight becomes moral totalism. A City built on visible burden should protect the right to challenge the people who reveal burdens.

Oversight remains legitimate only if an oversight failure can be named without collapsing the legitimacy of oversight itself. If the City can correct an auditor while preserving audit independence, it has achieved a mature balance. If correction of oversight is treated as betrayal, the watchdog has become a sovereign.

29.5.2 — Auditor Independence

Auditor independence should be tested across four practical dimensions: organization, money, information, and future opportunity. Who appoints and can remove the audit lead? Who can narrow the budget after an adverse finding? Who can block access or bargain over publication? Who offers consulting work, prestige, or future employment? Appointment protections, direct governing-body access, conflict disclosure, recusal, cooling-off periods, and external quality review do not guarantee courage, but they make capture, retaliation, and self-review visible (GAO, 2024, 2025; IIA, 2024; INTOSAI, 2019).

Engagement-level independence must be visible. Before work begins, the record should state who set the scope, selected criteria

and samples, approved access, decided publication, separated management response from finding status, and followed unresolved obstruction. If any of those powers sits with the unit under review, the limitation must be disclosed and routed to external quality review. Independence is not a general reputation; it is a set of decisions that can be inspected in each engagement (IIA, 2024; GAO, 2024, 2025).

Independence must be protected from operators, donors, founders, public relations staff, vendors, participants, political allies, and public crowds. Each can pressure audit in a different way. Operators can limit access. Donors can threaten support. Founders can invoke mission. Vendors can hide complexity. Participants can demand protection from embarrassing findings. Crowds can demand punishment before evidence is complete. Auditors need a structure that lets them resist all of these.

Independence is not isolation. Auditors must understand operations, law, records, care, security, and technical systems. They need cooperation from the offices they review. But cooperation must not become dependency. The audit plan, evidence standard, sampling method, finding status, and public summary should not be determined by the office under review.

The audit office should also have independence from its own ambition. Auditors should not seek dramatic findings because drama proves relevance. They should not avoid findings because disruption threatens institutional confidence. They should not convert protected material into public proof of seriousness. Independence requires objectivity, competence, due care, confidentiality, and humility before evidence.

Nominal independence is inadequate when adverse findings carry personal or institutional penalties for the auditor. If auditors can be removed for embarrassing findings, if their budgets depend on pleased operators, if they cannot access necessary records, if they cannot publish bounded findings, or if they must negotiate language with the office being criticized, audit is not independent enough.

Auditor independence is practical when a serious finding against a powerful City body enters a public, protected, follow-up process without retaliation or quiet burial. Independence is proven not by title, but by what happens when the finding hurts.

Rotation and conflict rules should prevent both capture and amnesia. If reviewers stay too long, they can become part of the culture they inspect; if they rotate too quickly, they may miss slow patterns. The City needs documented conflicts, cooling periods, institutional-memory transfer, technical continuity, and enough renewal to keep oversight from becoming a club.

Independence also has an appearance dimension: an arrangement is weak if a reasonable affected person must rely on the auditor's private virtue despite design, employment, consulting, or reporting conflicts (GAO, 2024; IIA, 2024; INTOSAI, 2019).

Quality assurance should be independent of the individual engagement. A review file needs a traceable question, criteria, evidence set, sampling rationale, contrary evidence, reviewer judgments, management response, and follow-up status. Periodic external quality review can test whether internal audit selects reputation-safe topics, overuses confidential classifications,

repeats unsupported language, or closes recommendations without evidence. The audit of auditors should therefore examine not only whether a report followed a template, but whether the function had sufficient access, competence, skepticism, and freedom to reach an inconvenient conclusion.

Independence does not make an auditor sovereign. Audit findings remain claims supported by a defined record, not moral verdicts about a person or institution. Public summaries should state scope limits, unresolved evidence, and the difference between control effectiveness and broader justice. A clean audit cannot certify that the City is humane, wise, or worthy of trust in every domain. An adverse audit cannot erase due process or predetermine discipline. The authority of audit is strongest when it is exact about what it examined, candid about what it could not know, and answerable when its own methods cause harm.

29.5.3 — Rotation and Conflict Rules

Rotation should follow a written conflict and continuity plan: enough turnover to challenge shared assumptions, enough overlap to preserve case knowledge, and mandatory recusal when financial, personal, political, professional, or prior-review interests could reasonably affect independence.

Rotation should apply to audit leadership, external inspectors, red-team panels, public-report committees, conflict reviewers, and specialized review pools where feasible. It should be calibrated, not mechanical. Some technical or legal domains require continuity. But continuity must be balanced with peer

review, second opinions, conflict disclosure, and periodic external quality assessment.

Conflict rules should reach beyond money. Prior employment, donor relationships, vendor ties, ideological affiliation, family relationships, public advocacy, personal friendship, hostility, future contract interest, and repeated professional dependence can all impair review. The City should not treat conflict as a confession of corruption. It is a condition to be disclosed, managed, recused, or avoided.

The conflict record should be usable. It should say what the relationship is, which matter it affects, what recusal or mitigation is required, who approved the mitigation, and whether the public needs a status label. Private details may be protected, but the existence of material conflict should not vanish into administrative discretion.

Capture can also form through a closed circle of trusted reviewers. A small group of trusted reviewers audits the City, selects the next reviewers, speaks at City events, advises vendors, joins donor committees, and becomes the only class of people treated as competent. The circle may still contain excellent people. The problem is that excellence without rotation becomes unchallengeable culture.

Conflict rules work when someone outside the usual circle can identify a conflict, request review, and receive an answer not decided by that same circle. Rotation and conflict rules make oversight public enough to trust and humble enough to learn.

A public audit summary should be written for use, not applause. It should state scope, method, limits, evidence types, severity, disputed areas, remediation deadlines, and follow-up status in language an ordinary citizen can understand. It should also explain what cannot be published and why, so protection does not become a cover for opacity.

A useful summary also separates finding from response. For each material issue, readers should see the criterion, condition observed, people or functions affected, consequence, severity rationale, management response, responsible owner, due date, current status, verification method, and any disagreement. Aggregate tables should report aging, extensions, repeated findings, accepted risk, overdue action, and findings closed without independent verification. Where publication would expose a person, the summary can use protected categories and bounded description while preserving the existence and seriousness of the issue. The public should not have to infer whether accepted recommendations were ever implemented or whether implementation actually worked (GAO, 2024, 2025; IIA, 2024).

29.5.4 — Public Audit Summary

A public audit summary gives citizens and affected people access to the meaning of audit without forcing publication of raw protected material. It should identify scope, criteria, method, limits, confirmed findings, disputed findings, protected categories, obstruction, management response, corrective actions, deadlines, follow-up schedule, and unresolved questions. It

should be readable without becoming simplistic (GAO, 2024; Bovens, 2007; O'Neill, 2002a).

The summary must distinguish audit evidence from moral judgment. Audit findings concern systems and controls. They should not be converted into public shame against a particular participant or staff member unless lawful process and public relevance require specific identification.

Public summaries should include what the audit could not conclude. Missing evidence, sampling limits, protected legal constraints, unresolved disputes, conflicting accounts, noncooperation, and delayed material should be visible. A summary that appears more certain than the underlying review shifts uncertainty onto the public. That is a fairness failure.

Follow-up status also belongs in the public record. Findings without follow-up become institutional memory without obligation. The public should be able to see whether corrective actions are pending, implemented, verified, disputed, overdue, ineffective, or closed with reason. Follow-up turns audit from diagnosis into burden repair.

An audit summary fails when it becomes a badge rather than an explanation. Phrases such as independent review completed, controls strong, recommendations accepted, or no material weakness may symbolize trust while concealing what was tested, what failed, and what remains uncertain. Public authority belongs to scope, evidence, limitations, minority findings, and follow-up, not to ceremonial assurance language.

Its public value appears when a skeptical reader can follow the burden route at issue. Who was affected? What system failed? Which evidence supports the finding? What remains protected, and why? What will change, who will verify the change, and when will the next review occur? If those questions cannot be answered, the document may be a notice of audit activity, but it is not yet public accountability.

Corrigibility completes the design. If later evidence changes a finding, protected information was overexposed, or a material dissent was omitted, the public version must be visibly superseded rather than silently edited. Version history, affected-person notice, linked corrections, and a reasoned change log allow the summary itself to be challenged before the failure has to travel into a meta-complaint route.

29.5.5 — Meta-Complaint Route

A meta-complaint route lets people challenge the complaint, audit, ombuds, inspection, red-team, or public-report process itself. It is the route for saying: the reviewer mishandled my protected detail, the audit ignored a conflict, the ombuds misrepresented my options, the appeal body delayed unfairly, the public summary misled readers, or the inspector became abusive. Without such a route, accountability tools become insulated (Venice Commission, 2019; Hirschman, 1970; OECD, 2016).

The route must protect independence while allowing correction. A meta-complaint against an auditor should not be decided by the operator who disliked the audit. A meta-complaint against an ombuds should not expose confidential conversations

unnecessarily. A meta-complaint against an inspector should not become retaliation against criticism. The reviewing body must be independent from both the oversight body and the office originally reviewed.

The meta-complaint intake should identify the oversight process challenged, the alleged defect, affected persons, protected categories, requested relief, urgency, retaliation risk, and conflict concerns. It should distinguish disagreement with a finding from defect in the process. People can disagree with an audit without proving audit misconduct. But when process fails, a route must exist.

Possible remedies include corrected public summary, sealed addendum, apology, process redesign, reviewer recusal, re-audit, protected-record repair, publication of limitation, staff support, or escalation to external review. The remedy should not punish good-faith critical oversight merely because it caused discomfort. It should correct burden that oversight wrongly created. Each remedy should have a named owner and completion point so meta-review does not become another unresolved layer.

Meta-review must avoid both infinite recursion and premature finality. Infinite recursion allows every decision to be appealed forever until governance collapses. No recursion allows oversight to become final. The City needs disciplined meta-review with thresholds, time limits, independence, protected evidence, and final status labels that explain remaining uncertainty. A closure rule should state when further review requires genuinely new evidence rather than repeated disagreement with the result. Meta-

review should also examine withdrawn or abandoned complaints when process friction may have prevented a merits decision.

Meta-complaint review succeeds when a harmed person can challenge the accountability system without destroying accountability. A City that can hear that its auditor, ombuds, inspector, or public-report body caused harm has built one of the hardest forms of humility into its walls. Aggregate reporting can then reveal recurring oversight failures without exposing the protected details of individual complaints. Aggregate reports should state which oversight procedures changed afterward so meta-complaint review produces visible institutional learning.

29.6 — Authority Without Moral Totalism

Authority Without Moral Totalism is the chapter's closing discipline. It accepts that the City needs real authority. A City that cannot enforce participation conditions, protect records, suspend unsafe practices, require correction, discipline misconduct, pause a system, or publish bounded findings will not be a serious institution. But authority becomes totalist when it mistakes its role for ownership of the person (Tyler, 2006; Scott, 1998; OECD, 2017a).

The City's authority is role authority, bounded to chosen public-power formation and the institutional systems that support it. It does not become general authority over persons, government, belief, or human worth.

This boundary must be visible in verbs. The City may host, record, classify, delay, protect, summarize, correct, audit, refer, pause, suspend, disclose, review, and refuse within lawful role boundaries. It may not sanctify, redeem, condemn, rank, own, absolve, command government, certify souls, demand belief, or turn public fascination into judgment. The verbs are part of the ethical firewall.

Benevolent totalism is the deepest governance danger. An institution can overreach because it loves its mission too much, claiming that more exposure creates trust, more discipline creates seriousness, more data creates clarity, or more correction creates virtue. Limits are not weakness. They are the conditions under which a bounded civic-formation institution remains humane.

29.6.1 — Role Authority Only

Role authority only means the City may act where a participant, staff member, visitor, vendor, record, space, safety rule, or governance process falls within its bounded role. It may not convert institutional proximity into general jurisdiction over the person. The question is not whether the City has strong values; the question is whether its authority can be named before it acts.

In practice, this confines the City's jurisdiction to the chosen public-power formation role and the institutional conditions that make that role reviewable. It does not govern the whole person, private citizens, families, children, partners, friends, ordinary voters, or host-community residents by proximity. The Transparent Vow is a voluntary adult public-power burden, not a transferable condition of human life. Strong role authority and strict personal limits are therefore complements rather than opposites.

The City may set entry requirements, activation procedures, record obligations while active, access rules, campus conduct rules, complaint procedures, staff roles, archive custody rules, public bundle standards, support conditions, exit procedures, and remedies. These are serious powers. They must be lawful, consented where required, reviewable, proportionate, and bounded by rights. They are not spiritual or universal authority.

Role authority requires status clarity. Applicant, active participant, paused participant, former participant, staff member, visitor, volunteer, expert, auditor, host-community complainant, and ordinary citizen are different statuses. Each status carries

different obligations and protections. If the City blurs them, burden can spread. A volunteer becomes treated like staff. A family member becomes treated like a participant. An applicant becomes a public dossier. A former participant remains trapped.

The record should follow role authority. It should state when active-period obligations begin, when they pause, what records exist, which are protected, public, disputed, sealed, or corrected, and what ends after exit. Vague status must not keep institutional authority alive after the lawful role changes.

Role authority becomes moral totalism through mission creep. A governance body begins with role formation and slowly reaches into ordinary life, political loyalty, religious affiliation, private relationships, social media, donor interest, or public approval. It may claim relevance. Relevance must be tested. Public-power relevance is not a magic word that makes every human domain governable.

Role authority remains bounded only if the City can say no to itself. If a fact, practice, relationship, or feeling does not affect role-bound public-power formation in a lawful and reviewable way, the City should not govern it. Role authority becomes trustworthy when it accepts that much of a human life remains outside its reach.

29.6.2 — No Soul Jurisdiction

No soul jurisdiction is the ethical firewall in governance form. The City may record conduct, context, correction, influence, burden, and role-relevant evidence. It may not claim access to inner essence, spiritual state, ultimate goodness, hidden destiny,

holiness, loyalty, or metaphysical worth. That limit protects both participants and the series from cultic or quasi-religious drift (Nissenbaum, 2010).

The practical consequence is strict. The institution may observe role-relevant conduct, preserve evidence, protect rights, support correction, and give the public structured information where lawful. It may not certify inner essence, final character, holiness, salvation, destiny, karmic balance, spiritual purity, or the total meaning of a life. Governance stops at the boundary between accountable conduct and claims about the person that no City can legitimately own.

Archive evidence can be unusually intimate: daily routine, deliberation, correction, conflict, stress, care, apology, failure, and public explanation. That density tempts readers to mistake evidence about a role for knowledge of a whole person. The City's language, summaries, artifacts, and education should resist that conversion. A record may deepen public judgment about conduct while remaining radically incomplete as a portrait of a human being.

No soul jurisdiction also separates the City from the Religion of Fairness. Optional religious meaning belongs to the religious domain, including the Religion of Fairness, and must remain optional. The City may allow reflection, ritual where voluntary, pastoral or spiritual support where appropriate, and plural forms of meaning. It may not require participation in the Religion of Fairness, imply City participation is spiritually superior, or treat civic record as evidence of sacred standing.

The archive must carry this boundary. Conduct records should not be described as inner truth. Machine summaries should not infer essence. Public bundles should not claim to reveal who someone really is. Correction records should not become redemption narratives. Failure records should not become damnation. The words used by the City should preserve mystery where governance has no right.

Moral-transparency language is especially dangerous because it can make a record appear to reveal the true self. If readers begin to believe the City reveals the true self, the City has moved from public-power formation into spiritual possession. That risk is especially high when public admiration gathers around participants who appear humble, disciplined, brilliant, or corrected. The City should not turn visible struggle into sainthood.

The no-soul-jurisdiction rule is honored when the City can describe role conduct while leaving the person larger than the record. If public imagination begins treating the archive as the person's soul, the institution should redesign its language, summaries, artifacts, and interpretive education.

No worth ranking forbids governance from becoming a status ladder. Acceptance, delay, complaint outcome, readiness bundle, audit finding, de-loading, exit, public criticism, or office pathway cannot become a measure of human value. The City may make role-bound decisions, but it must never teach the public that a person outside the City is lesser or that a person inside it is higher.

29.6.3 — No Institutional Worth Ranking

No Worth Ranking means the City does not measure human value. Participation is not worth. Acceptance is not worth. Readiness is not worth. Completion is not worth. Public approval is not worth. A clean audit, strong record, delayed candidacy, refusal, exit, or failure does not rank the person as more or less human, holy, civic, lovable, trustworthy in all domains, or entitled to rule (O’Neil, 2016; European Union, 2024).

Status drift can create an informal hierarchy even when the City rejects scores: participant over ordinary citizen, accepted over refused, ready over not yet, corrected over failed, transparent over private. Labels, charts, summaries, ceremonies, and public language should make role-specific evidence legible without converting it into human rank.

Readiness language needs special care. The City may present role-specific evidence for democratic judgment. It may say that a participant has completed certain formation stages, responded to certain simulations, corrected certain errors, or remains not yet ready for a particular role. It should not say that the person is a better human being, more morally valuable, or entitled to public trust by City status.

No worth ranking also protects people who refuse the City. Ordinary citizens remain complete. People who never apply remain complete. People who apply and withdraw remain complete. People refused for role-fit reasons remain complete. Former participants remain complete. The City's burden

architecture exists for a chosen public-power role, not as a universal model of a superior life.

Public artifacts are high risk here. Badges, seals, medals, stars, progress bars, rankings, leaderboards, halo colors, or simplified readiness icons could turn complex evidence into status. The safer artifact uses words, limitations, role context, dispute labels, and interpretation notes. A chart should help public judgment, not create caste.

The no-worth-ranking rule is visible when a person outside the City can read the chapter and remain unranked. If the City's existence makes ordinary privacy look inferior, the prose has failed. Public power may carry more burden. Human worth does not.

29.6.4 — Lawful Constraint

Lawful constraint names the City's dependence on actual legal authority. The City can design candidate institutions, internal rules, contractual duties, host agreements, records systems, and public-facing explanations, but enforceability must be reviewed through appropriate legal architecture. Where law does not permit an action, beauty of purpose does not create permission.

Lawful constraint also requires a conflict route for the moments when City policy, host rules, professional duty, contract, and public law point in different directions. The immediate response should identify the controlling authority, preserve evidence, protect affected people, suspend only what must be suspended, and route the question to competent human decision makers. The City may adopt a stricter internal safeguard when law permits it,

but it may not use private agreement to waive nonwaivable rights or create public powers that no lawful body granted. A written conflict register should record the issue, interim measure, decision owner, review date, and public explanation available without exposing protected detail (Fuller, 1964; Venice Commission, 2019; Tyler, 2006).

Authority must be identified before action begins. Is the action based on voluntary participation terms, campus policy, employment agreement, professional duty, legal obligation, emergency authority, record custody rule, host-jurisdiction law, court order, or government office requirement? If the source cannot be named, the action may be morally motivated but institutionally unsafe.

Governance must maintain a live authority map showing which decisions belong to the City and which return to law, government, science, private life, religion, or transition governance. Unclear ownership should trigger referral rather than City self-expansion.

Emergency is the hard case. Urgency can tempt the City to act first and explain later. Some emergency action may be necessary to protect life, safety, records, or continuity. Emergency authority should be logged, time-limited, reviewed, and returned to ordinary lawful channels as soon as possible. A permanent emergency is hidden government by another name.

Lawful constraint collapses when mission exceptionalism treats rights as obstacles. The City may begin to believe that because it serves fairness, law is merely a delay, rights are merely friction, privacy is merely opacity, labor protection is merely cost, and

public criticism is merely misunderstanding. Lawful constraint blocks this moral shortcut. Fairness language cannot become a bypass around rights.

Every serious City action should answer six questions: what is the source of authority, who is affected, what right remains, what record exists, what appeal or review is available, and what limit ends the authority? If those cannot be answered, the City is not ready to act.

29.6.5 — Correction Over Control

Correction over control gives the chapter its final tone. The City should prefer repair, narrowed authority, clarified rules, better records, staff support, appeal, de-loading, external review, and public explanation over domination. Control may sometimes be necessary for safety or role integrity, but it must remain bounded, reviewable, and subordinate to the purpose of returning burden to accountable power.

Correction Over Control sets the governing tone. Control asks how to restore order. Correction asks where burden moved wrongly and what must change so it does not move there again. The City will need consequences, restrictions, pauses, and discipline. But if those tools are used to protect the institution's comfort rather than to repair burden, governance has become domination (Sabel and Zeitlin, 2012; Argyris and Schön, 1978; Edmondson, 2018).

A corrective system begins by naming harm. What happened, who was affected, which office acted, which record was wrong, which route failed, what protected category was touched, what

burden remains, and what future risk exists? The City should avoid immediate moral drama. It should first reconstruct the burden route.

Corrective actions may include apology, record correction, protected summary revision, compensation, accommodation, training, staffing change, procedure redesign, vendor correction, audit follow-up, security policy change, public explanation, leadership recusal, pause of a function, or referral outside the City. The remedy should fit the burden, not the institution's desire for closure.

Correction requires verification: did repair occur, relief reach the harmed person, workload change, retaliation stop, future people become safer, and public context become accurate? Unverified correction is a wish.

Correction fails when discipline substitutes for redesign. One person is punished, one apology is issued, one policy is rewritten, and the system that moved burden remains intact. Another failure is control disguised as care: a person is restricted, silenced, monitored, or removed for the institution's reputation while the burden they named remains unaddressed.

The final test is whether the City reduced hidden burden or merely restored calm. If order returns while burden remains hidden, control has defeated correction. The chapter ends by insisting that the City govern itself through repair, review, and lawful limits, then turns to the technical systems that could either support that humility or become a new sovereign of memory.

Correction should begin with an explicit order rather than a

general promise to improve. The order identifies the harmful condition, the source of the finding, the authority responsible for repair, the people or records affected, the interim protection, the evidence required for closure, and the date of review. Where an affected person can safely participate, that person should be asked whether the proposed correction addresses the actual injury rather than the institution's preferred description of it. This makes correction a governed transfer of responsibility, not a communications exercise. The order should also identify who can verify completion independently of the office responsible for the failure.

Different failures require different clocks. A dangerous access permission may need immediate suspension, while a curriculum redesign may require deliberation, testing, and notice. Emergency action should be narrow and reversible, with a recorded reason and expiration point. Long-term repair should not use complexity as permission for indefinite delay. A public correction register can show which issues are open, which interim measures are active, who owns the next step, what evidence closed a finding, and which disagreements remain. The register tracks institutional work; it is never a score of persons. Missed deadlines should automatically trigger escalation rather than silently resetting the review clock. Closure verification should occur after enough time to test whether the corrected failure recurs under ordinary operating conditions.

Sometimes correction changes who may lead, what a body may decide, or whether the City may continue. A governance system that can revise wording but cannot remove an operator, terminate

a vendor, compensate an injured person, surrender an authority, or close an unsafe program has built control around reputation rather than responsibility. The deepest proof of limited authority is therefore practical: leaders can lose an argument, lose a power, or lose office through a route they did not control. The City remains answerable only while correction can reach the structure that made correction necessary. A correction system proves its independence when those consequences can occur even against a successful or popular operator. Any temporary corrective power should expire after repair unless a separately reviewed rule authorizes its continuation.

Chapter 30 — Archive, Records, and Artificial Intelligence

The City becomes dangerous at the exact point where its memory becomes useful. A public record that can show how power was formed can protect citizens from image, rumor, selective confession, and hidden influence. The same record, if governed badly, can become a machine for suspicion, a marketplace for intimate inference, a vendor product, an Artificial Intelligence training pile, or a public interface that makes technical fluency look like truth.

The technical rooms of the City require the same moral seriousness earlier chapters brought to bedrooms, classrooms, office suites, public interfaces, and host communities. The archive is not background machinery. Capture devices, validation systems, classification rules, access controls, search indexes, summary tools, provenance logs, incident reports, vendor contracts, and shutdown procedures decide where burden goes when a record exists.

The technical stack raises a human question before it raises an engineering one: who carries the cost when the system remembers? Participants bear capture and interpretation burdens; staff bear classification, moderation, security, and correction work; nonparticipants can acquire unwanted traces; citizens can be misled by summaries; host communities can absorb service failure; and future readers can inherit records whose status was never made legible. Technical governance must therefore assign purpose, custody, access, review, incident response, appeal, correction, retention, and retirement before convenience hardens into infrastructure.

The chapter's first discipline is layer separation. Capture is not validation. Validation is not classification. Classification is not release. Release is not interpretation. Interpretation is not research consent. Research consent is not model-training permission. Search is not judgment. Summary is not truth. Artificial Intelligence assistance is not authority. Archive memory is not ownership of a person.

The sequence must become stack design, interface design, staffing, procurement, audit, and incident response rather than remain a slogan. A public bundle should show which stages the material passed through. A participant challenging an output should be able to identify which layer produced it. When an Artificial Intelligence system flags a pattern, the City should know which data, version, threshold, reviewer, and appeal route governed the result.

The second discipline is technical humility. The City will need sophisticated tools because the record burden is too large for memory-by-hand. It will need provenance systems, tamper-evident logs, access controls, secure backups, deepfake defenses, search assistance, translation aids, summary labeling, query-class restrictions, and incident response. It will also need enough moral restraint to say that a useful tool is still only a tool.

Fluent systems are especially dangerous because they can make uncertainty sound finished. A search result can imply relevance by appearing first. A summary can smooth over disagreement. A classifier can convert a sensitive category into a technical status that nobody challenges. A dashboard can turn a pattern into a suspicion. A model can give staff a feeling of confidence while

hiding the training, prompts, retrieval choices, and errors that shaped the output.

Artificial Intelligence belongs under deliberate friction. An alert begins a question, a search result begins navigation, a summary begins human review, and pattern analysis begins an inquiry. None establishes guilt, readiness, trust, virtue, rank, or proof. Whenever machine assistance shapes consequential attention, the record should identify the source boundary, model and version, human reviewer, decision, and contest route.

The third discipline is vendor humility. A private technology provider can govern public memory without ever issuing a public command. The vendor that controls storage, authentication, classification tools, search ranking, model APIs, telemetry, backups, or the record-site interface may become a hidden constitutional actor if the City cannot inspect, exit, replace, or constrain it. Procurement is therefore part of fairness, not a purchasing afterthought.

The fourth discipline is adversarial realism. Any archive that matters will be attacked. False media will be offered as evidence. Genuine records will be challenged as false. Protected records may be targeted for theft. Search systems may be probed for inference. Staff may be phished. Vendor systems may fail. The public record site may be flooded, scraped, spoofed, or selectively quoted. Cybersecurity is not a technical appendix to the City. It is one of the conditions under which public memory can remain humane.

Technical danger must not create a new authority of panic.

Deepfakes, sabotage, model error, vendor lock-in, and cyberattack are real risks, but fear can become its own authority. If the City responds by hiding everything, it recreates the opacity it was built to reduce. It should instead increase justified transparency, named status, bounded access, audit, delay where lawful, and repair.

The archive must also resist public appetite. A public record site is not a raw-data dump. It is not a gossip engine. It is not a spectator platform. It is not a moral search bar into a participant's life. It is an official public interface for role-relevant, contextual, contestable evidence of public-power formation. Its design must teach readers how to look without devouring what they see.

That means the chapter is not anti-technology. A fragile, underbuilt, manually improvised archive would be unjust because it would shift burden to staff, delay correction, invite tampering, frustrate affected-person review, and make public evidence unusable. Fairness requires serious technical infrastructure. But the infrastructure must be subordinate to rights, record-stage boundaries, affected-person remedies, human responsibility, and public claim-status discipline.

Scientific validation remains outside this chapter's jurisdiction. City records may someday be requested for research, but operational records are not research data by default. Public release does not create research consent, and a research consent process still does not authorize Artificial Intelligence training. Endpoint science, latent-experience measurement, model validation, and scientific verdict language belong to *The Science of Fairness*. The City owns a different question: can public-power formation be

remembered, searched, corrected, and protected without turning persons into raw material?

The most important technical sentence in the chapter is not about code. It is this: every technical aid must have a named purpose, a defined scope, a human owner, a status label, a contest route, an audit trail, and a retirement or shutdown path. These are not proof conditions. They are civic design conditions. Without them, the tool begins to move burden silently.

A reader should leave this chapter able to distinguish a record from a summary, a summary from an interpretation, an alert from a finding, a finding from a public conclusion, a public conclusion from a readiness claim, and a readiness claim from human worth. The City becomes credible only if its memory system can help the public see power while preserving the right of every person to remain more than what a system can retrieve.

Consider a hypothetical false-summary incident. A City search assistant generates a concise public account of a procurement discussion. It merges two people with similar names, attributes a conflict disclosure to the wrong participant, and links a synthetic audio clip that arrived through a compromised public submission channel. The summary is copied into a public bundle, a donor briefing, and an internal readiness discussion before the affected person sees it.

The first response is not to debate whether the model was usually accurate. The disputed output is frozen, each dependent artifact receives a visible status warning, and access logs preserve who saw or reused it. The affected person receives the source chain,

the match logic that can lawfully be disclosed, the right to submit evidence, and an independent human reviewer. The vendor may explain the system, but it does not decide the appeal.

Provenance analysis shows that the audio lacks a trustworthy creation history. That fact does not prove the clip false, because provenance authenticates a chain rather than the truth of a claim. Human reviewers compare primary records, inspect the custody events, separate the two identities, and determine that the summary's attribution is unsupported. The archive retains the disputed object only under the rule governing hostile submissions and marks it as unverified rather than laundering it into evidence (NIST, 2024c; C2PA, 2026).

Correction must travel as far as the error traveled. The public bundle is replaced with a correction notice, the donor briefing is withdrawn, the readiness discussion is annotated, and downstream machine indexes are rebuilt. The affected person can contest whether the correction is sufficiently prominent. A public incident summary explains the failure class, scope, remedy, and prevention changes without exposing protected system details or turning the person into an example.

The final review reveals that the vendor's update changed entity-resolution behavior without revalidation. The City invokes contractual audit and export rights, disables automated summaries, preserves search-only manual fallback, and either restores a validated version or retires the service. The lesson is institutional rather than mystical: a useful tool lost authority because it could not remain traceable, contestable, and governable (NIST, 2022, 2023a, 2024b, 2025b; ISO/IEC, 2023).

30.1 — The Technical Stack in Place

A technical stack is a set of decisions pretending to be machinery. It decides what counts as an original record, what counts as authentic, what category a record enters, what the public may see, what can be corrected, and who can inspect the whole sequence. If those decisions are invisible, the stack becomes a constitution with no legislature, no court, and no public explanation (NARA, 2023; ISO, 2016a; NIST, 2024a).

The City needs technical layers because a role-bound active record cannot be maintained by memory, charisma, or staff improvisation. Yet every layer must remain subordinate to human rights and institutional accountability. The same camera, database, classifier, or search system that makes hidden power harder to deny can also make protected life easier to expose if its purpose is not bounded.

The governing discipline is separation by function. Capture creates or receives source records. Validation checks authenticity and integrity. Classification assigns handling status. The public record site presents released and contextualized bundles. Correction preserves repair and version history. Oversight audits the whole system. No layer may inherit the authority of another simply because the interface makes them appear seamless.

Each layer therefore needs a named owner, a prohibited-use boundary, a failure label, a review route, and a remedy path. Those requirements are not decorative. They let a participant challenge a classification, let a nonparticipant object to exposure, let staff report tool misuse, let oversight trace responsibility, and

let the public understand whether a record is source, summary, disputed, corrected, delayed, or protected. The stack is fair only if its distinctions survive pressure.

30.1.1 — Capture Layer

This technical governance card is the minimum packet for any City archive, search service, classifier, summary aid, alert, provenance tool, or automated workflow. It treats technology as a governed instrument rather than an institutional voice. The card joins records-lifecycle discipline, privacy and access control, Artificial Intelligence risk management, secure development, adversarial-machine-learning review, digital-identity assurance, incident response, supply-chain review, and archival preservation while preserving a named human owner, an appeal route, a manual fallback, and a shutdown path (NARA, 2023; NIST, 2020a, 2020b, 2022, 2023a, 2024a, 2024b, 2024d, 2025b, 2025c, 2025d; ISO, 2016a, 2019; ISO/IEC, 2022, 2023; ISO, 2025a).

Operational ownership begins at capture. The capture file should name every device and input channel, the event that activates it, the record class it creates, the people likely to be incidentally recorded, the continuity rule, and the human office able to stop collection. A device that records first and asks about authority later has already shifted burden onto the people in its field (NARA, 2023; ISO, 2016a; NIST, 2020b).

Capture passes field review only when an affected person can follow the route from event to record, see the applicable status, and reach a challenge without engineering knowledge. Reviewers should test blind zones, incidental contact, clock error, duplicate

streams, outage, tamper evidence, and the clean termination of capture. Legibility is part of control: a technically complete route that only a vendor can explain is not publicly governable.

Table 30.1. Technical Governance Card.

Governance field	Minimum declaration and control
Purpose and prohibited use	State the exact task the system may assist and the people or decisions it may not score, infer, or determine. Name the human owner and disable the system if purpose drifts.
Data and legal basis	List sources, sensitivity, bystanders, protected categories, lawful or voluntary basis, and excluded data. No training or reuse by default; quarantine or delete data when authority or necessity fails.
Model, vendor, and version	Record supplier, model family, version, configuration, dependencies, hosting, license, and material changes. Freeze unvalidated changes and preserve a vendor-exit path.
Provenance and access	Record origin, transformations, custody, uncertainty, access classes, purpose limits, and audit logs. Preserve dispute and revoke abusive or out-of-scope access.
Validation and human boundary	Test task accuracy, error patterns, subgroup performance, drift, and uncertainty. A named human owns the decision and may reject output without penalty.
Bias, accessibility, and language	Document representation gaps, disability access, language limits, cultural variation, and human alternatives. Limit or withdraw functions that cannot meet declared access standards.

Governance field	Minimum declaration and control
Security and incident response	Maintain a threat model, detection, triage, notification, containment, recovery, and evidence-preservation plan. Temporary incident authority must be dated and reviewable.
Appeal and correction propagation	Give affected people a route to contest alerts, matches, summaries, searches, or status. Freeze disputed output and correct both the source and downstream derivatives.
Retention and deletion	Declare schedules for inputs, logs, outputs, prompts, annotations, backups, and model artifacts. No indefinite convenience retention; legal holds and exceptions remain explicit.
Audit and transparency	Maintain logs, tests, documentation, contract audit rights, reviewer access, and a plain public status account. Trade-secret claims cannot erase safety, legality, provenance, bias, or exit review.
Continuity and manual fallback	Define essential functions, recovery objectives, staffing, export formats, offline or manual procedures, and restoration tests. Stop automation rather than improvise opaque emergency use.
Retirement and vendor exit	Set end-of-life, export, migration, access revocation, contract termination, residual-copy, and notification rules. Retirement is complete only after governed records and unauthorized copies are reconciled.

The capture layer is the place where the City first creates or receives original record material. It includes devices, sensors, meeting recordings, document intake, upload systems, timestamping services, staff attestations, physical transfer logs, and emergency capture protocols. Its function is narrow: to

preserve source records under role-bound active-record rules. It does not decide public release, civic meaning, readiness, credibility, or human worth.

Capture should follow public-power relevance rather than appetite. Active public-power formation is recorded because the participant accepts that role burden, yet the system must distinguish participants, staff, visitors, professionals, families, dependents, counterparties, and incidental third parties. Capture infrastructure that cannot support masking, segmentation, category flags, stoppage, and later correction is unfit for a City built around bounded visibility.

The capture layer also needs continuity without perfection theater. Devices will fail, power will drop, networks will degrade, emergencies will interrupt, and human operators will make mistakes. A fair system logs continuity breaks, names the type of failure, preserves what can be preserved, protects affected persons, and creates a repair path. It should not treat every gap as scandal or every exception as permission for hidden active life.

Source records should carry basic provenance from the beginning: time, place, device or intake source, responsible office, custody transition, protection flags, and any known limitation. Provenance does not prove truth. It helps later reviewers know where a record came from, what it purports to be, and what questions remain. A record without provenance may become public rumor wearing institutional clothing.

Capture also has a minimization duty. The City should not collect collateral material merely because collection is easy. It should not

sweep in a household, clinic, legal office, visitor path, or staff break area without a role-specific reason and protected handling. A broad capture system may look efficient, but efficiency can become mass exposure when the system has not asked whose burden it is collecting.

The capture layer loses legitimacy through source inflation. If everything near a participant becomes source record, the City becomes surveillance. If operators can omit source records without trace, the City becomes opaque. The remedy is scoped capture, status labeling, continuity logs, nonparticipant shielding, independent inspection, and a clear route to challenge wrongful capture or wrongful absence.

30.1.2 — Validation Layer

Validation requires a separate ownership record because authenticity, completeness, and source integrity are not properties a file can declare about itself. The responsible office should record checks performed, unresolved conflicts, confidence limits, preserved originals, derivative history, and the authority for moving material forward. Unvalidated material may remain useful as a lead or contested submission, but it may not acquire evidentiary status by repetition.

A validation layer is credible when an affected person can see what was checked, what remained uncertain, and how a contrary source enters review. Field testing should include damaged files, mismatched identities, synthetic media, incomplete custody, translation error, and honest records that lack ideal provenance. The layer fails if uncertainty disappears merely because the

interface needs a simple label (NARA, 2023; ISO, 2016a; W3C, 2013).

The validation layer asks whether a record is what it claims to be. It checks integrity, provenance, timestamps, device identity, custody history, signatures, known edits, compression artifacts, conflicts with other records, and signs of manipulation. It is not a truth oracle. It may find a file consistent with a source path, identify an alteration, or mark the record as incomplete, disputed, or unverified. It cannot determine what a person's inner life means.

Validation must be especially careful because technical confidence can become public confidence too quickly. A hash can show that a file has not changed since a recorded state, but it cannot show that the original scene was complete. A signature can associate a record with a device or process, but it cannot prove context. A provenance credential can help trace media history, but it cannot replace human review when the stakes include dignity, reputation, or public authority.

Validation should operate as a layered practice. Automated checks can flag integrity problems. Staff can compare records across sources. Independent reviewers can inspect anomalous cases. Affected persons can challenge the result. External technical experts can audit the validation process. These layers are not redundancy for its own sake. They prevent a single tool, vendor, office, or expert from becoming the gatekeeper of reality.

Validation must also record uncertainty. Some records will be authentic but incomplete. Some will be genuine but misleading

when isolated. Some will be partly corrupted. Some will contain protected persons. Some will be contested by a participant or nonparticipant. A validation label should preserve these distinctions rather than forcing every record into true, false, or ready-for-release status.

A validation layer that uses Artificial Intelligence for media analysis must disclose that use internally, record the model or tool class, preserve the human reviewer, and provide a route for challenge. Artificial Intelligence may help identify anomalies, duplicates, mismatched metadata, or likely synthetic artifacts. It may not become the final judge of authenticity, intent, or public meaning.

Validation fails when technical status drifts into substantive interpretation. The public begins to treat validated as interpreted, staff begins to treat unverified as false, or operators use technical uncertainty to bury records inconvenient to the City. The remedy is label discipline, review clocks, human sign-off, appeal, independent audit, and public explanation when validation limits affect public understanding.

30.1.3 — Classification Layer

Classification needs a named decision owner and an explicit public-purpose theory for every category. The file should identify why a record is public, delayed, protected, sealed, research-restricted, disputed, or scheduled for review, along with the people affected by that choice. Classification is governance because each label determines who carries exposure, opacity, delay, and the work of correction.

Field review of classification should begin with hard edge cases rather than easy examples. Reviewers should test mixed records, intimate context attached to official conduct, bystander material, protected professional communications, lawful secrecy, and disputed public-interest claims. A category system is legible only when people can understand the route into a class, challenge it, and see when review will occur (NIST, 2020a; ISO, 2016a; Nissenbaum, 2010).

The classification layer assigns handling status to records after capture and validation. It decides whether material is public, delayed, restricted, shielded, summarized, sealed, disputed, corrected, security-sensitive, legal-interface material, clinical-interface material, intimate material, child-related material, staff role material, or nonparticipant material. This is one of the most powerful layers in the City because it decides where public memory becomes public view.

Classification must not be a cloak for comfort. A record may be protected because release would harm a child, expose a nonparticipant, compromise lawful counsel, reveal clinical care, create sexual spectacle, endanger security, or distort meaning without context. A record may not be protected merely because it embarrasses a participant, reveals City failure, inconveniences a donor, exposes staff misconduct, or complicates a readiness narrative.

Classification is a form of burden routing. Public release can injure dignity, while nonrelease can obstruct public judgment; delay can protect safety or conceal power; summary can preserve civic meaning or sanitize harm. Every classification decision

should therefore state the category, public-purpose theory, protected-person theory, decision owner, evidence basis, appeal route, review clock, and visible status label. A reader should be able to tell not only what was released, but why this form, this audience, and this moment were chosen over less exposing or more informative alternatives.

Classification tools may assist with triage, but classification authority must remain human and contestable. A model can help identify records likely to contain faces, voices, minors, sensitive locations, medical terms, legal terms, or intimate material. It cannot finally decide what public interest means. It cannot quietly learn from protected records for future training. It cannot convert category likelihood into lawful release.

The layer must serve multiple affected persons. Participants need a route to challenge inaccurate or misleading classification. Nonparticipants need a route to object to exposure and request shielding. Staff need a route to report pressure or misuse. The public needs status labels that explain why material is absent, delayed, summarized, or disputed without revealing what protection forbids.

Classification becomes dangerous when categories collapse. If everything validated becomes public, the City becomes spectacle. If everything sensitive disappears without label, the City becomes opaque. If a classifier becomes law, the City becomes machine-administered exposure. The remedy is category standards, expert review for high-risk domains, appeal, review clocks, public labels, and audit of classification patterns over time.

30.1.4 — Public Record Site Layer

The public record site needs its own accountable owner because interface choices shape meaning after classification is complete. Search order, excerpts, thumbnails, timelines, download options, correction banners, accessibility features, and status displays should all be treated as public decisions. The site is not a neutral window; it is the place where institutional memory becomes an experience for citizens.

The public-site test is whether a nonexpert can distinguish original material, derivative copy, verified record, disputed claim, machine-assisted summary, corrected version, and protected absence. Review should include screen readers, low-bandwidth access, mobile use, translation, hostile crops, and the tendency of prominent fragments to escape their context. Public legibility must survive ordinary use, not only an expert demonstration (NARA, 2023; ICA, 2011; W3C, 2023).

The public record site is the official interface between the City archive and the citizen. It is not the archive itself. It is not a newsroom. It is not a civic platform. It is not an Artificial Intelligence answer engine. It presents public bundles, status labels, context layers, correction histories, dispute notices, release notes, protected exclusions, role pathways, and accessibility aids so citizens can review public-power formation without raw archive exposure.

Interface design carries moral force. Search ranking, thumbnail choices, excerpt previews, timelines, filters, suggested records, visual prominence, download options, sharing tools, and

summary placement can shape public judgment before any reader reaches the source records. A public record site can therefore become hidden interpretation while appearing neutral. The City must design the interface to slow misuse and surface context.

The site should teach the reader how to read. It should identify source records, human-authored summaries, machine-assisted summaries, disputed records, delayed materials, protected summaries, correction logs, nonparticipant shielding, and release limitations. The public should not have to guess whether a bundle is complete, contested, machine-assisted, legally constrained, or undergoing review.

Accessibility is part of fairness here. If the record site is usable only by lawyers, archivists, data scientists, or journalists, public memory becomes elite memory. The site should include plain-language explanations, screen-reader compatibility, translation pathways, disability-access testing, glossary links, record-stage definitions, and public-question routes. Usability must not be achieved by hiding uncertainty.

The public record site should also resist virality. It should not reward the most humiliating clip, the most intimate fragment, the most dramatic expression, or the easiest outrage. Download and sharing controls, context-preserving excerpts, hostile-cropping review, rate limits, and public-summary labels can help the site preserve review without becoming a content platform.

Interface design acquires de facto sovereignty when its choices are mistaken for neutral display. The public may believe the official site merely shows records while ranking, default views,

summaries, search fields, download options, and sharing controls quietly determine what becomes prominent, buried, contextualized, or viral. Public design documentation, accessibility review, hostile-use testing, correction links, version history, and independent review of consequential interface changes keep the public record site from becoming an unacknowledged editor of civic meaning.

30.1.5 — Correction Layer

Correction requires more than edit permission. Its ownership file should identify who may initiate review, who decides, which upstream and downstream artifacts must change, how prior versions remain traceable, what notice is owed, and when interim labels are necessary. A correction layer exists to make error travel visibly toward repair rather than disappear into silent replacement.

A correction system passes field review when a person can identify the contested proposition, submit evidence, obtain a reasoned result, and see that result propagate to search indexes, summaries, bundles, public excerpts, and authorized copies. Reviewers should test both false correction requests and valid requests made by people with little technical or legal power. The right must remain usable under pressure (European Union, 2016; NARA, 2023; SAA, 2020).

The correction layer maintains accuracy, context integrity, version history, right of reply, and remedy when the record is wrong, incomplete, misleading, overexposed, wrongly summarized, misclassified, or technically corrupted. Correction

is not an embarrassment to the archive. It is how public memory remains alive to truth after the first capture.

Correction must serve participants and nonparticipants. A participant may challenge a timeline, summary, attribution, classification, release label, source association, or Artificial Intelligence output. A nonparticipant may challenge exposure, mistaken association, missing masking, inferred identity, or misleading context. Staff may challenge role-record errors, advice logs, or public summaries that misstate their authority.

The layer should distinguish error types. Some errors are factual inaccuracies. Some are missing context. Some are wrongful exposure. Some are outdated labels. Some are translation failures. Some are machine-summary distortions. Some are interface mistakes that caused readers to infer too much. Each error type needs a remedy that fits the burden it created.

A correction system must preserve version history without preserving humiliation unnecessarily. Silent editing lets institutions rewrite memory. Eternal display of every mistake can prolong harm. The City should show that correction occurred, what status changed, why it changed, who authorized it, and how the public interpretation is affected, while shielding protected content where continued display would create fresh injury.

The correction layer also needs deadlines and escalation. A wrongful exposure cannot wait behind ordinary interface improvements. A machine summary that falsely implies misconduct must be routed quickly. A dispute over protected

categories may require expert review. A public correction should not wait until the damage becomes irreversible.

A correction process fails when it becomes theater. The City offers forms, acknowledgments, and polite language but leaves the burden where the error placed it. The remedy is tracked intake, named ownership, visible status, expedited pathways for serious harm, affected-person notice, public correction logs, appeal, and audit of how long correction actually takes.

30.1.6 — Oversight Layer

Oversight owns neither the archive nor the final meaning of every record. Its file should define sampling authority, sensitive-access limits, conflict rules, protected-contact routes, incident escalation, reporting duties, and the body that reviews oversight itself. The purpose is to make layer performance visible without creating a universal observer with unrestricted curiosity.

Oversight should be tested through ordinary samples, not only spectacular incidents. Reviewers need to confirm that logs can reconstruct a decision, access is purpose-bound, exceptions expire, complaints can alter findings, and audit work itself leaves a contestable record. If the layer cannot be understood without the same people it reviews, independence is too weak for public trust (NIST, 2024a; GAO, 2025; IIA, 2024).

The oversight layer audits the entire technical stack. It asks whether capture is scoped, validation is honest, classification is fair, public display is contextual, correction is real, Artificial Intelligence is subordinate, cybersecurity is maintained, vendors are constrained, and query classes are respected. Oversight is not

a final layer floating above the system. It must be able to enter every layer without becoming unreviewed power itself.

Oversight needs different competencies. Archivists understand preservation and authenticity. Cybersecurity experts understand attack surfaces and recovery. Privacy lawyers understand protected handling. Disability experts understand access. Civil-liberties reviewers understand overreach. Artificial Intelligence governance reviewers understand model risk. Staff representatives understand hidden labor. No single expertise is enough.

Oversight also needs logs that do not create exposure. It should be able to inspect decisions, access patterns, tool outputs, appeals, vendor changes, incident response, classification patterns, bias tests, and query abuse without publishing protected content. The oversight record should show process, authority, status, and remedy rather than raw sensitive material.

The oversight layer must preserve shutdown authority. A tool, feature, vendor path, search class, summary system, or public interface component should be pausable when it creates unfair burden. Shutdown is not failure of technological ambition. It is evidence that the City has designed memory under moral control.

Oversight also needs audit of auditors. Review bodies can become prestigious, captured, fatigued, overly technical, overly legalistic, or too protective of their own prior findings. Affected persons and staff need routes to challenge oversight misuse, access abuse, conflict of interest, delay, or public-summary error.

Oversight fails when its visible presence substitutes for evidence of scope, access, findings, remedy, and follow-up. The City announces audits but cannot show scope, access, independence, findings, response, remedy, and follow-up. The remedy is published audit calendars, external review, sampled logs, red teams, incident exercises, public summaries, protected appendices, and measurable correction commitments that remain non-scoring and non-ranking.

30.2 — Artificial Intelligence Pattern Analysis and Search

Artificial Intelligence enters the City as a set of bounded technical services, not as an office, custodian, witness, evaluator, or judge. Pattern search, multilingual retrieval, anomaly detection, translation, clustering, and summary assistance may help human reviewers navigate an archive whose scale exceeds unaided attention, but usefulness cannot create authority. Contemporary risk-management and rights frameworks converge on named human oversight, traceability, testing, contestability, incident response, and limits tied to purpose and affected rights. They do not authorize the City or settle applicable law; they clarify why every use must remain attributable, reviewable, correctable, and capable of shutdown (NIST, 2023a, 2024b; Council of Europe, 2024; European Union, 2024).

Artificial Intelligence should be designed to add friction where its fluency would otherwise remove it. Every consequential output should state uncertainty, source limits, excluded records, protected categories, human owner, and appeal route before it can affect a person or public record. The goal is not slower technology for its own sake. It is slower judgment at the point where a plausible sentence could become an unearned institutional fact.

The governing rule is assistance with accountability. Every allowed use must identify the purpose, the model or tool class, the data sources accessed, the records excluded, the human reviewer, the decision path, the affected-person route, and the shutdown condition. Every forbidden use must be equally clear: no human-

worth scores, no loyalty ratings, no readiness ranking, no public approval prediction, no emotion inference, no soul claims, no research conversion, and no model training by default.

Artificial Intelligence also changes staff burden. It may reduce some review work, but it can add new work: reviewing false positives, explaining outputs, checking bias, managing appeals, documenting prompts, supervising vendors, and recovering from errors. If the City treats machine help as labor savings while hiding new burdens on staff, it has merely moved unfairness into the technical layer.

30.2.1 — AI Alerting

AI alerting should identify a bounded condition for human attention, not announce guilt, risk identity, readiness, or truth. The technical governance card should declare the signal, expected false-positive and false-negative behavior, data window, threshold, prohibited inferences, triage owner, escalation clock, and evidence required before downstream action. Alerts should enter a review queue with source context, uncertainty, visible status, and expiry; an unreviewed alert should never change access, care, discipline, or public reputation. Repeated noise, systematic subgroup error, or inability to explain the trigger should suspend the function until revalidation (NIST, 2023a, 2024b; Raji et al., 2020).

The alert interface should display trigger category, source scope, exclusions, confidence limits, review status, and responsible human office before any dramatic visual cue. It should distinguish a newly generated signal from a confirmed incident and a

confirmed incident from a public finding. That ordering prevents speed and visual emphasis from manufacturing guilt. Affected people need the same status language when the alert changes access, delay, or investigation.

AI Alerting means the system flags a pattern, anomaly, inconsistency, risk category, or possible abuse for human review. It may identify a sudden access spike, repeated queries around a protected person, conflicting metadata, unusual classification delay, likely duplicate records, possible synthetic media, suspicious vendor behavior, or public-interface manipulation. An alert is a notice that a human question is needed. It is not a finding.

An alert label should state what triggered it, which records were examined and excluded, what uncertainty applies, whether protected categories may be involved, and who reviews the result. Alerts can create institutional suspicion before anyone states it publicly. Poorly designed alerting may burden a participant, staff member, complainant, or nonparticipant before evidence justifies any consequence.

No alert should automatically change public status. A model should not trigger public release, suppression, investigation, readiness label, staff discipline, or donor review without human review and documented authority. The City must resist automated escalation, especially when the model touches protected domains, identity, political speech, disability, mental health, intimacy, family, protest, or lawful confidentiality.

Alerting should also be scoped by role. Public-interface abuse alerts are different from archive-integrity alerts. Staff access

alerts are different from participant conduct alerts. Vendor anomalies are different from public mob activity. Collapsing these alert classes makes every technical signal look like misconduct. Separate classes preserve proportionality.

Affected persons need a route when an alert produces consequence. If an alert leads to delayed release, restricted access, investigation, correction, or public explanation, the record should show that the alert was machine-assisted and human-reviewed. Where lawful and safe, the affected person should be able to challenge the basis, the data, the inference, and the outcome.

Artificial Intelligence alerting becomes unsafe when suspicion is automated. The City begins to trust alerts because they are numerous, fast, and official-looking. The remedy is alert thresholds, human review, false-positive tracking, bias review, protected-category suppression where appropriate, audit sampling, and public status labels when machine assistance affected a public-facing decision.

30.2.2 — Search Assistance

Search assistance may retrieve records only within a declared query class and must preserve source status, date, version, correction history, exclusions, and access basis. Relevance is not authority, and machine ranking must not turn controversy or repetition into institutional importance (Nissenbaum, 2010; NARA, 2023; NIST, 2023a).

The search layer is a navigation aid, not a hidden investigative power. It may locate meetings, drafts, corrections, release notes, appeals, public bundles, or advice traces, but it may not

reconstruct protected facts, infer private traits, or permit curiosity browsing.

Section 30.5 supplies the full query-class architecture. Machine-assisted search therefore remains inside those classes, exposes its status and ranking limits, and routes unusual or high-impact queries to accountable human review.

30.2.3 — Summary Assistance

Summary assistance must preserve the difference between extraction, synthesis, inference, and unresolved dispute. A usable summary identifies its source set, time boundary, status labels, omissions, corrections, and material uncertainty; it does not write over minority accounts or make one machine-generated narrative appear to be the archive itself. High-reach summaries require independent source checking, visible links to the underlying governed record, and a named human signer who can refuse publication. When the source record changes, the correction must propagate to every derivative summary rather than leaving the most shareable version wrong (NIST, 2024b; Council of Europe, 2024; European Union, 2024).

A useful summary interface places source pointers, exclusions, unresolved disputes, generation date, human reviewer, and correction status beside the text rather than behind a secondary link. Readers should be able to move from compression to the governed underlying record and earlier versions. Fluency cannot erase disagreement or uncertainty; convenience remains legitimate only when traceability survives it (Bender et al., 2021; Mitchell et al., 2019; NIST, 2024b).

Summary assistance is justified when the record is too large to navigate unaided, but the compressed view must remain visibly subordinate to the governed source. Public, oversight, accessibility, translation, incident, and correction summaries should preserve dispute, correction, omission, and uncertainty status rather than smoothing contested material into one narrative.

Summary tools must not generate readiness scores, morality labels, psychological profiles, motive claims, loyalty indicators, trust rankings, or claims about consciousness. Where a lawful human process has made a specific finding, a summary may attribute that finding to the responsible body, identify its scope and evidence, preserve any dispute or appeal, and link to the governed record. It may not convert that finding into the model's own judgment of the person.

Affected persons need summary appeals. A participant may say the summary omits correction, exaggerates a pattern, buries a dispute, or overstates a machine inference. A nonparticipant may say the summary exposes them by description even if it masks their name. Staff may say an advice summary misstates their role. The correction layer must reach summaries as well as source records.

Summary assistance becomes sovereign when compressed output is treated as the record itself. Readers stop looking at records, staff rely on summaries to decide, journalists quote summaries as final truth, and public memory becomes the voice of a model. The remedy is source pointers, status labels, human review, summary versioning, right of reply, machine-use disclosure, and a rule that

summaries cannot be used as sole basis for consequential decisions.

30.2.4 — Human Audit

Human audit is a separate control, not a ceremonial click after automation has shaped the record. Reviewers need task competence, sufficient time, access to the governed source set and tool documentation, authority to abstain or reject the output without penalty, and independence from the team whose performance is being measured. The review program should test automation bias as well as machine error by comparing unaided and tool-assisted judgments, examining overrides in both directions, and recording unresolved disagreement. The audit file should identify sampled verification, source checks, overridden outputs, abstentions, downstream effects, and the human reasons for any consequential use. When review becomes routine confirmation, the system should be redesigned or retired rather than defended by the presence of a person in the loop (Raji et al., 2020; IIA, 2024; NIST, 2023a).

Where human review affects public output, the interface should show that review occurred, the role responsible, the date, the record version, and any unresolved limitation. It need not expose the reviewer's private identity, but it must not hide accountability inside a department name. The public should also be told when review was sampled rather than case-specific. Human signoff is meaningful only when its scope is visible (Raji et al., 2020; IIA, 2024; NIST, 2023a).

Human audit is the accountable review of technical output by people with defined authority and responsibility. It is not a rubber stamp after the machine has decided. It is the structured act of asking whether the tool acted within scope, whether the inputs were proper, whether protected material was touched, whether the output is supported, and whether the consequence is fair.

Audit should happen before consequence, after consequence, and through sampling. Before consequence, a human reviewer decides whether an alert, search result, or summary should affect action. After consequence, the system records what happened and whether the output was challenged. Through sampling, auditors review ordinary cases so errors do not appear only when someone has enough power to complain.

The institution must also record who signed off, what competence they had, what conflicts existed, and what review path follows.

Human audit must include people who understand different burdens. A technical auditor may see model drift. A privacy reviewer may see protected inference. A disability reviewer may see inaccessible summaries. A staff representative may see hidden labor. An archivist may see source-context loss. A civil-liberties reviewer may see surveillance drift. Human audit is plural because technical harm is plural.

Audit also needs courage against productivity pressure. Machines can produce more outputs than humans can responsibly review. If the City lets volume define workflow, human review will become symbolic. The system must limit output volume, prioritize high-

risk cases, pause features when review capacity is exceeded, and count audit labor as real staff burden.

Human review fails when it is staged rather than empowered. A person clicks approve without access, time, competence, or authority to disagree. The remedy is reviewer training, workload limits, conflict checks, escalation routes, sampled re-review, documented dissent, feature pauses, and public reporting of audit patterns without exposing protected content.

30.2.5 — Appeal of AI Output

An appeal of AI output begins with notice that a tool materially influenced search, alerting, summary, translation, classification, or prioritization. The appellant should receive the relevant source record, tool purpose, output status, known limits, and a route to independent human reconsideration that can suspend downstream effects while the dispute is open. Correction must reach the source, indexes, summaries, public bundles, and any other governed derivative in which the error traveled. A system that cannot support notice, challenge, reasoned review, and propagation should not be used for consequential work (Council of Europe, 2024; European Union, 2024; NIST, 2023a).

The appeal interface should begin with a plain statement of what the tool did and what consequence followed. It should allow challenge to data, retrieval set, category, ranking, summary, protected-person exposure, or human reliance without demanding expertise in model architecture. Status, deadline, reviewer, interim relief, and correction propagation should remain visible throughout. A technically available route that exhausts the

complainant is not meaningful contestability (European Union, 2016, 2024; Kroll et al., 2017).

Appeal of Artificial Intelligence output begins with the recognition that machine assistance can injure. An alert can trigger investigation. A search ranking can amplify a fragment. A summary can misstate meaning. A classification aid can misroute sensitive material. A translation aid can distort tone. An anomaly score, even if not public, can become internal suspicion. Any output with consequence needs challenge.

The appeal route should be available to participants, staff, affected persons, and, in some cases, public users who identify record-site errors. The route should say what can be challenged: input data, scope, model class, retrieval set, summary text, category label, ranking behavior, protected-person exposure, public-interface placement, or human reliance on output. A vague appeal right is not enough.

Appeal should not require the affected person to become a technical expert. The City should provide plain-language explanation, the relevant status labels, a human contact point, a protected submission route, and access to underlying public or affected-person records where lawful. The burden of intelligibility belongs to the institution using the tool, not to the person harmed by the tool.

Where a challenge is sustained, the remedy should fit the output. A summary may be corrected and versioned. A public bundle may be relabeled. A search ranking may be adjusted. A classification may be reopened. A protected-person exposure may be shielded

and notified. A consequential decision may be paused or reconsidered. A tool may be restricted, retrained only where lawful, replaced, or shut down.

Appeal patterns should become system evidence. Repeated appeals around a model, vendor, language group, protected category, disability context, political viewpoint, or record type indicate a systemic problem. The City should not treat each appeal as isolated inconvenience when the pattern shows the tool moving burden unevenly.

An appeal route can exist on paper and still fail through delay, cost, obscurity, stigma, or a scope too narrow to reach the harm. Accessible intake, declared deadlines, interim relief, independent review for serious cases, public correction logs where appropriate, and reporting on withdrawn or abandoned appeals make that failure visible.

30.2.6 — Bias and Error Review

Bias and error review should be tied to the actual task, population, language, disability context, data source, and consequence rather than to a generic fairness score. Testing should examine false positives, false negatives, calibration, subgroup and intersectional performance where defensible, representation gaps, distribution shift, adversarial behavior, and the burden of abstention or manual fallback. Reviewers should also ask whether the target itself is legitimate and whether the system's categories erase the social or institutional context that produced the data. Material drift, unrepairable disparity, inaccessible use, or purpose expansion should trigger restriction, retraining under new

approval, or retirement (NIST, 2023a, 2024b; Selbst et al., 2019; Council of Europe, 2024).

Public reporting on bias and error should state tested contexts, important exclusions, known failure modes, mitigation status, human review limits, and the consequences of remaining uncertainty. It should not advertise one average accuracy figure as proof of fair operation. Readers need to know where the tool should not be trusted and what route exists when it fails. The interface becomes more credible when it can display limits without translating them into a score of institutional virtue (Barocas and Selbst, 2016; Selbst et al., 2019; Gebru et al., 2021).

Bias and error review asks whether technical assistance distributes mistakes unevenly. A tool may work well in aggregate while failing for accented speech, disability communication, minority language, noisy environments, nonstandard names, trauma responses, older devices, low-bandwidth locations, protest contexts, clinical language, or protected cultural practices. Fairness is not the average performance of a model. It is the burden imposed when the model fails.

Where subgroup or protected-category testing requires sensitive data, use minimization, aggregation, protected handling, and expert oversight. Technical curiosity is not a sufficient reason to create new dossiers.

Error review must distinguish false positives, false negatives, misleading summaries, misclassification, hallucination, retrieval omission, translation distortion, demographic performance gap, prompt vulnerability, data drift, vendor update error, and human

overreliance. Each error type routes burden differently. A false alert may burden a participant. A missed deepfake may burden the public. A hallucinated summary may burden everyone who believes it.

Bias review must include protected domains where the stakes are high: children, nonparticipants, clinical material, legal interface, intimacy, staff role records, protest, disability, religion, and cross-jurisdictional records. These domains often require expert review before release, not merely later correction. Technical humility matters most where harm cannot be fully repaired.

Model changes should trigger renewed review. A vendor update, new retrieval method, changed prompt template, new classification rule, added language model, modified ranking system, or expanded data source can change outcomes. The City should maintain change logs and rerun validation before a tool affects public-facing records or consequential internal decisions.

Bias review becomes an alibi when statistics excuse known harm or conceal unmeasured populations. The City says the tool works well enough while harmed people carry the failures. The remedy is subgroup and context testing, human escalation, error logs, public summaries of model-risk findings, vendor accountability, feature limitation, and shutdown where technical assistance cannot be made fair enough for the domain. Review should also test whether correction reaches every derivative output that depended on the faulty signal.

A worked technical case makes the card operational. Imagine that an access-alert model links a nonparticipant to a suspicious query

pattern because two names share an identifier after a vendor update. The alert enters a protected human queue, but a staff reviewer relies on the ranking and delays a public correction that the nonparticipant requested. Once challenged, the appeal office freezes the alert's downstream effects, preserves the model and vendor version, retrieves the query and access logs, identifies the data join that produced the match, and gives the affected person a plain account of what the system did and did not establish. Independent reviewers compare the source records, test similar identifiers, examine language and demographic error patterns where lawful and proportionate, and determine that the output is unsupported. The record is corrected at the source, the alert is withdrawn, search indexes and summaries are updated, any recipient of the erroneous result receives notice, and the public incident summary explains the class of failure without republishing the person's identity (NIST, 2023a, 2024b; Council of Europe, 2024; European Union, 2024). Vendor explanations should be preserved with the incident record so later audits can test whether promised fixes occurred.

The technical governance card must change after that event. Its data map records the identifier collision; the validation plan adds held-out tests for the failure mode; the access design narrows who may view alerts; the human-review protocol requires source inspection before consequence; the vendor contract assigns remediation, export, audit, and notification duties; and the public status card records the suspension and later decision. Reinstatement is allowed only after independent testing, reviewer training, workload review, and proof that correction can

propagate through every derivative surface. If those conditions cannot be met, the alerting function is retired and the City returns to a slower manual route rather than preserving automation for prestige or sunk cost. The event also tests governance beyond the model: whether staff could disagree with the tool, whether the affected person could reach an independent human, whether the archive retained enough provenance to reconstruct the error, and whether the City carried the labor and cost of repair. A system passes only when its failure can be found, contested, repaired, learned from, and, when necessary, ended (Raji et al., 2020; NIST, 2024a, 2025b; IIA, 2024). Repeated error classes should trigger reconsideration of whether the tool remains necessary at all. Any reinstated tool should enter a defined monitoring period with a recurrence threshold that triggers renewed suspension or retirement.

30.3 — Cybersecurity, Deepfakes, and Sabotage

A public archive worthy of trust will attract attack. The more useful its memory becomes, the more valuable it becomes to those seeking to erase, alter, flood, discredit, expose, or weaponize it. Security is therefore a condition of public ethics rather than an engineering concern beside it: records can protect answerability only while people and protected information remain governable under threat (NIST, 2024a, 2024c, 2025b; C2PA, 2026).

Cybersecurity in the City must protect confidentiality, integrity, availability, provenance, interpretability, and remedy. Confidentiality protects people who should not be exposed. Integrity protects records from tampering. Availability protects public review from being silenced. Provenance protects history from forgery. Interpretability protects the public from panic and rumor. Remedy protects affected persons when the system fails.

The chapter avoids two mistakes. It does not use cyber risk to justify permanent secrecy, and it does not use transparency rhetoric to ignore technical danger. A security incident can create wrongful exposure, false accusation, public misinformation, staff trauma, legal risk, and democratic confusion. A fair City must prepare for those harms before they occur.

The City also needs public communication discipline. During an attack, people will ask whether records can be trusted, whether protected material was exposed, whether public bundles are accurate, whether a participant was framed, and whether the City is hiding failure. Silence can become rumor. Overconfidence can

become deception. The response must be fast enough to protect trust and careful enough to avoid amplifying the attack.

30.3.1 — Cyber Threat Model

Cyber threat modeling should connect named assets and protected people to likely adversaries, insider risks, credential and other entry paths, vendor and supply-chain dependencies, public interfaces, model inputs, backups, essential services, recovery authorities, detection, containment, evidence preservation, continuity, communication, and remedy. Tabletop and restoration tests should include records, privacy, legal, operational, and affected-person owners. The standard is not perfect safety; it is whether foreseeable attack paths have accountable owners before an incident and usable remedies afterward, with unrehearsed dependencies entered in the bounded public risk register (NIST, 2024a, 2025b; ISO, 2019).

Attackers may include hostile political actors, foreign services, criminal groups, disgruntled insiders, exploitative media operators, abusive fans, anti-City movements, compromised vendors, opportunistic hackers, or people seeking to protect a participant from exposure. Motives may include theft, erasure, sabotage, extortion, embarrassment, manipulation, denial of service, source poisoning, or public distrust.

The attack surfaces include capture devices, authentication systems, access logs, public record site, search index, summary tools, model APIs, vendor portals, staff devices, backup systems, correction forms, complaint portals, metadata stores, key management, network segmentation, and physical access to

technical rooms. The threat model should identify not only technical entry points but also human pressure points such as phishing, coercion, fatigue, and privileged access.

Cyber harms should be classified by the burden they create. A breach of intimate material differs from denial of public site access. A forged record differs from a search-rank manipulation. A stolen key differs from a misleading public summary. A compromised vendor differs from a staff curiosity breach. Each harm needs different containment, notice, review, and remedy.

Adversarial-machine-learning review should distinguish attack stage and attacker goal. Poisoning may enter through data, feedback, or model updates; evasion targets inputs at use; privacy attacks seek protected information; misuse turns general capability toward impersonation, inference, automated probing, or harmful generation. Mitigation must follow the actual route because one generic model-security control cannot answer every attack class (NIST, 2025a).

A generic security vocabulary is itself a failure because it conceals the actual threat model. The City says it takes cybersecurity seriously but cannot name threat actors, assets, attack paths, affected persons, incident owners, notification rules, or recovery priorities. The remedy is a living threat model, tested controls, red-team exercises, staff training, vendor review, incident playbooks, and public summaries that disclose lessons without exposing weaknesses.

30.3.2 — Deepfake Defense

Deepfake defense begins by avoiding two category errors: treating plausible media as self-authenticating and treating inconvenient genuine records as synthetic merely because they are contested. Provenance, forensic assessment, source comparison, custody review, corroboration, and public judgment are separate steps. The disputed object and the reasons for its status should remain preserved while consequential use is paused or narrowed (NIST, 2024c; C2PA, 2026; Verdoliva, 2020).

The operational workflow should identify the submitting source, preserve the original, verify available credentials, compare primary records, record tool disagreement, obtain independent human review, and assign a bounded status with a review clock. Content credentials can establish parts of creation and transformation history, but not the truth of a depicted claim; their absence does not establish falsity. Impersonated or exposed people need rapid notice, correction, lawful takedown assistance where available, safety support, and preservation of evidence without needless amplification (NIST, 2024c; C2PA, 2026; Verdoliva, 2020).

Deepfake defense protects public memory from synthetic or manipulated media that appears to show conduct, speech, presence, absence, agreement, anger, confession, intimacy, staff action, official instruction, or archive failure. The City cannot assume that seeing is believing, but it also cannot assume that every contested record is fake. The correct posture is disciplined verification.

Deepfake defense begins at capture. Source devices, provenance credentials, custody logs, timestamps, environmental context, independent corroboration, and controlled intake can make later forgery harder. The City should not rely only on detection after the fact. Detection tools are useful but limited; provenance, custody, context, and human review remain essential.

Suspicious media should receive a bounded status without sensationalism. Labels such as authenticity under review, source unverified, synthetic-content concern, provenance gap, custody break, and disputed media preserve caution without pretending certainty. Article 50 of the European Union Artificial Intelligence Act offers one jurisdiction-specific example by distinguishing provider-side machine-readable marking from deployer-side disclosure for deepfakes and certain Artificial Intelligence-generated or manipulated public-interest text. The duties apply from 2 August 2026, while the 2026 amending regulation gives qualifying generative systems placed on the market before that date until 2 December 2026 to satisfy the provider marking duty. The European Commission's July 2026 guidance further distinguishes provider, deployer, and enforcement roles. These rules do not become universal City law; their value here is the discipline of assigning the correct actor, status, and review route before media becomes an institutional verdict (European Union, 2024, 2026; European Commission, 2026).

Deepfake defense must protect people as well as records. A participant falsely depicted in misconduct may need rapid status labeling, public correction, and safety support. A nonparticipant falsely inserted into a record may need shielding and notice. Staff

falsely shown mishandling records may need protection from retaliation. The public needs a route to understand uncertainty without being trained into distrust of all records.

Artificial Intelligence may assist synthetic-media detection, but its output remains evidence for review rather than final truth. Tools may disagree, confidence can be miscalibrated, and adversaries adapt. The City should combine detection with provenance review, source comparison, expert human assessment, and, when necessary, temporary nonpublication or protected release while verification remains open.

Deepfake defense fails at either extreme: panic or complacency. Panic lets every powerful person dismiss damaging records as fake; complacency lets forged records damage public memory. The remedy is provenance-first design, detection as assistance, status labels, rapid review routes, public explanation, correction logs, and careful refusal to let authenticity uncertainty become a political weapon.

30.3.3 — Archive Integrity Under Attack

Archive integrity under attack is tested by the ability to preserve evidence, maintain essential access, identify corruption, isolate affected systems, and restore trustworthy service without rewriting history. Recovery drills should include partial compromise, malicious insiders, lost keys, damaged backups, and uncertainty about which version is authoritative. Integrity is a recoverable process rather than a permanent adjective (NIST, 2025b; ISO, 2019; NARA, 2023).

Durable integrity requires more than keeping one copy online. Signed manifests, checksums, append-only event logs, geographically and administratively separated replicas, access records, version history, and tested restoration should make alteration detectable and recovery attributable. Investigators must preserve the difference between compromised content, uncertain custody, unavailable service, and verified loss rather than declaring the entire archive either trustworthy or ruined. Recovery restores governed status and chain of custody, not merely files that can once again be opened.

Operationally, the City preserves trustworthy memory while adversaries attempt to alter, delete, flood, encrypt, leak, spoof, or corrupt records. Integrity therefore includes custody, metadata, classification, access logs, correction history, query logs, public-interface behavior, and an attributable account of what changed after an incident. A file may survive while the evidentiary system around it has failed. The incident response must restore the record's status, not simply its visibility.

The archive should be built with defense in depth: segmented systems, least-privilege access, multi-factor authentication, key rotation, immutable or tamper-evident logs, offline backups, tested recovery, independent snapshots, monitored administrative actions, and separation between production systems and public display. These are not technical luxuries. They prevent public memory from being rewritten by convenience or attack.

Integrity controls must also protect against insiders. A trusted employee may become compromised, coerced, resentful, careless, or overconfident. Privileged access should be limited,

monitored, peer-reviewed for high-risk actions, and subject to break-glass procedures that generate later review. Staff dignity and staff privacy still matter, but official access to public memory cannot be invisible.

During attack, availability may need to be narrowed. The City may temporarily suspend search, disable downloads, freeze public bundles, block certain query classes, restrict administrative actions, or move to read-only mode. Such narrowing should be labeled, logged, time-bound, and reviewed. Security measures should not become permanent opacity after the crisis passes.

Integrity also means preserving evidence of the attack. Logs, forensic images, affected systems, vendor notices, communications, and decision records should be preserved under protected handling. The City must be able to explain what it knows, what it does not know, what it is doing, and how affected persons can seek remedy.

Archive integrity is lost through either fragile memory or secret security rules. A fragile archive collapses under attack. A secret security regime hides too much after attack. The remedy is resilience planning, isolation, backups, incident playbooks, independent forensic review, public status labels, affected-person notice, and restoration that includes correction of public understanding.

30.3.4 — Public Communication During Breach

Breach communication should be evaluated for speed, accuracy, uncertainty, affected-person protection, and correction. Early notices should state what is confirmed, what is suspected, what

people should do, which details remain protected, and when the next update will occur. Every later update should visibly identify which earlier statements remain valid or changed and why, and that supersession should propagate to the record site, machine-readable feeds, affected-person notices, and other governed public artifacts (European Union, 2016; NIST, 2025b; EDPB, 2023).

Public communication during breach is a form of burden routing. If the City speaks too slowly, rumor carries the burden. If it speaks too confidently, error carries the burden. If it speaks too technically, ordinary readers carry confusion. If it speaks too dramatically, panic and spectacle carry the burden. The communication protocol must protect truth, people, and public usability at the same time.

A first notice should state what is known, what is under review, what systems or record classes are affected where safe to say, what is being protected, what public functions are paused, what affected persons should do, and when the next update will occur. It should avoid premature blame, technical theater, and language that implies all records are compromised when only a layer is under review.

Different audiences need different communications. Participants may need direct notice about records, appeals, and safety. Nonparticipants may need protected channels and shielding support. Staff may need operational instructions and anti-retaliation protection. Public users may need record-site status and warning labels. Host jurisdictions and lawful authorities may need coordination within legal limits.

Communication categories should be written before crisis: suspected breach, confirmed breach, public site outage, synthetic media event, unauthorized access, vendor incident, protected-person exposure, integrity under review, service restoration, and final incident summary. Templates should not become canned reassurance. They should preserve clarity when stress is high.

Communication must also resist adversarial timing. Attackers may leak fragments, impersonate City notices, seed false claims, or pressure for premature release. The City should have official channels, message authentication, archive status pages, and instructions for verifying updates. Public trust requires not only content, but reliable route.

Breach communication fails when image defense displaces truthful public explanation. The City speaks to protect its reputation rather than affected persons and public truth. The remedy is incident status labels, scheduled updates, affected-person priority, correction of misinformation, independent review, and final public summaries that describe failure and repair without exposing protected technical details.

30.3.5 — Recovery and Audit After Attack

Recovery after attack is not closure merely because service resumes. The post-attack record should identify affected records, vendor and governance responsibility, clean-system recovery, credential and key rotation, integrity verification, forensic preservation, continuity, affected-person remedy, independent root-cause review, remediation ownership, residual exposure, and tested recurrence prevention. A finding remains open until

corrective action is tested under the condition that failed, and the lessons should update the threat model, contracts, staff training, access design, continuity plan, remedy route, and public account of material change (NIST, 2025b; GAO, 2024, 2025; ISO, 2019).

Recovery after attack is not merely return to service. It is the restoration of trustworthy memory, affected-person safety, staff capacity, public understanding, and institutional learning. A system that comes back online without explaining what was affected, what changed, and what remedies exist has restored convenience, not fairness.

Recovery should proceed through containment, forensic review, integrity verification, affected-person notification, public-status update, restoration of services, correction of public records, review of vendor and staff actions, and external audit. Each step should have an owner, a timeline, a record, and a protection rule. The City should not improvise the sequence after damage occurs.

Public bundles affected by attack may need relabeling. Search indexes may need rebuilding. Summaries may need regeneration under human review. Classification decisions may need rechecking. Access logs may need forensic reconstruction. Correction windows may need extension. Public readers may need an explanation of what they can rely on and what remains under review.

Affected-person remedy is central. A person whose protected material was exposed may need shielding, takedown support, legal referral, counseling, public correction, compensation where authorized, and a route to challenge continuing harm. A staff

member harmed by breach response may need labor protection. A public user misled by forged material may need corrected public explanation.

The final incident audit should ask what failed, what worked, what burden was shifted, whose warnings were missed, whether vendor controls were adequate, whether staff were overloaded, whether Artificial Intelligence tools amplified the incident, and whether public communication preserved trust. The audit should not be written as a reputational defense.

Recovery is incomplete when the institution forgets the breach as soon as systems function again. The remedy is failure memory: a protected incident record, public summary where safe, revised controls, staffing adjustments, vendor consequences, retraining, red-team follow-up, and scheduled review of whether the same vulnerability has reappeared in a new form.

30.4 — Vendor Capture and Infrastructure Continuity

The City will not build every technical tool itself. It will depend on vendors for storage, networking, authentication, search, security testing, accessibility testing, media forensics, translation, public interface support, backup, incident response, and perhaps Artificial Intelligence services. Vendor use is not failure. Unreviewable vendor dependence is failure (NIST, 2022; ISO/IEC, 2022; ISO/IEC, 2023; Sculley et al., 2015).

Vendor capture occurs when a private provider becomes difficult to leave, difficult to inspect, difficult to challenge, or difficult to explain to the public. It may happen through proprietary formats, hidden model behavior, migration costs, contract secrecy, staffing dependence, identity systems, data-hosting arrangements, interface design, or the vendor's control of logs. Capture is not only money. It is practical sovereignty.

Procurement is therefore part of governance. A tool is not suitable because it is impressive, cheap, famous, fast, donated, or bundled. It is suitable only if the City can define its purpose, inspect its behavior, secure its lifecycle, constrain its data use, challenge its outputs, continue without it, and end the relationship without losing public memory.

Infrastructure continuity matters because a record system that disappears when a vendor fails, raises prices, changes terms, trains on data, refuses audit, or withdraws service has placed public memory in private hands. The City should be able to continue core memory functions under degraded conditions, with

human review and public explanation, even when a vendor path becomes unsafe.

30.4.1 — Vendor Control Risks

Vendor control risk begins with an inventory of private power over public memory. The City should know which provider can access data, change configurations, push model or software updates, view telemetry, appoint subprocessors, suspend service, alter prices, withhold documentation, train on records, or make export practically impossible. Each capability should connect to a contract term, named human owner, monitoring record, incident route, and public dependency summary. Hidden subcontracting or undocumented technical control is a governance defect before an incident occurs (NIST, 2022; ISO/IEC, 2022; ISO/IEC, 2023; Sculley et al., 2015).

Good-faith service does not remove incentive conflict. A provider may optimize for growth, data reuse, investor value, technical lock-in, reduced support burden, brand protection, or market position while the City owes continuity, privacy, correction, contestability, and public memory. Governance begins by naming that difference without presuming malice.

The riskiest vendor locations are storage, identity, access logs, classification tools, search ranking, summary generation, model hosting, security monitoring, public record site design, backup, and incident response. Whoever controls those layers can shape what is preserved, found, withheld, summarized, protected, or believed. Even without formal authority, technical control can become memory power.

Contract secrecy is a public-risk factor. Some security terms may need protection, but the public should know the categories of vendor dependency, the existence of audit rights, the no-training-by-default rule, the data-use limits, the breach-notice duties, and the exit obligations. A City that hides vendor relationships under procurement confidentiality invites suspicion and capture.

Vendor telemetry also requires scrutiny. A tool may collect usage patterns, search behavior, error reports, prompts, summaries, access attempts, or performance logs. These data may reveal protected facts even when source records remain protected. Vendor telemetry must be minimized, governed, retained only as needed, and excluded from training or secondary use unless a separate lawful pathway exists.

Vendor influence can also shape design culture. Staff may begin using the vendor's categories, dashboards, model assumptions, risk labels, or public-interface patterns as if they were City law. The City should maintain its own vocabulary and status labels. A vendor may provide functions; it may not define the meaning of fairness, readiness, public interest, protected nonvisibility, or record-stage separation.

30.4.2 — Exit Paths From Vendors

A vendor exit path must be designed at procurement and exercised before dependence becomes crisis. It should specify and test export formats, metadata and audit-log portability, integrity verification, restoration, configuration documentation, encryption-key transfer or destruction, model and annotation ownership, access-control migration, deletion attestation,

subprocessor closure, fallback operations, continuity of public labels, transition assistance, time limits, and replacement staff capacity. Contract language alone is not an exit; exercises must reveal the real time, cost, data-loss, staff-load, continuity, and protected-person risks of leaving (NIST, 2022; ISO/IEC, 2022; ISO, 2019; NARA, 2023; Weick and Sutcliffe, 2015).

Contracts should also preserve chain-of-custody continuity, model-use logs where applicable, and escrow for critical documentation during transition.

Exit also protects negotiation integrity. A vendor that knows the City cannot leave can change terms, narrow audit access, delay support, increase prices, resist incident disclosure, or expand data use. The best time to preserve public memory from private leverage is before the vendor has become irreplaceable.

Vendor exit should be tested through drills. A paper exit plan can fail when file formats, metadata fields, access controls, search indexes, or public-site links do not transfer cleanly. Drill results should be recorded, corrected, and reviewed. If a vendor cannot pass an exit drill, the dependency should be treated as governance risk, not an inconvenience.

Exit must include protected-person handling. Migration can expose records through misconfigured permissions, missing masks, broken category labels, or incomplete deletion. A vendor transition should have privacy review, security review, archive review, affected-person risk review, and post-migration audit before normal operations resume.

Continuity is captive when the City cannot leave a vendor without losing records, functions, or practical control. The City continues using a vendor because leaving feels too difficult even after risk is known. The remedy is exit rehearsals, data portability standards, escrow, redundant skill inside the City, emergency fallback, public dependency reporting, and authority to pause features rather than accept unsafe vendor power.

30.4.3 — Multi-Vendor Redundancy

Multi-vendor redundancy should reduce correlated failure rather than merely multiply invoices. Two services that rely on the same cloud region, identity provider, model family, code library, data pipeline, or specialist staff may fail together while appearing contractually independent. Redundancy analysis should identify common failure domains, incompatible formats, synchronization risks, divergent security controls, and who decides which system becomes authoritative during conflict. Manual fallback and open, tested interchange matter more than the number of logos on the architecture diagram (NIST, 2022, 2024a; ISO/IEC, 2022).

Redundant systems can also disagree. The continuity plan should specify which source becomes authoritative, how divergent versions are reconciled, who may invoke failover, what evidence is preserved, and when the primary service may return. Without that conflict rule, redundancy can preserve availability while corrupting custody (NIST, 2022; ISO, 2019; Weick and Sutcliffe, 2015).

Multi-vendor redundancy reduces dependence on one provider, but it is not a cure by itself. A City that spreads functions across

several opaque vendors may create more complexity without more accountability. Redundancy is fair only when it increases resilience, inspectability, substitutability, and continuity without multiplying access to protected data.

Every vendor in a redundant chain remains bound by the Vendor Data-Use Standard in Section 30.4.4; adding a second processor creates no second permission. The multi-vendor test is whether routing, replicas, telemetry, and subprocessors preserve the same no-training default end to end.

Redundancy should also avoid monoculture. If multiple vendors rely on the same cloud dependency, the same model provider, the same identity service, the same hardware supply chain, or the same proprietary standard, the City may appear diversified while remaining exposed to a single failure. Dependency maps should look beneath vendor names to shared infrastructure.

Protected data should not be copied widely merely to create redundancy. The City can use segmentation, encrypted backups, limited replicas, synthetic test data, secure enclaves, and role-separated access to preserve continuity without spreading sensitive records. More copies may mean more attack surface and more staff burden.

Operationally, redundancy should include failover testing, manual fallback, degraded public-site modes, emergency-only access paths, and review of which functions can stop safely. Not every feature needs instant continuity. Some public search functions can pause. Life-safety, affected-person protection,

breach response, and core archive integrity deserve higher continuity priority.

Redundancy becomes theater when nominal alternatives share the same hidden point of failure. The City buys redundant tools but cannot explain which burden each protects, how failover works, what data travels, who can access it, and when a feature should shut down instead of fail over. The remedy is dependency mapping, risk-tiered continuity, protected-data minimization, tested failover, and public status labels during degraded operation.

30.4.4 — Contractual Audit Rights

Contractual audit rights must reach the evidence needed to test safety, legality, provenance, bias, incident handling, retention, subcontracting, material change, secure development, and exit. The right should cover relevant logs, control and test reports, data and model lineage, subprocessor records, protected interviews, remediation plans, and proof that corrective action works. Trade secrecy may govern handling, but it cannot make a public-memory function unavailable to every competent reviewer. Persistent refusal, incomplete evidence, or an unremedied material finding should permit suspension and termination (NIST, 2022, 2024e; GAO, 2024; IIA, 2024; ISO/IEC, 2022).

Without enforceable access, the City may know that a vendor was involved while remaining unable to determine how records were processed, where data traveled, whether models or configurations changed, whether subprocessors touched protected material, whether logs were retained, whether data was reused, or whether

breach signals were missed. Contractual audit rights convert private service into inspectable public-risk infrastructure by making those questions answerable before crisis, during incident response, and after remediation.

The contract should allow review of data flows, access logs, security controls, subprocessor lists, model-use boundaries, training prohibitions, deletion practices, incident response, uptime claims, backup procedures, change management, vulnerability disclosure, penetration-test summaries, and support timelines. The City may not need to publish all technical details, but it must have enough access to govern.

No-training-by-default belongs in the contract. City operational records, prompts, queries, logs, summaries, corrections, protected metadata, and public-interface usage should not be used to train, fine-tune, evaluate, improve, benchmark, or market vendor models unless a separate lawful, consented, and governance-approved pathway exists. Public release does not change that default.

Audit rights should also include change notice. A vendor should not silently change model behavior, ranking logic, classification assistance, retention settings, telemetry, subprocessor involvement, data location, security controls, or interface components that affect City records. Significant changes should trigger City review before deployment where possible and immediate post-change review where urgency is unavoidable.

Secure acquisition should reach the development lifecycle behind the product. The City should be able to examine how a vendor

secures model development, protects training and evaluation assets, manages third-party components, documents releases, handles discovered vulnerabilities, and separates development evidence from promotional claims. NIST SP 800-218A is voluntary guidance rather than certification, but its AI-specific secure-development profile clarifies the evidence an acquirer may reasonably require before a model-enabled system touches public memory (NIST, 2024e).

Contracts should protect staff who raise vendor concerns. A technician, archivist, reviewer, or participant who notices vendor misuse should have a safe route to report without retaliation. Vendor dependence often survives because the people who see the problem fear being blamed for disrupting operations. Contract governance must connect to staff protection.

Contractual audit rights are hollow when they cannot be exercised in practice. The contract says the City can audit, but the vendor delays, withholds logs, invokes proprietary privilege, or provides unreadable summaries. The remedy is enforceable access rights, termination triggers, independent technical review, escrow, penalties for misuse, public dependency summaries, and a rule that unresolved audit obstruction can require tool suspension.

30.4.5 — Public Memory Without Private Sovereignty

Public memory cannot depend on private sovereignty. The City or another lawful public custodian must retain authority over purpose, access, correction, retention, export, incident response, and termination even when private systems provide storage, search, or analysis. Contracts should prohibit undeclared reuse,

model training, monetization, and unilateral policy changes; require open or documented formats; and preserve deletion, sealing, and migration duties across backups and subprocessors. Vendor innovation remains welcome only inside a custody structure the public can still govern (NARA, 2023; European Union, 2016; NIST, 2022).

Public memory remains public only when no private provider can decide what survives, what is searchable, or what may be corrected. Custody plans should preserve format migration, provenance, retention, lawful disposal, public access, and institutional succession beyond any one contract. The City may rent infrastructure; it may not outsource the meaning of its archival duties (ICA, 2011; NARA, 2023; Schwartz and Cook, 2002).

Public memory without private sovereignty means the City may use private tools without letting a private party define what the public can know, search, correct, or challenge. The archive belongs to a public-power formation institution under lawful governance and rights constraints. It does not belong to a cloud provider, model vendor, interface designer, donor, platform partner, or technical contractor.

This principle requires institutional competence. The City must retain enough internal understanding to ask hard questions, read logs, challenge vendor claims, interpret technical incidents, supervise migration, review model limits, and explain public-facing status. Outsourcing function without retaining competence creates dependency disguised as efficiency.

Public memory also requires public-facing transparency about vendor role. Citizens do not need every technical diagram, but they should know when a public summary is machine-assisted, when a search interface depends on external tools, when a major vendor incident affects records, and what protections exist against vendor data use. Trust is not created by hiding complexity.

Private sovereignty can also occur through standards of convenience. If the vendor's categories become City categories, the vendor's dashboard becomes governance, or the vendor's model confidence becomes public confidence, then the City has outsourced judgment even while keeping records in its legal custody. The City should translate tool outputs into its own reviewed status language.

The principle also protects vendors from unfair expectation. A vendor should not be asked to decide moral, legal, political, or scientific questions that belong to City governance or other books in the series. Clear boundaries help vendors serve without ruling. The City must not hide behind the vendor when harm occurs.

A tool begins to govern when its contract quietly determines public memory. Public memory is practically governed by private defaults that no affected person can challenge. The remedy is internal competence, public dependency maps, open standards where feasible, exit paths, audit rights, human authority, no-training-by-default, and public explanation that keeps tool providers in service roles.

30.5 — Search, Retrieval, and Query Classes

Search is one of the most powerful verbs in the City. A person who can search broadly can often learn more than a person who can read one released record. Search can connect fragments, infer protected facts, map relationships, identify routines, reveal absences, and turn ordinary proximity into a dossier. A public archive without search may be unusable, but a search system without limits may become surveillance (Nissenbaum, 2010; Solove, 2006; Citron and Solove, 2022).

The City therefore needs query classes. A query class defines who may search, what corpus they may reach, what purpose they must state, what results they may receive, what logging applies, what review follows, and what protected inferences are blocked. Query class is the difference between public access and public appetite, between oversight and fishing expedition, between affected-person remedy and voyeurism.

Query classes also protect the boundary with research and Artificial Intelligence training. A public user may search public bundles. An oversight reviewer may access deeper materials under authority. An affected person may search records related to their own exposure or remedy. A researcher may not treat public availability as research permission. A model developer may not treat any query path as training authorization.

Identity assurance belongs inside each query class rather than inside one universal login. Public browsing can remain minimally identified and logged, while oversight and affected-person access may require stronger proofing, authentication, federation,

recovery, and step-up controls. Assurance should follow consequence and exposure risk, preserve accessibility, allow correction of identity errors, and retain a non-digital route where network identity would exclude. Stronger identity establishes who is using a separately bounded authority; it does not expand that authority (NIST, 2025c, 2025d).

Search design must assume adversarial users. A person may use repeated queries to reconstruct protected facts, infer a child's presence, identify a nonparticipant, map intimate relationships, detect a sealed event, or pressure the City into release through public speculation. Query safeguards must protect against what can be inferred, not only what is directly shown.

30.5.1 — Public Query Class

A public query class should make deliberately released records discoverable without turning public access into population-scale inspection. It should use the least identity and logging needed for safety, expose context and status by default, limit high-risk combinations, and provide non-search routes for people who need a specific public record. Public access is a right to governed information, not a license to build dossiers from repeated queries.

For citizens, this query class permits search across deliberately released public bundles, summaries, status labels, correction logs, release notes, and public explanations. Its purpose is democratic interpretation rather than unrestricted discovery. The interface should help users understand public-power formation while denying raw access to protected records, hidden metadata, and

search dimensions that reconstruct the whole person. Public availability is therefore designed, not assumed.

Public query results should carry context by default. A search result should show bundle category, record status, date, role context, dispute status, correction history, protected exclusions, and whether any summary is machine-assisted. The interface should avoid naked fragments that invite readers to infer more than the public record supports.

The public query class should limit search dimensions that produce exposure risk. It should avoid enabling queries by intimate category, medical term, child presence, household relationship, protected professional interaction, private location, staff private life, or nonparticipant identity. Where public-interest searching requires sensitive terms, results should be summary-bound, rate-limited, and context-preserved.

Popularity must not determine retrieval order. Search should not promote a record because it is viral, humiliating, sexually suggestive, politically useful, or frequently clicked. Where relevance ranking is used, the system should disclose understandable categories, retain an unranked or chronological route where appropriate, and audit whether defaults amplify harm or bury correction. Civic retrieval should serve interpretation, not reproduce the incentive structure of an attention platform.

Public search logs create their own privacy questions. The City should not build ordinary-citizen dossiers from search behavior. Abuse detection may require limited security logging, but ordinary users should not become subjects of record because they

looked at public materials. Anti-bot and anti-harassment controls should be separated from public-user profiling.

Public search becomes public surveillance when query power outruns legitimate purpose. Citizens receive a tool that seems democratic but allows protected inference, crowd punishment, fan culture, harassment, or ordinary-user profiling. The remedy is corpus limitation, rate controls, protected-term handling, context-first results, minimal user logging, abuse controls, and public audit of query design.

30.5.2 — Oversight Query Class

An oversight query class may reach deeper records only through a defined mandate, case or audit scope, purpose-coded authorization, time limit, conflict check, and reviewable access log. The class should require stronger identity assurance where consequence and exposure justify it, but stronger identity must not expand substantive permission. Search authority ends with the assignment and remains challengeable by affected persons and independent reviewers.

Oversight queries carry greater access and therefore require stronger purpose logging, separation of duties, sensitive-query review, and sanctions for curiosity browsing. Red-team exercises should test whether an inspector can quietly exceed scope, use one case to explore another, or convert protected evidence into a generalized search power. Oversight must remain powerful enough to investigate and bounded enough to be investigated (GAO, 2024; NIST, 2020a; NARA, 2023).

The oversight query class allows authorized reviewers to search deeper records than the public can see. Ombuds offices, auditors, external inspectors, red teams, privacy reviewers, accessibility reviewers, cybersecurity reviewers, and lawful investigators may need access to patterns that public bundles cannot reveal. Their access is justified by review, not curiosity.

Oversight search must not collapse into public release. A reviewer may see protected material to test whether the City is hiding power or exposing people, but that access does not make the material public. The oversight result may become a public summary, protected finding, confidential remedy, or referral, depending on category and law.

Oversight access still imposes burden. A participant's acceptance of active public-power record does not authorize unlimited, unlogged browsing by every reviewer, and a nonparticipant never inherits the Vow. Oversight queries should therefore be necessary, minimized, purpose-coded, logged, and reviewable by an authority outside the first reviewer when misuse is alleged.

The oversight query class should include abuse detection. Repeated searches by a reviewer, searches outside assignment, protected-category browsing, or query patterns focused on a person rather than a problem should trigger review. Oversight must be strong enough to find hidden power and humble enough to police its own appetite.

Oversight queries become watchdog surveillance when reviewers can search without purpose limits or review. Oversight receives deeper access and becomes the very hidden audience it was meant

to prevent. The remedy is purpose-coded queries, access minimization, peer review for sensitive searches, audit of oversight logs, meta-complaint routes, and public summaries that show review without exposing protected content.

30.5.3 — Affected-Person Query Class

An affected-person query begins with standing to know, correct, protect, or seek remedy, not with public curiosity. The route should establish identity and relationship only to the degree needed for the requested record, support authorized representatives and accessible alternatives, and avoid forcing the person to disclose more sensitive information than the inquiry requires. Proofing failure itself needs a correction and appeal route because identity error can block remedy.

Affected-person queries should be tested for both underaccess and overexposure. A person needs enough information to understand and challenge what happened, yet the route must protect other people's identities, legal rights, confidential communications, and security-sensitive facts. The interface should disclose the basis of any withholding and provide independent review rather than forcing the affected person to guess what the archive contains (European Union, 2016; NIST, 2020b; Citron and Solove, 2022).

The affected-person query class allows participants, nonparticipants, staff, visitors, professionals, partners, family members, or other affected persons to search or request records related to their own exposure, correction, complaint, appeal,

shielding, right of reply, or remedy. This class is not public access. It is recourse infrastructure.

An affected person may need to know whether they appear in a record, whether their image or voice was released, whether a summary describes them by inference, whether a correction was made, whether a complaint file references them, or whether a protected category was applied. The City should provide enough access to support remedy without exposing other people or revealing sensitive institutional security details.

The affected-person query route should be accessible and humane. A person should not need to know archive jargon to ask whether they were exposed. The intake should allow plain-language description, approximate time, relationship to the record, urgency, safety concern, and preferred contact method. The City should then route the request through protected review.

This query class must respect conflicts among affected persons. A participant may seek access to a record involving a partner, child, clinician, lawyer, staff member, or visitor. A nonparticipant may seek protection from a record involving the participant. The City should not treat one person's remedy request as automatic access to another person's protected information.

Artificial Intelligence may help locate possibly relevant records, but affected-person query results require human review before disclosure. The tool may identify likely matches; it may not decide identity, exposure, consent, or remedy. False matches and missed records can both injure people, so the process must include correction and appeal.

Affected-person access fails in either direction: remedy without meaningful access, or access without protection. The City either tells affected people to trust the institution or gives them records in a way that exposes others. The remedy is protected intake, human-reviewed search, segmented results, safety screening, appeal, correction, and notice when a request reveals systemic exposure risk.

30.5.4 — Research Query Class

A research query introduces a new purpose and therefore requires new authority. The route should state the question, data necessity, lawful and ethics basis, inclusion rules, security conditions, disclosure-control method, retention period, publication plan, participant and affected-person protections, and whether model training, linkage, or future reuse is excluded. Operational access never silently becomes research access.

Research queries create a special inference risk because combining fields, repeated extracts, and model-assisted analysis can reveal facts absent from any single record. The research route therefore needs a separate question, authority, minimization plan, disclosure-control review, access environment, publication review, and withdrawal condition. Public availability alone does not create research permission or model-training consent (National Commission, 1979; United States Department of Homeland Security, 2012; NIST, 2020b).

The research query class marks the clearest boundary between the City and *The Science of Fairness*. A City record may be operationally necessary, publicly releasable, or available to

oversight and still not be research data. Public release is not consent to research, and research authorization does not carry permission to train an Artificial Intelligence system. Each use must pass through its own purpose, authority, minimization, consent or waiver, security, publication, correction, and withdrawal rules.

The research query class should be designed to say no. Some records may be too sensitive, too identifying, too context-dependent, too burdened by nonparticipant presence, too vulnerable to misuse, or too outside the research purpose to be included. A system that treats every record as potentially research-useful has already turned people into raw material.

Research permission should specify separately whether it allows model training or fine-tuning, evaluation or benchmarking, creation of embeddings or search indexes, retrieval-augmented use, and product improvement. These operations have different effects: retrieval and embedding do not by themselves train a model, yet they can still copy protected material, create new inferences, or extend access. None should be inferred from a general grant of research access.

Operational records used to improve City tools also need governance. Tool evaluation may be necessary, but using real records to test models can expose protected material or teach systems hidden associations. Synthetic test sets, protected review environments, minimization, and strict deletion may be required before operational improvement becomes ethical.

Research access becomes data conversion when secondary use occurs without genuinely separate authority. Records gathered for public-power formation become research inputs or model material because they are convenient and rich. The remedy is default exclusion, separate consent, *The Science of Fairness* governance for scientific use, no-training-by-default contracts, nonparticipant shielding, data-use logs, and public status labels for approved research pathways.

30.5.5 — Inference Safeguards

Inference safeguards govern what a query system can reveal without directly displaying a protected field. Reviewers should test the strongest plausible reconstruction attack across timing, absence, geography, co-occurrence, relationship structure, rare events, query history, public fragments, and external-data linkage. Controls may require aggregation, minimum result counts, query throttling, delayed access, field suppression, secure review, reduced granularity, or abstention. A record is not protected merely because a name has been removed (Ohm, 2010; Narayanan and Shmatikov, 2008; Nissenbaum, 2010).

Inference can reveal protected facts without direct disclosure: names may be masked while schedules, locations, relationships, roles, voices, rare conditions, sequences, query counts, or absences identify people or events. Attack tests should ask whether users can identify children, infer clinical visits, map relationships, combine datasets, or derive sensitive attributes.

Additional controls may include randomization, restricted facets, contextual excerpts, join limits, access separation, and human

review. Controls must match the protected burden rather than hide obvious inference routes behind technical complexity.

Public summaries also require inference review. Relationships, timing, rare circumstances, household roles, or professional context can identify a protected person. Summaries should preserve civic meaning without making identification easy.

Cross-system dossiers are prohibited. City records cannot be joined with religious, voting, donor, platform, or government data to build hidden trust profiles. Query, export, and model-training controls must reject those joins.

Masking fails when a person remains discoverable. Remedies include adversarial testing, affected-person review, firebreaks, query limits, summary review, and correction. Search needs mercy because retrieval can revive a record after its purpose narrows. The rule must govern correction, context, expiry, sealing, query classes, and protected life. The archive may remember public power without possessing identity.

30.6 — The City as an Anti-Forgetting Institution

The City remembers because public power often survives by forgetting. A campaign forgets who shaped the candidate. A public biography forgets who paid, trained, threatened, rescued, shielded, or corrected the future official. A scandal forgets the years of formation that made the event possible. A polished office forgets the burden carried by staff, families, host communities, and the public. Anti-forgetting is therefore a civic purpose (ICA, 2011; Schwartz and Cook, 2002; NARA, 2023).

But the City must not confuse memory with possession. To remember public-power conduct is not to own the person who acted. To preserve a record is not to capture a soul. To identify a pattern is not to decide destiny. To refuse erasure is not to deny mercy. The City exists to make public-power formation answerable, not to preserve every human trace forever.

This final section gives the archive its deepest moral boundary. Public memory should resist myth, not create new mythology. It should preserve conduct, context, correction, and consequence, not claim access to inner life. It should protect future democratic judgment, not freeze persons in their worst or most photogenic moments. It should make forgetting harder where power is involved and easier where exposure no longer serves lawful public burden.

The anti-forgetting institution must also remember its own failures. A wrongful release, biased tool, breached archive, vendor capture, inaccessible interface, staff retaliation, misleading summary, or delayed correction should not vanish

after repair. Failure memory is how the City learns without pretending it was always fair. Yet even failure memory must be bounded by dignity, protected persons, and time review.

30.6.1 — Anti-Forgetting Purpose

The anti-forgetting purpose is legitimate only when the record improves future public judgment without claiming the whole person. The archive may preserve conduct, context, revision, influence, and remedy, but it should name why each retained element still serves a public role. Memory becomes possession when retention continues after purpose, review, and proportionality have disappeared.

Its positive purpose is to preserve public conduct, reasons, influence, correction, and institutional response long enough for democratic and historical judgment. It is not a command to capture every hour, feeling, relationship, or bodily detail. The archive should favor records that explain consequential public-power formation and City governance while excluding or minimizing material whose only value is curiosity. Memory earns legitimacy by helping people verify what happened and whether the institution learned, not by making disappearance impossible (NARA, 2023; SAA, 2020; ICA, 2011).

The burden test is straightforward: forgetting is unacceptable when it shifts cost onto citizens, staff, affected persons, future voters, or future institutions. Retention is equally unacceptable when no continuing public purpose, remedy need, or lawful duty justifies the exposure. Anti-forgetting therefore preserves what keeps public authority answerable over time and refuses

accumulation merely because the material may someday interest someone.

This purpose reaches formation, reasoning, correction, staff influence, donor and vendor pressure, public interface, office continuity, crisis exceptions, record disputes, and institutional failure. It asks what future public judgment would need to understand how power was formed. It does not ask what the public might want to see.

Anti-forgetting also protects participants from mythology. A person who later campaigns for office should not be able to reinvent a seamless self after years of visible formation. The archive can show learning, revision, error, apology, dependence, resistance to capture, treatment of staff, and response to correction. That memory may help the public see beyond persona.

The purpose also protects the City from self-mythology. The institution may be tempted to remember its successes and summarize its failures. A fair archive preserves complaints, corrections, breaches, pauses, redesigns, and dissent in appropriate form. Institutional humility requires memory that can embarrass the institution without devouring protected persons.

Anti-forgetting should have purpose labels. A record may be retained for role-relevant public memory, complaint history, correction record, audit requirement, legal duty, participant access, nonparticipant remedy, institutional learning, or public bundle context. Purpose labels prevent retention from becoming accumulation by habit.

An anti-forgetting institution can be captured by memory appetite. The City keeps records because it can, because they may someday be useful, or because deletion feels like weakness. The remedy is retention purpose, review clocks, sealing pathways, deletion limits, public-interest tests, affected-person routes, and oversight that asks whether continued memory still carries a lawful burden function.

30.6.2 — Conduct, Not Consciousness

Conduct can be documented; consciousness cannot be read from the archive. Public labels and summaries should therefore state the observable act, source, context, dispute, correction, and institutional consequence without claiming motive, inner truth, destiny, or final worth. The boundary should survive search results, guide pages, machine summaries, and detachable excerpts (Nissenbaum, 2010; European Union, 2024).

The archive may hold actions, words, decisions, roles, corrections, interactions, classification status, public explanations, and institutional responses. It may not certify holiness, sincerity, hidden love, ultimate loyalty, spiritual worth, inner redemption, or a final account of the person. Public-power memory can be exact about conduct while remaining silent about the human whole.

Archives invite overreading. A reader may see repeated behavior and claim to know a person's heart; a model may detect linguistic patterns and infer motive; a summary may describe emotional tone and imply character; and a public bundle may assemble enough conduct to tempt moral totalism. Every interface must

therefore teach the limit of the record as clearly as it presents the record itself.

The record can support role-specific interpretation. It may show how a participant handled conflict, correction, staff authority, public pressure, ambiguity, secrecy, or technical limits. It may help citizens assess public trust. But those assessments remain human, contestable, contextual, and limited to public-power relevance. They are not measurements of whole-person value.

Artificial Intelligence should be especially constrained here. It should not infer mental state, spiritual state, loyalty, sincerity, deception, empathy, narcissism, virtue, or destiny from records. Clinical contexts belong to clinicians under care boundaries. Scientific constructs belong to the science domain under separate governance. The City archive is not a psychological oracle.

Public summaries should avoid consciousness language. They may say what the record shows, what was disputed, what was corrected, what explanation was given, and what public-power relevance exists. They should not say what someone really meant unless the record directly supports a narrow, reviewable claim. Even then, interpretive language should remain cautious.

30.6.3 — Pattern, Not Destiny

Patterns may justify a question, a review, or a narrowly reasoned institutional response, but they do not become destiny. The archive should preserve base rates, context, counterexamples, change over time, and the difference between prediction and decision. No pattern may become a readiness score, civic rank,

loyalty estimate, or permanent explanation of the person (O’Neil, 2016; Selbst et al., 2019; NIST, 2023a).

Any pattern-triggered review must specify the decision it may inform, the time window, minimum evidence, comparison set, alternative explanations, review owner, expiry, and abstention route. Repetition can matter for role review, system diagnosis, security, or institutional learning, but it must not become a permanent label, predictive civic rank, eligibility shortcut, or presumption that future conduct is already known. Consequence increases the burden of current evidence, independent human review, explanation, appeal, and the ability to decline an inference.

Patterns matter because isolated moments mislead. Repeated conduct may show how a person learns, avoids correction, treats staff, uses authority, responds to dissent, carries stress, or handles protected information. Such evidence can help the public resist persona, but recurrence remains historical description rather than fate. Repetition may change, may depend on context, and may be revised by later conduct.

Artificial Intelligence pattern analysis needs special restraint. A model may detect clusters or anomalies that human reviewers should examine, but it cannot decide that a person is a type. It cannot turn repeated behavior into a fixed label. It cannot rank readiness, infer destiny, or produce hidden risk profiles that follow a person across City, government, religious, Workgame, voting, donor, or research systems.

Pattern presentation should include counter-patterns where relevant. A participant may have a history of error and a history of repair. A staff team may show repeated delays and later redesign. A public interface may have produced confusion and then improved. The public deserves the structure of recurrence, not a dramatic list of incidents without learning.

Pattern also needs mercy because visible life can magnify ordinary imperfection. The City should not turn repetition into humiliation when the pattern is not role-relevant, has been repaired, belongs to protected context, or no longer serves public burden. Pattern is useful only when it helps future public judgment without denying the possibility of change.

Pattern analysis becomes deterministic memory when past records are made to dictate future identity. The City presents patterns as fate, labels as essence, and risk as identity. The remedy is context layers, correction history, time review, role-specific relevance, human interpretation, appeal, and a prohibition on machine-generated destiny labels.

30.6.4 — Memory With Mercy

Memory with mercy keeps enough evidence for accountability while permitting sealing, summary, access reduction, time review, and correction when continuing exposure no longer serves the public purpose. Mercy is not deletion on demand or concealment of official conduct. It is disciplined refusal to let punishment, curiosity, and technological permanence exceed the role-relevant reason for remembering (SAA, 2020; ICA, 2011; Caswell, 2016).

A merciful archive also records change. Replies, later evidence, overturned findings, apology and repair, expiry decisions, access reviews, lawful restriction, and the voices of people affected by the original record belong beside the first account. A record that remembers only accusation or only triumph is narrative control rather than public memory. Enough context must remain visible to prevent an old fragment from becoming a fresh and misleading punishment.

Mercy appears in protected summaries, delayed release, sealing, time review, right of reply, correction logs, post-exit boundaries, posthumous review, and refusal to display intimate or humiliating details without civic necessity. These are not loopholes. They are ways to keep public memory from reproducing the injuries it was built to expose.

Mercy is especially important for people without power. A nonparticipant, child, partner, staff member, clinician, lawyer, visitor, protester, or public contributor should not become permanently visible because they were near someone who accepted the Vow. The archive should remember public-power formation without making collateral people carry the participant's burden.

Mercy also applies to participants. A participant who made a public-power mistake may need record, consequence, correction, and public explanation. They do not need the archive to become a ritual of endless shame. The public can know enough to judge without being invited to consume the person.

Memory with mercy should be administered through criteria rather than sentiment. The City should ask whether continued exposure serves public-power relevance, whether a protected person is burdened, whether correction has occurred, whether the record is needed for remedy, whether a summary can serve the public better than raw detail, and whether time has changed the burden of release.

Memory loses mercy at either extreme: sentimental erasure or punitive permanence. The City hides too much in the name of compassion or exposes too much in the name of accountability. The remedy is criteria, review, affected-person routes, public status labels, independent oversight, and time-bound reevaluation of what public memory still requires.

30.6.5 — No Eternal Exposure Machine

A City becomes an eternal exposure machine when capture, searchability, derivative copies, and public appetite continue after the governing purpose has ended. Prevention requires review clocks, retention and sealing rules, downstream propagation, post-exit boundaries, access analytics, and authority to retire public interfaces. The institution should be able to remember its own public history without making permanent visibility the price of participation (European Union, 2016; Solove, 2006; Citron and Solove, 2022).

A workable prevention regime combines retention schedules, access tiers, review clocks, de-indexing, sealing, lawful deletion, historical-use limits, derivative-output controls, and restrictions on automated inference. Some records must remain for legal,

remedy, or historical reasons, but continued custody does not require universal searchability or perpetual algorithmic reuse. A system that cannot reduce access, end a secondary use, or propagate a restriction after justification expires has converted memory into possession.

The final boundary is temporal. The City may require a comprehensive active-period public-power record while a person carries the role-bound burden, and it may preserve public-power memory after that burden ends. What it may not do is let temporary visibility become permanent whole-person possession through search, copying, model training, caching, or institutional habit. The ability to end a use is part of the legitimacy of beginning it.

Time review is essential. A record that needed public release during candidacy may need different handling years later. A protected summary may remain useful while raw material becomes unnecessarily injurious. A correction may reduce the need for a prior warning. A sealed record may need continued protection. A public bundle may need relabeling to avoid outdated inference.

Exit and posthumous dignity matter here. Former participants remain human beings, not living exhibits of the City. Their families, children, partners, and communities do not inherit perpetual visibility. After death, the archive should still respect dignity, context, protected persons, and public-purpose limits. Historical memory is not permission for unlimited exposure.

Retention, sealing, deletion, and public-access review are separate acts. Retention preserves a record under governed custody. Sealing restricts access. Deletion removes material where lawful and appropriate. Public-access review reassesses what the public may see. These stages should not be collapsed into a vague promise of long-term memory.

Artificial Intelligence must not make exposure eternal by copying, embedding, training, summarizing, caching, or distributing protected records in ways that cannot be undone. No-training-by-default, deletion obligations, model-use logs, retrieval limits, cache controls, vendor restrictions, and research firewalls are necessary because technical systems can remember beyond the archive's moral authority.

Chapter 31 — Failure, Exit, and Reintegration

The City is judged most honestly when something goes wrong. A public institution can speak eloquently about burden, visibility, dignity, and rights while its real character remains hidden until a participant misfits the role, a record breaks, a staff member is harmed, a bystander is exposed, a public claim collapses, or a person asks to leave. Failure is where institutional language either becomes real or becomes decoration.

Every serious institution should be able to say plainly that the City will fail in some ways. It may fail through participant conduct, staff exhaustion, technical interruption, mistaken classification, security breach, public appetite, legal ambiguity, donor pressure, inadequate care, or its own desire to protect reputation. A design that cannot name its possible failures has already begun hiding them.

When safeguards break, the first task is to trace where the burden moved. Treating every difficulty as participant misconduct transfers design failure onto the person; treating every harmful act as stress transfers accountability away from those harmed; repairing reputation before repairing people makes institutional survival another private cost; and remembering without mercy converts the archive into a second sanction. Failure classification must therefore precede consequence, because care, discipline, redesign, breach response, exit, and closure answer different conditions and must not be collapsed into one moral story.

Failure classification should be multidimensional and revisable. One event may involve participant misconduct, staff overload, system design, data injury, and public misinterpretation at once. The case record should separate allegation from finding,

individual responsibility from institutional contribution, urgent protection from final consequence, and private remedy from public notice. Provisional labels need a review clock and a visible path to correction.

The chapter also refuses severity theater. A City under public pressure may be tempted to prove seriousness through dramatic removal, harsh public notice, or visible shame. That is not fairness. Consequence should protect people, preserve evidence, reduce future harm, correct record, and keep the City answerable. It should not feed the crowd, perform toughness, or convert a person's worst moment into institutional branding.

The opposite error is just as dangerous. A City that calls itself humane may soften language until real harm disappears. Misconduct can be renamed mismatch. Retaliation can be renamed tension. Breach can be renamed technical incident. Exhaustion can be used to erase agency. Public office can be protected by claims of complexity. The City must have enough compassion to refuse cruelty and enough precision to refuse euphemism.

Data injury receives special attention because record power can injure without a bruise, a shout, or a locked door. A breach can expose a nonparticipant, reveal a child's connection, make a protected consultation searchable, enable blackmail, seed misinformation, or allow Artificial Intelligence to reconstruct what the City promised to shield. Technical harm is civic harm when it changes the burden carried by a person who did not consent to carry it.

Remedy is therefore not an afterthought. A fair institution cannot say, the record was corrected, and then leave an affected person to repair reputation, employment, family strain, legal risk, emotional damage, or public misunderstanding alone. Remedy must be matched to harm. It may require correction, explanation, compensation, shielding, changed classification, staff discipline, system redesign, public notice, or referral to lawful authorities. Repair is where the City proves that accountability is not a caption under an error.

Exit receives equal attention because a voluntary Vow is only as honest as the path out. A participant may leave because the role no longer fits, health changes, family burden changes, public life becomes too costly, office ends, consent changes, or the City itself has failed. If exit is technically permitted but materially punishing, the Vow becomes captivity by design. If retirement becomes permanent public ownership, the City becomes a lifetime exposure machine.

Reintegration tests whether ordinary life is genuinely complete. The person who leaves visible formation is not a failed citizen, lesser servant, discarded candidate, or permanent specimen. The City imposed unusual visibility for a bounded public-purpose role. When that purpose ends, the role narrows and future privacy widens.

Finally, the chapter looks beyond life itself. The archive may outlive participants, officials, families, host communities, first-generation critics, and the public controversies that made a record famous. Death does not turn a human being into public material. Historical access may be necessary, but necessity is not appetite.

The City must distinguish public memory from possession of the dead.

Chapter 31 is therefore the City's failure test, exit test, remedy test, record test, and mercy test. If the City cannot classify harm, correct itself, protect affected persons, preserve due process, allow departure, repair data injury, and remember without cruelty, then its record power has outrun its moral architecture. A City that does not know how to fail fairly cannot teach public power how to govern fairly.

Failure belongs late in the book because the reader has now seen every major system it can cross. Failure touches every one of those systems. A single bad classification can travel across record, role, family, office, archive, and public memory. The City must be designed so a correction can travel just as far.

The guiding rule is simple, but it demands discipline: failure should move burden toward the institution that can repair it, not toward the person easiest to expose. That does not excuse wrongdoing. It prevents the City from using wrongdoing as a shield against its own design duties. Fair consequence and institutional self-accusation must stand together, or the City becomes another machine for hiding power behind cases.

Consider two hypothetical participants who leave in the same month. The first has not violated a rule. Visible life is worsening a chronic condition, the office track no longer fits, and family care obligations have changed. The second has used protected access to retaliate against a staff member and has altered a disclosure record. Treating both cases as failed participants would conceal

the institution's obligations and injure both truth and dignity.

The first person enters the misfit and exhaustion route. The City provides de-loading, independent clinical and accommodation advice, a choice among role change, pause, and voluntary exit, and continuity for housing, healthcare, and dependent support. The public record says only what lawful City purposes require. No notation implies disloyalty, weakness, or diminished worth, and the person's ordinary future is not conditioned on remaining available to the archive.

The second case enters the misconduct and data-injury routes. Interim access is suspended under a defined standard. The staff member receives protection from retaliation, independent complaint support, and notice of the investigation. The participant receives allegations, evidence access subject to protection of others, representation, an impartial decision maker, reasons, and appeal. Any removal record distinguishes proven conduct from allegation and records correction if the finding changes.

Suppose the investigation then finds that the system made retaliation easy: one supervisor controlled access, staff schedules, complaint routing, and the first public summary. Individual misconduct remains individual responsibility, but the City also enters the institutional-failure route. Leadership changes, access architecture is redesigned, affected staff receive restitution, and an external report prevents the participant's wrongdoing from becoming camouflage for the system that enabled it (Reason, 1997; Leveson, 2011; OECD, 2020b).

A separate closure scenario tests the final route. Repeated privacy

breaches, vendor lock-in, unsustainable staff turnover, and failed external inspections show that the City cannot protect participants or hosts. Closure is not delayed to preserve prestige. Housing and care continue through a funded transition, staff receive wages and severance, contracts and records move through lawful custodians, affected persons retain remedies, and the public receives a failure account that does not expose protected lives.

The measure of the route is not whether every ending feels redemptive. Some harms remain. Some records must remain. Some people will disagree with the outcome. The measure is whether the institution classified the event honestly, used proportional authority, repaired what it could, preserved appeal and correction, and stopped claiming ownership over a person's future. Where those conditions fail, the remedy may be the end of the City itself (Hirschman, 1970; UNODC, 2020; ICA, 2011).

31.1 — Misfit, Misconduct, Exhaustion, and Drift

Fair response begins by naming the kind of failure. The City will encounter role mismatch, harmful conduct, bodily or household overload, slow deformation of a role, and failures created by the institution itself. These conditions can coexist, but collapsing them into one judgment would erase the differences on which care, consequence, and repair depend (Reason, 1997; Dekker, 2012; Edmondson, 2018).

The governing triage rule is classification before consequence. Ask what happened, who was burdened, what caused the burden, what needs immediate protection, what can be repaired, and what must be remembered. This is an operational discipline rather than a formal mathematical claim: classification, protection, remedy, memory, and review travel together.

Misclassification is itself an institutional injury. Treating exhaustion as misconduct denies care; treating misconduct as misfit weakens accountability; treating institutional failure as participant weakness shifts burden downward; ignoring drift because no single moment is dramatic allows slow harm to become normal.

A usable failure vocabulary lets the City act without panic. It does not decide every legal standard, every employment rule, every clinical threshold, or every officeholding consequence. Those require lawful and expert review. It names the City's internal responsibility to avoid moral laziness in the first moments after failure appears.

The first question is not who can be blamed, but what happened to the burden. Review should ask whether the movement was chosen, lawful, foreseeable, and reversible; whether affected people had a usable route to protection and remedy; whether organizational design made the harm easier; and which authority can now carry the work of repair. Responsibility is not dissolved by this inquiry. It is located more accurately, so personal misconduct, institutional contribution, care need, and lawful dissent do not erase one another (Kristof-Brown et al., 2005; Hirschman, 1970; ILO, 1982).

A useful failure taxonomy should be written for auditors, clinicians, legal reviewers, staff, participants, and ordinary readers at once. It should be understandable enough for public trust and disciplined enough for expert review. When a case later becomes controversial, the City should be able to show how it classified the event without exposing protected facts merely to prove that it was careful.

Classification should preserve uncertainty because cases can change as evidence improves. What begins as alleged misconduct may reveal exhaustion; apparent misfit may reveal institutional failure. A fair system permits reclassification and corrects the label before it hardens into public memory.

31.1.1 — Misfit

The route below prevents one word, failure, from becoming a moral verdict. It classifies the burden before selecting a response, separates care from discipline, distinguishes personal conduct from system design, and gives exit a future. Procedural fairness,

valid-reason termination standards, restorative practice, privacy-breach response, whistleblower protection, and organizational learning all require more than a binary choice between impunity and expulsion (ILO, 1982; OECD, 2016, 2020b; UNODC, 2020; European Union, 2016, 2019; Reason, 1997; Dekker, 2012).

Misfit is not wrongdoing. A person may enter the City with serious intent and still prove unsuited to a particular pathway, schedule, public interface, office track, visibility intensity, or role burden. Treating mismatch as moral failure would make the City cruel in one of the quietest ways institutions become cruel.

A misfit finding should also state what the City learned about its own menu. If a pathway repeatedly filters out people who are cautious, disabled, local, poor, caregiving, neurodivergent, non-elite, or less comfortable with public performance, the mismatch may reveal a design bias rather than a person's lack. The record should therefore ask whether the role was too narrow, whether accommodations were too late, whether the pathway confused charisma with readiness, and whether redirection would protect public burden better than exclusion.

Misfit separates the person from the pathway. Someone may be wrong for an executive track and still be valuable in local service, advisory work, public education, technical review, community mediation, or ordinary private life. Review should ask whether the role, timing, support, environment, or the City's own reading of burden is wrong before it treats the person as the problem.

A misfit finding should not become public humiliation. A status label may need to show that a pathway was withdrawn, delayed,

or redirected, but it should preserve the institutional decision without implying defective personhood. The person's future privacy and ordinary standing remain intact.

Evidence for misfit should be longitudinal rather than theatrical. One poor performance, awkward public interface, difficult week, or ordinary conflict should not automatically define the participant. The City should look for repeated signs that the person and pathway are mismatched even after support, accommodation, correction, and rest have been tested.

The remedy for misfit is often redirection, narrowing, pause, de-loading, or dignified exit. It may involve a different role pathway, a changed schedule, a non-candidacy recommendation, a public status update, or a private transition plan. Misfit should move the person toward truth, not toward shame.

Misfit also teaches the City about its own admissions and formation systems. If many participants misfit the same pathway, the problem may not be the people. The pathway may be too narrow, too performative, too elite, too physically demanding, too legally confused, or too dependent on a model of public power that does not fit real civic life.

A misfit review note should keep the person and the pathway separate. It should name the role, demand, schedule, public interface, or support condition that did not fit; identify the accommodations or redirections attempted; state whether any person was harmed by the mismatch; and explain what future route remains open. The note should not invite readers to treat a

limited role mismatch as a verdict on capacity, worth, courage, or civic seriousness (OECD, 2020b; UNODC, 2003; Tyler, 2006).

The misfit record should show why redirection served fairness better than accusation: the pathway considered, evidence of mismatch, supports attempted, alternatives offered, and privacy boundary around the person's future. Its purpose is not to certify institutional gentleness, but to show that a human being was not converted into a failed instrument.

31.1.2 — Misconduct

Misconduct review should include an affected-person map. The map does not expose names by default, but it identifies categories of people burdened by the conduct, including staff, participants, family members, visitors, vendors, complainants, public users, or nonparticipants. Without that map, the City may punish the visible wrong while missing the hidden burden trail. The consequence must answer the trail, not merely the headline.

Misconduct names conduct requiring consequence. It includes action, omission, manipulation, harassment, coercion, record evasion, retaliation, wrongful exposure, donor entanglement, staff abuse, violence, serious dishonesty, or other behavior that places unfair burden on others. The City must be able to say misconduct without hiding behind therapeutic language.

Calling something misconduct does not cancel due process. A severe institution must be careful when it accuses. The participant, staff member, official, vendor, or other role-holder must receive notice, evidence access where lawful, opportunity to

respond, counsel or support where appropriate, and appeal. Public seriousness without procedure becomes domination.

Misconduct must also be separated from personality judgment. The City should not use record fragments to declare a person's soul corrupt. It should identify conduct, harm, role, evidence, pattern, and remedy. The public may draw moral conclusions, but the institution's duty is to act on what can be fairly established.

Two failures distort misconduct review. Concealment protects a promising, popular, symbolic, useful, or politically important participant; spectacle magnifies wrongdoing into punishment beyond what safety, repair, and lawful accountability require. Both move burden away from evidence and affected people.

Misconduct response should begin with protection of affected persons. Staff, nonparticipants, families, complainants, public users, and other participants may need safety, shielding, record correction, support, or immediate separation before the final classification is complete. Care before final classification does not presume guilt. It prevents further burden while facts are reviewed.

When misconduct is established, the City's answer should be proportionate and intelligible. Probation, suspension, recall, removal, referral to lawful authorities, record correction, apology, compensation, or public notice may be necessary. The question is not how severe the response appears. The question is whether it places burden honestly and reduces future harm.

A misconduct file should be sharper than a rumor and narrower than a moral portrait. It should name the conduct at issue, the rule

or boundary affected, the people or offices burdened, the protection measures taken, the evidence still contested, and the consequence under review. That discipline protects harmed people from institutional vagueness and protects the accused person from being reduced to a total story.

The misconduct record should make accountability legible without becoming indictment theater. It should separate established conduct, contested evidence, affected persons, protective measures, response, appeal, and referral boundaries. A reader should be able to see why consequence was necessary and why the City did not use a person's worst conduct to claim total knowledge of their character (Bovens, 2007; Lind and Tyler, 1988).

31.1.3 — Exhaustion

Exhaustion review should include a load history rather than a heroic endurance story. Hours, sleep, travel, family pressure, public interactions, correction cycles, crisis periods, medical continuity, staff demands, and record exposure should be read together. The City should be able to say which burdens were necessary to public formation, which were avoidable, and which became unfair because the institution normalized strain as a sign of seriousness.

Exhaustion is not virtue and not disgrace. A participant living under active record may experience cumulative load from visibility, public interface, sleep disruption, family pressure, role intensity, correction, archive anxiety, public misinterpretation, or repeated stress. Staff may experience similar exhaustion from

care work, moderation, security, record handling, and constant moral vigilance.

Endurance is not readiness. Continued performance under exhaustion may show that a person has learned to ignore bodily and relational limits, a habit that can later distort public judgment. Formation should test whether the person can recognize, disclose, and respond to limits rather than reward the ability to hide them.

Exhaustion should trigger care, de-loading, load review, schedule modification, sleep protection, mentor review, clinical independence, household review, and possible pause. It should not automatically trigger a readiness penalty or public suspicion. The record should show how the City responded to overload, not merely that overload occurred.

There are cases where exhaustion contributes to harmful conduct. A tired person may be impatient, careless, reactive, or unwise. Still, the City must ask whether the institution created the conditions. It must not use exhaustion to excuse harm completely, but it must also not pretend that the body was irrelevant to the event.

Exhaustion classification requires expert caution. Clinicians, mentors, staff reviewers, and participants may all see different pieces of the burden. The City should avoid amateur diagnosis and avoid weaponizing clinical language. It can say that load exceeded safe conditions without claiming more clinical certainty than it has.

The most important exhaustion question is future-facing: what must change so the same burden is not reproduced? A fair

response may reduce intensity, adjust public interface, change staff ratios, alter archive release timing, revise work blocks, strengthen sleep safeguards, or pause the pathway. Exhaustion should teach design.

An exhaustion file should begin with load rather than blame. It should record hours, duties, public exposure, schedule pressure, recovery options, staff warnings or observations, relevant clinical interfaces, available support, and the participant's own account. Its purpose is to show whether care arrived early enough, expectations were realistic, and the City learned from overload without turning fatigue into public confession or personal weakness.

31.1.4 — Drift

Drift detection should notice small incentives before they become culture. A private shortcut, repeated exception, flattering audience, undisclosed adviser, protective staff habit, or casual classification change can look harmless in isolation while changing the institution's operating norm through accumulation. The audit record should therefore connect recurring deviations, identify who benefited or was burdened, and test whether informal convenience is displacing published authority. Hidden power often begins as an exception no one thought important enough to record (Vaughan, 1996; Dekker, 2012; Reason, 1997).

Drift is failure without a single dramatic beginning. It is the slow movement of a role, habit, office, staff relation, public interface, archive practice, or governance culture away from the City's

stated purpose. Drift is dangerous because it can be normalized before anyone feels authorized to name it.

A participant may drift toward persona, status hunger, secrecy, staff dependence, public approval addiction, retaliation against criticism, or overidentification with the City. A staff role may drift toward hidden authority. A mentor may become a gatekeeper. A security function may become carceral. An archive office may become a meaning authority. A donor may become a quiet governor.

Drift is often defended through small reasons. An exception saves time. A donor request seems harmless. A platform shortcut improves engagement. A protected room is used for convenience. A staffer begins filtering criticism because the participant is overloaded. None of these may appear catastrophic alone, but together they can remake the institution.

The City needs drift detection because ordinary complaint systems often wait for discrete harm. Drift review should use staff reports, participant feedback, public interface data, audit findings, workload patterns, release practices, governance changes, and external inspection. The goal is not paranoia. It is early correction before drift becomes identity.

Drift should be named without instantly moralizing everyone involved. Many forms of drift arise from pressure, fatigue, success, fear, legal confusion, technical convenience, or institutional desire to survive. Naming drift is not the same as accusing every actor of bad faith. It is the act of returning a system to its burden question.

A mature City should expect drift and design for correction. Rotation, audit, public reporting, role separation, decertification pathways, failure memory, and external critique are not signs that the City distrusts itself too much. They are signs that it understands institutions well enough not to worship them.

A drift review should reconstruct patterns rather than dramatic moments. It should track slow changes in advice networks, donor access, staff dependence, resistance to correction, public persona, record avoidance, and treatment of people with less power, together with countermeasures and contrary evidence. Because drift can hide inside ordinary success, the reviewer needs sequences of small signs rather than a single accusation that arrives after the pattern has hardened.

31.1.5 — Institutional Failure

Institutional failure names the City's own contribution to harm: defective rules, inadequate staffing or training, unclear authority, weak care, flawed architecture, vendor dependence, inaccessible systems, funding pressure, or governance delay. The category prevents participant wrongdoing or staff error from concealing the conditions that made injury more likely (Perrow, 1984; Turner, 1978; Weick and Sutcliffe, 2015).

Individual and institutional responsibility may coexist. The review should identify each causal contribution, the evidence supporting it, the people burdened, and the office responsible for repair. A finding must then lead to a funded action, deadline, independent verification, and public account where warranted. The record should show what changed and what remains

unresolved. Verification should test the revised safeguard under the conditions that produced the failure, using a simulation or protected record review where reenactment would expose people again.

The decisive test is whether the City's archive can expose the institution as clearly as it exposes participants. Failure memory should preserve the lesson and corrected safeguard while protecting affected people from unnecessary reuse of their injury.

31.2 — Probation, Recall, Removal, and Suspension

Consequences should protect people, restore boundaries, preserve record integrity, repair harm, and prevent recurrence rather than satisfy public anger. A serious institution may need firmness, but firmness is different from spectacle (ILO, 1982; OECD, 2020b; Tyler, 2006).

Probation, recall, suspension, and removal are tools rather than moral ranks. Probation structures correction when continued participation remains possible; recall withdraws unsafe authority or status; suspension protects people while facts are investigated; removal ends participation when continuation would unfairly burden others or destroy institutional integrity.

Every consequence requires due process. A City cannot claim to form public power under fairness while using hidden or arbitrary discipline. Notice, evidence access, representation, counsel where appropriate, appeal, timelines, public status labels, and remedy should exist before crisis rather than be improvised inside it.

Consequences must also protect nonparticipants and complainants. A harmed staff member, family member, visitor, bystander, or public user should not be forced to wait for a full adjudication before immediate safety measures are available. Protective measures can be taken without prejudging final outcome when those measures are narrow, reasoned, and reviewable.

Discipline is treated here as burden placement. The City should ask what burden a person has created, what burden the institution created, who must be protected immediately, what information

the public needs, what dignity still belongs to the person under review, and what remedy the situation demands (ILO, 1982; OECD, 2020b; Tyler, 2006).

Consequence design should include a proportionality matrix that does not look like a morality ladder. The matrix should ask about immediate safety, role authority, likelihood of recurrence, harm already caused, evidence confidence, institutional contribution, repairability, affected-person needs, and appeal status. This makes response visible without letting a single word, such as removal, pretend to explain everything.

Protective status changes must remain distinct from final findings. A suspension during investigation may protect people and evidence without declaring guilt. A recall of authority may prevent ongoing harm while facts remain incomplete. This distinction matters because the City's record will be public enough to shape reputation, and public status labels can wound even when they are technically temporary.

31.2.1 — Probation

Probation is structured correction under continued participation. It is appropriate when the City identifies a serious pattern or risk that can plausibly be corrected without immediate removal. The purpose is not to brand a participant as morally lesser. It is to make continued participation conditional on visible change.

Probation should have a beginning, a middle, and an end. The beginning states the concern, evidence, rights, and conditions. The middle records support, compliance, changed circumstances, and affected-person protection. The end produces a reasoned

decision: restoration, extension, narrowing, recall, suspension, removal, or exit. A probation that never ends becomes soft captivity; a probation that ends without reasons becomes invisible discretion.

A fair probation order should name the conduct, pattern, load condition, or role problem being addressed. It should specify required changes, support offered, review timeline, public status where needed, and the consequence if the conditions are not met. Vague probation becomes discretionary control. Clear probation becomes a repair tool.

Probation must include support, not only surveillance. If the issue involves staff treatment, the participant may need mentoring, role separation, apology work, and structured feedback. If the issue involves record anxiety or performance drift, the participant may need release-delay adjustments, mentor intervention, and load review. Correction requires conditions under which correction is possible.

Probation should not be used to keep someone inside the City when exit would be fairer. If the core problem is misfit, coercion, unsafe load, or loss of genuine consent, probation may become a way to postpone the truth. The City must ask whether the person is being corrected or merely contained.

Public communication about probation should identify that a readiness pathway is conditional without releasing raw detail that exposes nonparticipants or turns correction into humiliation. The status label should tell the truth about the institutional decision while refusing to make public appetite the purpose of discipline.

Probation ends in review. The City should determine whether the participant corrected the pattern, whether support was adequate, whether affected persons were protected, whether the record was corrected, and whether continued participation remains fair. Probation without review becomes shadow suspension.

The probation order should also identify the reviewer, the evidence that will close the matter, and the appeal route if probation becomes unfair. It should specify what the City must change while the participant is changing, because probation can expose institutional weakness as well as individual need (Hirschman, 1970; Bovens, 2007; OECD, 2020b).

Probation should receive a closing review, not because every correction is suspect, but because correction can quietly become control. The closing review tests whether the conditions were clear, achievable, time-limited, role-related, accessible, and free from loyalty demands. A probation that cannot be completed except by pleasing a hidden gatekeeper is not correction; it is suspended dependency.

31.2.2 — Recall

Recall should be available before disaster becomes irreversible. When a participant holds a readiness claim, public interface role, delegated authority, training responsibility, or campaign-facing status, unsafe continuation can shift burden outward quickly. Recall does not have to decide the whole person. It withdraws a specific public-power claim or authority until the City can determine what burden has appeared and who must be protected.

Recall pulls back unsafe authority, status, access, pathway, or public-facing function before the damage expands. In the City context, recall does not mean the City unilaterally removes lawful public office. Government remains government. It means the City withdraws or pauses City-conferred readiness status, office-interface support, public record release posture, pathway privileges, or other internal functions within its lawful authority.

Recall is necessary because some risks appear after activation or after office interface begins. A participant may mishandle staff influence, abuse public interface, enter hidden dependency, misuse protected rooms, become captured by donor or party pressure, or show patterns that make continued public release misleading. The City cannot keep presenting the old status as if nothing changed.

A recall decision should identify the role being pulled back. The City must avoid language that suggests legal authority it does not possess. If the issue concerns a public office, lawful office procedures belong to government and constitutional structures. The City may report, withdraw support, suspend record-bundle claims, or refer matters where appropriate, but it must not pretend to be the state.

Recall should be proportional and temporary unless converted into another decision after review. It may protect a process while facts are gathered. It may pause a readiness claim while record gaps are investigated. It may pull back public interface access while harassment risks are addressed. It should not become an unreviewed penalty in disguise.

Affected persons should receive protection during recall. Staff, nonparticipants, public contributors, or other participants may need access changes, shielding, complaint support, or remedy. The recalled participant also remains entitled to dignity, notice, and review. Fairness must not become one-sided because the public mood is urgent.

Recall teaches that the City's public claims remain living claims. A readiness bundle, pathway status, or office-interface support is not a halo that remains bright after evidence changes. Public-power formation must remain correctable after public trust has begun to gather.

A recall order should state the authority being withdrawn, the reason immediate withdrawal is necessary, the people protected, the facts still unresolved, and the conditions for return, conversion, or exit. Recall is most legitimate when it is precise. If the City recalls too broadly, it punishes before review. If it recalls too narrowly, it leaves exposed people carrying risk for the institution's hesitation.

Recall requires later review because emergency withdrawal of authority can save people and still distort status. The City should examine whether the recall protected the right burden, whether it lasted only as long as necessary, whether the participant had a meaningful route back or out, and whether the public label avoided treating a protective step as a verdict (ILO, 1982; OECD, 2020b; Tyler, 2006).

31.2.3 — Suspension

Suspension is often the most publicly misunderstood tool. It may be necessary to protect evidence, people, staff independence, or the participant's own health, but it can also stigmatize before facts are settled. The City should therefore pair suspension with status clarity: the reason category, the protected limits, the expected review path, the rights preserved, and the rule that temporary protection is not final judgment.

Suspension is temporary protection during investigation, review, crisis, or unresolved risk. It should not be treated as final judgment. A suspension says that continuation under ordinary conditions is not fair until the City understands what happened or until immediate risk is reduced.

The City may need suspension when there is credible evidence of harm, serious record breach, unsafe load, potential retaliation, security threat, staff abuse, protected-category exposure, or major continuity break. The decision should state the scope. A person may be suspended from public interface, from a pathway, from office-suite access, from certain spaces, or from active participation itself.

Suspension must include a timeline and review clock. Open-ended suspension becomes hidden punishment. The person under suspension needs notice, support, access to counsel or advice where appropriate, and a path to challenge the suspension. Affected persons need safety and protection from pressure.

During suspension, the record should be handled with care. Public labels must distinguish suspension from guilt, misfit, exit, and

removal. Citizens may need notice that status has changed, but premature detail can damage the participant, complainant, or nonparticipants. The City must speak enough to prevent rumor without speaking so much that it harms dignity or due process.

Suspension is also a test of staff discipline. Staff should not treat the suspended person as condemned unless findings are complete. Nor should staff minimize the concerns that caused suspension. The City must train people to live inside procedural uncertainty without converting uncertainty into gossip, hostility, or institutional theater.

A fair suspension ends with one of several outcomes: return, probation, recall, removal, exit, remedy, referral, or institutional correction. The City should explain the outcome in a way consistent with privacy, record integrity, and affected-person rights. Suspension exists to make a just next step possible.

A suspension order should preserve uncertainty in its own language. It should identify the investigative question, the protection need, the temporary restrictions, the support available during suspension, the review clock, and the public label that prevents confusion with removal. If suspension protects the institution but abandons the person, the City has turned process into punishment.

Every suspension should be revisited after the immediate danger has been contained. The renewed review tests whether the suspension protected evidence and people, whether it became slower than the risk required, whether support continued during uncertainty, and whether the public description distinguished

investigation from guilt. Temporary protection should not harden into unannounced removal.

31.2.4 — Removal

Removal is strongest when it is narrow in explanation and complete in route. The City must state what participation status ends, what record remains, what rights continue, what appeals remain, what support is provided, and what protected information stays protected. Removal should never be staged as expulsion from humanity, citizenship, dignity, or future usefulness. It ends a role burden; it does not end personhood (ILO, 1982; UNODC, 2003; OECD, 2020b).

Removal ends participation, pathway status, office-interface support, or another City-held role where continuation would be unfair, unsafe, unlawful, or institutionally false. Removal is serious because it changes a person's public status and may affect future civic life. It must never be casual, theatrical, or hidden behind vague language.

Removal may be required for serious misconduct, repeated breach, intentional record evasion, sustained abuse of staff or nonparticipants, donor capture, violence, serious coercion, unrepaired data misuse, or failure to meet conditions after probation. It may also result from misfit when all fair alternatives have been exhausted, though that kind of removal should be framed as role end rather than punishment.

Due process becomes especially important when removal is considered. The City must define the basis, disclose evidence where lawful, allow response, protect complainants, provide

appeal, and record the reasoning. Removal without due process would teach exactly the wrong lesson about public power.

Removal should not erase the person's dignity. The participant remains more than the role. The City may need to publish a status change, but it should not publish humiliating detail beyond public need. It should protect family members, children, partners, staff, and nonparticipants from being pulled into the removal narrative.

Removal can require aftercare. If the City provided housing, healthcare continuity, dependent support, or other stabilization, abrupt withdrawal may create coercive or harmful conditions. Severance support may be necessary even when removal follows misconduct, because support can protect dependents, legal process, safety, and ordinary dignity without excusing harm.

Every removal should generate institutional learning. Did admissions fail? Did staff warnings go unheard? Did the record system miss patterns? Did donor or public pressure distort response? Did the City act late to protect its image? Removal should close a role, but it should open institutional learning.

A removal order should be exact because removal is the City's strongest participation consequence. It should state the finding, evidence standard, affected persons protected, appeal route, lawful referrals, continuing rights, severance or dependent protections, public status label, and the City's own design lessons. The person is removed from a role or pathway; they are not removed from dignity.

Removal deserves a post-decision audit because it is the strongest City-held consequence. The audit should test evidence, due

process, affected-person protection, aftercare, referral boundaries, and public status language. It should also ask whether earlier intervention, better staff routes, or stronger anti-capture design might have prevented the point where removal became necessary.

Appeal must be structurally independent enough to matter. A person should not appeal to the same private circle whose judgment is being challenged, and an affected person should not be forced into public exposure to seek review. Appeal should test classification, evidence, proportionality, process, remedy, and retaliation risk. If appeal can only confirm the institution's story, it is not appeal; it is theater with paperwork.

31.2.5 — Appeal

Appeal preserves due process and institutional humility. A City that cannot be appealed is too powerful to trust. Appeal does not mean every decision is wrong. It means every serious decision may be mistaken, incomplete, biased, disproportionate, procedurally flawed, or based on evidence that later changes (Tyler, 2006; ILO, 1982; Venice Commission, 2019).

Appeal should be available for major classifications and consequences: misconduct findings, removal, suspension, recall, public status labels, record corrections, remedy decisions, and certain access or release decisions. Affected persons also need appeal where the City denies remedy or protection. Appeal must not belong only to participants.

An appeal body should be independent enough to matter. It should not merely review whether the original office followed its

own preference. It should examine evidence, procedure, proportionality, burden placement, protected-category handling, affected-person rights, and whether institutional failure was wrongly shifted onto a person.

Appeal timelines matter. Too fast, and the process becomes symbolic. Too slow, and burden continues. The City should establish urgent appeal tracks for safety, exposure, and active status; ordinary tracks for classification and remedy; and public explanations when delay itself affects public trust.

Appeal outcomes should be visible in the record without becoming spectacle. A decision may be affirmed, reversed, narrowed, expanded, remanded, corrected, or converted to another response. The public should know when a public label has changed. The public does not need every protected detail that made the change necessary.

Appeal also protects the City from its own pride. The ability to reverse itself is not weakness. It is the operational form of answerability. A City that can correct its own disciplinary record is less likely to turn public-power formation into a new caste of unreviewed authority.

An appeal order should make review real. It should state what is being appealed, which body will hear it, what material may be reviewed, what protected material remains shielded, what interim protections apply, what outcomes are available, and when the decision will be issued. Appeal should be a working path, not an ornament attached to a decision already made final by power.

Appeal should be evaluated by whether it changed anything when change was justified. A symbolic appeal protects the institution's image, not fairness. The City should track reversals, narrowed findings, remands, delayed remedies, complainant safety, participant dignity, and whether the appellate body became dependent on the very offices it was supposed to review. Protective consequence is incomplete until the injury itself receives repair. Periodic sampling of unappealed decisions can reveal systemic error that individual appellants never had the time or resources to challenge.

31.3 — Record Breach, Bystander Harm, and Data Injury

The archive's capacity to remember also creates capacity to injure. A breach, wrongful release, machine misuse, research conversion, inference leak, or nonparticipant exposure may burden a person long after the original event (European Union, 2016; NIST, 2020b, 2025b; Citron and Solove, 2022).

Data injury is human rather than merely technical. It can produce fear, humiliation, professional and family harm, legal exposure, platform abuse, blackmail, misclassification, public distortion, or loss of ordinary privacy. Error codes and communications strategy do not describe those consequences.

Archive harm reverses the intended direction of burden. A system designed to move accountability upward toward public power can instead expose bystanders, families, staff, professionals, host residents, and public contributors who never accepted the Vow. Proximity to the City is not consent to become public material.

Repair requires more than saying the breach is regrettable. The City needs breach classification, affected-person notice, containment, record correction, public explanation where needed, compensation where appropriate, platform-removal efforts, vendor accountability, and failure memory. Without these tools, record power becomes irresponsible power.

31.3.1 — Record Breach

Future misuse belongs in breach analysis from the first notice. Data removed from lawful context can be copied, searched, clipped, trained on, inferred from, or recombined long after the

original system is repaired. Complete restoration may be impossible, which makes prevention, rapid notice, derivative tracing, and verified deletion or sealing central before harm multiplies (European Union, 2016; NIST, 2025b; Citron and Solove, 2022).

Data injury needs its own grammar because ordinary disciplinary words often miss it. A person may be harmed because a fact was released, because a protected fact was made inferable, because metadata exposed a relationship, because a search tool reconstructed a shielded category, because a model output repeated a false pattern, or because a correction did not travel with the original mistake. The City must define injury by burden, not by whether an attacker left a dramatic trace.

Breach response should begin with containment, preservation of evidence, affected-person identification, notification route, immediate shielding, technical correction, legal review, and public communication discipline. But the City cannot stop at procedure. It must ask who now carries fear, reputational risk, domestic risk, employment risk, legal risk, or public curiosity because the archive failed.

A record breach is not measured only by the number of files involved. One wrongly exposed therapy note, one child-related marker, one legal consultation, one protected family address, or one searchable pattern may carry more burden than thousands of low-risk entries. Breach severity should be measured by exposure, sensitivity, identifiability, inference risk, affected-person vulnerability, and the speed with which harm can spread.

Operationally, breach includes unauthorized access, alteration, disclosure, loss, corruption, destruction, extraction, or uncontrolled exposure of City records. It may arise through technical intrusion, staff misuse, vendor failure, accidental release, a misclassified public bundle, weak redaction, an improper query, or compromise in a connected system. The category must be broad enough to capture real injury, yet precise enough to identify the affected data, custody failure, responsible route, continuing risk, and required remedy.

The first breach question is what kind of record was affected. Source archive, public record site, protected summary, staff role record, nonparticipant record, clinical interface record, legal interface record, intimate record, child-related record, or metadata each carries different burden. A breach of raw protected material is not the same as a mislabeled public summary, although both may require remedy.

The second question is what happened to the record. Was it seen, copied, changed, deleted, inferred, published, trained on, sold, clipped, or combined with another record regime? The City must avoid vague breach language that hides the real path of harm. Affected persons need to know what risk they carry.

Containment must happen quickly but lawfully. Access should be frozen where necessary. Compromised credentials should be revoked. Vendor systems should be isolated. Public materials should be corrected or withdrawn. Search indexes should be reviewed. Yet containment must not become evidence destruction. The City must preserve enough record to investigate the breach.

Public communication during a breach must balance truth and safety. Saying too little creates rumor and distrust. Saying too much may spread the very harm the City is trying to contain. The public notice should explain category, scope, status, protective steps, and future review without exposing protected details.

A breach is also a governance signal. The City should ask whether the breach arose from technical weakness, staff overwork, vendor capture, unclear classification, insufficient redaction, excessive access, poor training, or public-release pressure. The breach is not complete as an event until its causes have been entered into failure memory.

For a record breach, the review note should map the record's path through systems rather than merely naming a breach category. It should distinguish source archive, public record site, search index, staff account, vendor environment, public platform, research workspace, and Artificial Intelligence tool. The note should also show what has been frozen, corrected, withdrawn, or placed under heightened review (Nissenbaum, 2010; Solove, 2006; NIST, 2020b).

31.3.2 — Nonparticipant Exposure

The breach file should give affected persons a practical map of the injury: what category of record was involved, whether the material was viewed, copied, altered, inferred, or published, what has been contained, what remains uncertain, and which immediate supports are available. Technical precision matters, but the language must remain human because the person receiving notice is not a systems auditor.

Nonparticipant exposure is among the City's clearest moral failures because the nonparticipant did not take the Vow. The City should not hide behind the participant's public role when a spouse, child, neighbor, visitor, patient, client, staff member, or incidental contact becomes legible. The burden belongs to the institution that captured, classified, searched, released, or failed to shield, not to the person who happened to stand near public power.

The violation is especially grave because proximity does not transfer consent. A visitor, child, partner, lawyer, clinician, clergy member, journalist, vendor worker, staff member, protester, host-community resident, or incidental contact may become exposed through another person's chosen public role. Even when the participant's record was lawfully created, collateral capture, search, inference, or release can impose an unchosen burden. The institution, not the nearby person, owns the duty to prevent and repair that transfer.

Nonparticipant exposure is a distinct injury, not a secondary inconvenience. The City's public purpose does not make collateral visibility acceptable. Its record system exists to make public-power formation answerable, not to extend civic burden to every partner, child, clinician, lawyer, visitor, staff member, or stranger who enters a participant's orbit.

Nonparticipant exposure can happen through raw image, voice, name, metadata, timing, household reference, relationship context, professional interaction, location pattern, or indirect inference. A child may be exposed by a schedule. A clinician may be exposed by a room label. A partner may be exposed by

narrative context even if their name is removed. Shielding must consider reconstruction, not only obvious identifiers.

Remedy for nonparticipant exposure should begin with direct protection. The affected person may need removal of material from public interfaces, correction of summaries, access logs, notification of who saw the material, support in dealing with platform spread, legal referral, safety review, or compensation. The City should not require a nonparticipant to become more public in order to obtain remedy.

Review should also ask why the nonparticipant was exposed. Was the participant over-recorded near a household? Was a staff role misunderstood? Did public interface personnel fail to mask visitors? Did an automated system include metadata? Did a public bundle prioritize narrative vividness over protection? These questions make repair systemic.

Nonparticipant exposure should affect future release discipline. Every serious exposure should lead to redaction audit, protected-summary review, access class review, training revision, and possible change in public artifact standards. The City's moral credibility depends on whether people outside the Vow can trust that the City will not absorb them by accident.

The review note should state which public interfaces have been limited and make protection reachable without requiring the nonparticipant to understand the City's whole architecture.

For nonparticipant exposure, the affected-person record should begin with the fact that the person did not accept the Vow. It should explain how collateral exposure happened, what relation

to the participant or City caused the exposure, what public or private circulation is known, what shielding has been attempted, and how the nonparticipant can obtain review without becoming more visible (European Union, 2016; NIST, 2020b; Ohm, 2010).

31.3.3 — Data Misuse

Data misuse includes more than theft. It includes unauthorized model training, purpose drift, researcher overreach, vendor reuse, staff browsing, inference reconstruction, cross-architecture linkage, query abuse, copied summaries, and public-interface scraping. The City's rule should be purpose discipline: records created for public-power formation cannot silently become research fuel, commercial asset, political weapon, or curiosity archive.

Data misuse occurs whenever an otherwise lawfully captured record is used outside its authorized purpose; lawful capture does not make later reuse authorized.

Operational recording and secondary use must remain separate authorizations. Acceptance of active record for public-power formation does not authorize research, model training, platform recommendation, commercial analytics, donor review, party strategy, or public scoring. Consent is purpose-bound even when the institution believes the next use would be valuable.

Nonparticipant data requires even stronger exclusion. A person who appears incidentally in a record has not consented to any secondary use. The City should treat nonparticipant inclusion in research or machine systems as a high-risk violation unless a

separate lawful pathway, masking system, and expert review explicitly authorize it. Silence is not consent.

Data misuse may be invisible to the affected person. A record can be queried, inferred from, summarized, classified, or combined without anyone seeing a public post. This is why access logs, query classes, audit trails, vendor review, and inference safeguards matter. Harm can begin inside a system before it appears on a screen.

Where data misuse creates a cross-architecture dossier, repair must follow every linkage and derivative output. Review should identify which City records were joined to participation records from the Religion of Fairness or Workgame, public-voting signals, donor files, government records, platform metrics, research estimates of latent experience, or machine-inferred trust profiles; then it should suspend the linkage, preserve evidence, notify affected people, correct downstream products, and determine what deletion or withdrawal can actually be verified. The City exists to make a narrow public-power burden visible, not to create a total file about the person.

When data misuse occurs, the remedy should reach the use, not only the leak. Unauthorized models may need removal from service. Derived summaries may need withdrawal. Vendor contracts may need enforcement or termination. Research materials may need destruction or re-review. Public explanation should state what use was unauthorized and how future conversion will be prevented.

The review must also identify derivative files or systems created through misuse, state what can be withdrawn or corrected and what cannot be guaranteed, and assign a human owner to each remedy. Misuse may persist in a derivative system even after the original copied file is removed.

31.3.4 — Harm Notification

Harm notification should be truthful, staged, and centered on the affected person. People need to know what happened, what is known and uncertain, what has been contained, which risks remain, what support exists, how to challenge the record, and when further updates will arrive. Technical language should not shift comprehension burden onto the person already carrying the injury (European Union, 2016; EDPB, 2023; NIST, 2025b).

Harm notification is the duty to tell affected persons that burden has moved onto them. Notification is not merely legal compliance or institutional politeness. It is the first step in returning agency to people who may now carry risk because the City failed to protect their record, image, voice, data, role, or relation.

Affected persons should be classified carefully. Participants, nonparticipants, staff, children’s guardians, families, visitors, professionals, host-community members, and public contributors may need different notices. A single public announcement cannot substitute for direct notice when direct notice is possible and safe.

A good notice should say what happened, what kind of record or data was affected, when it occurred, what is known and unknown, what immediate protections are being taken, what the person should do, what support is available, and how to challenge or

correct the City's understanding. It should not use vague language that protects the institution more than the person.

Timing matters. Delayed notice may be necessary in limited cases to contain harm, protect an investigation, avoid greater exposure, or coordinate safety. But delay must be justified, logged, and reviewed. The City should not use uncertainty as an excuse to wait until public pressure forces disclosure.

Notification should also be trauma-aware. A person who learns that intimate material, child-related material, professional communication, or location data was exposed may need human contact, legal guidance, clinical support, safety planning, or family consultation. The City should not send sterile notices for injuries that may alter someone's sense of safety.

Public and individual notification must work together. Citizens need enough information to understand that a breach occurred, which safeguard class failed, and what the institution is doing; affected people need more specific notice, support, and recourse. The City must tell enough truth to protect trust without allowing notification itself to become further exposure.

Harm notification needs a notification log that is separate from public messaging. The log should show when the City knew enough to notify, which affected-person classes were identified, why any delay was necessary, who delivered notice, what support was offered, and what follow-up remains. The log should be private where needed, but the existence of the route should be publicly intelligible.

Delivery quality needs its own evidence. The City should record whether notice reached the correct person through an accessible channel, whether language or disability accommodation was provided, whether the recipient could obtain a human explanation, and whether unanswered notices were followed up. A notice sent but not reasonably received should not be counted as completed harm communication.

31.3.5 — Repair and Compensation

Repair and compensation should follow the shape of the injury. A breach may require technical correction, public correction, private support, legal assistance, relocation support, counseling support, employment documentation, financial compensation, identity protection, or long-term monitoring. Money alone may be insufficient, but refusal to compensate can make the harmed person subsidize the City's error. Repair should be generous where uncertainty burdens the vulnerable.

Repair begins with the recognition that some harms cannot be fully undone. Once data is copied, a clip spreads, a nonparticipant is identified, or a private fact becomes searchable, the City may not be able to restore the world as it was. This truth should make the City more urgent about repair, not less (Citron and Solove, 2022; UNODC, 2020; Zehr, 2002).

Repair may include removal, redaction, sealing, correction, protected summary substitution, apology, public clarification, safety support, clinical support, legal referral, compensation, vendor action, research withdrawal, platform takedown efforts,

and future access restrictions. The remedy should match the harm, the person affected, and the continuing risk.

Compensation should not be treated as admission theater or silence purchase. Where the City's breach imposes cost, lost work, legal expense, relocation need, clinical need, reputational damage, safety burden, or family burden, compensation may be part of fair repair. The exact legal structure belongs to lawful review, but the moral need should be named in advance.

Repair must include nonparticipants. A bystander who never accepted the Vow should not have to prove that they are central to the City's mission in order to receive remedy. Their lack of participation is precisely why the City has a heightened duty to repair exposure. The remedy route should be usable without requiring the bystander to master City terminology or accept new publicity as the price of help.

Repair also teaches future design. Every compensation decision, correction, access restriction, platform removal, or redaction audit should inform the record lifecycle. The City should ask what design change would have prevented the injury and whether the same risk exists elsewhere. Repair without prevention is only partial fairness. A recurring pattern across cases should trigger design-level review rather than remain a sequence of isolated settlements.

Repair and compensation should be tracked as obligations, not gestures. The review file should identify the repair promised, the person or office responsible, the deadline, the funding source, the affected-person contact route, the appeal path, and the evidence

of completion. The City should not confuse announcing remedy with carrying it to the point where burden is actually reduced. If a promised step cannot be completed on time, the file should record the reason, the revised date, and the authority responsible for escalation.

The repair file should also record whether the affected person agrees that the promised action occurred and whether burden actually decreased. Institutional completion evidence may include restored access, corrected search results, payment, deleted derivatives, safer housing, or documented withdrawal of a harmful use; disagreement should remain visible rather than being converted into closure. Compensation must remain traceable as repair for burden shifted, not hush money, pity, or discretionary grace. Where only part of the burden can be reduced, the record should identify what remains unresolved and who owns the next review.

31.4 — Remedy, Appeal, Correction, and Public Notice

A City that can name harm but cannot repair it is not ready for the Vow. Remedy is not kindness appended to failure; it is one of the conditions that makes a severe record institution morally possible (UNODC, 2020; Zehr, 2002; Braithwaite, 1989).

Repair architecture belongs in place before harm occurs. The aftermath of injury is chaotic, reputationally charged, legally sensitive, and emotionally intense. Without predeclared owners, clocks, evidence routes, interim relief, appeal, and completion checks, the institution will protect what is easiest to protect: itself.

Individual remedy, appeal, record correction, public notice, and anti-retaliation form one repair discipline. Publicity is not the aim. The aim is to make harm answerable, correct it wherever it traveled, preserve necessary memory, and avoid exposing people beyond what repair requires.

Remedy operates across every layer on which harm traveled. The affected person may need direct relief; the record may need correction; the public may need notice; staff may need protection; a vendor or leader may need consequence; and the system may need redesign. Repair is incomplete when one layer closes while another continues to carry the injury.

31.4.1 — Remedy Selection

Remedy can be tested by asking who is doing the work after the finding. If the harmed person must chase each correction, finance every challenge, restate context to every office, absorb retaliation, and teach the City how to respond, the institution has left the

injury in place under a new name. The authority that created or enabled the harm should coordinate correction, notice, support, compensation where warranted, prevention, and downstream repair, while the affected person retains voice without becoming the unpaid manager of institutional conscience (UNODC, 2020; Zehr, 2002; Braithwaite, 1989).

A remedy route should be designed before the City needs it. Crisis is a poor time to invent standing, deadlines, evidentiary standards, public labels, compensation rules, appeal bodies, or retaliation protections. The more visible the City becomes, the more carefully remedy must be prebuilt, because harmed people should not have to negotiate for repair with the same institution that injured them.

Remedy should also account for asymmetry. A participant may have counsel, platform visibility, and public familiarity, while a staff member, volunteer, visitor, child, relative, or incidental contact may have none of those protections. A fair remedy system does not require the least powerful person in the record to become publicly fluent before the City takes their injury seriously.

Remedy selection should begin with the question of burden, not with the question of institutional convenience. Who has been harmed, what kind of harm occurred, what continuing risk exists, what public meaning was distorted, what protected person now carries fear, and what changed rule will prevent recurrence? A remedy that fits the paperwork but not the burden is administrative neatness, not fairness.

The first decision is therefore not what the institution can most easily offer, but what the harmed person and the public record actually require. Who carries the burden now? Is the harm continuing? What can be stopped immediately? Which record, access route, relationship, or public meaning must be corrected? What support, restoration, compensation, explanation, or prevention measure is proportionate? Remedy should follow the burden rather than the convenience of the office delivering it.

A practical remedy map can guide the work: immediate relief, record correction, protection from recurrence, compensation where appropriate, and institutional learning. This is not mathematics and not proof. It is a reminder that apology alone is rarely enough when burden has already shifted.

Different harms require different remedies. Misclassification may require correction and public update. Wrongful exposure may require takedown, masking, safety review, and compensation. Retaliation may require protection and discipline. Staff overload may require workload reduction and staffing changes. Institutional failure may require public reporting and external audit.

One-size remedies should be rejected. A participant harmed by wrongful readiness labeling differs from a child exposed in a public artifact. A staff member retaliated against by a supervisor differs from a host-community resident wrongly captured in a public interface. Fairness requires remedy specific enough to respect the person and the harm.

Remedy selection should include the affected person's voice without forcing them to carry the entire design of repair. They may know what would actually help. They may also be exhausted, afraid, or legally constrained. The City should ask and listen, but it should not transfer administrative labor back onto the injured person.

Every remedy decision should be reviewable. The person receiving remedy should understand what was granted, what was denied, why, what timeline applies, and how to appeal. Remedy without explanation becomes another discretionary power inside the City.

The remedy-selection file should record the harm, immediate protection, chosen remedy, rejected alternatives, responsible owner, completion evidence, recurrence control, and appeal status. It should make under-repair and overreach equally visible.

31.4.2 — Appeal Review

Appeal review begins by defining the decision under challenge and the relief that remains available. The file should identify the original decision-maker, the appellant, affected third parties, the evidence available to the reviewer, any protected material, interim protection, the standard of review, and the deadline. This prevents the second level from merely restating the first office's conclusion while the original burden continues.

Appeal review should produce reasons that can be evaluated. A bare statement that the original decision is affirmed or reversed is not enough for an institution built around answerability. The appeal body should name the contested classification, key

evidence, protected limits, standard of review, reasoning route, remedy, and remaining uncertainty. Reasons create reviewable burden; silence recreates hidden power.

Appeal review in remedy matters because first decisions often reflect the institution's blind spots. A harmed person may be told that a breach was minor, that a public correction is unnecessary, that compensation is unavailable, that a record label is accurate enough, or that the City followed protocol. Appeal gives the burden a second hearing.

The appeal body should have enough independence to challenge the original office. If the archive office denies correction, the appeal should not be controlled by the same archive office. If operations denies staff burden, the appeal should not be managed by operations alone. Separation protects trust.

Appeal should review facts, procedure, proportionality, category handling, nonparticipant protection, public meaning, and whether the remedy actually reduces the burden. It should also ask whether the original decision minimized institutional responsibility or overexposed affected persons in the process of review.

Appeal access should be available to participants, staff, nonparticipants, affected persons, and sometimes host-community complainants. A City that allows participants to appeal but not collateral persons repeats the downward burden problem. People harmed by the City's record deserve recourse even when they never entered the Vow.

Appeal decisions should be documented with status labels. A public update may be necessary when an appeal corrects a public record, changes a breach classification, or expands a remedy. The explanation must still withhold protected detail that would make the appeal itself a second exposure.

Appeal review is also institutional education. Reversed or modified decisions should be studied for pattern. If many appeals succeed in the same domain, the problem is not only individual error. It may be a flawed standard, biased classification, undertrained staff, or a governance structure that needs redesign.

Where an appeal remands the matter, the appeal file should identify the remand instructions and the office responsible for carrying them out.

Appeal review should have its own quality audit. The City should examine whether the second-level reviewers had the evidence they needed, whether protected details were over-shared or under-shared, whether the person appealing could understand the question, and whether the remedy changed when the original decision had placed burden in the wrong place (European Union, 2016; NARA, 2023; SAA, 2020).

31.4.3 — Record Correction

Record correction must follow the error through every governed derivative. The correction manifest should identify the source object, superseded versions, status labels, machine summaries, search indexes, public bundles, internal notes, external notices, affected recipients, and evidence that each reachable copy was

updated or visibly disputed. Correction is not silent deletion. It is a versioned account of how public memory learned.

Record correction fixes public memory. In a City built around records, correction is not a clerical afterthought. It is one of the ways dignity survives error. A wrong record, misleading status label, incomplete context, faulty attribution, or stale public bundle can continue harming a person long after the original mistake.

Correction does not mean erasing every unfavorable fact. The City must resist pressure to sanitize records for reputation. It must also resist the opposite pressure to preserve every error in the name of raw transparency. Correct memory is neither propaganda nor appetite. It is governed, contextual, reviewable public memory.

A correction should identify what changed and why, while respecting protected material. It may add context, change a status label, remove a false assertion, append a right of reply, correct a timeline, restore omitted dispute, replace raw material with a protected summary, or label a record as withdrawn, superseded, sealed, or under review.

Version history matters. The City should not silently edit public memory. Silent correction can look like manipulation, and sometimes it is manipulation. A public correction log, with protected details shielded where needed, allows citizens to see that memory is governed rather than smoothed.

Affected persons must have a route to request correction. Participants, staff, nonparticipants, professionals, and host-community members may all be misrepresented. The route should

not demand that the person become publicly visible merely to correct public memory. Confidential intake and protected adjudication may be needed.

Record correction also requires downstream correction. A public record site may be fixed while machine summaries, public bundles, search indexes, press materials, civic server discussions, or external platform references continue circulating the old version. The City cannot control everything outside itself, but it should correct what it can and publicly indicate what has been corrected.

The correction record should also state the limits of propagation. The City cannot erase every external copy, quotation, screenshot, or platform reference, but it can correct what it controls, notify known recipients, publish a durable supersession notice, and give affected people a route to report surviving uses. Honest repair distinguishes verified completion from work that remains open.

31.4.4 — Public Notice

Public notice should be neither concealment nor confession theater. It should identify the failure category, burden created, affected records, protection limits, immediate action, and review route. It must be clear enough to prevent rumor and restrained enough to avoid a second exposure of protected people (NIST, 2025b; European Union, 2016; Bovens, 2007).

Public notice explains institutional failure where public trust requires it. Not every error requires a public announcement. Some remedies should remain private to protect affected persons. But when the public record, institutional integrity, participant status,

nonparticipant exposure, archive trust, or public interface has been materially affected, silence becomes another burden.

A good public notice should explain category, scope, current status, immediate protections, review process, remedy route, and future prevention. It should avoid legalistic fog, triumphal reassurance, and humiliating detail. The purpose is to give the public enough truth to understand the City's answerability.

Public notice must protect vulnerable persons. If the notice names too much, it can reproduce the harm. A record breach involving a child-related category, intimate record, clinical interface, or nonparticipant exposure may require category-level notice rather than identifying detail. Transparency should not become a second release.

Public notice is not public confession. The institution does not need to dramatize its shame. It needs to state what happened, what was harmed, what is being done, what remains unknown, and how review will continue. The public needs a path to evaluate correction, not a performance of remorse.

Notice timing should be tied to risk and review. Immediate notice may be necessary to protect affected persons or prevent misinformation. Delayed notice may be justified when immediate disclosure would worsen harm, compromise containment, or reveal protected information. Any delay must be logged and later explained where public trust requires it.

Public notice becomes part of failure memory. A notice should not vanish after the news cycle. It should connect to the correction log, audit summary, remedy tracking, and future review. The

public should be able to see whether the City actually did what the notice promised.

Public notice should have an authorization memo before it has a public voice. The memo should identify the audience, the protected details withheld, the public facts stated, the affected-person risks, the review route, and the update schedule. This keeps public notice from becoming either reputation management or a second exposure of the people harmed.

The public-notice file should preserve two audiences at once. Citizens need enough information to know what category of failure occurred and how the institution is responding. Affected persons need assurance that the public explanation did not trade their dignity for institutional credibility. The file should show how those needs were balanced.

31.4.5 — No Retaliation

No retaliation is a condition of truth. People will not report harm if they believe the City, a participant, a supervisor, a donor, a vendor, or a public crowd will punish them for speaking. Retaliation can be direct, but it is often subtle: schedule changes, exclusion, reputational hints, access loss, social pressure, downgraded support, or increased scrutiny (OECD, 2016; European Union, 2019; Near and Miceli, 1985).

Protection against retaliation begins at first good-faith reporting, not only after a complaint is proven. Complainants, witnesses, staff, participants, nonparticipants, critics, public contributors, and affected persons need interim shielding, option-aware contact, record preservation, and a route outside the accused

authority. Otherwise hidden burden remains safer to carry than to report.

Retaliation rules should cover institutional retaliation and crowd retaliation. A participant's supporters may harass a complainant. Volunteers may attack critics. Public forums may expose a bystander. Staff may isolate a colleague who reported overload. The City's public interface and internal labor systems must both be included.

Anti-retaliation protection requires monitoring. The City should review role changes, access changes, workload shifts, public mentions, social pressure, security reports, platform harassment, and new record attention after a complaint. Retaliation often hides in ordinary administrative moves. The burden is on the City to notice patterns.

Remedy for retaliation must be firm because retaliation attacks the City's ability to know itself. It may require protection orders inside the City, role changes, discipline, public correction, platform action, staff remedy, or external legal referral. A City that tolerates retaliation will become blind by design. Remedy should also restore lost access, work conditions, or participation status where retaliation altered them.

No retaliation also protects honest participants. A participant accused of harm should not retaliate, but they also should not be subject to public punishment before process. The City must keep due process and anti-retaliation together. Truth-telling and fairness both suffer when public mood replaces procedure.

Interim protections should be revisited as facts change so they do not become punishment by another name.

Monitoring should also test donor pressure and supervisor behavior after a complaint or correction. The review should distinguish ordinary supervisory action from adverse treatment linked to the protected report, with reasons recorded for contested cases.

The anti-retaliation record should protect the route by which truth reaches the City. It should identify who may be at risk, what protective measures are active, how retaliation will be monitored, and what remedy follows if retaliation appears. Without this record, the City may praise candor while quietly making candor too costly to use. Closure should state when monitoring ends and where a later related incident can be reopened.

31.5 — Continuity Breaks and Failure Memory

A City built on a complete active-period record needs a disciplined response when continuity breaks. A missing segment, delayed capture, corrupted file, emergency exception, device failure, or contested absence can generate suspicion, wrongful blame, and institutional pressure to minimize the gap. The first obligation is to preserve the break as a governed status rather than improvise certainty (Weick and Sutcliffe, 2015; Vaughan, 1996; Reason, 1997).

Continuity breaks require classification rather than instant scandal or reassurance. Some are technical, emergency-driven, caused by human error, or linked to misconduct. The status should identify what is known, what remains uncertain, who is affected, which uses are paused, and when review occurs.

Failure memory records more than the patch. It preserves what caused the break, who carried its burdens, how public meaning was protected, which remedy was completed, and what changed afterward. That memory serves correction and future design rather than permanent cruelty.

The record should be strong enough to admit when the record broke. This is a paradox only for institutions that confuse authority with perfection. A trustworthy archive is not one that never fails. It is one that records its failures well enough for the public, participants, affected persons, and future builders to understand them.

31.5.1 — Continuity-Break Classification

Continuity under humility requires a grammar for breaks, responsibility, public meaning, and failure memory. It names break categories, distinguishes participant responsibility from system responsibility, governs public meaning, and preserves failure memory as a civic asset without making people into exhibits of error (NIST, 2025b; ISO, 2019; Reason, 1997).

A continuity break creates an interpretive vacuum. Missing record may look like evasion, protected pause like secrecy, technical interruption like manipulation, and lawful security exception like privilege. Classification should state the layer, cause status, affected interval, evidence quality, public risk, protected limits, repair owner, and next review so that rumor does not become the default record.

Failure memory is different from a wall of shame. It should record what happened, what burden moved, what corrected, what remains unresolved, which safeguards changed, and how future reviewers should interpret the event. It should not freeze a person as a failure image or allow the institution to treat memory as evidence that it has learned when it has only archived.

A suspected interruption in expected record integrity should receive a provisional label promptly and a confirmed or revised finding after review. Planned or protected pause and lawful access or release restrictions are separate statuses, not continuity failures by themselves. The public may not need raw detail, but it needs a meaningful label.

Break categories may include technical interruption, emergency-related record interruption, participant- or staff-caused interruption, vendor or infrastructure failure, cybersecurity incident, and archive corruption. Record contested or unknown causes as under review. These categories should be plain enough for citizens, not only technicians.

A classification should include scope. Did the break affect audio, video, metadata, access log, public bundle, source archive, protected interface, travel corridor, office suite, or civic server? Did it last seconds, hours, days, or longer? Did it affect one participant, one area, one device, one vendor, or an entire system? Scope prevents vague reassurance.

Provisional labels matter because final answers may take time. The public should know that a break is under review and what protective steps have begun. A provisional label must be humble. It should not prematurely blame the participant, clear the institution, or imply harmlessness before review.

Classification should trigger specific duties. Technical failure triggers system audit. Emergency exception triggers after-action review. Participant-caused interruption triggers due process. Vendor failure triggers contract review. Protected handling receives its separate category audit. Unknown break triggers escalation. A label without duty is only language.

Classification standards should be published before breaks occur. If labels are invented during crisis, critics will rightly suspect manipulation. Predefined categories make later public meaning

more trustworthy and reduce the chance that institutional reputation chooses the label.

For continuity-break classification, the ledger should distinguish what broke: capture, storage, access, public release, classification, correction, or review. It should also state the first known cause, the uncertainty level, the protection chosen, and the next evidence checkpoint. A break in continuity should become a reviewed fact, not a floating suspicion (Dekker, 2012; Tyler, 2006; Reason, 1997).

31.5.2 — Participant Responsibility

The classification should remain revisable because early continuity labels are often provisional. A corrupted file may initially look technical, later reveal negligent maintenance, and later still expose a procurement weakness. The ledger should show each revision as learning rather than embarrassment, because honest public memory is allowed to become more accurate.

Participant responsibility for a break should require evidence, not suspicion created by the break itself. An unexplained gap can tempt the public to infer evasion because evasion is dramatic. The City must resist that impulse. It should examine access logs, witness accounts, technical status, participant conduct, staff process, and emergency context before attaching responsibility to the person whose record is missing or interrupted.

Participant responsibility applies when a participant intentionally evades record, negligently undermines continuity, misuses protected handling, creates unauthorized off-record active

conduct, destroys record material, or pressures others to hide public-power formation. Because the Vow centers active record, deliberate evasion is a serious violation.

The City must still distinguish intentional breach from confusion, technical failure, medical crisis, ambiguous status, or poorly marked space. A participant cannot be fairly blamed for a threshold the City failed to make legible. Architecture, signage, devices, training, and status labels all matter when assessing responsibility.

Evidence for participant responsibility should be specific. The City should ask what the participant knew, what the participant did, what alternatives existed, whether the space was clear, whether staff gave correct guidance, whether emergency conditions applied, and whether the participant later disclosed the break. The difference between concealment and immediate self-reporting matters.

Participant-caused continuity breaks may require probation, suspension, recall, removal, public label, or referral depending on severity and harm. But consequence must be proportionate. A minor negligent lapse with immediate disclosure is not the same as deliberate hidden meeting, donor contact, or destruction of protected record.

Public interpretation requires restraint. A gap caused by a participant may be significant, but it does not automatically prove what occurred during the gap. The public should know what is known and unknown. The City should not fill absence with speculation to satisfy public appetite.

Participant responsibility also produces learning. If a participant found a path to evade record, the City must ask why that path existed. If confusion was plausible, the system must be clearer. If temptation was predictable, supervision, access design, or support may need change. Responsibility does not end systemic review.

For participant responsibility, the ledger should identify the act or omission that placed continuity at risk, the authority the participant held, the warning or rule involved, and the people burdened by the break. It should also state whether the City created conditions that made the breach more likely. Responsibility is individual only to the extent the evidence supports that narrow claim.

Participant responsibility should include a revision trigger different from the one used for technical breaks. New evidence might show coercion, unclear instruction, staff direction, or system weakness. The ledger should therefore name what would narrow, expand, or reverse the responsibility finding so the first label does not become permanent merely because it arrived first (Reason, 1997; Leveson, 2011; Dekker, 2012).

31.5.3 — System Responsibility

System responsibility is not less serious because no individual intended harm. A failed sensor, weak staff protocol, bad vendor patch, confusing rule, inadequate redundancy, inaccessible reporting path, or exhausted review team can move burden just as surely as misconduct. The City must let technical and organizational causes accuse the institution, even when no villain is available for public attention.

System responsibility applies when the City's own design, technology, staffing, training, vendor dependence, architecture, policy, or governance causes or contributes to a break. This category protects participants and affected persons from being blamed for failures created by the institution.

Technical failures are the obvious case: hardware failure, storage corruption, synchronization problem, power interruption, sensor malfunction, software bug, access-control failure, or metadata loss. But system responsibility is broader. A poorly trained staff member, unclear protected-zone rule, overloaded archive team, or underfunded maintenance process can also break continuity.

Vendor responsibility must be included within system responsibility. A vendor may fail, but the City chose the vendor, contract, redundancy plan, audit rights, and exit path. If vendor failure harms record continuity, the City should not hide behind outsourcing. Public memory without private sovereignty means the City remains accountable for the systems it uses.

System responsibility should trigger repair rather than reputation defense. Correction may require changed public labels, apology, compensation, stronger infrastructure, revised training, more staffing, added redundancy, or a different vendor. Good intentions are not the object of proof; reduction of future burden is.

Public communication should name system responsibility when it is found. Vague phrases like administrative issue or technical matter may be insufficient if the break affected public trust or harmed people. The public does not need every security detail,

but it needs enough truth to know that the institution has not blamed the wrong actor.

System responsibility is one of the City's most important humility practices. The archive must be able to show that the City failed the participant, not only that participants failed the City. Without that symmetry, record becomes a tool of institutional power rather than answerability.

For system responsibility, the ledger should point toward repairable architecture. It should identify the failed tool, policy, staffing level, training route, vendor obligation, access control, or oversight practice. If the system failed, the remedy should change the system, not only console the persons injured by it.

System responsibility should name the evidence that would change the finding into shared or participant responsibility. A fault initially traced to software may later include skipped review or unauthorized workaround. Conversely, a suspected person may be cleared by technical logs. The ledger's job is to keep the City from protecting machines or people through premature certainty.

31.5.4 — Public Meaning

Public meaning after a continuity break should be governed before speculation hardens. The City should state what can be known, what cannot be known yet, what is protected, what is being reviewed, and what conclusions should not be drawn. This protects both public trust and the participant. Rumor is a hidden burden machine, and silence often feeds it (Bovens, 2007; O'Neill, 2002a; Hood, 2010).

Public meaning is the work of preventing a continuity break from

becoming either panic or concealment. A missing segment invites interpretation. People may assume corruption, sexual misconduct, hidden donor contact, security conspiracy, or institutional cover-up. The City must speak in a way that reduces false certainty without demanding blind trust.

A continuity label should explain what is known, what is unknown, what is under review, what protective steps have been taken, and what the label does not mean. It should not suggest that a gap proves innocence or guilt beyond the evidence. Absence is evidence of interruption, not automatic evidence of hidden conduct.

Public meaning should be contextual. A five-minute device failure in an empty corridor is not the same as a two-hour unexplained gap during office-interface activity. A logged emergency exception is not the same as an unauthorized private meeting. A protected clinical interval is not the same as secret public-power formation. Labels help citizens read the difference.

Continuity notices also need protection against hostile clipping. A public artifact saying record gap may travel without context. The public record site should link gap labels to explanations, review status, later findings, and correction logs. Public meaning should be designed for skeptical reading, not only friendly reading.

Public meaning must preserve dignity. If a gap involves health, crisis, intimacy, children, legal counsel, or nonparticipant protection, the City may need to say less while still explaining the category. The public does not gain trust by seeing protected

details. It gains trust by seeing that protected categories are governed.

A well-governed continuity break can strengthen trust. It shows that the City does not pretend perfection. It shows that gaps have labels, review, repair, and memory. The public may not like every gap, but it can learn to distinguish governed incompleteness from hidden power.

Public meaning is a separate repair object. The continuity ledger should record how a gap could be misread, which explanation is supported, what remains unknown, what protected detail cannot be released, and when the public account will be revisited. The aim is not to eliminate suspicion by disclosure. It is to keep ambiguity from hardening into an unsupported story.

Public meaning changes when facts change. The ledger should state which interpretations need correction if classification changes, which notices require update, and which protected details remain shielded when rumors prove false. Fair memory does not answer suspicions with exposure. Failure memory should be organized for future prevention. Each memory entry should identify the event type, burden path, affected categories, decision route, corrective action, unresolved questions, time review, and public explanation. It should be searchable by safeguards and lessons, not by humiliation. The City remembers failure so that future people do not have to pay for the same ignorance.

31.5.5 — Institutional Failure Memory

Institutional failure memory should preserve the cause, burden,

correction, unresolved risk, and governance change in a form that future operators and auditors can retrieve without turning affected people into examples (Cannon and Edmondson, 2005).

Failure memory should not become a wall of shame. A participant who misfit, exited, collapsed, erred, or was removed should not become a permanent teaching exhibit beyond public need. Staff should not be memorialized as examples of failure in ways that harm future work. Nonparticipants should not be preserved as collateral stories. The memory should be oriented toward systems, safeguards, and burden placement.

The City can maintain different levels of failure memory. Internal operational memory may preserve detailed analysis for governance and training. Public memory may preserve category, response, reform, and unresolved questions. Research memory, if ever used, belongs under separate scientific governance. Historical memory may be reviewed over time.

Failure memory should include successful restraint. A pause that prevented harm, a shutdown decision, a narrowed program, a decertification, or a refusal to release protected material should be remembered as fidelity. Institutions often celebrate growth and bury restraint. The City should remember restraint as one of its virtues.

A failure memory ledger can become one of the City's strongest anti-drift tools. It should connect failures to later audits, training revisions, technical changes, staffing ratios, public artifact standards, donor rules, vendor controls, and host-community remedies. Memory should change practice.

The final test of failure memory is whether it remains merciful. The City should remember enough to prevent repeated harm and forget, seal, summarize, or time-review enough to avoid permanent humiliation. Memory without mercy becomes possession. Mercy without memory becomes repetition. The City needs both.

For failure memory, the ledger should preserve the lesson without keeping the wound open for spectacle. It should record the cause, burden path, repair, design change, unresolved risk, and future review date. It should also state what should not be reused as teaching material because dignity would be harmed by making a person's injury into institutional theater.

Failure memory should identify what would change the lesson. A pilot-era breach may teach one thing before technical redesign and another thing after new access controls are tested. The City should let later evidence refine the memory so the archive does not freeze an early explanation into permanent institutional folklore.

The City also needs a closure threshold for failure that cannot be repaired within acceptable burden. Closure becomes a legitimate option when the institution can no longer protect nonwaivable rights, maintain lawful and trustworthy records, provide safe care and work, preserve independent oversight, sustain essential operations, or justify the burdens imposed on participants, staff, families, nonparticipants, and the host community. The decision should not belong to the operator whose survival is at stake. It should require an independent review, affected-person protection, a stated evidentiary basis, and a public explanation bounded by

privacy and safety (GAO, 2025; ISO, 2019; Ostrom, 1990). Closure review should separate tasks that can stop from unresolved claims that still need a reachable, accountable office.

A closure decision must activate a wind-down plan rather than an institutional disappearance. New admissions and nonessential capture should stop. Care, housing, payroll, benefits, severance, family and dependent support, complaint and appeal routes, records custody, vendor exit, contract termination, host obligations, creditor claims, physical-site safety, and continuity of essential services should receive named owners, funded timelines, and independent verification. A reserve or remedy fund should remain available for harms discovered after operations cease. Closure is complete only when people are not left carrying the institution's unfinished obligations (ILO, 1982; ISO, 2019; NARA, 2023). Before staff disperse, a claims-routing exercise should test whether a former participant can still reach the responsible office.

Closure should produce a certificate and residual-authority map stating why the City closed, which functions ended, which duties continue, who holds sealed and public records, how later claims and corrections can be filed, and when each remaining authority expires. Transfers must preserve lawful custody, affected-person rights, and unresolved obligations; a purchaser's claim of continuity is insufficient (NARA, 2023; GAO, 2025; ISO, 2019). The receiving custodian should test an authorized sample retrieval before accepting custody, confirming that access restrictions, correction history, and retention deadlines survive the transfer.

Buying assets or claiming continuity does not transfer the City's name, participant records, data rights, donor relationships, or accreditation without the applicable independent review and lawful authorization. Both custodians should acknowledge each transfer. The map must be checked after staff or vendor departures so claimants can still reach an accountable office. Continued record custody does not continue active capture or institutional control over former participants. The next section explains how voluntary exit, support, retirement, and future privacy make that ending real.

31.6 — Exit, Retirement, and Reintegration

Exit is one of the conditions that makes the Vow honest. A voluntary adult burden ceases to be voluntary when departure becomes shameful, materially impossible, publicly degrading, or administratively trapped (Hirschman, 1970; ILO, 1982; Goffman, 1963; Link and Phelan, 2001).

People leave because of role misfit, completed service, family care, health change, withdrawn consent, misconduct findings, changed vocation, or a decision that public-power formation no longer fits. Ordinary exit, retirement, removal, and departure with unresolved remedy require distinct routes so leaving is neither betrayal nor disposal.

Reintegration matters because active record, public attention, schedule, housing, staff relationships, family burden, and readiness status may alter a person's identity and ordinary attachments. The City cannot simply end participation and act as though no transition remains.

Legitimate public memory does not create perpetual active burden. Records from participation may remain governed public-power records, but the person's future ordinary life should not stay searchable, reportable, or monitorable by default. The Vow has an active period; the person has a life beyond it.

31.6.1 — Voluntary Exit

Exit should be judged by where its costs fall. Poor design shifts housing, care, income, dependent support, reputation, record correction, and privacy burdens onto the departing person, family,

staff, or host community. A governed route identifies which obligations end, which support continues, which records remain, what becomes public, who closes open remedies, and when City authority expires. Departure then becomes a status transition rather than a civic cliff (Hirschman, 1970; ILO, 1982; Tyler, 2006).

Exit planning must be operational, not sentimental. It should address housing, work, care, legal interfaces, record status, future privacy, family burden, public labels, continuing obligations, and the person responsible for unresolved issues. A promise that a person is free to leave means little if departure destroys the conditions that made leaving possible.

Exit friction should be measured without turning the measurement into another score. It should ask whether a participant delayed leaving because of public shame, dependency, debt, housing risk, medical continuity, family pressure, fear of being called unready, or uncertainty about the archive. Where friction is excessive, the failure belongs to design, not simply to personal hesitation.

Voluntary exit must be available before collapse. No participant should have to prove breakdown, scandal, illness, or humiliation to leave. Ordinary changes of mind, family burden, health, vocation, or role fit are enough. The City's dignity grows when people can depart while still whole.

The Vow remains voluntary only through a lawful, known, reviewable exit that does not brand the departing participant as

morally inferior. Persistence is not virtue, and public-power formation is not a permanent identity.

The exit process should distinguish reasons without demanding public confession. A participant may leave because of misfit, family obligation, health, changed vocation, loss of consent, conflict with City conditions, or desire for ordinary life. The public may need a status label, but it does not need every private reason.

Exit notice should define when active record ends, what records remain, what release or sealing rules apply, what support continues, what public status changes, and what appeal or review rights remain. Ambiguous exit creates risk. A person should not be secretly active, publicly inactive, or privately trapped.

Exit coercion must be actively prevented. A participant should not be pushed out because they complained, embarrassed leadership, challenged donors, exposed staff burden, or became inconvenient. Voluntary exit must be genuinely voluntary, not pressure disguised as freedom.

Exit should also protect affected persons. Families, staff, complainants, public contributors, and other participants may need clarification, safety planning, record correction, or boundary setting. The participant's departure should not leave unresolved harms without remedy.

A fair City should be able to say that leaving can be honorable. Ordinary private life remains complete. A person who chooses not to continue visible public-power formation is not lesser than

a person who stays. The City's burden is role-specific, not a measure of human seriousness.

A voluntary-exit plan should mark the moment active obligations change. It should specify record stop, public label, remaining support, unresolved remedy, privacy boundary, adviser handoff, and the office responsible for closing open questions. It should also state how the person can challenge a public description that makes departure sound like fault when the record shows ordinary change (ILO, 1982; OECD, 2020b; Maslach and Leiter, 2016).

31.6.2 — Severance Support

A hidden-coercion review of voluntary exit asks whether the person stayed too long because leaving seemed socially, financially, medically, or reputationally impossible. If so, the City's duty is not to praise endurance. It is to alter the exit route so the next person can leave before burden becomes injury.

Severance support makes departure materially possible rather than merely legal. Bounded, reviewable, nonpossessive help may include housing and healthcare transition, dependent care, a financial bridge, legal guidance, counseling, travel, employment transition, record explanation, data-injury assistance, and safety planning. These supports prevent abandonment and coerced dependence after the City has asked someone to reorganize life around its public burden. They are not reward, absolution, or payment for silence.

Severance support should apply differently depending on exit type, but dignity should remain. A person leaving voluntarily may need transition. A person removed for misconduct may still have

dependents who should not be punished. A person harmed by institutional failure may need more support. The City must not use severance as moral approval or moral banishment.

Transparent terms matter. Participants should know before activation what support exists after pause, withdrawal, removal, pilot shutdown, and retirement. Hidden severance discretion can become leverage. People should not fear that criticizing the City will cause support to vanish.

Severance should not extend City control into post-exit life. Support should have time limits, appeal, privacy rules, and no loyalty conditions. A person receiving transition support should not be required to praise the City, remain silent about harm, or remain available as public evidence of successful reintegration.

Severance must be funded before the City opens. If it can afford capture, archive, buildings, and public interface, it must afford the cost of humane exit. A City without exit reserves may become a beautiful institution that quietly traps people through dependency.

A severance-support plan should specify the duration, funding source, and privacy conditions of each commitment.

Severance must pass the same coercion test: was support adequate to make leaving real? A City that offers symbolic exit while withholding practical transition has converted dependency into consent. When severance is too narrow, the correction should be budgetary and structural, not merely apologetic (ILO, 1982; Goffman, 1963; Maruna, 2001).

31.6.3 — Retirement After Office

Retirement should end active public-power burden without erasing the record of office. Some review and record duties may continue, but curiosity does not justify permanent visibility. Former role, continuing accountability, historical record, and future private life must remain distinct.

Term completion, resignation, electoral defeat, removal, incapacity, health, aging, or changed vocation may close authority through different routes. Each route needs a clear status, continuing duties, and privacy boundary. None makes the person permanently active.

Office records, City formation records, government records, campaign records, and private post-office life must remain distinct. The City may preserve public-power memory from the active period and office interface where lawful. It should not extend active formation burden into ordinary life simply because the person once held authority.

Retirement review should clarify status. Is the person a former participant, former officeholder, continuing participant, advisor, private citizen, witness in an ongoing review, or subject of unresolved remedy? Status clarity protects public trust and future privacy. It also prevents former authority from lingering informally inside the City.

Retirement may require public explanation where public roles are involved. Citizens should understand whether a person's City record remains open for review, whether readiness claims are retired, whether unresolved public matters remain, and what

future record rules apply. But retirement notice should avoid turning ordinary aging, grief, illness, or family life into public material.

Post-office capture also requires review. A retired public-power holder may be courted by donors, parties, vendors, media, foreign hosts, or symbolic movements. The City's formal authority may end, but its records can help public understanding of post-office influence where lawful. That does not justify a permanent active Vow.

Retirement should be treated as part of public dignity. A person who carried visible burden should be allowed to become ordinary again where public authority has ended. Public memory remains governed. The living person is not a museum of their office.

A retirement-after-office review should separate active role, former public authority, continuing public record, and ordinary private life. It should state which records remain open because they concern office, which records belong only to City formation, which are sealed or time-reviewed, and what public claims the person can no longer make. Retirement should close authority without erasing accountability.

The retirement record should let readers understand a status transition without following the person home. It should explain why the active public role ended, which duties remain for unresolved public matters, whether any readiness claim is retired, and how future privacy begins. That distinction protects citizens from false continuity and protects the former officeholder from permanent exposure.

31.6.4 — Post-Exit Future Privacy

Post-exit privacy must be prospective, enforceable, and visible in system rules. The active period may remain governed by its record obligations, but future ordinary life should not be captured by default, searched by habit, linked to new dossiers, or treated as an epilogue to formation. The public gains memory of the bounded role, not a lifelong monitoring right (European Union, 2016; Solove, 2006; Nissenbaum, 2010).

Operationally, future privacy begins with deactivation. Capture credentials, device permissions, staff workflows, search defaults, alerts, and vendor access must change at the recorded exit time; cached and derivative systems should be checked for continued collection. A policy that says the Vow has ended while systems continue to watch has not completed exit.

A clear record stop must be defined. The date and time of exit, retirement, removal, or status transition should be clear. After that point, active capture ends unless another lawful status applies. Public confusion about whether a person is still active can create both surveillance risk and trust risk.

Future privacy does not erase legitimate public accountability. If the former participant held office, certain public records may remain. If unresolved harm, data injury, or legal matter continues, lawful processes may continue. If the person later seeks power again, prior records may become relevant under defined rules. But none of this means ordinary post-exit life is City property.

Post-exit privacy protects families and dependents especially. Children after exit should not be followed by the archive. Partners

should not remain public because they were once adjacent to the Vow. A household should be able to rebuild ordinary boundaries without becoming a continuing footnote in a participant record.

The City's public record site should show post-exit status clearly. Citizens should know which material belongs to active record, which belongs to office record, which is sealed, which is time-reviewed, which is corrected, and which is no longer being updated. Clarity prevents both suspicion and overreach.

The Vow must not become a lifetime shadow. Public-power formation can remain in bounded memory without licensing continued observation of a person who has returned to ordinary life. The institution proves its limit by allowing the living person to become larger than the historical record.

A post-exit future privacy plan should define the boundary in time, record category, and public interface. It should state what active capture has ended, what existing records remain governed, what future ordinary life is outside the City, and what exceptions require separate lawful authority. The boundary must be operational enough that staff, search tools, journalists, and public readers can understand it.

Post-exit privacy requires another coercion check: did the person's future life remain observable because systems, habits, or public curiosity failed to stop? If capture does not end cleanly, exit is incomplete. Correction may require technical deactivation, staff training, search limitation, public-site relabeling, and accountability for improper post-exit attention.

31.6.5 — Ordinary-Life Reintegration

Ordinary-life reintegration should include social meaning, not only logistics. The person may need to rebuild friendships, family rhythms, work identity, spiritual practice, privacy habits, local belonging, and freedom from being interpreted through the City. Reintegration should communicate that ordinary life is not demotion. It is the human scale to which public burden must finally answer.

Ordinary-life reintegration returns personhood beyond role. A participant may leave the City carrying public memory, public criticism, family repair needs, altered habits, identity strain, and practical disruption. The City should not assume that removing the active burden automatically restores ordinary life (Braithwaite, 1989; Maruna, 2001; Link and Phelan, 2001).

Reintegration may involve housing, work, education, family repair, privacy adjustment, mental health support, financial transition, community reentry, public communication, or protection from harassment. Not every person will need every form of support. The City should make pathways available without turning reintegration into continued institutional supervision.

Identity reintegration matters. A person who lived under the Vow may have learned to narrate, explain, perform, justify, or anticipate public interpretation. Returning to ordinary life may require relearning privacy, spontaneity, silence, and relationships not mediated by record. The City should treat this as human adjustment, not weakness.

Family reintegration may be complex. Partners, children, dependents, and household members may carry collateral burden. They may need restored boundaries, counseling, or support. The City should aid repair while preserving household privacy.

Public reintegration should avoid permanent stigma. A former participant may be known for misfit, exit, failure, or conflict. Record labels should remain accurate and bounded. The public should not treat former participants as failed citizens. Leaving the Vow is not civic disgrace.

Reintegration is social as well as archival. Dignity may require help rebuilding work, community, family rhythm, digital boundaries, and a public identity not organized around former City status. It also requires freedom from performing a successful return for the institution's benefit.

A reintegration plan should address the whole person: practical support, household needs, community reentry, privacy restoration, harassment protection, record explanation, and the point at which City support ends. It cannot demand gratitude for permission to become ordinary again.

Reintegration reveals hidden coercion when return is burdened by reputation, platform hostility, staff dependency, unresolved complaint, or a public narrative the person cannot escape. A difficult return does not show that ordinary life was impossible; it shows which conditions the City must repair before exit becomes socially and materially complete.

31.7 — Posthumous Records and Long-Term Dignity

The City's archive will outlive many of the people it records, creating a final moral question: what does a public-power record owe a person after death? Death neither erases dignity nor converts the archive into ownerless public material (ICA, 2011; SAA, 2020; ISO, 2016a; Cook, 2013).

Long-term memory can protect public accountability. Future citizens, historians, harmed persons, institutions, and legal processes may need records of public-power formation and office conduct. Access, however, is not appetite. Historical importance does not automatically justify raw exposure, intimate detail, child-related material, or family humiliation.

Posthumous governance should distinguish the public role from the human life around it. A person who sought public power may leave records of public consequence; family members, children, partners, clinicians, lawyers, staff, and ordinary contacts do not become public property after death. Collateral dignity remains.

Long-term dignity also requires time review. The public relevance of some records may grow, fade, change, or require different handling as immediate political stakes pass and historical inquiry begins. A record that should be public during office may later need summary rather than raw exposure. A protected category may remain protected for generations.

31.7.1 — Death and Archive Status

Posthumous governance must be built while people are alive. Participants should know, before entry and during review, how

death changes archive status, who receives notice, what family interests are protected, which records remain public, which records are delayed, which records are summarized, and what long-term review applies. The dead cannot negotiate with the archive, so the living institution must bind itself in advance.

Commemoration must remain distinct from release. To honor a person is not to expose every record. To preserve accountability is not to make grief public. To serve history is not to feed curiosity. Long-term dignity requires categories strong enough to survive political fashion, scholarly hunger, platform incentives, and the flattening pressure of time.

Because the person can no longer speak for the record, death should increase rather than relax the archive's duty of care; sealed material does not become public by default.

Death should trigger status review rather than automatic release. The City should mark the change, close or transfer active processes, preserve unresolved appeals and remedies, identify surviving people who may be affected, and decide which records remain public, restricted, sealed, summarized, delayed, or subject to periodic reconsideration. The review record should explain the authority, public purpose, continuing harm, less exposing alternatives, and next review date. Death changes governance conditions; it does not turn silence into consent.

The public may need basic notice when a former active participant or officeholder dies, especially if public records, unresolved reviews, or historical materials are affected. The

notice should be dignified and spare. It should not become an occasion to release protected material or to reopen spectacle.

Archive status after death should preserve distinctions among active-period records, office records, family-protected records, intimate records, child-related records, clinical or legal interfaces, staff records, and nonparticipant records. A single death should not collapse categories that were carefully separated in life.

Unresolved matters require careful handling. A pending complaint, data injury, appeal, public correction, or institutional review may continue after death if affected persons or public trust require it. The City should avoid using death to close uncomfortable institutional questions. It should also avoid turning unresolved matters into rumor.

Death may alter the balance of public need and private harm, but it does not automatically remove harm. Surviving relatives, affected persons, staff, and nonparticipants may still be burdened by release. The City must ask who carries the cost of posthumous disclosure, not only who wants to know.

31.7.2 — Family Dignity

Family dignity includes more than privacy of facts. It includes timing, language, contact method, grief burden, child protection, partner safety, cultural practice, religious practice, and the right not to become an explanatory accessory to a public life. Families may need information, but they should not be drafted into public performance because the participant once lived under record.

Family dignity protects surviving relatives from becoming public objects through another person's record. A participant's death

may intensify public curiosity about partners, children, parents, dependents, household members, estranged relatives, or private conflicts. The City must not allow grief to become content.

Families do not own the public-power record, but they do retain dignity. This distinction matters. The record cannot be handed to families as private property if public accountability requires preservation. Yet public accountability does not give the City permission to expose family pain, child history, intimate material, or household conflict beyond public need.

Surviving relatives may need notice, consultation, and support when archive status changes affect them. Consultation is not a veto over accountability, nor is it a ceremonial courtesy. It helps identify factual error, child or dependent risk, safety concerns, cultural and religious burdens, and less harmful ways to preserve public meaning without surrendering the record to private control.

Children deserve heightened protection after a participant's death. Public sympathy often turns children into symbols of legacy. The City must refuse this. No child should become evidence of the participant's humanity, evidence of the City's success, or emotional material for public mourning.

Family dignity also protects against hostile historical storytelling. A family may be blamed, romanticized, used to explain misconduct, or treated as a key to the participant's soul. The archive should avoid feeding narratives that turn private relations into simplistic causes of public conduct unless there is clear public-power relevance and protected handling.

The City's posture toward families should be modest. It can preserve records, notify where needed, consult where appropriate, and protect against wrongful exposure. It should not claim to narrate the family. A family is not an appendix to a public record.

31.7.3 — Long-Term Access Review

Over time, the access decision must be reconsidered. Immediate political stakes may fade, affected people may age, children may become adults, historical value may grow, legal duties may change, and search technology may make an old disclosure newly powerful. Scheduled review, stated reasons, affected-person routes, and appeal prevent a decision made for one moment from becoming an unexamined rule for every future audience.

Sensitive categories need explicit review clocks. Intimate material, child-related records, clinical and legal interfaces, nonparticipant exposure, staff-role records, and protected summaries may remain sealed, move to contextual summary, or receive narrowly expanded access as law, technology, affected-person status, and public purpose change. No category should become permanently open merely because the first custodian failed to schedule reconsideration.

Long-term review should consider public relevance, continuing harm, affected-person status, historical value, legal obligations, technological risk, and whether less harmful forms of access can serve the same purpose. Raw exposure should not be the default answer to historical curiosity.

Review bodies should include appropriate expertise. Archive professionals, legal reviewers, privacy experts, child-protection

experts, historians, disability advocates, technologists, and affected-person representatives may be needed depending on category. The City should not let archive staff alone decide every long-term dignity question.

Machine access changes long-term risk. A record that seemed obscure in one era may become easily searchable, inferable, and recombinable later. Long-term access review must account for future retrieval power, not only original publication context. Privacy erosion can happen years after release through better tools.

The purpose of long-term review is not to bury history. It is to make historical memory lawful, contextual, and merciful. A society may need to remember public power, but it does not need to consume every private trace that happened near public power.

31.7.4 — Historical Use Limits

Historical use limits protect context as well as content. A fragment can misstate a life, campaign, office, family, or failure when it travels without classification, correction, dispute status, or protected-category limits. Historians, educators, journalists, public record sites, and later custodians should preserve the labels that keep authentic old material from becoming new misinformation (ICA, 2011; SAA, 2020; Schwartz and Cook, 2002).

The archive should distinguish source access, public quotation, summary use, educational use, research use, machine-assisted search, and public reproduction. Each may require different rules. A historian may be permitted to review restricted context under

conditions that would not justify public republication of raw material.

Use mode changes burden even when the source object does not. Viewing in a controlled setting, quoting in scholarship, reproducing an image, teaching from a protected summary, indexing for search, and using records to train or evaluate a model create different reach, persistence, and inference. Long-term access review should authorize each mode separately rather than treating permission to inspect as permission to copy, publish, automate, or repurpose.

Sensational legacy is a real danger. A participant's intimate life, breakdown, family conflict, continuity break, or removal may become more marketable than their public-power record. The City must not feed historical entertainment that uses its archive to humiliate the dead or burden the living.

Historical use should preserve status labels and context. A draft should remain a draft. A disputed record should remain disputed. A protected summary should not be represented as raw source. A correction should travel with the original error. Historical work that strips context can reproduce harm even when the record itself is authentic.

Research use remains separate. *The Science of Fairness* governs claim-status discipline and research ethics. Historical use of City records should not become a back door into behavioral datasets, machine training, or inference about latent experience. The archive's historical value does not override the no-silent-conversion rule.

A mature City should welcome serious history and reject historical voyeurism. The difference is not always obvious, which is why review, context, access classes, and long-term dignity standards matter. History should help future people understand public power. It should not make the dead permanently available for consumption.

31.7.5 — Memory Without Possession

Memory without possession is the final ethic of the chapter. The City may preserve public-power memory, but preservation is not ownership of the person. The participant is not the archive. The record is not the soul. Death does not make a human life available for institutional completion (Cook, 2013; Caswell, 2016; ICA, 2011).

The archive may need to preserve conduct, decisions, role, harm, correction, failure, and institutional lessons for public accountability. It does not thereby gain authority to claim consciousness, destiny, total meaning, or final moral interpretation. Even a complete active-period record remains a bounded record of public-power life, not a complete human being.

Possession begins when memory loses restraint. It begins when the archive treats every trace as public entitlement, when historians treat dignity as obstruction, when platforms monetize posthumous detail, when families are reduced to narrative material, or when the City protects its myth by controlling the dead person's meaning. The City must refuse all of these.

Mercy in memory does not mean erasure. People harmed by public power may need records. Citizens may need history. Institutions may need failure memory. Future builders may need to know what went wrong. Mercy means preserving what must be preserved without pretending that accountability requires total exposure.

Humility before mystery should remain possible. A record can show conduct under conditions. It cannot finally say who a person was. It cannot contain grief, love, repentance, confusion, faith, doubt, or private meaning in full. The archive should never speak as though it has conquered the human interior. That restraint leaves room for history to remain truthful without pretending that documentation exhausts a life.

The chapter returns to the burden question. Failure, exit, and posthumous memory reveal whether the City carries the cost of its own power or transfers it to participants, staff, families, nonparticipants, and the dead. A fair City remembers, repairs, releases, seals, corrects, supports, and lets go. Closure therefore includes knowing when the institution's remaining claim on a person has actually ended.

Two duties close the argument: remember enough to protect public accountability, and refuse to possess the dead. Memory without possession is the final test of whether the archive serves fairness or converts time into an excuse for appetite (ICA, 2011; SAA, 2020; ISO, 2016a). The durable principle is stewardship without ownership: preserve what public accountability truly needs, then let privacy, dignity, and ordinary life resume wherever the record has no remaining public claim.

Part IX — Buildability and Network Discipline

A buildable City begins not with a rendering but with a cost ledger in a host-review room. It names land, construction, utilities, accessibility, archives, staff, care, maintenance, uncertainty, reserves, failure, and closure. The question is whether every promise has an owner, a funding path, a review date, and a lawful way to shrink or stop.

Around that table, a construction manager tests contingency, a labor representative asks who can stop unsafe work, a host resident names service and housing pressures, a disability reviewer protects access from value engineering, and an archivist asks who funds migration after donors leave. Their questions convert beauty into obligations.

Part IX brings institutional imagination to the threshold of conditional buildability. It does not choose a site, allocate public money, approve construction, select a host, authorize a pilot, or create a network. Lawful authorities and transition processes own those decisions. This Part defines the evidence, burdens, alternatives, safeguards, and stop conditions any serious proposal must survive.

The comparison is not an expensive City against a costless status quo. Existing public-power formation already consumes money, attention, investigative labor, donor access, and trust, often without one visible budget. Those burdens cannot be converted into promotional savings by assertion. The City must compare itself with credible alternatives under common categories, disclose uncertainty, and accept that a less intrusive reform may perform better.

Cost changes meaning once every safeguard is treated as a funded promise. A budget is not an embarrassment to minimize in public and enlarge later; it is the material map of what the institution claims it can protect. Complaint routes require independent staffing, protected nonvisibility requires trained review and secure infrastructure, voluntary exit requires housing and care continuity, and resilience requires maintenance reserves. An unfunded safeguard does not disappear. Its burden moves to the person with the least power to refuse it.

Resource dependence is governed by boundaries, disclosure, diversification, reserves, conflict rules, and a credible ability to refuse a funder or replace a vendor (Pfeffer and Salancik, 1978; Ebrahim, 2003; Reich, 2018).

The physical build creates its first moral test before any participant arrives. Construction workers, subcontractors, inspectors, delivery crews, nearby residents, local businesses, ecosystems, public utilities, transit systems, and emergency services encounter the City as a project, not as a philosophy. Safety, fair procurement, wages, working time, subcontractor conditions, environmental burden, local disruption, grievance, beneficial ownership, change-order review, and stop-work authority therefore belong to the City's own public record. A project that speaks about visible public power while hiding its construction and procurement chain has failed at the threshold (International Labour Organization, 1988; International Labour Organization, 2022b; World Bank, 2017a; World Bank Group, 2025).

A staged pilot replaces the launch story. Rights, archive integrity, staffing, host readiness, Artificial Intelligence and vendor controls, care, accessibility, exit, and shutdown capacity each receive their own evidence gate before the next burden begins. Passing one gate creates no entitlement to weaken another, and failing a gate is not a communications problem. It is a governed decision that can stop construction, occupancy, admissions, technical activation, public release, or replication (Cooper, 1990; Government Accountability Office, 2020b; NASA, 2016).

Dry runs make controlled failure available before uncontrolled failure reaches the public. The City should rehearse a wrongful archive release, a staff complaint against a supervisor, a cyber incident, a medical de-loading request, a hostile public-interface event, a bystander-privacy claim, a vendor failure, an evacuation, and a participant exit before real people carry the full consequence. Rehearsal cannot establish safety, but it can expose missing authority, confused handoffs, fragile staffing, unavailable records, and assumptions that collapse under time pressure. Its value lies in letting the institution learn while the burden is still containable (Reason, 1997; Leveson, 2011; Weick and Sutcliffe, 2015).

Phased admissions then protect the first cohort from becoming a symbolic offering. A small group is more than a smaller crowd; it is a different burden environment. Staff can observe whether care routes are usable, whether the record is comprehensible, whether privacy boundaries survive ordinary life, whether public attention distorts behavior, and whether host relations remain stable. Expansion should occur only when workload, rights, technical

integrity, and exit remain within declared bounds. Pilot research and implementation science repeatedly distinguish feasibility from effectiveness and process from outcome; the City should be at least as careful with people as a serious trial is with an intervention (Eldridge et al., 2016; Proctor et al., 2011; Skivington et al., 2021).

Post-occupancy evaluation turns a beautiful plan into a lived test. Light, heat, noise, distance, wayfinding, crowding, accessibility, security, privacy, food, rest, staff movement, maintenance, and public-interface pressure become experience after occupation. A rights audit asks a different but connected question: can a person actually complain, appeal, request shielding or accommodation, obtain a correction, pause, or leave without hidden penalty? A technically compliant building can still be exhausting, inaccessible, or coercive in use. Evaluation therefore joins physical performance, protected nonuse, user experience, rights outcomes, staff burden, nonparticipant impact, and public usability (Preiser, Rabinowitz, and White, 1988; Leaman, Stevenson, and Bordass, 2010; World Health Organization, 2018b; United Nations, 2006).

The Part then confronts replication. One City is not enough if singularity makes access scarce, turns firstness into authority, or allows one jurisdiction to be mistaken for a universal design. But more Cities are not safer merely because they are numerous. Weak copies can carry a trusted name while diluting rights, underfunding staff, centralizing records, subordinating local law, or buying legitimacy through donors. The question is not how to

scale quickly. It is whether safeguards can travel without turning the network into an empire or the original into a shrine.

Accreditation remains scoped to institutional functions rather than people. Here it means a revocable finding that a named site has demonstrated specified rights, record, staffing, host, Artificial Intelligence, audit, exit, and stop capacities for a defined period and operating scope. It confers no judgment of personal character, professional license, public authorization, office eligibility, or legal approval. The accrediting body must disclose its competence, impartiality, funding, conflicts, evidence limits, post-approval surveillance, complaint and appeal routes, suspension, withdrawal, and meta-review. ISO 19011 guides auditing but does not itself confer certification, while ISO/IEC 17011 supplies the more exact competence and impartiality frame for accreditation bodies (ISO/IEC, 2017; ISO, 2026; ISEAL Alliance, 2025).

Local translation is equally important. A City in a coastal heat zone, a multilingual federal system, a post-authoritarian society, a region with weak data protection, or a community with a history of institutional surveillance cannot simply reproduce the first site's form. Climate, law, language, labor, disability access, public memory, and host institutions require local design. Translation becomes drift only when adaptation erases the invariants that protect voluntary entry, ordinary privacy, staff dignity, record separation, human authority, complaint, appeal, exit, and decertification (Acharya, 2004; Merry, 2006; Dolowitz and Marsh, 2000).

A network also needs restraint in what it shares. Corridors can support travel, emergency hosting, technical learning, and mutual aid. Archives can exchange provenance and verification without exchanging whole-person dossiers. Record-sites can publish interoperable status and correction information without centralizing interpretation. Mutual assistance can preserve local accountability rather than replacing it. Polycentric systems are strongest when multiple centers can learn and coordinate while retaining independent authority and review (Ostrom, 2010; Provan and Kenis, 2008; W3C, 2013).

Field experts should encounter their actual decision questions rather than generic institutional language. Public appraisal requires a declared strategic case, alternatives, social value, distribution, affordability, deliverability, base year, scenarios, confidence, and opportunity cost. Procurement review requires competition, beneficial ownership, conflicts, rated criteria, contract changes, performance evidence, portability, and vendor exit. Labor review requires worker voice, stop-work authority, training, subcontractor conditions, pay, scheduling, and remedy. Urban review requires housing, services, environment, transport, health, and place effects. Implementation review requires feasibility measures, staged gates, process evidence, minority findings, and stopping rules. Accreditation review requires defined scope, reviewer competence and independence, periodic surveillance, appeal, suspension, withdrawal, and review of the accreditor. The Part succeeds only when each discipline can identify both the evidence it would demand and the decision it

could stop (MHCLG, 2026; OECD, 2025c; World Bank Group, 2025; ISO/IEC, 2017; ISO, 2026).

By the end of this Part, the City is no longer merely visible, livable, educative, answerable, and capable of failure. It is financially and operationally mortal. Permission can expire, captured funding can be refused, occupancy can be postponed, a beautiful second site can be denied, a popular member can be suspended, and a network can close before prestige turns continuation into duty. Stoppability is therefore not the opposite of hope. It is the form hope takes when it refuses to make other people pay for its self-image. A stop decision can therefore be evidence that the institution kept its commitments rather than proof that the vision failed.

None of the estimates in this Part is a launch budget because no site, jurisdiction, cohort, legal form, financing agreement, or operating scale has been authorized. The bounded planning identity records category, unit, currency, base year, range, assumption, source version, evidence owner, affected people, uncertainty, expiry, revision trigger, and stop consequence instead of inventing a headline number. The pilot gate file separates hard bars, conditional deficiencies, and watchpoints so unresolved danger cannot hide inside one overall score. The accreditation instrument names exact scope and term rather than a brand. Each object earns value by remaining versioned, inspectable, appealable, and capable of producing delay, redesign, refusal, or withdrawal. Every estimate should be revised when site evidence changes the assumptions that made the earlier range plausible.

Buildability begins when restraint becomes part of the aspiration. A City that can count hidden burdens, refuse captured money, protect workers and hosts, delay its own opening, learn after occupancy, deny a weak replica, and remember failure may earn further consideration. A City that cannot perform those functions should remain on paper. The moral achievement of Part IX is therefore not construction. It is a decision environment in which construction, pilot, replication, or refusal can each become an honest answer. That discipline allows ambition to remain credible because expansion is earned by demonstrated capacity rather than momentum.

Chapter 32 — City Costs and Anti-Capture

Buildability requires one lifecycle ledger that prices the safeguards as well as the buildings: staff, care, accessibility, records, cybersecurity, complaint, audit, maintenance, vendor exit, reserves, and closure must remain visible beside capital cost.

Cost becomes a moral question when its distribution is visible. Review must show who pays, benefits, gains access or influence, and carries deferred or unpriced obligations. A low aggregate number can still be unfair when workers, hosts, families, participants, nonparticipants, or future budgets bear concentrated burdens they cannot refuse or correct.

Romantic undercounting and promotional overclaim are equal threats. Hope does not staff archives, secure servers, maintain accessible buildings, provide independent counsel, or support exit. Nor may every hidden cost of existing leader formation be claimed as a City saving. Bounded scenarios, source classes, uncertainty ranges, lifecycle categories, and affected-person routes keep comparison useful without pretending to be a final budget.

Two ledgers belong on the same table without being collapsed into one persuasive total. The City's planning record includes capital, operations, archive, care, exit, reserves, host mitigation, accessibility, cybersecurity, audit, maintenance, breach response, and closure. The status quo carries burdens of late discovery, donor dependence, private gatekeeping, corruption, scandal, bad office, investigative labor, public guesswork, and mistrust. Some effects can be priced; others should remain qualitative, distributional, or bounded by ranges. The comparison succeeds when neither ledger is allowed to disappear.

Money enters not only as resource but as authority pressure. Public funding can bring democratic oversight and political leverage. Philanthropy can bring patient capital and expectations of gratitude, naming, access, narrative control, or rescue. Mixed finance can diversify dependence while obscuring it. Vendors can supply essential capacity and become landlords of data, maintenance, or institutional memory. A City created to expose hidden public power cannot allow its own financing to become a hidden government.

Refusal capacity gives anti-capture rules practical force. Funding may expand the City only while admissions, archive access, naming, governance, correction, public interpretation, and audit remain independent of financial leverage. No donor, vendor, lender, contractor, or public funder may purchase human rank, silence, favorable evidence, protected access, or guaranteed continuation.

The cost ledger extends beyond the campus. Hosts may absorb traffic, rental pressure, service demand, construction disruption, environmental risk, security posture, and political contention. Workers may carry schedule pressure, subcontracting risk, injury, emotional labor, or unstable employment; families may carry relocation, care, and uncertainty. Counting only internal spending hides part of the City's burden.

Architecture must not become a luxury object for people already closest to power. Expensive form cannot justify prestige admission, elite comfort, political favoritism, future-office entitlement, or aesthetics that consume the reserves needed for accessibility, care, staff relief, archive migration, and exit. Cost

discipline should direct design toward repairable systems, adequate staffing, transparent tradeoffs, and adapted space where adaptation serves the purpose. The symbol remains worthy only while the rights it houses continue to govern it.

A credible review therefore resembles a public-finance charter, an anti-corruption protocol, a host agreement, a labor covenant, and a continuity plan at once. Capital estimates need base dates, units, scope, contingencies, market testing, procurement route, and independent challenge. Operating estimates need staffing ratios, service levels, replacement schedules, maintenance backlogs, audit capacity, and escalation triggers. Reserves must cover complaint, remedy, breach, de-loading, exit, vendor replacement, decertification, closure, and aftercare rather than revenue volatility alone. Every line identifies the evidence source, current version, decision owner, affected people, expiry, and consequence when it is cut (Government Accountability Office, 2020a; HM Treasury, 2026a; OECD, 2025c; World Bank Group, 2025).

The bounded planning identity is intentionally less glamorous than a headline total. It keeps categories beside one another so that a low construction estimate cannot erase a weak exit plan, a generous gift cannot erase donor leverage, and projected local benefit cannot erase displacement or public-service load. Every line names its unit, time horizon, uncertainty, affected people, evidence owner, revision trigger, and stopping consequence. A budget claim becomes admissible only when readers can see what would change the answer (Boardman et al., 2018; Government

Accountability Office, 2020a; HM Treasury, 2026a; MHCLG, 2026).

The worked hearing in Section 32.2 ends with a visible design change rather than a rhetorical victory. Reviewers discover that a ceremonial hall and plaza are fully funded while archive migration, staff relief, accessibility, host mitigation, and exit reserves remain thin. The project therefore postpones the symbolic features, strengthens the protective systems, and publishes the reason. The scene demonstrates what cost discipline is for: giving the less visible promise authority over the more photogenic object.

32.1 — How the City's Cost Must Be Justified

Cost justification requires comparison with credible alternatives. The City has a visible budget; existing leader-formation systems also impose dispersed costs through vetting, donor dependence, late discovery, investigation, administrative repair, and mistrust. Those costs must be estimated on the same terms as the City's costs, without assuming that the City would eliminate them. The question is which option best addresses the identified burdens within lawful, affordable limits (Government Accountability Office, 2020a; HM Treasury, 2026a).

At this stage, disciplined visibility is the strongest claim the comparison can support. The City cannot promise automatic reductions in corruption, scandal, bad office, or mistrust, and no mathematical savings rate is defensible before pilots, audits, and long-term review. Cost justification therefore opens an evidence file rather than announcing economic triumph. Its credibility depends on how quickly the file can narrow, reverse, or defeat the original assumption.

A useful starting frame is a burden comparison rather than a budget victory. The City's visible cost ledger includes the costs required to make public-power formation lawful, humane, and reviewable. The hidden formation cost ledger includes burdens that societies already carry when power is formed privately and judged late. The City is justified only if its visible burdens are less unfair, more reviewable, and more correctable than the hidden burdens it seeks to replace (Bowler and Karp, 2004; Kumlin and Esaiasson, 2012).

A burden comparison becomes admissible only when its hidden-cost claims are disciplined by the same rules applied to the City's visible budget. Every claim retains a stated counterfactual, affected people, evidence class, time horizon, uncertainty range, revision trigger, distributional account, and the no-build option. The bounded planning identity therefore prevents moral concern from being translated into fictitious cash savings or an automatic case for construction.

32.1.1 — Hidden Formation Cost

Hidden formation cost begins before a campaign and outside any public budget. Family advantage, class position, elite education, professional networks, party sponsorship, donor access, media coaching, and private mentorship can affect who becomes plausible as a future officeholder. None of those influences is automatically corrupt. The relevant question is whether a pathway creates role-relevant dependence or exclusion that citizens cannot inspect once substantial public authority is sought (Carnes, 2013; Dal Bó et al., 2017; Besley, 2005).

The burden chain is explicit: a formation advantage changes access; access changes opportunity and obligation; obligation can shape candidacy, staffing, policy attention, or silence; those choices then move cost onto people who never consented to the original relationship. A hidden-formation claim is strongest when it identifies that chain rather than treating elite biography as self-proving evidence of capture.

The ledger separates at least five cost classes. Selection cost concerns who never reaches consideration. Dependence cost

concerns favors, gratitude, or future access attached to the pathway. Discovery cost concerns reconstructing the pathway after office. Interpretation cost concerns deciding whether an influence mattered. Remedy cost concerns correcting a decision after the influence has already traveled.

Not every class can be monetized defensibly. Some should be reported in time, delay, complaint volume, investigative effort, unequal access, conflict incidence, or the number of decisions requiring later review. Assigning a currency figure to every civic burden would create false precision. The method should use money only where the unit and causal link are credible, and retain nonmonetary burdens beside it (Government Accountability Office, 2020a; HM Treasury, 2026a).

The comparison needs a declared reference system. Private professional education, party leadership pipelines, civil-service development, ordinary campaign vetting, public fellowship programs, and no reform are different counterfactuals. A City should not select the weakest comparator and then describe the difference as an avoided cost. Each comparator receives the same boundary, time horizon, affected-person map, and uncertainty discipline.

Distribution matters as much as the total. Hidden formation can benefit a future candidate while shifting scrutiny to journalists, emotional strain to families, reputational risk to staff, mistrust to citizens, and repair work to public institutions. A burden that is small in aggregate may still be unacceptable when concentrated on people with little knowledge, voice, or exit.

The City also creates formation cost. Applicants surrender time and some role-relevant privacy; staff carry review and care duties; hosts absorb land and service effects; the public funds records and oversight. The institution earns no moral discount merely because its costs are visible. Its claim is that the new allocation can be more lawful, reviewable, and corrigible than the old one.

Pilot evidence updates the hidden-cost range in both directions. If private-pipeline burdens were overstated, the estimate narrows. If the pilot reveals unanticipated City burdens, they enter the visible ledger. If earlier records prevent a late conflict or expose a false assumption, that event is recorded without being generalized beyond its conditions. Corrigibility is the evidence of seriousness.

Hidden formation cost earns a disciplined comparison and, at most, a bounded pilot; it does not authorize construction by default. The no-build option, lower-cost alternatives, host burden, and failure costs remain active throughout the review. Opacity in the status quo is a serious research and governance problem, but it is not a blank check for a new institution (Flyvbjerg, 2006; HM Treasury, 2026a).

32.1.2 — Corruption Cost

Corruption cost is the burden created when public authority is bent toward private leverage, concealed obligation, preferential access, procurement distortion, regulatory favoritism, or conflicts that are not properly governed. The City should address only the subset plausibly connected to public-power formation, donor dependence, staff influence, and record continuity. It does not

own a general cure for corruption (Rose-Ackerman and Palifka, 2016; World Bank, 2020; OECD, 2017b).

A useful analysis separates prevention, detection, response, and repair. Formation records may prevent some leverage by making prohibited relationships harder to establish. They may detect other leverage earlier. Complaint, audit, and correction routes affect response. Investigation, contract reversal, compensation, institutional repair, and restored access belong to the repair ledger.

These functions require capacity rather than slogans. Conflict mapping needs trained reviewers. Donor firewalls need contact controls and escalation. Procurement concerns need beneficial-ownership and relationship checks. Staff warnings need protected intake. Public explanations need source trace. Each function has a cost, an owner, a service standard, and a failure consequence.

The causal claim remains narrow. Earlier visibility may reduce certain hiding places, but corruption can arise after office through new money, emergency power, patronage, coercion, ideology, personal loyalty, or vendor control. A clean formation record does not certify future conduct. It creates evidence and response routes that can be tested against ordinary alternatives.

Pathway-specific objects make corruption cost measurable: undisclosed contacts, conflicts found before activation, prohibited conditions refused, near misses, complaint latency, time to correction, contract exposure, and the public resources consumed by repair. A dramatic aggregate estimate without these

intermediate objects would be difficult to interpret and easy to misuse.

Self-audit belongs inside the corruption model. Donors may seek admission influence, vendors may design dependency into archives, founders may protect allies, auditors may become ritual authorities, and staff may anticipate funder preferences without receiving an explicit request. These are institutional possibilities, not accusations. Treating them as ordinary review objects prevents the City from placing itself outside the risk analysis it applies to everyone else.

Near misses deserve their own category. A donor inquiry that is refused, a contact that is logged, a conflict disclosed before decision, or a vendor term rejected for control risk may show that the firewall worked. The same event may also show where the design is being pressured. Reporting both meanings prevents success theater.

Distribution again governs the conclusion. Corruption repair is paid by taxpayers, service users, honest competitors, employees, future budgets, and people whose rights or opportunities were distorted. The City may justify an upstream cost only where it reduces or reveals those routes without placing comparable burden on applicants, staff, hosts, or ordinary private life.

The admissible conclusion is conditional and useful. A governed formation system may lower certain corruption-related burdens when its records, firewalls, complaints, audit, and correction routes perform better than feasible alternatives. Comparative evidence can strengthen, narrow, or defeat that claim. Until then,

it remains an avoided-cost hypothesis rather than a savings entry (Government Accountability Office, 2020a; HM Treasury, 2026a).

32.1.3 — Scandal Cost

Scandal cost is late-discovery burden. It includes emergency investigation, suspended public work, legal response, staff and family exposure, policy reversal, communications disorder, reputational spillover, and the civic effort required to determine what actually happened. The relevant evidence is not headline intensity. It is the difference between what could have been known earlier and what became costly because no trustworthy category or record existed (Bowler and Karp, 2004; Bovens and 't Hart, 1996).

The ledger distinguishes the underlying conduct from the cost of revelation and the cost of institutional response. Those are different objects. A serious conflict may be cheap to reveal but costly in consequence. A minor fact may become expensive because an institution concealed it, mishandled it, or forced the public to reconstruct context from fragments.

Timing is therefore central. Review should ask when a fact became role-relevant, who could lawfully have assessed it, whether protected review was sufficient, whether public release was necessary, and what harm earlier action could have prevented. Information that is intimate but irrelevant belongs outside the scandal-cost case even when public appetite is high.

A lawful record can reduce interpretive chaos by preserving sequence, source, status, correction, and response. It cannot make

every fact simple. The public may still disagree about severity or fitness. The value lies in replacing rumor and isolated fragments with an accountable record that distinguishes allegation, evidence, finding, appeal, remedy, and unresolved dispute.

The affected-person map must include the person accused, complainants, witnesses, staff, family members, bystanders, public users, and institutions whose work is interrupted. Earlier visibility is not fair when it merely shifts the cost of scandal onto people who never sought public power. Protected categories and delayed release remain part of the cost analysis.

Public artifacts use mechanism categories rather than personal wreckage. Concealed conflict, abusive supervision, false qualification, donor leverage, financial irregularity, and repeated refusal to correct can be explained without reproducing humiliating details. The public needs a map of late discovery, not a theater of exposure.

Each record class should be judged by the public function it performs. A category that improves complaint response, conflict review, correction, or public interpretation may deserve preservation. One that mainly increases voyeurism, retaliation, or context collapse should be narrowed, delayed, aggregated, or withdrawn. The archive earns its reach by reducing harm and improving answerability, not by feeding attention.

Evaluation compares the actual incident pathway: time from first warning to intake, intake to finding, finding to remedy, and remedy to public correction; number of people unnecessarily exposed; service interruption; legal and administrative effort; and

recurrence after corrective action. These measures are imperfect, but they are more disciplined than valuing scandal by publicity.

Scandal cost can support the City only if the institution demonstrates earlier, safer, more contextual discovery than feasible alternatives. It cannot justify unlimited capture, permanent suspicion, or a public right to every private fact. The fair replacement for late spectacle is bounded knowledge with usable remedy (Kumlin and Esaiasson, 2012; Bowler and Karp, 2004).

32.1.4 — Public Trust Cost

Public trust cost appears when people cannot judge whether an institution or official is reliable enough for a specific public purpose. It is paid through repeated verification, withdrawal, delay, defensive politics, rumor, partisan substitution, and the expectation that every explanation hides another bargain. Trust is not admiration and cannot be demanded as a civic duty (OECD, 2026c; OECD, 2017a; Hetherington, 2005).

The relevant object is warranted reliance. A person may trust that a record is complete enough to challenge while distrusting the participant's judgment. A journalist may trust provenance and still reject the institution's interpretation. A voter may accept that a conflict was disclosed and still vote no. The City should make disagreement better informed, not manufacture approval.

Trust burden has several dimensions: search cost, verification cost, coordination cost, correction cost, and the emotional strain of persistent uncertainty. These burdens fall differently. Citizens may withdraw; staff may overdocument; journalists may

reconstruct basic facts; public agencies may repeat review because prior records are not credible. A single trust score would conceal these routes.

More records are not automatically better. Volume without categories can raise search cost. Raw exposure can destroy legitimate privacy. Machine summaries can flatten uncertainty. Conflicting versions can reward whichever excerpt circulates fastest. Trustworthy public memory therefore depends on provenance, status labels, correction, accessible explanation, and visible limits.

The City tests whether its public bundles reduce avoidable interpretive work. Can a skeptical reader locate the source, see what changed, understand what remains disputed, and reach a human challenge route without specialized assistance? Usability is part of trustworthiness because an accurate system that ordinary people cannot navigate leaves the burden where it began.

Trust costs are also distributed across honest public servants and critics. A candidate with a responsible history may be treated as deceptive because the wider system has trained suspicion. A critic may be dismissed because institutional prestige outruns evidence. Better records protect neither side from disagreement; they protect both from a system that makes persona the primary evidence.

Distrust can be informative. It may signal real abuse, exclusion, failed service, or an inaccessible remedy. The City should not code skepticism as a deficit to be corrected in the public. It should

ask whether the institution has earned specific reliance and whether refusing reliance remains safe.

Evaluation uses disaggregated evidence: comprehension, source trace, correction latency, appeal completion, repeated inquiries caused by ambiguity, public-use barriers, and differences across language, disability, expertise, and political position. A rise in favorable opinion is not by itself evidence that trust burden fell.

Public trust cost belongs in appraisal because opaque institutions consume attention and coordination capacity. Yet the City's objective is not trust by awe or saturation. It is answerability that gives people better reasons to rely, disagree, investigate, or refuse (Government Accountability Office, 2020a; HM Treasury, 2026a).

32.1.5 — Cost Claim Caution

Cost-claim caution is the discipline that prevents institutional ambition from becoming a forecast. Before site, jurisdiction, cohort, legal form, operating model, and pilot evidence are fixed, the City cannot claim that it pays for itself, prevents a percentage of corruption, produces a trust return, or saves a determinate public amount. Appraisal may compare burdens while keeping every result conditional (HM Treasury, 2026a; Government Accountability Office, 2020a; Boardman et al., 2018).

Public summaries require an even stricter ceiling. They may explain that private leader formation has hidden burdens and that a visible institution must count its own full lifecycle costs. They may not convert modeled burdens into cash savings, treat correlation as prevention, or imply that construction is the only

remedy. The artifact should teach the comparison, not pre-decide it.

Fiscal seriousness begins by declining useful exaggeration. The City is likely to be expensive. The status quo and competing reforms are also costly in different ways. Only a versioned appraisal with alternatives, distribution, uncertainty, implementation risk, and the no-build case can show whether the proposed burden is justified.

The first caution is causality. If corruption later falls in a jurisdiction that uses the City, the City cannot assume it caused the fall without proper evidence. If trust rises, the reason may be broader social change, better journalism, legal reform, economic stability, or political renewal. Economic claims require careful attribution (Besley, 2005; Dal Bó et al., 2017).

The planning identity also protects against fiscal theater. A polished budget may still hide unfunded safeguards, deferred maintenance, staff goodwill, or host burdens excluded from formal line items.

Every major cost therefore needs a burden owner. If an item leaves the City budget, review must show whether it moved to staff, local services, participant stress, nonparticipant exposure, technical fragility, or later repair. A shifted burden is not a saving.

A plain-language test follows: if removing a cost would place burden on someone less able to consent, contest, repair, or leave, the reviewer must classify the item as a transfer, genuine saving, avoided-cost hypothesis, or deferred obligation. The test traces

who carries what the institution declines to fund; it is not proof (HM Treasury, 2026a; MHCLG, 2026; Flyvbjerg, 2006).

Fiscal prudence has a public-relations imitation. Calling the City efficient may reassure donors without showing that burden was placed fairly. The harder test is whether rights, staff, care, archive integrity, host mitigation, and exit remain funded after the language of efficiency disappears.

Plain public labels distinguish known cost, estimated cost, modeled hidden cost, pilot-observed cost, avoided-cost hypothesis, and unresolved cost. They prevent plausible burdens from becoming savings figures and let auditors say when a claim strengthens, weakens, or must be withdrawn. Each estimate's supporting file should identify its calculation version, price date, source inputs, and the person responsible for updating them. When an input changes, the revision log should separate the arithmetic effect from any model change, allowing an authorized reviewer to reproduce the difference.

A disciplined comparison names its counterfactual. Private elite training, campaign vetting, party pipelines, professional schools, civil-service formation, and no reform produce different results. The City may not choose the easiest comparator merely because it makes the budget look noble (International Monetary Fund, 2016; OECD, 2017a).

A versioned sensitivity and risk file, not one preferred forecast, completes the cost-claim analysis. Reviewers should see how construction contingency, inflation, staffing, wages, archive migration, host mitigation, discounting, demand, delay, failure,

and closure alter the result, including correlated stresses. The file names which assumptions reverse the decision and which remain unresolved. A case surviving only one optimistic configuration is too fragile to warrant construction (Government Accountability Office, 2020a; HM Treasury, 2026a; MHCLG, 2026; Kahneman and Lovallo, 1993). Construction finance becomes credible only when capital, operations, reserves, uncertainty, and exit costs remain visible under the same comparison that justified building.

32.2 — Capital Costs, Operating Costs, and Reserve Design

The City's budget is not one number. It is a layered moral structure. Capital costs build the place. Operating costs keep it alive. Archive costs protect memory. Care and exit costs preserve humanity. Reserves protect refusal, pause, and repair. If any layer is underfunded, the City will move burden somewhere else and may call the movement efficiency (Government Accountability Office, 2020a; HM Treasury, 2026a).

Founding cost and continuing cost must remain separate. Many institutions can raise money to open. Fewer can maintain staffing, care, technical integrity, complaint systems, accessibility, legal review, and repair after the first public excitement fades. Buildability is less about the ribbon cutting than about the tenth year, the first breach, the first serious complaint, the first shutdown threat, and the first decertification review.

Reserves turn practical voluntariness into an operational fact. They fund a participant's ability to leave without ruin, a staff member's ability to complain without endangering payroll, and a pilot's ability to pause while care and aftercare continue. Reserve floors should therefore be tied to exit, complaint, vendor replacement, breach response, host duties, and closure rather than to revenue volatility alone. Financial slack is part of the institution's noncoercion architecture (NIST, 2024a; ISO, 2019).

Each lifecycle category is paired with the capacity it purchases and the failure it is meant to prevent. Capital, operations, archives, care, exit, maintenance, and reserves remain visible beside their

burden owners, evidence basis, renewal horizon, and stop conditions. This prevents architectural prestige from consuming the less visible systems that make rights, correction, refusal, and closure usable (Government Accountability Office, 2020a; HM Treasury, 2026a).

32.2.1 — Capital Costs

The planning identity is a comparison frame. Every number entered into it should retain category, unit, scenario, time basis, uncertainty, affected people, evidence source, and decision owner so a low headline total cannot hide omitted obligations.

Capital costs begin with the stubborn reality of land, buildings, utilities, accessibility, resilience, secure archive space, care rooms, deliberation rooms, visitor boundaries, staff facilities, and systems infrastructure. A City that undercounts capital cost invites later shortcuts, and shortcuts usually fall on the people least able to refuse: workers, neighbors, participants, disabled visitors, archivists, and maintenance staff (Government Accountability Office, 2020a; World Health Organization, 2018b).

Consider a hypothetical host-review hearing. A donor offers to fund a ceremonial hall and public plaza, while the draft budget leaves archive migration, staff relief, accessibility remediation, vendor exit, and participant reintegration below credible ranges. The gift is attractive because it closes the most visible capital gap. The planning identity shows that it widens the institution's less visible liabilities and creates naming leverage at the same time.

Capital-cost artifacts explain function rather than perform spectacle. A diagram can explain why the archive requires hardened storage, why exit rooms require privacy, why staff areas require distance from participants, and why accessibility cannot be a decorative add-on. The built form should appear as an ethics instrument before it appears as an image.

The hearing does not ask whether the donor is generous or whether the design is beautiful. It asks which obligations would remain unfunded, who would carry the resulting burden, what assumptions support the ranges, and what the City could no longer afford to refuse. The proposal is restructured: the ceremonial element is reduced, the gift loses naming and governance conditions, and funds are redirected to lifecycle reserves, staff capacity, accessibility, archive migration, host mitigation, and exit support. A budget line changes the design because burden has become visible.

The capital-cost claim remains local to the City. *The Constitution of Fairness* owns legal authority, and *The Peace of Fairness* owns macrofinance and material capacity. Here the question is narrower and more concrete: does each built asset carry a fairness function, and can its cost be defended to those who bear it?

The worked file compares three planning scenarios rather than presenting one preferred total. The limited pilot occupies adapted buildings, restricts public interface hours, and delays several technical functions. The purpose-built pilot carries higher capital and commissioning risk but may reduce operational fragmentation. The no-build scenario redirects resources to existing civic education, disclosure, journalism, public

administration, and oversight reforms. None is treated as the moral default. The comparison records what each option can and cannot test, who benefits, who is burdened, and what evidence would change the decision (Boardman et al., 2018; HM Treasury, 2026a).

Capital accounting must continue beyond the construction invoice to commissioning, adaptation, and eventual decommissioning; excluding those later obligations can make an unsafe design appear affordable (Government Accountability Office, 2020a; HM Treasury, 2026a).

Every major category receives a burden owner. Capital compression belongs to workers when schedules become unsafe, to users when accessibility is deferred, and to future budgets when cheap systems fail early. Operating compression belongs to staff when ratios become impossible and to participants when correction, care, or public explanation slows. Archive compression belongs to bystanders when reidentification risk is accepted and to future custodians when migration is postponed. Naming the owner prevents a line from disappearing merely because it has been moved outside the institution's accounts.

The estimate preserves a basis of estimate. Quantity, unit rate, base year, location, scope boundary, design maturity, contingency method, escalation assumption, schedule, exclusions, source version, and confidence range remain visible. A polished total without those fields is not an estimate that another reviewer can reproduce.

The medium scenario initially appears strongest because it balances ambition and price. A lifecycle review changes that conclusion. The technical vendor assumes only three years of migration support, the operating plan treats public moderation as a part-time function, and the maintenance reserve excludes climate adaptation after the first major replacement cycle. The file therefore marks the apparent middle option as under-specified rather than prudent. A midpoint is not inherently moderate when its hidden assumptions are extreme (Government Accountability Office, 2020a; Flyvbjerg, 2006).

Reference-class evidence challenges inside-view optimism. Costs from comparable campuses, archives, accessible public buildings, secure technical systems, care facilities, and complex civic projects should be used where comparison is defensible. Differences in law, climate, scale, labor market, security, and service model remain explicit rather than being averaged away (Flyvbjerg, 2006; Boardman et al., 2018).

Host review also changes the budget. The first draft counts local jobs as benefit but does not separate permanent skilled roles from temporary subcontracting, nor does it model rental pressure near the site. The host panel requires a distributional appendix, a housing-monitoring trigger, local grievance funding, traffic mitigation, and an independent service-capacity review. These are not public-relations additions. They are costs of placing the City somewhere rather than nowhere (Kline and Moretti, 2014; Chapple and Zuk, 2016).

Design-to-cost is legitimate only after protected functions are fixed. The project may simplify finishes, reduce nonessential

area, stage expansion, reuse existing structures, or choose a different site. It may not create savings by removing accessibility, worker safety, archive integrity, complaint capacity, host mitigation, or the physical conditions required for care and exit.

The public-funding option arrives with a proposed annual appropriation and a request for government observer seats. Public money may require audit, procurement, reporting, and democratic authorization under applicable law, but it cannot silently make the City an operating arm of government or give an observer access to protected formation records. The financing route remains unresolved until actual legal and host review determine whether those conditions can be met; institutional enthusiasm cannot settle it.

Capital appraisal compares options by whole-life burden. A cheaper system that requires frequent replacement, proprietary migration, excess energy, inaccessible maintenance, or risky shutdown can be more expensive over time. The decision file therefore joins acquisition, operation, renewal, resilience, vendor exit, and closure rather than rewarding the lowest opening bid.

The philanthropic option is tested against the same discipline. The donor offers a large unrestricted gift on the understanding that the founder's family name will remain visible and that the funded platform will be presented as the City's central innovation. The gift is acceptable only after the institution proves it can refuse the naming, govern the platform independently, disclose connected interests, return unused funds, and continue care and exit without future rescue (Reich, 2018; Pfeffer and Salancik, 1978).

Public explanation shows why each major asset exists, which burden it reduces, which lower-cost alternative was examined, and what follows if the asset is omitted. Architecture earns dignity by serving function and human scale. Monumental form, donor preference, or the desire to appear historic cannot substitute for necessity, burden reduction, and transferability.

The final decision is conditional rather than celebratory. The adapted-site scenario advances only to a narrower design and host-evidence phase, with admissions, technical activation, public claims, and accreditation discussion expressly blocked. The planning identity succeeds not by producing a persuasive number, but by preserving the City's ability to change or refuse the project.

32.2.2 — Operating Costs

Operating costs are the price of keeping fairness alive after opening day. Staff salaries, training, supervision, utilities, food, cleaning, security, clinical support, legal review, records administration, public-interface moderation, accessibility support, technology maintenance, insurance, complaint handling, and external audit all belong in the operating budget. If these costs are minimized to make the City look affordable, the burden will return as burnout, delay, unsafe shortcuts, or hidden unpaid labor (World Health Organization, 2018b; United Nations, 2006).

Operating cost is where the City's moral language meets payroll. The institution cannot ask for severe public-power formation while treating staff, reviewers, clinicians, archivists, and maintenance workers as invisible scaffolding. A fair City pays for the labor its own standards require.

Service capacity gives operating cost its public meaning. The budget must show who receives a complaint, who reviews a shield request, who maintains provenance, who supports accessibility, who covers a crisis shift, who keeps the record site usable, and who protects staff rest. A promise without a staffed and funded route is not an operating commitment (Government Accountability Office, 2020a; HM Treasury, 2026a).

Capacity modelling begins with demand, not an ideal organization chart. Expected and surge volumes, service-time assumptions, simultaneous needs, leave, training, supervision, turnover, relief coverage, and after-hours duty determine whether staffing is real. Before any go/no-go decision, the model should publish a low, base, and high annual operating range; required full-time-equivalent staffing by protected function; reserve and relief assumptions; expected service volumes; and per-participant-year or per-pathway cost ranges where those denominators are meaningful. Every figure should carry its source, base year, uncertainty, expiry, and trigger for revision. Headcount alone can hide a system that works only when needs arrive one at a time.

Each service needs a minimum standard and an escalation rule. Complaint acknowledgment, protected review, urgent care, accessibility response, archive correction, incident communication, and exit support have different time horizons. Delays that would undermine a right or safety route trigger workload reduction, temporary intake limits, or admissions pause.

The operating model must price role separation. The same person should not recruit participants, judge complaints, authorize record release, approve donor conditions, and certify compliance merely because the institution is small. Independence has a staffing cost. Treating that cost as administrative excess would rebuild hidden power inside a visible institution.

Recurring training, simulation, maintenance, security review, legal updating, language access, and vendor transition are operating duties rather than launch expenses. An institution forgets when renewal is not funded. A system that was safe on opening day can become unsafe through staff turnover, drift, obsolete software, or degraded infrastructure.

Efficiency is earned when waste is removed without reducing care, rest, correction, safety, access, or refusal. A lean profile is dishonest when it relies on unpaid overtime, staff families absorbing exhaustion, deferred maintenance, slower appeals, or participants managing institutional gaps. The cost model should make those transfers visible (ISO, 2021b; World Health Organization and International Labour Organization, 2022).

32.2.3 — Archive Costs

Archive costs are not optional storage costs. They cover capture, classification, redaction, retention, migration, chain of custody, access control, delayed release, cybersecurity, public search, correction, provenance, audit logs, and long-term stewardship. A weak archive makes every other cost dishonest because the City's formation record cannot carry public trust if its memory is cheap,

unstable, or vulnerable to capture (Government Accountability Office, 2020a; HM Treasury, 2026a).

Archive-cost artifacts need to show how spending protects privacy as well as openness. Storage, trained redaction, query controls, migration, and delayed-release review prevent raw memory from becoming spectacle. A cost table should distinguish public access from protected custody so critics can see why archive infrastructure is not a surveillance warehouse.

Archive funding remains subordinate to human dignity. Public memory serves answerability; it does not own the person. The City pays for records because public-power formation must be reviewable, not because every intimate or contextual trace deserves preservation. A sound archive budget therefore funds minimization, lawful access, correction, deletion, sealing, and restraint as deliberately as it funds capture and storage.

Storage is only one component of archive cost. Human review, accessibility, security, incident response, deletion verification, and long-term custody often determine whether memory remains lawful and usable (ISO, 2016a; NIST, 2024a).

Workload units anchor the estimate. Consider an illustration, not a staffing recommendation: 20 participants producing 2 recorded role-hours a day over 300 days would generate 12,000 source-hours a year. At an assumed 1.5 human-review hours per source-hour, review would require 18,000 labor-hours. If one full-time reviewer supplied 1,200 net review hours a year after leave, training, supervision, and other duties, that task alone would require 15 full-time-equivalent reviewers. These assumptions are

invented for the example and must be replaced by dry-run evidence. The calculation excludes care, security, storage, translation, appeals, and other archive work. It shows why record volume, review intensity, and usable staff time belong in the same estimate; it does not justify broader capture or weaker review.

Retention and deletion both cost money. Indefinite keeping creates security, review, and context burdens. Deletion requires authorization, proof, exception handling, legal-hold separation, and evidence that copies or model-training derivatives did not survive elsewhere. A cheap archive that cannot delete lawfully is not a low-cost archive.

Archive costing must include exit, not merely operation. Budget lines should cover export, metadata and audit-log portability, replacement support, verification, migration testing, continuity during cutover, and lawful erasure so vendor dependence is priced before selection.

Public usability is also an archive expense. Search, status labels, language access, non-digital help, accessible documents, source trace, and human explanation require design and staffing. A technically complete archive that ordinary users cannot interpret leaves the public burden unresolved.

Archive funding fails when core functions depend on temporary grants, proprietary goodwill, or unpriced staff improvisation. No record function should activate without a funded path for correction, migration, incident response, and retirement. If the institution cannot afford lawful memory, it cannot afford the record burden it proposes.

32.2.4 — Care and Exit Costs

Care and exit costs protect the City from coercion by dependency. If participants, staff, families, or dependent persons can remain safe only by staying in the institution, the City has built captivity into its budget. Housing continuity, health support, dependent care, counseling, debt stabilization, transportation, mediation, severance, and post-exit privacy protections belong in the cost architecture because refusal must be real (Hirschman, 1970; Wertheimer, 1987).

Public communication presents care support as infrastructure rather than luxury. It is a safeguard against hidden coercion. A participant who cannot leave because housing, medical care, dependent care, or public explanation would collapse is not freely carrying public-power burden. A staff member who cannot report a problem because employment loss would be devastating is carrying hidden institutional risk.

This cost line is one of the clearest Law of Fairness tests in the chapter. Burden is not fair merely because a person volunteered at the beginning. It remains fair only if they can pause, leave, be redirected, or return to ordinary life without the City making material survival depend on obedience.

Eligibility and continuity rules attach care and exit costs before entry. The plan identifies which supports arise because the City created burden or dependence, who decides confidentially, what emergency route applies, and how review occurs without turning care into a loyalty test. Undefined generosity is less reliable than a narrow, funded obligation.

Clinical and therapeutic judgment remains independent of admissions, discipline, fundraising, and public narrative. The budget must support confidential referral, second opinion, emergency care, reasonable accommodation, and continuity when participation pauses. No official should be able to delay care to preserve a cohort, a schedule, or an institutional story.

Exit support is portable enough to make refusal real. Housing transition, health continuity, dependent arrangements, travel, legal or financial advice, record review, and time-limited reintegration may be required where the City created practical reliance. Portability does not mean lifetime sponsorship; it means the institution cannot use avoidable ruin as an exit deterrent.

The cost model distinguishes ordinary support, acute response, aftercare, and closure continuity. Each category has an owner, trigger, duration, evidence rule, appeal route, and reserve source. This prevents the care budget from being consumed by routine operations until a person most needs it.

Staff and household routes matter as well. A pause can move workload to colleagues, care to partners, uncertainty to children, and costs to host services. Exit appraisal therefore traces the whole transition rather than treating the participant's departure date as the end of institutional responsibility.

The governing rule is practical: active burden requires funded care, and voluntary participation requires funded exit. When those routes cannot be financed at the planned cohort size, intake should shrink or stop rather than the promise of care becoming thinner.

Budget realism therefore protects consent before the first person enters (Hirschman, 1970; Wertheimer, 1987).

32.2.5 — Reserve Design

Reserve design is the budgetary form of the City's promise that safeguards will not vanish when money tightens. A reserve is not idle virtue or a general cash cushion. It is ring-fenced refusal, repair, host mitigation, incident response, litigation and rights review, payroll continuity, vendor transition, decertification, exit, and closure capacity held before crisis demands it. Each reserve needs a protected purpose, release authority, liquidity rule, minimum floor, replenishment plan, and prohibition on diversion to expansion (ISO, 2019; Government Accountability Office, 2020a).

Reserve design also protects independence. If a single donor can threaten withdrawal and force a governance concession, reserves are too weak. If a vendor migration is impossible because no transition reserve exists, public memory is privately captured. If staff cannot report harm because payroll depends on reputation, the institution is financially fragile in a morally dangerous way.

The central budget error would be to treat visible construction as the main cost and human sustainability as secondary. The City is not a monument with services attached. Its moral reality is created through staff ratios, record integrity, care routes, complaint systems, and the funded possibility of exit. A beautiful shell without those capacities is an incomplete institution rather than a cheaper one.

Purpose-specific reserves prevent one large balance from inviting silent substitution. Operating liquidity, maintenance, cybersecurity incident response, care, exit, host repair, vendor transition, decertification, and closure face different triggers and time horizons. A reserve cannot protect refusal if it may be spent on expansion without an independent decision.

The reserve file states the minimum protected amount, replenishment rule, eligible uses, authority to release, evidence required, review interval, and consequence of falling below threshold. The public need not receive sensitive operational detail, but it should know which obligations are ring-fenced and who can stop admissions when protection weakens.

Liquidity and budget adequacy are distinct. An institution may have assets while lacking cash available when a breach, evacuation, vendor failure, or departure occurs. Stress testing should examine timing, convertibility, legal restrictions, donor conditions, insurance delays, and the possibility that several costs arrive before reimbursement.

Compound scenarios matter more than isolated shocks. A technical incident may create legal review, public communication, participant support, staff overtime, vendor migration, and host-service demand at the same time. Donor withdrawal can coincide with reputational crisis. Reserve adequacy should be tested against correlated events rather than one emergency at a time (ISO, 2019; Weick and Sutcliffe, 2015).

Predeclared triggers govern release. Falling below the care and exit floor stops new admissions. Falling below the maintenance

floor blocks expansion. Loss of vendor-transition capacity disables affected systems. Inability to fund closure requires immediate external review. These responses should not depend on confidence, embarrassment, or founder preference.

Independent reserve governance resists momentum. Finance proposes; the rights, care, host, records, or closure owner verifies the protected need; an authorized body decides; and the decision is logged with dissent. No single team should be able to spend a reserve that exists to constrain that team.

Before admissions, jurisdiction-specific legal and financial review should establish whether care, exit, payroll, data-migration, and closure reserves can be held in segregated fiduciary, escrow, trust, or other protected arrangements that remain usable during leadership conflict, donor withdrawal, vendor failure, or insolvency. If a reserve disappears with the operator, it is not a credible exit safeguard.

Replenishment is part of the design. After use, the institution states what remains, which activities are limited, when the reserve must be restored, and what happens if restoration fails. Borrowing from a protected reserve without a credible replenishment path converts a safeguard into a temporary label.

Reserve design is therefore a test of stoppability. A City that can open but cannot pause, care, migrate, repair, decertify, or close has financed momentum rather than freedom. The prudent budget is the one that remains humane when the institution is least able to rely on optimism (Government Accountability Office, 2020a; HM Treasury, 2026a).

32.3 — Public, Philanthropic, and Mixed Finance

No funding source is morally pure by default. Public funding can create democratic legitimacy and legal accountability, but it can also invite government pressure, partisan capture, budget politics, and constitutional complexity. Philanthropic funding can create early capacity and experimental freedom, but it can also invite donor mythology, soft ownership, naming hunger, and access claims. Mixed finance can reduce dependence on one source, but it can also blur accountability (Reich, 2018; Frumkin, 2006).

Finance therefore has to be governed as a domain of authority. The central question is not only whether a source can pay. The question is what the source can influence, what it must be barred from influencing, how its terms become visible, and how the City can remain able to refuse. Funding becomes fair only when it is transparent, bounded, audited, and unable to purchase authority.

Final financing cannot be fixed in the abstract. Different jurisdictions, pilot stages, host communities, legal structures, and public mandates may require different arrangements. What cannot vary is the rule that money may not buy the Vow, the archive, admission, governance, public meaning, doctrine, research use, or silence.

The public funding map distinguishes source, amount, restriction, term, governance rights, naming rights, access rights, vendor relation, conflict status, and audit status. Unlike a donor wall, it exposes authority rather than celebrating generosity. Readers can see who makes the institution possible, what each source is

permitted to support, and which forms of influence remain prohibited (OECD, 2015; UNCITRAL, 2011).

32.3.1 — Public Funding Possibility

Public funding can be considered only under legal review, political neutrality, rights protection, and ordinary-privacy safeguards. It may offer democratic legitimacy and stable support, but it can also turn the City into a perceived government instrument, incumbent advantage, party tool, or state-sponsored credential. Because no route is presumptively mature, public finance remains a jurisdiction-specific choice subject to strict anti-capture conditions (Callahan, 2017; Pfeffer and Salancik, 1978).

Public artifacts must be careful. A diagram that shows public money entering the City could be misread as government ownership or as proof that City graduates deserve office. The safer artifact labels funding as support for a testable institution and shows the firewalls: funding source, independent governance, legal gate, rights review, no admission influence, no voter instruction, and no formal-law proof claim.

The public-funding question belongs partly to law and government, but the City book owns its own boundary. It may say what funding must never buy. It must not decide constitutional legality, election treatment, or macro-budget priority as if design alone enacted law.

Public funding may be appropriate in some contexts because the City serves a public-power function. If the City helps form and make knowable people who seek public authority, a public

funding argument can be made. But such funding requires legal review, democratic authorization, public accountability, and careful protection against government control of the institution's records or admissions (OECD, 2015; UNCITRAL, 2011).

Public money can bring legitimacy because citizens can see the appropriation, debate it, challenge it, and subject it to public law. It can also reduce dependence on private donors. A City funded entirely by wealthy benefactors may struggle to persuade the public that it has not been shaped by the class of people it should be able to review.

Yet public funding can also create danger. Governments may try to shape admissions, suppress embarrassing records, influence readiness bundles, limit criticism, favor political allies, or use budget pressure to discipline the City. Public funding cannot become public ownership of participant interpretation or archive truth.

Jurisdictional legality is nonnegotiable. Public funding would raise constitutional, public-record, procurement, labor, privacy, administrative, and political questions. Those questions can be identified here, but legal architecture must review them before any actual structure is treated as possible (Frumkin, 2006; McGoey, 2015).

Public funding also cannot become mandatory civic ideology. Citizens should not be forced through taxation into funding an institution that operates outside lawful authorization, rights review, or democratic process. Public finance requires public justification, public limits, and public ability to challenge.

32.3.2 — Philanthropic Funding Possibility

Philanthropic funding can create room for patient pilot work and early infrastructure, but it also creates a distinctive burden: gratitude. A large gift can become a story, relationship, naming expectation, access request, or soft veto even without an explicit condition. The financing plan must therefore include the governance labor, reserves, and disclosure needed to keep generosity from becoming authority (OECD, 2015; UNCITRAL, 2011).

Consider a benefactor who offers to fund the archive building but asks for naming sovereignty and early research access. The fair answer is not a negotiation toward symbolic compromise. The gift must be refused or redesigned because the archive's public trust cannot be purchased by private prestige.

Philanthropy is not morally disqualified by wealth, but it is never innocent by size alone. The governing burden question asks where donor burden goes: onto governance bodies, ordinary citizens, future participants, staff who feel loyalty pressure, or public readers who wonder whether the City's record has been softened.

Philanthropic funding may help begin a pilot when public systems are not ready to fund an untested institution. It can provide patient capital, experimental capacity, and early independence from partisan budgeting. But philanthropy is never free of power. A gift carries narrative, access expectations, social prestige, tax implications, and often a desire to be associated with history (Frumkin, 2006; McGoey, 2015).

The donor may not intend capture. Capture can occur through gratitude, proximity, habit, repeated access, staff caution, naming practices, favored contractors, or the institution's fear of losing support. Soft ownership is often more dangerous than explicit control because it can remain deniable while shaping behavior.

Philanthropy can widen civic possibility when acceptance occurs through a public anti-capture filter. Donors receive no admissions influence, archive access, governance priority, protected briefing beyond the authorized reporting class, control over research or public meaning, or exemption from audit. The gift agreement, cumulative dependence, connected interests, conditions, renewal risk, and return route remain reviewable before the money becomes operationally necessary.

Naming is especially risky. A donor name on a building can become symbolic sovereignty, especially in a City designed to form public power. The City should be extremely cautious with naming rights and should forbid names on core spaces such as the archive, participant record site, rights offices, ombuds structures, admission gates, and public interface thresholds (Pfeffer and Salancik, 1978; Ebrahim, 2003).

Philanthropy also must not create a donor class around visible participants. Invitations, dinners, visits, private tours, informal conversations, and prestige events can become influence channels. Donor relations should be designed so funders support the institution without gaining privileged access to participants or staff influence.

The City may accept philanthropy only if it can afford to disappoint donors. If the City cannot say no, publish conflicts, reject a restricted gift, or survive withdrawal, then philanthropy has become dependency. The gift should serve safeguards. It cannot become a claim on the City's soul, archive, or future (OECD, 2015; UNCITRAL, 2011).

32.3.3 — Mixed Funding Possibility

Mixed funding can reduce dependence on one source, but diversity can also multiply capture routes. Public grants, philanthropic gifts, user fees, research support, endowment returns, bond-like instruments, vendor discounts, and host contributions each bring their own expectations. A mixed model is not safer because it is complex; it is safer only if the complexity is visible enough to audit (Frumkin, 2006; McGoey, 2015).

Public presentation must not use mixed finance to blur responsibility. A reader should not have to decode a financial puzzle to know who pays for the archive, who pays for care, who pays for construction, who pays for host mitigation, and who reviews conflicts. Complexity should be converted into legibility, not used as institutional armor.

Mixed finance is best treated as an engineering problem in civic trust. Multiple supports can strengthen the institution only when their joints are inspectable and none can become a hidden control path. The financing design must reveal where leverage could enter, how one source can be replaced, and which safeguards survive if a relationship turns hostile.

The benefit of mixed finance is resilience. A City funded by several sources may be less vulnerable to one donor, one government cycle, one vendor, or one political shift. It may also allow different cost classes to be funded differently, with public support for public interfaces, philanthropic support for pilots, and endowment support for long-term care and maintenance.

The danger is opacity through complexity. If the funding stack becomes too complicated for citizens, participants, staff, and host communities to understand, it becomes another hidden power structure. A mixed funding model should be simpler to audit than to hide behind.

Mixed finance also creates boundary problems. Public money may come with legal duties. Philanthropic money may come with restrictions. Vendor financing may come with technical dependence. Fee structures may create access inequity. Endowment governance may create long-term control questions. Each source must be mapped to its risks (UNCITRAL, 2011; Reich, 2018).

Mixed finance becomes safer when each source is separated by the risk it creates. A source that benefits from public office cannot fund admissions; a vendor cannot finance a system it alone can operate; a donor cannot personalize participant support; and a party, campaign, or political vehicle cannot finance a participant's pathway. The funding architecture should prevent one source from combining access, dependency, and interpretive influence across several channels.

32.3.4 — Funding Open Decisions

Financing remains an open design question because premature certainty would be false. The City can define unacceptable capture, required safeguards, review routes, and cost categories while leaving the public, philanthropic, mixed, fee, endowment, and host-contribution mix to jurisdiction-specific decision. Responsible design here means knowing which boundaries survive every model. It does not mean pretending that institutional finance has already been solved (Pfeffer and Salancik, 1978; Ebrahim, 2003).

Public communication can make that uncertainty confidence-building rather than embarrassing. A mature institution can state which financing routes remain under review, what evidence will decide among them, and when the decision expires. What remains fixed is that rights, audit, exit, anti-capture, and ordinary privacy are not bargaining chips while funding is undecided. Clarity about the open question strengthens the credibility of the closed boundaries.

Funding review belongs at the major gates: pilot design, preconstruction, admissions, first-year operation, first audit, and replication review. A model that fits a small pilot may fail at scale, and a model that protects one host jurisdiction may create inequity in another. The review calendar remains public so an unresolved financing choice cannot quietly harden into custom.

Financing cannot be universalized before a legal entity, jurisdiction, host, and operating scale exist. Public, philanthropic, and mixed arrangements may differ across pilot phases, nonprofit

law, public mandates, labor structures, and transition sequences. Any chosen route remains provisional until expert, legal, host, and affected-person review establishes that its authority and burdens are acceptable (UNCITRAL, 2011; Reich, 2018).

Open does not mean vague. The document should identify which questions are unresolved: whether public funds are permissible, whether philanthropic funds are limited by amount or category, whether an endowment is required, whether fees are prohibited, whether host communities receive statutory mitigation, and how reserve thresholds are enforced.

Unresolved design choices and moral locks belong in different categories. The funding source mix may remain unsettled; donor control may not. The exact reserve percentage may remain unsettled; the need for exit reserves may not. Public funding law may remain unsettled; legal review may not.

Unresolved financing choices require language precise enough to prevent a proposal from hardening into assumed policy. Each record should identify the candidate model, alternatives, legal question, evidence needed, affected people, and review authority. Implementation language remains inappropriate until competent leadership, law, and expert review have settled the matter (McGoey, 2015; Callahan, 2017).

Public artifacts must distinguish candidate financing from ratified financing. Diagrams, donor pages, websites, recruitment materials, and summaries should identify what remains proposed, what is prohibited, and who must decide. Public trust can be

damaged by premature certainty even where the underlying idea is responsible.

Unresolved design belongs in the open rather than behind false funding certainty. Leaving a funding question unresolved can be more honest than hiding complexity behind a polished donor narrative. The record must state what is unknown, who owns the decision, what interim rule applies, and what evidence will close it (Pfeffer and Salancik, 1978; Ebrahim, 2003).

Every unresolved funding choice has a visible owner, question, alternatives, legal dependencies, affected people, evidence need, interim rule, expiry date, and prohibited inference. Until the competent authority decides, any temporary arrangement should remain narrow and reversible. Neither polished language nor institutional momentum can convert an unresolved choice about public subsidy, endowment structure, tax treatment, debt, or guarantee into settled City policy (HM Treasury, 2026a; Ebrahim, 2003).

32.3.5 — Transparency of Funding

Funding transparency is the right of the public to see who pays, what they pay for, what they cannot buy, what conditions were refused, and how financial dependence might affect institutional behavior. It is not a demand to expose every minor transaction in a way that endangers staff, vendors, residents, or security. The City must distinguish legibility from raw disclosure (UNCITRAL, 2011; Reich, 2018).

The funding transparency system records source category, major contribution bands or exact amounts where legally required,

restrictions, naming terms, governance exclusions, vendor relationships, conflict assessments, audit dates, and withdrawal risks. It should be readable by nonexperts because public legitimacy cannot depend on specialist interpretation alone.

Two ledgers are necessary: a public funding ledger and an internal conflict ledger. The first preserves public visibility over sources, terms, and restrictions; the second allows deeper review of conflicts that may contain sensitive information. Independent oversight can inspect both under appropriate safeguards, so unreported generosity never has to be accepted on faith.

Transparency must include changes over time. A harmless source can become a capture risk when repeated. A restricted gift can become more influential when budgets tighten. A vendor credit can become dependency after systems are built around it. Funding transparency should be longitudinal, not a launch-day disclosure (McGoey, 2015; Callahan, 2017).

The financing discussion must preserve a clear distinction between possible and permissible. A source may be financially possible while morally unsafe. A gift may be legal while capture-prone. A public appropriation may be authorized while politically distorting. A mixed model may be resilient while too opaque for public trust.

Any proposed funding model therefore needs a funding-risk matrix. The matrix should identify the source, benefit, restriction, influence risk, legal review need, conflict pathway, exit consequence, disclosure status, and safeguard required before

acceptance. A funding model that cannot be mapped cannot be trusted.

A refusal test asks whether the City can reject a public condition, donor request, vendor discount, or political favor while protecting participants and staff already under burden. If it cannot, dependence already governs the financing model (Ebrahim, 2003; OECD, 2015).

Funding requires hard anti-capture limits: money cannot buy entry, archives, governance, correction, priority, or the public story. The next section names refusal rules and consequences. If refusal is not financially possible, the firewall is ceremonial.

The public funding register records source, amount, restrictions, concentration, renewal expectations, related parties, vendor ties, governance contacts, and rejected conditions. It should reveal whether money shapes choices without exposing every administrative detail, remaining readable to citizens and auditable by specialists.

Rejected offers also require institutional memory, even when legal or privacy constraints prevent full publication. Attempts to buy admission influence, naming sovereignty, archive access, research priority, governance influence, or silence should not disappear merely because the offer was refused. Refusal records teach future fundraisers where the boundary is and show the public that it was used (Reich, 2018; Frumkin, 2006).

Reversal testing asks how finance behaves after goodwill ends—when a major funder becomes hostile, insolvent, constrained, or unwilling to continue. Contracts, data custody, staff pay,

maintenance, portability, reserves, and shutdown duties must remain usable without personal favor or emergency surrender. A route that works only while relationships are warm is delayed dependency; the file must show how the institution can continue, narrow, or close after a major exit (Government Accountability Office, 2020a; HM Treasury, 2026a).

Each funding route needs rules for declining, returning, isolating, or expiring money and a named authority. Public money is not automatically clean, philanthropy corrupt, or mixed finance resilient. The test is whether funding can buy admission, archives, naming, silence, or permanence. Credibility requires rejecting convenient money without shifting costs (OECD, 2017b; International Monetary Fund, 2016).

32.4 — Anti-Capture Funding and Donor Limits

Anti-capture funding rules exist because the City's purpose makes it unusually attractive to people who want influence over future public power. A donor may not ask for crude control. They may ask for access, proximity, recognition, advisory voice, early information, private tours, influence over design, preferred vendors, or a named place in history. Capture often begins as courtesy (Rose-Ackerman and Palifka, 2016; OECD, 2015).

Donor limits have to precede donor gratitude. It must be clear that funding is welcome only when it does not purchase authority. A person or institution may support the City's safeguards. They may not shape admissions, archive access, governance priority, participant visibility, public release, or silence around failure.

Donor discipline also protects serious donors. The best donor does not want the City to become donor-owned. Clear rules prevent future suspicion, protect the donor from being imagined as a hidden ruler, and protect staff from informal pressure. Anti-capture rules are not insults to funders. They are the conditions under which funding can remain honorable.

The directional test is simple: money may move toward safeguards, never toward control. It may support rights, care, host mitigation, archive integrity, staff dignity, maintenance, reserve design, accessibility, and independent audit. It may not purchase access to the people, records, meanings, or decisions those safeguards exist to protect. Every funding instrument is judged by that direction, including informal expectations that never appear

in the contract (Pfeffer and Salancik, 1978; Rose-Ackerman and Palifka, 2016).

32.4.1 — No Admission Influence

No admission influence means that money cannot purchase entry, priority, leniency, role pathway, visibility advantage, review delay, appeal favor, or quiet exception. The prohibition covers direct requests and indirect leverage through board members, founders, sponsors, intermediaries, named programs, political allies, or staff anticipation of donor preference (World Bank, 2020; Rose-Ackerman and Palifka, 2016).

The firewall begins with information separation. Fundraising personnel do not receive application files. Admissions personnel do not receive donor identities or contribution histories except where a legally necessary conflict alert is routed through independent compliance. Shared databases, informal briefings, and calendar access should be restricted accordingly.

Every donor contact about an applicant is logged, preserved, and routed outside the admissions chain. The record states who initiated contact, what was requested, who received it, what action followed, and whether any reviewer needs recusal. Polite language, friendship, or public prominence does not change the category.

Intermediated influence requires beneficial-control review. A request may arrive through a foundation, adviser, alumni group, political office, partner organization, or scholarship sponsor rather than the economic source of support. The firewall follows the influence network, not only the name on the message.

Access support remains permissible when it is independent of donor preference. Translation, travel aid, disability accommodation, application help, legal assistance, and broad outreach can reduce unequal opportunity. They should be financed through general pools with published criteria and administered by staff who cannot confer admission advantage.

Selection analysis tests for unexplained associations with donor networks, schools, regions, families, public figures, or sponsored programs. Statistical patterns do not prove improper influence, but they can trigger file review, process testing, and stronger separation. The analysis must avoid turning applicants into public suspicion objects.

The rule protects rejected and nonapplying people as much as admitted participants. A threshold that appears purchasable teaches the public that visible formation begins with invisible sponsorship. That perception can deter qualified applicants and reproduce the prestige pipeline the City was designed to examine.

A clean admissions threshold is more important than any gift. When the City cannot finance itself without donor access to selection, the correct finding is financial nonreadiness. The remedy is a smaller program, a different funding model, delayed admissions, or refusal of the money, never a softer firewall (Ebrahim, 2003; Pfeffer and Salancik, 1978).

32.4.2 — No Naming Sovereignty

No naming sovereignty means that recognition cannot become jurisdiction. A donor may not use a name, brand, memorial, endowed title, or sponsored program to control admission,

curriculum, archive interpretation, hiring, research priority, public communication, governance, or future use of the institution. Recognition is subordinate to function and revocable public responsibility (Reich, 2018; Callahan, 2017).

The naming policy distinguishes core civic assets, noncore spaces, temporary acknowledgments, historical records, and program descriptions. Archive, rights, complaint, care, exit, deliberation, and accreditation functions should not be branded as private property. The public should never have to speak a donor's name to use a right.

Every naming term has scope, duration, renewal conditions, conflict review, public status, and revocation grounds. Perpetual recognition is especially dangerous because future leaders inherit dependence without fresh consent. Time-limited terms preserve the ability to correct a relationship when facts or public values change.

The agreement prohibits design control and symbolic supremacy. A contribution cannot require monumental scale, privileged location, exclusive access, donor portraiture in rights spaces, or aesthetic choices that imply ownership. Architecture remains accountable to accessibility, function, host context, and cost discipline.

Related-party and cumulative naming effects matter. Several modest agreements from one economic network can create a campus that feels privately owned even when no single term crosses the formal threshold. Review should aggregate related donors, entities, family offices, advisers, and vendor ties.

Revocation must be operational. The City should know who can remove a name, what evidence is required, how records preserve the historical fact of the gift, how costs are funded, and how public explanation avoids both concealment and spectacle. A revocation clause that cannot be used is symbolic compliance.

Recognition never purchases narrative immunity. Public records may state the contribution and its accepted purpose while also recording rejected conditions, conflicts, later review, suspension, or revocation. Gratitude does not create a duty to omit material facts.

A donor may withdraw support when a name is refused or removed. That possibility belongs in reserve and dependency analysis before the gift is accepted. An institution that cannot survive the use of its own revocation clause has already sold more than a sign.

The safest default is modest recognition without sovereignty. The City can acknowledge help, preserve provenance, and honor legitimate contribution while refusing the conversion of money into public identity, control, or permanence (Frumkin, 2006; Ebrahim, 2003).

When the distinction remains unclear, the naming arrangement is declined. A useful contribution does not require the institution to risk confusion about who owns its rooms, records, standards, or public purpose.

32.4.3 — No Archive Access

No archive access means that contribution does not create a privileged route to participant records, protected material,

research data, unreleased findings, search functions, correction files, audit logs, or interpretive tools. The donor sees only what any member of the same lawful access class may see (ISO, 2016a; W3C, 2013).

The prohibition extends to informal preview. Briefings, demonstrations, donor tours, technical pilots, board packets, and fundraising stories can reveal protected information without granting a formal account. Every access path, including export, screen share, sample data, and model output, should be governed by the same role and purpose rules.

Research support does not purchase data priority. A funder may support a lawful research program only under independent protocol, consent, governance, publication, and conflict review. The funder may not choose participants, compel reuse, delay adverse findings, receive identifiable data, or obtain a proprietary model of the record system.

Technical vendors are not exempt because access is necessary for service. Least privilege, supervised support, logging, purpose limits, test data, secure environments, deletion, and vendor exit remain contractual requirements. A donor who is also a vendor receives the stricter combined conflict review.

Anomaly review tests unusual access patterns involving funders, board members, executives, vendors, researchers, and their intermediaries. Detection supports investigation; it does not create public accusation by algorithm. Independent human review remains necessary before any finding or remedy.

Public demonstrations use synthetic or deliberately prepared records that cannot reconstruct a person through rare details. Even anonymized examples can expose identity when the cohort is small. The burden of showing technical capability belongs to the institution, not to participants whose lives make the demonstration interesting.

Affected persons retain the right to challenge archive decisions. A participant, bystander, staff member, or host resident who believes donor or vendor influence altered access can seek an independent log review, correction, restriction, notice, and appeal. Remedy includes containment and deletion where lawful, not merely a future promise.

A breach or near miss involving a funder triggers more than ordinary incident response. The review examines the funding relationship, governance access, vendor ties, staff pressure, public communication, and whether continued support is compatible with independence. Money may need to be returned or segregated.

Archive independence must be demonstrable before activation. If donor or vendor access cannot be refused without interrupting essential service, custody has already become leverage. The gate remains closed until the City can operate independently, migrate the function, replace the provider, or adopt a financing route that preserves refusal. An archive is not independent merely because its contract uses the word (NIST, 2024a; Government Accountability Office, 2020b).

32.4.4 — No Priority Governance

Financial support creates no priority in governance. It cannot buy agenda order, board seats, vetoes, committee control, staff appointments, policy priority, audit scope, public-message approval, or faster resolution of a preferred issue. Advice may be heard through the same lawful routes available to others, but governing authority arises from the institution's public structure rather than the size of a gift (Reich, 2018; Pfeffer and Salancik, 1978).

The rule reaches soft priority as well as formal authority. A donor dinner, recurring private briefing, early access to plans, privileged access to founders, or repeated invitation to strategic sessions can shape attention without a formal vote. Contact frequency, subject, participants, and resulting actions belong in the influence record.

Board composition requires cumulative conflict review. A person may be independent in legal form while financially, professionally, socially, or politically tied to major supporters. Beneficial ownership, shared advisers, family relationships, vendor interests, and future employment expectations should be considered before appointment and during service.

Agenda-setting power remains traceable. Proposals identify origin, supporting evidence, conflicts, affected people, decision owner, and disposition. When a donor-originated proposal proceeds, the record should show the same review applied to any other proposal and why the issue belongs within City authority.

Funders cannot control silence. Agreements should prohibit approval rights over publication, criticism, incident notice,

adverse findings, suspension, decertification, or return of funds. Confidentiality may protect lawful private information, but it cannot suppress institutional facts necessary for rights, audit, or public accountability.

Priority governance also includes negative control. A supporter must not be able to slow a review, postpone a public warning, narrow an audit, or threaten withdrawal to prevent an uncomfortable decision. Reserve design and diversified funding make refusal operational rather than rhetorical.

The public record discloses material governance contacts and the categories of proposals received without turning every conversation into spectacle. Legibility requires enough information to identify influence routes, recusals, rejected conditions, and decision consequences while protecting legitimate security and personal privacy.

A near miss triggers process review. Staff anticipation of donor preference, an agenda item moved after a funding conversation, or a reviewer excluded because of anticipated controversy may reveal capture even when no explicit instruction exists. Institutional dependence often acts through expectation.

When financial support and governing independence cannot coexist, the money must yield. A City that keeps a donor by surrendering agenda, audit, warning, or correction authority has converted public formation into private government (Ebrahim, 2003; Rose-Ackerman and Palifka, 2016).

32.4.5 — Donor Audit

Donor audit turns funding influence into a reviewable object. It examines economic source, beneficial control, restrictions, timing, renewal dependence, related parties, intermediaries, public narrative, vendor ties, political connections, naming and access requests, promised future support, and attempts to affect admissions, research, governance, or public explanation. The process is ordinary integrity work rather than an accusation. It connects findings to rejection, refund, isolation, disclosure, recusal, and review remedies (OECD, 2015; OECD, 2025c; UNCITRAL, 2011; World Bank Group, 2025).

Donor audit requires enforceable remedies. A gift may be rejected, restructured, anonymized in a lawful public way, moved to a blind general fund if permissible, separated from naming, refunded, or prohibited from renewal. If donor conduct crosses into influence attempt, the response should be logged and reported to oversight.

Donor audit must include institutional gratitude as a risk. People who depend on funders may protect them without being asked. Staff may internalize what donors prefer. Leaders may avoid reforms that make fundraising harder. Audit should ask how the institution behaves around money, not only what money formally requires.

Donor limits must include personal, institutional, family, corporate, foundation, and pass-through sources. Capture can arrive under many names. A donor can support through a foundation, a related vendor, a family member, a consulting

arrangement, a land transfer, a media partnership, or an in-kind technical system. The City must review the influence pathway, not merely the label (International Monetary Fund, 2016; Ebrahim, 2003).

The ban on naming sovereignty extends to visual culture. Even when a donor name is not formally attached to a core office, repeated public images, donor-centered ceremonies, and founder-donor narratives can teach the public who the City appears to serve. Public artifact review should test whether the City visually belongs to its purpose or to its funders.

A cooling-off rule governs major gifts tied to public controversy, campaign cycles, vendor selection, land decisions, or admissions windows. Timing can create influence even when a gift contains no explicit condition. A well-timed gift can function like pressure because the institution knows what continuation depends on.

Donor adjacency requires separate attention. A person who is not formally a donor may be part of a donor network, family office, affiliated foundation, vendor consortium, or political circle. Anti-capture review should therefore examine relational proximity, not only the legal donor name on the gift (Rose-Ackerman and Palifka, 2016; OECD, 2015).

The City can now accept support only under limits strong enough to prevent money from becoming authority. The next section widens the cost ledger beyond donors and budgets to the host region. A City is not financed only by those who give money. It is also financed, sometimes invisibly, by workers, roads, housing markets, public services, and neighbors who must live beside it.

Routine donor review begins before scandal. It should be routine, independent, and empowered to inspect source concentration, related-party transactions, communications with admission or governance staff, gift restrictions, vendor relationships, and post-gift influence attempts. The audit must be allowed to conclude that a gift once acceptable has become unsafe because circumstances changed.

The donor-audit report is public enough to preserve trust and protected enough to avoid reputation theater. The central question is not whether a donor is pure. The central question is whether any funder, friend, family, government, vendor, or foundation has gained a route to hidden authority over the City's public function (World Bank, 2020; International Monetary Fund, 2016).

Donor audit identifies the economic person and influence network behind support, not only the name printed on an agreement. Intermediaries, donor-advised vehicles, affiliated foundations, family entities, related vendors, political committees, debt holders, naming partners, and future pledges can create leverage outside the formal contract. The file records beneficial control where lawful, connected transactions, cumulative exposure, conditions, contacts, exceptions, procurement overlap, and whether the City could refuse or return funds without harming care, payroll, host duties, or exit (World Bank, 2020; OECD, 2025c; World Bank Group, 2025; Rose-Ackerman and Palifka, 2016).

Anti-capture becomes credible only when refusal can occur without operational panic. A City that depends on one gift to meet payroll, preserve records, provide care, or fund exit has already

weakened its donor firewall, even if the governing documents use perfect language. Reserve rules, replacement plans, portability clauses, and staged commitments should give the institution enough time to refuse pressure without abandoning people. The practical test is not whether leaders intend to resist; it is whether the financial architecture lets them resist when the cost is immediate (International Monetary Fund, 2016; Government Accountability Office, 2020a).

Adverse scenarios test the donor limits. Reviewers can test a request for admissions preference, a naming demand, an attempt to reach protected records, pressure to suppress criticism, a vendor tie, or a condition attached through an intermediary. The drill should record who received the request, who classified it, who could stop it, what was disclosed, what remained protected, and how the institution continued after refusal. A firewall that has never been exercised may be only ceremonial. Rehearsal turns the rule from founder promise into observable institutional capacity (OECD, 2015; ISO, 2025a; Government Accountability Office, 2020b).

32.5 — Local Labor, Regional Spillovers, and Civic Benefit

A City is not built in abstraction. It arrives in a region with workers, renters, homeowners, roads, emergency services, utilities, schools, clinics, businesses, public agencies, cultural memory, political tensions, and ecological limits. The financial ledger must therefore include local burden, not only institutional budget. The host community may carry costs no donor page ever names (Miller and Blair, 2009; Moretti, 2010).

The first host question is who will absorb the City's presence. Workers may gain opportunity or face exploitation; housing markets may gain investment or pressure; public services may receive support or strain; regional identity may gain civic purpose or become polarized. The City cannot claim civic benefit until it has counted who absorbs each effect and which people can challenge the result.

Civic benefit cannot be assumed because the mission is noble. A project can speak of humanity while burdening the neighborhood. It can create jobs while underpaying workers. It can promise public trust while making traffic worse, rent higher, services strained, and local politics tense. Host equity review makes these effects visible.

The local ledger is governed by distribution rather than aggregate benefit. Employment quality, wage standards, construction disruption, housing effects, traffic, public-services load, environmental and health effects, emergency response, local procurement, cultural spillover, public access, and grievance

routes must be traceable to the people who experience them. The baseline, geographic boundary, time period, confidence, and method should be published at an appropriate level. A regional-benefit claim remains incomplete until affected people can challenge its assumptions, obtain mitigation, and see what would cause the claim to be revised or withdrawn (International Finance Corporation, 2012; OECD, 2025d; MHCLG, 2026).

32.5.1 — Local Hiring

A local hiring plan can generate civic value, but it can also become a slogan that hides hierarchy. A City that hires nearby residents only for construction cleanup, food service, security, or low-status maintenance while importing higher-paid professionals and decision-makers has not shared opportunity fairly. The hiring plan must ask which jobs, wages, training routes, promotion paths, and governance channels reach the host community (Zuk et al., 2018; Chapple and Zuk, 2016).

Celebratory worker images can counterfeit local consent. A fair report can show job categories, wage bands, training completion, retention, safety incidents, promotion rates, complaint routes, and contract standards without using local faces as decoration. The question is whether authority and benefit are shared, not whether the institution can stage belonging.

Local hiring is judged by who benefits from the payroll and who bears the friction of the campus. The role map distinguishes work that can be recruited locally, work that requires specialized qualification, and work that should include funded training or

apprenticeship. A target percentage alone cannot answer whether the resulting jobs are safe, durable, and influential.

Local hiring can create real civic benefit, but only if the work is dignified. A job created by the City is not automatically fair. Wages, safety, scheduling, benefits, training, career mobility, role clarity, complaint routes, and protection from overexposure determine whether employment is opportunity or hidden subsidy (International Finance Corporation, 2012; OECD, 2025d).

Local hiring begins with an explicit division between roles that can reasonably be filled locally and those requiring specialized recruitment. Construction, maintenance, food service, accessibility support, administration, public interface, translation, facilities, care support, and technical roles involve different qualifications and training paths. The map prevents local recruitment from becoming either tokenism or unsafe underqualification.

Training belongs in the cost. If the City wants local labor to participate in a specialized institution, it must fund training rather than simply import expertise and claim regional benefit. Local hiring without training may place workers into roles where they carry risk without preparation.

Staff role records and privacy protections must apply to local workers. A person should not lose ordinary privacy because the City hires from the host region. The City must not turn local employment into auxiliary transparency. Workers are role accountable. They are not full-life record subjects (Moretti, 2010; Kline and Moretti, 2014).

Local hiring is protected from political patronage. A host region may have powerful networks that try to place relatives, allies, contractors, or party affiliates into jobs. Anti-capture review must apply locally as well as nationally. The City should not escape donor capture only to fall into local patronage.

32.5.2 — Housing Pressure

Among host burdens, housing pressure is especially concrete because a beautiful institution can harm its neighbors before any formal injury appears. Staff, participants, visitors, contractors, researchers, security personnel, journalists, and auxiliary businesses can increase demand for housing before the community receives any benefit. If the City raises rents, displaces residents, or intensifies speculation, it has exported burden into ordinary life (International Finance Corporation, 2012; OECD, 2025d).

Housing review cannot wait for an annual report while displacement accumulates. Rent, vacancy, short-term lodging pressure, worker commutes, eviction and landlord complaints, and the ability of essential workers to live near their jobs require early triggers. Host review can pause growth or require mitigation before the project's own success makes correction politically harder.

The City exists to protect ordinary life from public-power opacity. It would contradict itself if its own presence made ordinary households less secure. Housing pressure therefore belongs in the core cost ledger, not in a later community-relations appendix.

Housing pressure is one of the easiest local costs to ignore. A new institution can bring staff, visitors, contractors, participants, media, experts, and ancillary businesses. That arrival may raise rents, change neighborhood patterns, increase short-term lodging demand, or make ordinary residents feel that a historic project is pricing them out of their own place (Moretti, 2010; Kline and Moretti, 2014).

Housing pressure cannot be dismissed as someone else's market event. If its presence predictably changes local housing burden, the burden belongs in the host ledger. Site choice, staff housing, visitor lodging, construction-worker accommodation, transportation planning, and phased admissions all affect housing pressure.

Housing mitigation may include staff housing strategies, visitor limits, transportation links, local housing funds, anti-displacement commitments, construction scheduling, or host-government agreements. The exact tools require legal and local review. The moral rule is clear: the City may not ask local residents to pay privately for the public meaning of the institution.

Housing conditions need a baseline before construction, active monitoring during it, and follow-up after occupancy. Rent shifts, vacancy changes, short-term lodging pressure, worker commute burden, and displacement complaints are tracked with transparent limits on causal inference. The purpose is not to attribute every market movement to the City, but to prevent convenient ignorance (Chapple and Zuk, 2016; World Bank, 2017a).

Public explanation matters here. Host residents should not hear only that the City is good for humanity. They should hear how housing burden is being measured, what remedies exist, and how complaints can change policy. A local burden hidden by universal rhetoric is still unfair.

Housing pressure is a test of humility. A City built to reduce hidden public burden cannot justify itself by making ordinary residents carry unchosen private cost in silence (International Finance Corporation, 2012; OECD, 2025d).

Monitoring begins before land acquisition is public and continues through construction, occupancy, and every expansion gate. Averages can hide displacement at the lower end of the market, so the review should track rent, vacancy, eviction, conversion, commute, and service access by neighborhood and household vulnerability. Mitigation may require slower growth, employer-assisted housing limits, anti-displacement funding, or a different site rather than a celebratory claim about regional demand (Chapple and Zuk, 2016; Zuk et al., 2018).

32.5.3 — Public Services Load

Public-services load includes the demand the City places on roads, transit, water, electricity, waste systems, emergency services, clinics, courts, schools, permitting offices, inspection agencies, communications networks, and public-safety coordination. Some load is ordinary civic presence. Some load is a transfer of cost from the City to the host community. Those categories must be separated before regional benefit is praised (Moretti, 2010; Kline and Moretti, 2014).

Public reporting calls a subsidy a subsidy rather than hiding it inside the phrase community partnership. The report should show what the City uses, what it pays, what it mitigates, what remains disputed, and how local residents can challenge undercounting. Clarity is a fairness protection because service load is often hidden in municipal departments.

A fair City pays attention to the pipes beneath its ideals. Public services are not background scenery. They are systems maintained by workers and financed by residents. If the City uses them, the burden must be counted, compensated, and made reviewable.

Emergency services require special attention because the City's record, security, and protected nonvisibility protocols may be unfamiliar. Local responders should not be forced to improvise during crisis. Training, access maps, communications protocols, legal review, and reimbursement agreements may be necessary before opening.

Utilities are also public burden. Water, energy, communications, waste, sewer, and resilience systems may need upgrades. If the City consumes capacity without supporting expansion or conservation, it transfers cost to the host. Sustainability claims are not enough. Utility burden must be counted.

Administrative load can be invisible. Permits, inspections, complaints, public meetings, legal review, zoning, transport planning, environmental review, and public-record coordination all require local government time. The City should treat

administrative burden as real labor, not as friction caused by local hesitation (OECD, 2025d; Miller and Blair, 2009).

Host agreements and recurring audits review public-services load. The City should pay, mitigate, or redesign where it imposes measurable strain. It should not rely on prestige to receive exceptions that ordinary projects would not receive.

If public services carry hidden cost, the City's budget is incomplete. A fair budget includes the public systems that keep the City possible, especially when those systems are outside the City's own payroll (Moretti, 2010; Kline and Moretti, 2014).

32.5.4 — Regional Benefit

Regional benefit is real only when it can be distinguished from institutional self-praise. A City may bring jobs, training, research attention, public deliberation, infrastructure improvement, civic education, host contracts, tourism, and reputational value. It may also bring pressure, speculation, policing anxiety, service load, and symbolic displacement. The accounting must hold benefit and burden together (Chapple and Zuk, 2016; World Bank, 2017a).

The operative object is a paired regional benefit and burden statement. It identifies who gains, who pays, when each effect appears, what conditions produce it, and how the distribution changes over time. A restaurant district, construction firm, university partner, or transit system may benefit while renters, low-wage workers, or neighboring families carry pressure. No regional average converts that imbalance into fairness.

Regional benefit cannot become moral blackmail. A host community may value jobs and still object to extraction, welcome public learning and still demand housing safeguards, or support the mission and still refuse the site. Benefits remain reviewable claims, not payment for silence.

The analysis separates benefit by group. Workers may benefit differently from homeowners. Renters may carry more burden than businesses. Local agencies may receive resources or strain. Schools and clinics may experience indirect effects. Indigenous, historically marginalized, or economically vulnerable communities may have distinct concerns. A single regional benefit claim can hide unequal distribution.

Regional uplift is credible only when it is not financed by extraction. Nor should the institution claim to place a region on the map when the principal audience is donors, media, or national elites. Civic benefit is measured by local capacity and standing, not by borrowed imagery.

Regional benefit may include shared infrastructure, public education spaces, local contracting, community review offices, visitor management, public archives accessible to host residents, and local complaint pathways. These benefits should be designed with host input rather than delivered as gifts decided elsewhere (Kline and Moretti, 2014; Zuk et al., 2018).

Measurement matters, but so does narrative humility. The City should not overstate its economic impact through inflated multipliers or promotional language. If benefits are uncertain, the City should say so. If benefits are uneven, it should say that too.

32.5.5 — Host Equity Review

Host equity review is the decision process through which the receiving place can test, condition, or refuse burdens created by the City. Residents, workers, local governments, affected neighborhoods, disability advocates, renters, schools, service providers, environmental reviewers, and public-safety bodies need standing within it. The process resists tokenism by connecting participation to evidence, reasons, mitigation, and reopening authority (OECD, 2025d; Miller and Blair, 2009).

A City cannot be fair only inside its walls. A campus that treats neighbors as externalities cannot form public power with integrity. The host community is not the audience for the City's virtue; it is one of the places where the City's fairness is tested.

Its first task is distributional. The review maps jobs, procurement, local access, housing pressure, traffic, public-services demand, environmental effects, emergency-system load, complaint outcomes, and the host-government duties created by the project. It then asks which groups gain, which groups carry burden, and which agreement can be changed. Consultation without that decision route is ceremonial.

Complaint routes give host equity review power to trigger real change. If residents report traffic danger, housing pressure, security overreach, noise, protest mismanagement, visitor intrusion, or service strain, the City should have pathways to investigate and remedy. Listening without remedy is reputation management, not fairness (Kline and Moretti, 2014; Zuk et al., 2018).

Host review must protect dissent as a form of local knowledge. A resident who criticizes the City is not opposing humanity, fairness, or the future. Local criticism may reveal burdens that supporters cannot see from inside the project. Legitimacy therefore depends on response, remedy, and the continuing ability to say no, not on gratitude for promised benefits.

The host ledger distinguishes predictable burden from unexpected burden. Predictable burden requires pre-opening mitigation. Unexpected burden requires complaint, investigation, and remedy. The City should not excuse predictable harm by calling it growing pains, and it should not dismiss unexpected harm because it was not in the original plan.

Shared learning counts as regional benefit when it expands local capacity and standing rather than turning the host into scenery. The host region should not merely endure a symbolic institution; it should gain public education, local access, infrastructure improvement where appropriate, and a voice in review. The City must avoid using local identity as scenery for a global message (World Bank, 2017b; International Finance Corporation, 2012).

The local ledger shows that the City's cost is carried by more than donors, governments, and institutional budgets. Workers, neighbors, renters, emergency systems, utilities, local agencies, and host communities can all become hidden funders if their burdens are not counted. The final section returns to the status quo and asks what it costs to leave leader formation private.

Host equity review occurs at baseline, annually, after incidents, and after expansion. Without a baseline, the City can claim

benefit while the host region feels pressure. Without annual review, small burdens can become permanent. Without incident review, specific harms can be absorbed into general goodwill. Without post-expansion review, replication logic can override local evidence.

The host review body receives the housing, traffic, emergency-service, environmental, procurement, employment, complaint, and community-input data needed for its mandate. It should also have the authority to publish disagreement with the City's own narrative. Local legitimacy cannot be produced by gratitude. It must survive the host community's right to say what the institution is costing them (Miller and Blair, 2009; Moretti, 2010).

The host equity report presents distribution rather than a single net-benefit figure. New jobs may accrue to commuters while rents rise for nearby tenants; procurement may favor large firms while public-service demand falls on a small jurisdiction. The review should therefore separate benefits and burdens by place, time, income, tenure, disability, occupation, and exposure, then record which mitigation is funded and who may reopen the agreement when conditions change (Kline and Moretti, 2014; OECD, 2025d). That format allows a proposed mitigation to be connected to the particular neighborhood or group it is intended to benefit. Mitigation should be tied to the affected group and observable outcome, so a benefit elsewhere cannot be counted as repair for a local burden.

Distributional reporting follows the people closest to each effect. Wage bands, job duration, contract tier, commuting distance, housing and health effects, procurement destinations, public-

service costs, environmental burdens, and neighborhood access remain separate enough to reveal who gains and who pays. Confidence, additionality, displacement, and uncertainty are published beside the finding, together with the authority able to reopen it. A favorable regional average cannot erase concentrated burden on low-wage workers, renters, disabled people, nearby residents, or small public systems (OECD, 2025d; MHCLG, 2026; Moretti, 2010). Keeping the categories stable across reporting periods makes it possible to see whether a remedy reached those who originally carried the cost. Stable categories also let reviewers detect when an apparent regional gain is being purchased by repeated losses borne by the same neighborhood or workforce.

Host legitimacy requires continuity. One opening hearing cannot settle years of construction, occupancy, traffic, service demand, security posture, health effects, and land-use consequence. The host route therefore includes a baseline, scheduled review, incident review, post-expansion review, affected-person complaint, public explanation of changed assumptions, and authority to renegotiate mitigation, slow growth, suspend a function, or require exit. A City that asks participants to live under continuing review should accept continuing review from the place carrying its physical presence (OECD, 2026b; World Bank, 2017b; MHCLG, 2026). Each review should end with a public account of the agreed adjustment, its responsible owner, and the next occasion for checking delivery. Continuity gives host review institutional memory, allowing unresolved commitments to follow the project across leadership changes and expansion

decisions. For each material mitigation, the agreement should specify what evidence will count as delivery and who can challenge that evidence, including a route for affected residents whose access needs prevent attendance at a hearing. A missed deadline should trigger a documented review of interim protection and any escalation already authorized by the agreement, keeping the unfinished obligation visible until resolved.

32.6 — The Cost of Leaving Leader Formation Private

With the Part's cost architecture established, the inquiry reaches its first economic test: justification. A City this expensive cannot rely on inspiration. A society this burdened cannot pretend that hidden leader formation is free. The comparison must be built carefully enough to make an economic argument without claiming more than the evidence can support (Besley, 2005; Dal Bó et al., 2017).

The proposal cannot be justified by its dream alone. It should be justified, if it is justified, by the burden of the alternative. Leaving leader formation private is not neutral. It means citizens continue to meet public-power seekers through persona, campaign, party label, donor signal, scandal, crisis, and late investigation. That system has costs even when those costs do not appear in a line item.

This final section names the hidden costs of doing nothing. Late discovery cost asks what citizens learn only after harm. Donor dependence cost asks how private leverage shapes public office before the public sees it. Bad office cost asks what happens when unready or captured people govern. Institutional mistrust cost asks how opacity drains civic life. Status-quo comparison discipline keeps the argument honest.

The cost comparison is not a claim that the City is cheaper. It requires both the visible proposal and the dispersed status quo to disclose burdens, alternatives, causal assumptions, and uncertainty, including late discovery, donor dependence, private gatekeeping, mistrust, poor office, investigative labor, and repair.

The question is whether a bounded, lawful, rights-protected institution could place some of that burden more honestly; the comparison remains conditional and cannot itself authorize expenditure (Power, 1997; Besley, 2005).

32.6.1 — Late Discovery Cost

Late-discovery cost begins when role-relevant information becomes usable only after voters, agencies, staff, or communities have committed. The burden includes rushed investigation, emergency vetting, public confusion, office disruption, candidate replacement, litigation, policy reversal, and reputational spillover. Earlier review is valuable only when relevance, ordinary privacy, and protected third parties remain governed (Hetherington, 2005; OECD, 2017a).

The financial mechanism is a timing comparison. It asks what it costs to discover conflicts, misconduct, dependency, incapacity, or formation gaps during a campaign, after appointment, during crisis, or after public harm. Then it asks which of those discoveries could responsibly have occurred during City formation without invading ordinary private life or creating public appetite for exposure.

The fairness question is who currently pays when discovery happens too late. Often it is the public, staff, family members, journalists, and institutions that did not create the hidden formation environment. The City may justify some cost by moving part of that burden earlier and upward, but only under strict relevance and shielding rules.

The late-discovery record separates the kinds of fact that arrive too late: concealed conflicts, unstable conduct, donor leverage, staff mistreatment, weak correction habits, undisclosed dependency, and capacity failure. Each category is linked to the stage at which it became observable, the stage at which it became consequential, and the people who carried the delay. Campaign, office, scandal, and crisis are not interchangeable discovery environments (Bowler and Karp, 2004; Kumlin and Esaiasson, 2012).

Late discovery burdens citizens because it forces urgent interpretation. People must decide whether a revelation matters, whether it was known by insiders, whether it changes readiness, whether the timing is manipulative, and whether the institution failed. This is civic labor performed under stress.

Late discovery also burdens institutions. Parties, agencies, courts, legislatures, watchdogs, journalists, and public offices may need to investigate or respond after damage has begun. The cost includes time, credibility, legal process, staff morale, administrative delay, and public distraction.

The City aims to move some discovery earlier. Formation records, staff influence logs, correction history, opposition behavior, and readiness bundles may reveal patterns before authority arrives. This does not eliminate late discovery, but it may reduce dependence on scandal as the first serious evidence (Besley, 2005; Dal Bó et al., 2017).

The late-discovery ledger asks which facts could reasonably have been known earlier through role-bound visible formation. It

should also ask which facts should remain protected because ordinary privacy, family dignity, legal privilege, or intimacy outweigh public relevance. Earlier knowledge cannot become total knowledge.

Late-discovery cost identifies hidden burden; it does not prove the pilot. It defines the problem against which City costs are tested (Carnes, 2013; Hetherington, 2005).

32.6.2 — Donor Dependence Cost

Dependence on donors becomes costly when public-power seekers, parties, offices, advocacy networks, or institutions rely on private money before accountability is visible. Dependence can shape agenda, silence, access, staffing, narrative, urgency, and the range of choices that feel possible. The City should treat this as a cost of the status quo without pretending that the City is immune to the same danger (Bowler and Karp, 2004; Kumlin and Esaiasson, 2012).

Renewal moments expose dependence that everyday harmony can conceal. A grant ending, a donor withdrawing, a funder threatening reputation, or staff anticipating displeasure before being asked can reveal decisions shaped by financial fear. The budget audit therefore examines quiet compliance as well as explicit conditions.

Cost is inseparable from refusal. A public-power formation institution must be able to disappoint its funders. If it cannot refuse money, return money, publish uncomfortable findings, or protect applicants against donor preference, financial dependence has become hidden governance.

The cost is not limited to illegal corruption. A candidate or future official may remain within the law while becoming shaped by repeated rooms, donor expectations, consultant advice, social gratitude, and fear of losing support. Hidden dependence can become public consequence without ever becoming criminal conduct.

Citizens pay donor dependence cost through narrowed choices. They may be asked to choose among public figures who have already passed through private filters. They may hear policy arguments after the boundaries of possibility have been set elsewhere. They may see campaign confidence without seeing the relationships that made the campaign possible.

The City's material stabilization and anti-capture rules are partly responses to donor dependence. A participant who can say no to private rescue, private sponsorship, and personal benefactors is better positioned to carry public burden. But the City must also ensure its own donors do not create a new dependence system around the institution (Hetherington, 2005; OECD, 2017b).

The donor-dependence ledger tracks pre-campaign access, mentorship, sponsorship, housing, debt relief, consulting, employment, family support, and prestige networks as well as campaign money. Dependence can be material, social, emotional, or reputational. It often begins before formal politics.

The relevant comparison includes the cost of leaving these dependencies hidden. Visible formation requires funding, but the financing route has to be clean enough that the proposed remedy

does not create another private pipeline into public office (OECD, 2026c; Bowler and Karp, 2004).

32.6.3 — Bad Office Cost

Bad office imposes public cost when a person with substantial authority governs poorly, abuses power, neglects duties, mistreats staff, makes reckless decisions, or enters office under hidden dependency. The category must be handled carefully. The City cannot promise good office. It can ask whether some failures might be reduced by better visible formation, correction, and readiness review (Besley, 2005; Dal Bó et al., 2017).

No public artifact may turn formation evidence into a personality score. A formation record concerns role-relevant conduct and burden, not worth or moral essence. Public explanation should connect evidence to specific risks such as staff treatment, conflict response, correction habits, pressure behavior, and willingness to be reviewed.

The City's economic claim here is modest and important. Bad office is expensive, and hidden formation can contribute to it. A costly formation institution may be justified if it creates better public evidence, but the final choice remains democratic, legal, and role-specific. The City does not replace judgment; it informs it.

Bad office cost is the distributed consequence of lawful authority exercised without sufficient steadiness, honesty, competence, correction capacity, staff dignity, or independence. It appears through harmful policy, administrative breakdown, abusive work culture, conflict escalation, public confusion, and delayed repair.

The category concerns public consequence, not a verdict on a person's total worth (Hetherington, 2005; OECD, 2017a).

The cost of bad office is often paid by people far from the official. A poor decision may affect housing, health, work, safety, time, immigration, debt, infrastructure, education, policing, climate resilience, procurement, or emergency response. Public power turns private formation into distributed consequence.

Much of that cost is cumulative rather than spectacular. Avoidable delay, poor appointments, unclear explanation, weak administration, refusal to listen, overconfidence with data, mishandled opposition, and contempt for staff can each remain below the threshold of scandal while steadily degrading public life. Formation evidence is relevant only where it helps the public recognize and respond to those role-specific failures.

The City can address some bad office risk by forming public-power seekers through education, deliberation, opposition, simulation, staff dignity, and record continuity. It can show patterns before office. It can say not yet. It can refuse to treat campaign polish as readiness (Bowler and Karp, 2004; Kumlin and Esaiasson, 2012).

Formation can improve judgment without guaranteeing good office. Lawful public work unfolds under changing conditions, role complexity, external constraints, unforeseen events, and ordinary human fallibility. A participant may perform well in the City and fail later, just as a skeptical applicant may grow into excellent public service elsewhere. The record supports bounded

democratic judgment; it never becomes destiny, entitlement, or immunity from later review.

Bad office cost justifies serious interest in formation, not overclaim. The City should be evaluated by whether it improves public interpretation and role readiness, not by whether it promises perfect leaders (Power, 1997; Besley, 2005).

32.6.4 — Institutional Mistrust Cost

Institutional mistrust creates operating burden when people reasonably suspect that hidden arrangements govern decisive choices. Compliance weakens, reform slows, polarization hardens, staff morale falls, litigation and oversight grow, and even honest explanations acquire the sound of manipulation. Mistrust is therefore not merely an attitude; it changes the cost and capacity of public systems (Hetherington, 2005; OECD, 2017a).

The cost file treats mistrust as friction rather than as a public defect to be corrected. Verification, communication, security, dispute resolution, external review, public education, and crisis response all expand when reliable reasons are scarce. City records cannot eliminate mistrust, but they can be tested for whether role-bound transparency reduces identifiable uncertainty without turning citizens into subjects of visibility.

Document volume can become trust theater. A large document dump can deepen mistrust when readers cannot trace a record through review, correction, appeal, audit, and changed status. Public artifacts therefore show the route by which authority can be challenged, not merely the quantity of material released.

A second burden is civic interpretation under chronic doubt. People spend attention deciding which outcome is legitimate, which explanation is manipulated, and which hidden route matters; cynicism, disengagement, conspiracy thinking, partisan bunker behavior, and exhaustion can follow. Honest institutions then inherit disbelief generated by institutions that hid too much. This is a different mechanism from administrative friction and must be reported separately (Bowler and Karp, 2004; Kumlin and Esaiasson, 2012).

Mistrust is sometimes rational. People are not foolish for distrusting systems that repeatedly reveal hidden influence late. A fairness architecture should not shame mistrust. It should ask what burdens created it, what information was missing, and whether public systems can become more worthy of trust.

The City offers one response by making some public-power formation more knowable. If citizens can inspect a role-specific record of learning, correction, opposition, staff treatment, and readiness limits, they may rely less on myth, rumor, or persona. They may still disagree, but disagreement can be better informed.

Mistrust cost also falls on administration. Public agencies spend time explaining, defending, re-explaining, and absorbing suspicion. Legal systems may be drawn into disputes intensified by lack of trust. Journalism becomes overburdened as a late discovery tool. The public sphere becomes more expensive to operate emotionally and institutionally (Besley, 2005; Dal Bó et al., 2017).

Mistrust cannot be answered by demanding belief. It should earn narrower, more specific forms of trust through record integrity, correction, rights, audit, host review, donor limits, and willingness to stop. Trust is not a mood the City can command. It is a burden it must carry.

Institutional mistrust cost belongs in the status-quo comparison because it is one of the greatest hidden expenses of opaque public power. A society that cannot trust public formation pays every day in suspicion, delay, and civic loneliness (Carnes, 2013; Hetherington, 2005).

32.6.5 — Status-Quo Comparison Discipline

Status-quo comparison discipline is the rule that the City may criticize hidden formation only with the same rigor it applies to itself. The present system is costly, but so is the proposed institution. The comparison must not be a contest between a detailed City budget and a vague villain called politics. Both sides need categories, uncertainties, and reviewable assumptions (Bowler and Karp, 2004; Kumlin and Esaiasson, 2012).

The first rule is symmetry. If the City counts the status quo's scandals, it must also count the City's possible record breaches. If it counts donor dependence in politics, it must count donor dependence in its own funding. If it counts public mistrust under opacity, it must count public mistrust if the City overexposes or overclaims.

Felt burden, not reputational failure, frames bad office cost. The issue is more than that an officeholder looks bad or embarrasses an institution. The issue is that ordinary people may experience

worse services, delayed care, unsafe policy, degraded trust, or administrative harm because public power was not formed under enough scrutiny.

Flaws in the status quo do not justify a pilot by themselves. A bounded pilot earns continuation only if visible formation, rights, care, archive discipline, staff dignity, donor limits, and host recourse place burden more honestly than the hidden system it challenges. The standard is comparative and operational, not rhetorical (Besley, 2005; Dal Bó et al., 2017).

The economic case ends in discipline rather than triumph. The City may be costly, but hidden leader formation is costly too. What matters next is whether the City can move from budget to build without hiding labor, rushing gates, burdening its host, or treating a pilot as destiny. Chapter 33 turns from cost to construction, host review, and the ethics of beginning.

A final fair comparison also requires institutional memory. If the City later discovers that it underestimated cost, overstated status-quo burden, or missed an effect on staff or host communities, the correction should not be treated as a public-relations failure. It should become part of the public learning record that makes future estimates more honest.

A mature public budget would also distinguish between costs that are necessary at launch, costs that belong to the pilot gate, costs that can wait until replication, and costs that must exist before any participant bears visible burden. This sequencing prevents the City from pretending that every future safeguard must be purchased on day one, while also preventing essential protections

from being postponed indefinitely (Hetherington, 2005; OECD, 2017a).

The final lesson is that anti-capture finance is not an accounting specialty. It is part of the City's moral architecture. A budget that can be audited, contested, corrected, and stopped teaches the same civic lesson that the City asks future officeholders to learn: public power becomes fairer when its burdens can be seen before they are shifted onto someone else.

The status quo remains a serious comparator rather than a caricatured villain. Many people who form leaders privately are teachers, mentors, organizers, family members, journalists, clergy, civil servants, neighbors, and friends acting in good faith. The City's criticism is not that all private formation is corrupt. The criticism is that when private formation becomes the pipeline into public power, the public often receives only the finished persona and the later crisis.

The final comparison remains bounded: the City is one proposed institution for making a subset of high-consequence public-power formation more visible, reviewable, and rights-protected. It is not a general claim that all private preparation should become public or that every leader must pass through the City. That boundary is what keeps the cost argument from becoming capture by another name (Bowler and Karp, 2004; Kumlin and Esaiasson, 2012).

Status-quo comparison discipline includes alternatives that do not resemble the City. A jurisdiction might strengthen campaign disclosure, party training, inspector independence, civic education, public-interest fellowships, archives, journalism, or

ordinary public administration instead. The City's case should be tested against those options and the no-build baseline, not against a caricature of total opacity. Opportunity cost is part of fairness because money committed here cannot simultaneously protect another burden route (Boardman et al., 2018; HM Treasury, 2026a). The appraisal should also price feasible combinations of smaller reforms, counting shared staff, facilities, and oversight once rather than treating every alternative as isolated.

Chapter 33 — Construction, Host Review, and Pilot

The City becomes morally serious when it leaves paper. Drawings can be revised without dust, and budgets can be corrected without waking a neighborhood at dawn. A record protocol can appear exact before a participant asks whether a protected conversation has become searchable. Construction is where the institution first places real burden on real people, and that burden becomes the first evidence of whether its values can survive contact with reality.

That first burden has to be governed before it is celebrated. A City built to reveal hidden public-power formation cannot let its own building process become hidden power. The burden now reaches construction workers, contractors, inspectors, drivers, neighboring residents, host officials, local businesses, emergency services, ecosystems, future staff, early applicants, vendors, and the public that will later be asked to trust the record (NASA, 2016; Skivington et al., 2021).

Construction is governed as a sequence of expiring permissions rather than a launch story. Renderings, funder expectations, public skepticism, applicant waiting, and good-faith host negotiations may all create pressure to proceed. None of them supplies the missing rights route, staff capacity, archive integrity, or emergency coordination required by the next stage. Physical progress becomes legitimate only when the next burden has already been made carryable.

A pilot earns its value by testing whether the City can carry its principles under ordinary pressure. Purpose, users, operating environment, evidence thresholds, dependencies, rights, and exit conditions are declared before readiness is judged. Stop authority

must work before momentum, labor exposure, or participant commitment makes reversal harder. Construction labor, protected records, care, and rehearsed exit are therefore first-order pilot outcomes rather than background conditions (Government Accountability Office, 2020b; International Labour Organization, 1988).

The first City can produce operational evidence. It can show that a rights route worked, or did not. It can show that an archive error was caught, corrected, and explained. It can show that staff strain forced an admissions pause. It can show that a host community had power to require mitigation. Those demonstrations matter, but their status stays operational. They are not scientific validation, moral certification, legal enactment, transition authorization, or proof of the Law.

Because the City is a built institution, its ethics must become project management, procurement discipline, labor protection, environmental review, accessibility, dry-run documentation, public communication, host-community review, and stop authority. The prose of care has to become the paperwork of care. Otherwise the City becomes another institution that speaks beautifully about burden while pushing the ordinary work of protection onto people who cannot easily refuse.

Continuation can look courageous when it survives criticism, delay, cost, and risk, yet momentum is not courage. The deeper courage may be to delay, redesign, freeze admissions, lock down records, replace a vendor, fund aftercare, or stop when those actions protect people. Such decisions are neither failures of belief nor shameful interruptions. They are the language through

which belief is prevented from injuring workers, hosts, staff, participants, and nonparticipants (International Finance Corporation, 2012; World Bank, 2017a).

The pilot design needs enough operational detail for architects, construction managers, labor experts, public administrators, auditors, rights advocates, host officials, civil-liberties reviewers, cybersecurity reviewers, clinicians, and skeptical journalists to recognize native competence. Gates, files, owners, review routes, remedies, dry runs, stop rules, and public explanations must be visible. The chapter remains a civic design rather than a compliance manual because each object is tied to a human burden and a decision that can change.

The governing promise is plain. The City may become a place where public power is formed under visible burden only after it demonstrates something humbler than grandeur: the capacity to build, staff, rehearse, admit, evaluate, pause, and remember without making hidden burden its foundation. Before anyone lives under the Transparent Vow, the institution must show that its own operations can accept correction and interruption. That competence is the first form of public readiness (Edmondson, 1999; NIST, 2024a).

Construction and pilot design also protect against the belief that good intentions make early harm forgivable. Worker strain, host disruption, staff overload, archive fragility, or participant distress cannot be treated as temporary sacrifices on the way to a better civic future. Learning is legitimate only when burden is minimized, reported, repaired, and allowed to stop the design.

The pilot exists to expose preventable harm before the institution learns to normalize it.

The word pilot therefore carries a strict operational meaning. It names a bounded test with defined scope, questions, evidence sources, independent review routes, care plans for affected people, and public explanation rules. It is not a marketing label for a partial launch or a signal that success has already been decided. Everyone around the pilot should be able to identify what remains uncertain and which result ends the experiment.

Host review is central because the City is built somewhere. It will use land, water, roads, services, labor, emergency response, political patience, and public meaning from a surrounding place. Host legitimacy cannot be reduced to permit compliance or philanthropic benefit. A host community needs ways to name its burden, demand mitigation, challenge drift, and require continuing review after construction no longer looks new (Eldridge et al., 2016; Proctor et al., 2011).

Delays, objections, audits, dry runs, and pauses should be read neither cynically nor reverently. The useful question is whether they reveal a burden that the institution is now willing and able to carry honestly. When a delay improves rights, staffing, host protection, archive integrity, or exit, it makes the City more real rather than less. When it merely protects reputation, the same record should expose that failure.

The integrated gate file prevents separate teams from declaring readiness while the whole system remains unsafe at the interfaces. A record system may pass technical tests while staffing cannot

sustain correction; a building may pass inspection while sensory burden remains intolerable; a host agreement may exist before emergency coordination is usable. Integrated review preserves noncompensable gates, tests their handoffs, records dissent, and forbids an overall score from averaging away a critical failure. Readiness becomes a chain whose weakest protected link can still stop the next burden.

The pilot's evidence ceiling is part of its value. A workable complaint route is evidence about that route under the observed cohort, load, staff, site, and period; a humane first month is evidence about that month. Neither result validates PTV, establishes general superiority, guarantees later cohorts, or authorizes replication. Process evaluation matters because it shows what was implemented, how context altered it, who was excluded, where mechanisms failed, and which result remains too uncertain to use (Moore et al., 2015; Skivington et al., 2021).

The worked milestone review in Section 33.1 makes delay concrete. Money, travel, publicity, and completed construction all pull toward opening, while a failed reidentification test and missing overnight correction coverage pull the other way. The gate file gives the second set of facts decision authority. Applicants receive support, systems are disabled, the host is informed, and the next review is scheduled. The City learns whether its stop power is real before participants are asked to trust it.

A staged pilot operates as a chain of expiring permissions. Design approval permits design; construction approval permits only the bounded build; commissioning permits tested occupancy functions; occupancy does not authorize admissions; one safe cohort does not authorize growth; and operational continuity does not authorize replication. Every gate names its owner, evidence threshold, affected-person route, unresolved burden, expiry date, and decision record. Later reviewers can then distinguish earned permission from inherited momentum (Government Accountability Office, 2020b; HM Treasury, 2026b).

The pilot's public record should distinguish readiness evidence from unresolved risk. A successful drill, completed building, favorable inspection, or early positive report may justify the next bounded test, but none should be described as proof that the institution is safe, desirable, or ready to scale. Public attention can make delay look like failure and continuation look like courage. The gate file has to reverse that pressure by making pause, redesign, and no-go outcomes ordinary products of competent implementation (HM Treasury, 2026c; Proctor et al., 2011).

33.1 — Design Thresholds and Go/No-Go Criteria

Design thresholds are the point where aspiration becomes answerable. A threshold is not a beautiful line in a planning document. It is a condition that prevents the City from transferring unresolved danger into the next stage. Construction, commissioning, occupancy, admissions, active capture, public release, office support, and replication consideration are separate movements with separate evidence. Each gate states what decision is being made and what it does not authorize (Cooper, 1990; Government Accountability Office, 2020b).

A useful gate has a controlled form. It names the stage, decision owner, independent reviewer, affected persons, required evidence, source version, pass threshold, uncertainty, dissent, challenge and appeal route, evidence expiry, immediate protection after failure, remedy owed to people already affected, and date of the next review. Without those fields, go or no-go language becomes symbolic confidence rather than an auditable decision.

The City needs conjunctive gates rather than compensating ones. A strong archive cannot compensate for a weak exit route. Skilled staff cannot compensate for host-community strain. A beautiful campus cannot compensate for a rights system that only works in theory. Each gate protects a different class of persons and a different stage of institutional risk.

The gate file uses three distinct statuses. A hard gate blocks movement until a protected condition exists, such as lawful record custody, worker stop authority, usable exit, or manual fallback. A

conditional gate permits one narrow, dated step after a specified repair and before additional active burden reaches people. A watchpoint records uncertainty that does not yet warrant stopping but must be measured against a named trigger and review date. No status is averaged into an overall score, and conditional permission expires when its evidence becomes stale.

The gate file also preserves minority findings. If the archive team says ready, the rights reviewer says not yet, and the host reviewer says only with mitigation, the public summary cannot compress those judgments into one reassuring tone. Dissent is early warning, not disloyalty. The decision record identifies which finding controls, who may appeal, what evidence could change it, and whether a conflict of interest affects the reviewer (Government Accountability Office, 2020b; NASA, 2016).

The staged-pilot gate file is therefore not a checklist whose strong columns can compensate for a failed one. Each gate names an accountable owner, current evidence, affected people, challenge route, next review, expiry, and stop consequence. Failure blocks the next movement even when schedule, funding, construction, or public enthusiasm is favorable. Conditional decisions remain narrow, reversible, and automatically lapse when the evidence window closes.

33.1.1 — Rights Gate

The gate file is the controlling operational object. It prevents separate teams from declaring readiness with incompatible evidence. Each gate names an owner, evidence, threshold, unresolved issue, affected people, decision, appeal, next review,

and stop consequence. Strong performance in one domain cannot compensate for a failed rights, labor, host, archive, care, or exit gate (Cooper, 1990; Skivington et al., 2021; Government Accountability Office, 2020b).

The Rights Gate asks whether participant protections exist as working routes rather than promised values. Before any active participation begins, a person needs plain-language terms, independent counsel or advocacy access, consent review, complaint channels, appeal, protected nonvisibility rules, health supports, family and dependent consultation where relevant, pause authority, and exit explanation. The gate protects the person before the person becomes part of the City's public evidence (Skivington et al., 2021; HM Treasury, 2026b).

Imagine a milestone review three weeks before the announced opening. Construction is substantially complete, the public interface has performed well in demonstrations, funding is secure, and the first cohort has traveled to the host region. The archive drill then reveals that a protected nonparticipant can be reidentified through linked search results, while staff scheduling shows no independent coverage for overnight correction and breach response.

Launch pressure is intense because delay will cost money and embarrass supporters. The gate file makes those considerations visible but noncontrolling. The archive gate fails, the staff gate is not met, and the exit gate is activated for applicants who cannot wait. Admissions are postponed, travel and housing costs are covered, the host receives a public explanation, the technical

system is disabled for repair, and the next review date is set. Delay becomes evidence that the pilot can still be governed.

Applicants are not the only people affected by the rights gate. Participants, households, partners, children, dependents, staff, clinicians, counsel, visitors, incidental third parties, and host residents can all be touched by visible public-power formation. The Rights Gate has to show which protections attach to each group and which protections are absolute. Children and nonparticipants do not inherit the Vow by proximity.

Scenario testing gives the rights gate its first operational evidence of usability. One scenario should involve a participant who asks to pause after seeing the record rules in practice. Another should involve a household member who objects to incidental exposure. Another should involve a third party whose name appears in a deliberation record. A rights system that cannot route those situations calmly is not ready (HM Treasury, 2026c; United Nations, 2006).

The record stage matters. A complaint about capture, access, release, interpretation, research use, machine summary, or long-term retention should not fall into the same undifferentiated inbox. The Rights Gate should verify that each stage has a reviewer with the authority to correct, delay, redact, summarize, seal, or escalate. The person should not have to know the technical architecture in order to ask for protection.

Table 33.1. Single Staged-Pilot Gate File.

Pilot gate	Pass condition and failure response
Rights	Pass when consent, shielding, complaint, appeal, remedy, anti-retaliation, and lawful review survive adverse scenarios under an independent rights lead. Failure blocks occupancy or admissions until people are protected and the full route is retested.
Archive and privacy	Pass when capture, classification, access, redaction, correction, provenance, migration, breach, and shutdown tests work end to end. Failure blocks record activation and admissions until systems are isolated, corrected, and retested.
Staff	Pass when staffing ratios, competence, role separation, rest, protected complaint, surge, and replacement coverage are demonstrated. Failure delays opening or limits the cohort; unpaid heroics do not substitute for capacity.
Host	Pass when permits, services, traffic, housing, environment, emergency coordination, mitigation, and community routes are current and usable. Failure pauses the affected stage for mitigation, redesign, compensation, relocation, or no-go.
Construction and labor	Pass when safety, procurement, subcontractor conditions, environmental controls, accessibility, commissioning, and defect closure are verified. Failure stops work or occupancy; unsafe or exploitative performance cannot be traded against schedule.

Pilot gate	Pass condition and failure response
AI and vendors	Pass when purpose, data, approval, security, fallback, exit, and retirement work. Failure disables service until fallback and migration work.
Care and accessibility	Pass when independent care, accommodation, sensory access, emergency support, de-loading, and continuity are staffed and rehearsed. Failure blocks or narrows occupancy and admissions until support is real.
Exit and closure	Pass when pause, withdrawal, housing, health, dependent continuity, records, severance, vendor transition, host repair, and closure are funded and rehearsed under compound stress. Failure blocks activation.
Integrated decision	Pass only when every gate has current evidence, status, conflicts, expiry, minority findings, and a noncompensatory decision rule. The outcome may be go, narrow conditional go, delay, redesign, or stop; a failed nonnegotiable gate cannot be overridden.

Rights review remains independent through an ombuds function outside ordinary operations, an appeal path outside the office that made the first decision, and an emergency stop route for imminent exposure. Rights protection cannot depend on staff goodwill alone. It has to work on a bad day, during public pressure, after a technical fault, and when the participant is unpopular.

A simple readiness exercise can reveal the gap between rights language and rights access. Give a test participant a confusing release notice at the end of a long day and ask where they would go, who would answer, and what would happen by tomorrow

morning. If the route works only when the person is rested, confident, and legally fluent, the route is not yet a rights route (Government Accountability Office, 2020b; NASA, 2016).

The field constraint is that rights systems fail most often in timing. A remedy that arrives after exposure may still be necessary, but it cannot make the original exposure harmless. The gate should therefore distinguish prevention, emergency shielding, correction, and later remedy. A participant should know which route acts in minutes, which acts in days, and which acts only after review.

The gate fails under concrete, observable conditions. If participants cannot understand the terms, if counsel is unavailable, if protected categories are unclear, if complaint response times are untested, if appeal is merely internal courtesy, or if emergency shielding cannot be activated, admissions remain closed. The remedy is not a better explanation after harm. It is redesign before exposure (Skivington et al., 2021; HM Treasury, 2026b).

33.1.2 — Archive Gate

The Archive Gate asks whether lawful public memory can operate without becoming raw exposure. The City's archive is not a pile of recordings waiting for public curiosity. It is a governed chain of capture, custody, access, release, interpretation, correction, sealing, deletion review, and long-term stewardship. Each stage has to be separated before the first active record is trusted (NIST, 2020a; W3C, 2013).

Record integrity begins with provenance. The archive should be able to say where a record came from, who touched it, what system processed it, what status label it carries, which protected categories apply, and whether any correction, redaction, delay, or contextual note has been added. A public bundle that cannot show its history asks the public to trust a surface.

Synthetic and mock records, never real participant burden, provide the Archive Gate's pre-activation evidence. Test files should include a disputed statement, a protected family detail, a machine-generated summary error, a delayed-release item, an access request from an affected person, and a suspected tamper event. The question is whether the archive routes each item differently and correctly (Government Accountability Office, 2020b; NASA, 2016).

The archive gate reaches participants, bystanders, staff, correspondents, journalists, professionals, family members, and future public users. A record can harm by omission as well as exposure. The gate should therefore test correction, right of reply, context integrity, and version history. Public memory is unfair when it freezes a person in an error or releases a fragment without the route that produced it.

Challenge and appeal bring together technical audit, rights review, cybersecurity review, access-class review, and public-communication review. Archive staff should not be asked to decide alone whether an item is public, research eligible, machine-trainable, or permanently retained. Public release is not research consent, and research consent is not permission for model training.

The archive also rehearses a boring error. A timestamp is wrong, a speaker label is inverted, a minor context note is missing, or a delayed item appears in the wrong queue. These errors are less dramatic than sabotage, but they train the public either to trust correction or to suspect indifference. Integrity is built in ordinary correction before catastrophic breach (HM Treasury, 2026b; HM Treasury, 2026c).

The archive also needs a degraded-mode plan. If the public record site goes down, if search becomes unreliable, if a release queue stalls, or if an integrity alarm triggers, the City should know whether capture continues, whether access is suspended, and how users are told. Continuity is not simply keeping the system online; sometimes integrity requires taking a function offline.

The Archive Gate fails if chain of custody is incomplete, if status labels are vague, if delayed release cannot be enforced, if correction logs are invisible, if breach response is unrehearsed, or if machine summaries can outrun source records. The remedy is record lockdown, technical repair, public notice where appropriate, affected-person notice where safe, and no admissions expansion until the weakness is resolved (NIST, 2025b; W3C, 2013).

A hostile linkage test belongs in the Archive Gate. Reviewers attempt to reidentify a protected person by combining search results, timestamps, travel records, and public summaries without using privileged access. A system that protects each field separately may still fail through composition. The gate therefore evaluates the query environment, not only the storage layer, and

it can require delayed release, coarser public bundles, human review, or a narrower search class (NIST, 2020b; NIST, 2024a).

33.1.3 — Staff Gate

The Staff Gate begins with a narrow claim: staff carry the City before participants do. If the institution asks staff to improvise care, discipline, explanation, record repair, complaint handling, public moderation, or crisis response without authority, rest, compensation, training, and role boundaries, it has hidden its first burden in labor (NASA, 2016; Skivington et al., 2021).

Readiness evidence covers staffing ratios, backup coverage, duty-hour limits, supervision, mental health support, whistle routes, anti-retaliation protections, compensation sufficiency, accessibility accommodations, training completion, role separation, and stop authority. These are not human-resources details outside the civic design. They are how the City keeps visible participants from being supported by invisible exhaustion.

The staff gate affects staff themselves, participants who depend on them, household members who rely on predictable support, visitors and public users who meet them at interfaces, and host responders who may be called when staffing fails. A thin staff plan can look efficient in a budget and become dangerous in a crisis. The gate should make that thinness visible before the first cohort arrives (HM Treasury, 2026b; HM Treasury, 2026c).

A practical stress scenario tests the Staff Gate. A key archivist is absent, a participant files an urgent complaint, a public interface attracts hostile attention, and a maintenance fault affects a protected zone. The question is whether the City can act lawfully

without heroics. If a route depends on one exceptional employee, the route is not institutional readiness.

The staff gate receives outside scrutiny from labor representatives, clinical or wellbeing reviewers where care roles are involved, operational auditors, role-boundary reviewers, and a confidential staff dissent channel. Staff should be able to say that the City is not ready without risking their job, status, or access to future work. A staff gate that hears only leadership confidence is already captured.

A useful staff test is the unpopular stop. During rehearsal, a mid-level staff member should be able to halt a process that senior leadership wants to continue, and the route should protect that person from retaliation. If stop authority exists only at the top, the people nearest the burden are being asked to witness danger without power (Cooper, 1990; Government Accountability Office, 2020b).

The staff file plans for absence instead of treating it as exceptional. People become sick, resign, grieve, make mistakes, and need rest. A gate that depends on permanent full attendance is false. The City should know which functions can continue, which must slow, and which must stop when staffing falls below the declared floor.

The staff gate closes when coverage requires unpaid overtime, role boundaries are unclear, complaint routes depend on informal trust, staff cannot refuse unsafe instructions, or training has not been tested under pressure. The remedy is hiring, redesign, reduced cohort size, delayed activation, or closure of the affected

function. Staff dignity is not a later management problem; it is a prerequisite for the City's first public burden (NASA, 2016; Skivington et al., 2021).

33.1.4 — Host Gate

The Host Gate asks whether the surrounding place has reviewed burden before it is asked to absorb it. A host community is not scenery for a civic experiment. It carries traffic, housing pressure, utility demand, emergency planning, construction noise, protest management, media attention, economic spillovers, and the symbolic weight of being associated with the City (HM Treasury, 2026c; World Bank, 2017b).

Permit compliance is not enough. A lawful permit may still leave residents carrying unaddressed disruption, service strain, dust, water demand, construction staging, road closures, parking pressure, or local political tension. The Host Gate should make those burdens visible in a public burden map before major construction and again before occupancy.

The host gate reaches nearby residents, local workers, small businesses, schools, transit users, emergency responders, host officials, utility operators, environmental neighbors, and people who never consented to become part of the City's story. Host legitimacy is not produced by gifts, promises, or prestige. It is produced by review power, mitigation, and continuing routes to object (Cooper, 1990; Government Accountability Office, 2020b).

The operating design includes host hearings, service-impact review, housing review, environmental review, construction-

schedule disclosure, emergency coordination, traffic and delivery plans, local labor review, mitigation funding, and a complaint route that survives the opening ceremony. Host residents should not have to wait for a crisis to be heard.

Host appeals must be partly external to the City. Host officials, community representatives, environmental reviewers, accessibility advocates, emergency responders, and independent auditors should have standing to raise objections. The City should publish what changed because of host review and what remains unresolved. A host process that only collects comments is consultation without leverage.

A host gate can be tested at street level. Can a resident find the construction contact? Can a small business learn when delivery routes will change? Can a school or clinic know whether emergency access is affected? Host review is not real when it lives only in binders shared among officials (Skivington et al., 2021; HM Treasury, 2026b).

Host review also has to continue after the original agreement. Construction may reveal burdens that planning did not anticipate, and occupancy may create burdens that construction did not show. The Host Gate should therefore have review dates, reopening triggers, and a method for revising mitigation without making the host prove every harm from the beginning.

The Host Gate fails when local impacts are vague, mitigation is unfunded, emergency coordination is incomplete, host complaints have no owner, or the City treats public benefit as a reason to override local strain. The remedy may be redesign,

delayed construction, reduced scope, changed logistics, compensation, service support, or abandonment of the site. A City that cannot be fair to its host should not ask the host to carry it (HM Treasury, 2026c; World Bank, 2017b).

33.1.5 — Artificial Intelligence and Vendor Gate

The Artificial Intelligence and Vendor Gate asks whether technical systems remain subordinate before they become operationally necessary. The City will depend on vendors, sensors, storage, search, cybersecurity, accessibility systems, public interfaces, translation tools, and possibly machine assistance. Dependence becomes capture when the institution cannot explain, audit, replace, or shut down the system it relies on (Government Accountability Office, 2020b; NASA, 2016).

A credible vendor gate separates procurement review, data-flow review, cybersecurity review, model-behavior review, access review, failure-mode review, and continuity review. A vendor should never receive authority by becoming hard to replace. A system that stores records, summarizes records, searches records, or routes public questions needs clear permissions, logs, limits, and human review.

Vendor and Artificial Intelligence decisions affect participants, staff, visitors, bystanders, public users, host residents, vendors' workers, and future users of archived material. Technical choices can move burden silently. A search tool may make protected context too easy to find. A summary tool may make an uncertain record sound settled. A vendor contract may make correction slow or expensive (Skivington et al., 2021; HM Treasury, 2026b).

Adversarial tests precede deployment. It should test hallucinated summaries, biased search ranking, access-class confusion, protected-category leakage, deepfake insertion, credential misuse, vendor outage, ransomware pressure, malicious prompt attempts, and a public query that asks for moral or psychological ranking. The correct answer is not better confidence; it is bounded function.

Outside ordinary operations, the vendor gate is reviewed by technical auditors, privacy reviewers, cybersecurity reviewers, rights advocates, accessibility reviewers, and staff who will actually use the system. The gate should also require an exit plan from each critical vendor: data portability, escrow or continuity planning where appropriate, replacement timing, contract termination rights, and safe degraded operation.

A revealing dry run asks the record site to answer a query it has no authority to answer. When a user asks which participant is most trustworthy, which staff member is biased, or which applicant is morally ready, the record site must refuse the scoring premise and route the user toward source records, limitations, and accountable human judgment. A machine-generated nonanswer is not enough if the interface still legitimizes the question (NIST, 2023a; Cooper, 1990).

The vendor gate also asks when refusal is the best technical answer. Some tasks should remain manual, narrow, or unavailable because automation would create false confidence or overbroad access. The City should be able to say that a feature is attractive, efficient, and still prohibited because the burden it moves is too hard to govern.

The vendor gate closes when Artificial Intelligence systems cannot be audited, logs are incomplete, model outputs lack source trace, vendor lock-in prevents correction, sensitive records become training material by default, or technical tools imply truth, worth, readiness, loyalty, or inner-life knowledge. The remedy is disabling the function, replacing the vendor, isolating data, issuing notice where needed, and freezing any stage that depends on the unsafe system (Government Accountability Office, 2020b; NASA, 2016).

33.1.6 — Exit Gate

The Exit Gate asks whether withdrawal is real before entry becomes morally credible. Voluntary entry loses force when the practical route out is unclear, humiliating, financially punitive, clinically unsafe, publicly stigmatized, or dependent on the same officials who want the person to remain. A usable exit route must be demonstrated before admission is celebrated (HM Treasury, 2026b; HM Treasury, 2026c).

Exit has more than one form. A person may decline before activation, pause after orientation, de-load before public release, exit for health reasons, leave because household burden changed, withdraw from a pathway while remaining in ordinary civic life, be removed after misconduct, or retire after service. The gate should show how each route handles records, support, public explanation, appeal, and reintegration.

Exit protection covers the departing participant, household members, staff who handled the departure, people named in records, public users who may see a status change, and future

applicants who learn what refusal costs. If exit looks like betrayal, later consent becomes contaminated. If exit erases accountability, public trust weakens. The gate has to hold dignity and memory together (Hirschman, 1970; Wertheimer, 1987; Nissenbaum, 2010).

A credible mechanism includes an exit office independent of admissions enthusiasm, plain-language exit terms, cooling-off review, emergency de-loading, record-stage review, support transition, housing and care continuity where the City created dependence, and public status language that avoids stigma. The question is not whether exit is easy. The question is whether exit is lawful, humane, understandable, and possible.

Exit review connects participant counsel or advocacy, rights review, archive review, clinical review when health is involved, and appeal where classification is disputed. The City should be able to distinguish misfit, changed circumstance, exhaustion, misconduct, breach, and honorable refusal. These categories carry different public meanings and different remedies.

A readiness exercise asks a participant advocate to leave the City on behalf of a hypothetical participant at the worst plausible moment: after public criticism, before a scheduled release, during staff shortage, and while a household need remains unresolved. If exit works only during calm, then exit has not yet been designed for life (NASA, 2016; Skivington et al., 2021).

Exit also has to be tested against public curiosity. A departure will invite interpretation. Supporters may want reassurance, critics may want scandal, and journalists may want the story. The Exit

Gate should prepare language that protects the person without hiding institutional facts, so that leaving remains a human route rather than a public trial.

The Exit Gate fails when a person cannot leave without losing necessary care, housing, debt relief, record protection, or dignity in public explanation. It also fails when public summaries convert exit into shame or loyalty testing. The remedy is not persuasion. It is redesigned exit terms, aftercare reserve, record limitation, public correction, and admissions freeze until withdrawal is truly available (HM Treasury, 2026b; HM Treasury, 2026c).

33.2 — Construction and Labor Dignity

Construction is the City's first fairness test because the building arrives before the promise can be inhabited. Cranes, trucks, scaffolds, subcontractors, dust, heat, noise, night work, staging areas, and change orders are not outside the moral account. They are the first places where the City either sees burden or hides it. Construction safety and dignity therefore begin with competent planning, worker participation, paid training, stop-work authority, contractor-chain accountability, incident learning, and protection against retaliation (International Labour Organization, 1988; International Labour Organization, 2022b).

A City that asks future public-power seekers to carry visible role burden has to notice the people whose work makes visibility possible. The person welding a stair rail, cleaning debris, flagging traffic, installing conduit, delivering stone, or repairing a water line should not become invisible fuel for a public architecture of fairness.

Construction and labor dignity require more than compliance language. The build record shows safety planning, procurement method, beneficial ownership where lawful, rated criteria, contractor and subcontractor conditions, environmental accounting, accessibility review, change-order justification, local disruption, worker complaint, inspection, defect closure, and vendor exit. Personal data remain protected, but institutional choices and material contract changes remain auditable (OECD, 2025c; World Bank Group, 2025; International Labour Organization, 2022b).

Construction is the City's first public demonstration of institutional character. The relevant test is whether it can build without hiding worker risk, corrupt sourcing, environmental cost, accessibility failure, or host disruption. A project that fails that test has not earned the standing to ask future participants for visible public trust, regardless of the quality of its architecture or the importance of its stated purpose.

Schedule is therefore a moral instrument rather than a neutral project variable. Acceleration can reduce exposure, cost, or uncertainty, but it becomes dangerous when it compresses safety meetings, procurement review, host notice, accessibility testing, environmental control, worker recovery, commissioning, or defect closure. The construction record identifies each accelerated decision, the safeguard preserved, the dissent received, and the person with authority to slow or stop work. No milestone is allowed to become a reason that workers or hosts must accept unreviewed burden (International Labour Organization, 1988; International Labour Organization, 2022b; World Bank Group, 2025).

33.2.1 — Worker Safety

Worker safety is the first non-symbolic test of the City's dignity. A construction worker who ties off on a roof edge, handles dust in a demolition area, guides vehicles near pedestrians, works in heat, or lifts materials through a narrow schedule is already carrying City burden. The institution should see that person before it sees the skyline (OECD, 2015; UNCITRAL, 2011).

The mechanism begins with a site-specific safety plan, hazard register, worker orientation, competent supervision, incident reporting, stop-work authority, heat and weather protocols, fall prevention, equipment safety, silica and dust control, traffic separation, emergency response, and protection for reporting hazards. These are not ornamental requirements. They are how the City refuses to make worker injury the hidden cost of public aspiration.

A responsibility map prevents subcontracting from dissolving accountability. The City must know who is on site, who employs each worker, what training and language access they received, how hazards are reported, how pay and working time are verified, and which principal has authority to correct unsafe conditions. A worker should reach a safe ladder, clean air, protective equipment, or a stopped lift through one usable route rather than navigate a chain of companies.

Construction risk reaches workers, families who rely on their wages and bodies, nearby residents, inspectors, drivers, emergency responders, and future occupants who inherit built defects. A hurried construction schedule can turn into years of maintenance risk. Safety is therefore both immediate care and long-term institutional honesty (World Bank, 2017a; United Nations, 2011).

Near misses belong in the safety record because they show whether the institution learns before injury occurs. A falling object that misses a worker, a vehicle that reverses into the wrong lane, or a scaffold tag ignored for an hour should matter. The City should reward early hazard discovery rather than quiet luck.

Safety planning reaches less dramatic risks: heat stress, fatigue, repetitive strain, language misunderstanding, rushed cleanup, poor lighting, blocked sanitation, and deadline pressure to remain silent. These burdens rarely become public symbols, but they decide whether a construction site is humane. The City's first record should be attentive enough to notice them.

Worker-facing evidence, not management reports alone, tests the safety plan. A person on the site should know how to stop work, how to report a blocked exit, how to refuse an unsafe lift, how to ask for translation, how to get paid for safety training, and how to complain without being quietly removed from the schedule. If the route depends on courage alone, the burden has already moved downward. The City should make the safest action the easiest action, especially for temporary workers, subcontracted workers, apprentices, cleaners, drivers, and people whose immigration, language, or economic position makes retaliation more frightening (International Labour Organization, 2022b; ISO, 2021b).

Schedule pressure belongs in the construction risk record. Failures often begin with compression rather than dramatic malice: a storm delay, donor visit, press deadline, change order, crew shortage, fixed concrete pour, or inspection squeezed between trades. The record should identify when pace threatens safety meetings, rest, review, commissioning, or defect closure, and who can slow the work. A schedule that transfers institutional anxiety into workers' hours is a hidden burden, not an efficiency.

The stop rule is direct. A serious unaddressed hazard, retaliation against a worker who reports risk, repeated near misses, hidden

injury data, unpaid safety training, or contractor resistance to stop-work authority should halt the relevant work package. The remedy is correction, compensation where harm occurred, contractor discipline, schedule revision, and public explanation of the institutional action (OECD, 2015; UNCITRAL, 2011).

33.2.2 — Fair Procurement

Fair procurement blocks the quiet conversion of civic ambition into private leverage. Construction creates contracts, and contracts create opportunities for influence, favoritism, corruption, labor abuse, inflated cost, local exclusion, and vendor dependence. The City cannot claim to reveal hidden power while hiding its own supply chain (World Bank, 2017a; United Nations, 2011).

Fair procurement also protects smaller local firms from symbolic inclusion. If local businesses are invited only to appear in public materials while major contracts travel through closed networks, the City has reproduced the hidden pipeline it criticizes. Procurement should distinguish capacity-building, fair competition, anti-capture review, and honest refusal when a local firm is not the right fit.

The burden reaches workers, unsuccessful bidders, local businesses, taxpayers or donors where funds are public or philanthropic, host residents, future staff, and participants who will inhabit the result. A corrupt contract is more than a financial injury. It can become a design defect, a maintenance burden, a donor obligation, or a public-trust fracture.

Procurement oversight remains independent through officers separated from donor relations, external audit, conflict review, transparent change-order summaries, labor and environmental review, and a complaint route for bidders and workers. Sensitive details may need protection, but secrecy should not cover influence, favoritism, or unexplained cost movement (OECD, 2025c; World Bank Group, 2025).

A seemingly helpful shortcut tests procurement independence. A supporter knows a contractor, a donor offers discounted equipment, a vendor offers bundled services, or an official suggests a favored local partner. The City should have a route for appreciating help while still requiring ordinary review, recusal, and comparison.

Payment discipline is part of fairness. A City can underpay without intending corruption if it lets slow invoices, disputed change orders, retention practices, or subcontractor delays carry cash strain down the chain. Procurement review should ask who waits longest to be paid and whether the people with least leverage are financing the schedule.

Procurement review follows the money after award, not merely before it. A clean bidding process can still produce unfairness if payment stalls, lower-tier subcontractors are squeezed, labor standards disappear below the prime contractor, or change orders become the hidden currency of influence. The City should know whether the people who swept dust, poured footings, installed access systems, wired archive rooms, cleaned temporary toilets, delivered materials, and maintained safety barriers were paid lawfully and on time. The build record should not stop at the

contract signature because burden rarely stops there (UNCITRAL, 2011; International Finance Corporation, 2012).

Fair procurement tests competence without borrowing prestige. A renowned architect, admired technology firm, respected donor, or politically connected contractor may bring genuine skill, but reputation cannot substitute for competition, conflict review, performance evidence, labor conditions, portability, or price discipline. The file should answer a simple counterfactual: would the selection still be defensible if the name attached to it were ordinary? If not, the institution is purchasing aura rather than verified capability.

Procurement fails when the record shows undisclosed conflicts, donor influence, bid manipulation, unpaid subcontractors, labor-standard violations, unexplained change orders, single-vendor dependence without justification, or contractor pressure for special access. The remedy is contract suspension, rebid, recusal, payment correction, public notice, vendor exclusion, or build delay. A City that cannot refuse a bad contract cannot later refuse a bad influence (World Bank, 2017a; United Nations, 2011).

33.2.3 — Environmental Burden

Environmental burden is not a decorative sustainability chapter hidden inside construction. Land, water, energy, waste, materials, habitat disruption, stormwater, heat, noise, dust, and construction emissions all become burdens for someone. The City has no moral right to describe itself as fair while treating environmental cost as background (World Bank, 2017a; International Finance Corporation, 2012).

The mechanism begins with baseline conditions. Before construction, the City should document water demand, energy sources, waste streams, soil conditions, drainage, material origins, embodied burden where feasible, local ecology, heat and dust effects, and operational assumptions. A fair environmental account distinguishes one-time construction cost, ongoing operation, mitigation, and uncertainty.

Environmental burden reaches host residents, workers exposed to dust and heat, downstream communities, maintenance staff, future participants, local ecosystems, utility users, and emergency responders. Its effects can be slow, cumulative, and politically quiet. They often hide because no single person can point to the whole cost in one moment.

Green imagery cannot substitute for an environmental account. Trees, water, and sunlight in a rendering may conceal concrete, cooling loads, supply chains, waste disposal, and maintenance. The project record must be plain enough for a skeptical host resident to see what the building demands, what changed because of that demand, and what remains uncertain (UNCITRAL, 2011; International Finance Corporation, 2012).

A concrete environmental test is the first summer storm, heat wave, or water restriction during construction. Plans that looked responsible in moderate weather can shift burden quickly when runoff, cooling demand, dust, or worker heat exposure rises. The environmental record should be able to show how the City changes behavior when conditions worsen.

Environmental review includes future maintainers. A material that looks efficient on opening day can become wasteful if it is impossible to repair, toxic to replace, dependent on rare parts, or exhausting to operate. The City should not purchase sustainability as an image while leaving maintenance staff to carry a brittle system.

The environmental file connects construction choices to operating burden. A wall assembly that reduces energy use but traps moisture, a water feature that photographs well but strains maintenance, a landscape that needs constant irrigation, a sensor network that requires frequent replacement, or a glazing choice that overheats recovery rooms may convert an environmental promise into daily operational cost. The City should treat maintenance workers as environmental witnesses. They will see where dust collects, where heat gathers, where waste is hidden, where access panels require unsafe reach, and where a beautiful detail becomes a repeated burden for people who did not design it (United Nations, 2011; International Labour Organization, 1988).

Host-community environmental review includes emergency assumptions. Fire access, evacuation routes, heat shelter, stormwater behavior, backup power, waste removal, and medical response all affect neighbors when systems fail. The City should not design resilience as a private virtue inside the campus. If its backup generator creates noise and fumes for nearby residents, if its water use hardens restrictions for others, or if its emergency traffic blocks local routes, the City has shifted environmental burden outward while naming itself resilient.

Construction must stop for unmitigated water strain, unreviewed hazardous materials, unmanaged dust or runoff, waste plans that collapse in practice, energy assumptions that require hidden subsidy, or ecological disruption that the host did not knowingly accept. The remedy may be redesign, reduced scale, changed materials, construction pause, mitigation funding, operational limits, or site refusal (World Bank, 2017a; International Finance Corporation, 2012).

33.2.4 — Pilot Construction Transparency

Construction transparency makes build choices auditable without turning the site into a spectacle. The public should be able to see why major decisions were made, how cost moved, how safety was handled, how host burden changed, and what unresolved risks remain. That visibility should serve accountability, not entertainment (UNCITRAL, 2011; International Finance Corporation, 2012).

The build record operates in layers. Public summaries can report schedule status, major contracts, aggregate safety information, environmental indicators, accessibility milestones, community mitigation, significant change orders, and unresolved findings. Restricted layers preserve security-sensitive layouts, worker privacy, proprietary detail, and protected incident information without turning legitimate protection into a general secrecy claim.

This decision affects workers whose privacy needs protection, host residents who need meaningful information, funders who need cost honesty, auditors who need source records, and future occupants who need to know what was built into the place. A

building that cannot explain itself becomes harder to maintain and easier to mythologize (World Bank, 2017a; United Nations, 2011).

Construction transparency gives reasons, not only announcements. When the City changes a material, moves a service route, revises a security threshold, delays a residence wing, or increases cost, the record should say what burden was avoided, what burden was accepted, who reviewed it, and whether dissent remained. This is the build version of public reasoning.

A credible construction challenge route joins the auditable build record, host-facing summaries, worker-protective reporting, and correction of inaccurate public claims. Public maps omit sensitive routes and protected zones; donor summaries retain uncertainty; and status pages show decisions, delays, limits, repairs, and open questions without turning construction into a moral leaderboard. Transparency is useful when it improves remedy and understanding rather than spectacle.

Public transparency includes the unphotogenic parts of building. A delay caused by safety review, a revised delivery route, a rejected material, or a corrected accessibility detail may teach more than a polished progress image. The City should make repair visible enough that the public learns to respect interruption (International Labour Organization, 2022b; World Bank Group, 2025).

The transparency layer provides a correction route for the build record itself. If a cost summary is wrong, a safety report is incomplete, or a host mitigation item is overstated, the record

should show the correction and the reason. An institution that corrects its construction record is practicing the memory discipline it will later ask the public to trust.

Construction transparency fails when review finds hidden change orders, safety incidents buried in private logs, public summaries that omit major cost movement, security claims used to hide ordinary decisions, or worker-identifying information released without need. The remedy is correction, disclosure where proper, restricted-record review, public explanation, and, when the pattern is severe, construction pause (OECD, 2015; UNCITRAL, 2011).

33.2.5 — Local Disruption Mitigation

Local disruption mitigation protects the host community during the least glamorous stage of civic ambition. Construction changes the rhythm of a place. It brings trucks, noise, dust, parking pressure, road closures, temporary fencing, night work, utility interruptions, media attention, and sometimes protest. Those costs should not be dismissed as the price of progress (United Nations, 2011; International Labour Organization, 1988).

The disruption route includes a calendar, delivery paths, noise windows, dust controls, traffic plans, pedestrian safety, emergency access, parking rules, construction contacts, complaint deadlines, language access, and published mitigation commitments. Host residents should know what is coming before it arrives at their curb.

Disruption mitigation protects nearby households, commuting workers, schools, small businesses, patients in nearby clinics,

emergency responders, transit users, people with disabilities, elders, children, and people whose work depends on predictable movement. A twenty-minute road delay can be a missed shift, a missed appointment, or a caregiver arriving late (World Bank, 2017b; United Nations, 2006).

Host mitigation should have an enforcement path: complaint intake, response clock, interim protection where needed, corrective order, follow-up verification, escalation, and authority to slow or stop work when repeated conditions remain uncorrected.

Local-disruption review brings together host representatives, construction managers, emergency services, accessibility reviewers, and public reporting that aggregates disruption without exposing private complainants. The City should invite critics to test the route before they need it. A complaint system first used during harm is already late.

A host mitigation drill follows one complaint from intake through remedy and verification. A resident reports blocked access. The issue is logged, verified, routed, corrected, communicated, and reviewed for recurrence. If the City cannot trace that ordinary complaint, it cannot credibly claim to hear larger host burdens (UNCITRAL, 2011; International Finance Corporation, 2012).

Time of day remains part of mitigation. A noise window that looks reasonable on paper may strike hardest during school drop-off, medical rest, worship, evening work, or sleep for shift workers. The City should not average disruption across the day and miss the moments when disruption becomes most costly.

Construction progression stops when complaints remain uncorrected, access barriers remain unmanaged, traffic is unsafe, communication reaches only supportive residents, or mitigation promises lack a budget. The remedy is schedule revision, route change, contractor discipline, compensation where appropriate, community notice, and construction pause when the City cannot protect the place that holds it (World Bank, 2017b; United Nations, 2011). Mitigation review should compare promised and actual disruption at resident-identified high-burden times, not only project-wide averages.

33.3 — Staff Recruitment, Training, and Dry Runs

A building can pass inspection while the institution inside it remains unready. Staff recruitment, training, and rehearsal are where the City proves that protections can be performed by ordinary professionals under pressure, across shifts, without founder presence or unpaid heroics. Recruitment criteria, role conflicts, staffing ratios, relief coverage, contractor status, training evidence, and replacement capacity belong in the readiness record. The City should not learn basic operations by placing the first participants under avoidable risk (ISO, 2023b; International Labour Organization, 2019a; Reason, 1997; Leveson, 2011).

Dry runs are not theatrical preparation. They are ethical instruments. They let archive errors, role confusion, crisis delays, public-interface confusion, exit weakness, and complaint routing failures appear before real people carry the full consequence. A failed rehearsal can be a successful act of care.

Staff are the living system through which rights, records, care, security, public access, and exit become real. A participant will not experience the City as a table of principles. They will experience it through the person who answers the door, explains a record, routes a complaint, notices overload, and has authority to stop.

Admissions remain closed until documented rehearsals test every critical route. Each scenario names the trigger, roles, expected route, actual route, time to decision, information boundary, failure points, affected people, reviewer, repair owner, retest date, and

stop consequence. The file records whether the procedure worked during ordinary staffing and degraded conditions. A dry run without authority to change design merely teaches the institution how to look ready.

Rehearsal design begins with the people who will carry the procedure when senior attention has moved elsewhere. Staff who answer phones, open doors, classify records, clean spaces, serve meals, escort visitors, de-escalate conflict, translate, moderate, and repair systems often know first where the written route will fail. Giving them authority to design, interrupt, score, and demand a retest is both staff dignity and operational evidence. Training records should show competence and limits rather than attendance alone (NIST, 2024d; ISO, 2023b; Reason, 1997).

33.3.1 — Staff Recruitment Standards

Staff recruitment begins with fit for burden, not enthusiasm for the City's image. The institution needs people who can work under public meaning without becoming performers, loyalists, gatekeepers, rescuers, confessors, or informal rulers. A staff member may believe in the project, doubt it, criticize it, or simply work professionally. The standard is role competence under limits (Edmondson, 1999; NIST, 2024a).

Recruitment standards define duties, authority, boundaries, supervision, conflict rules, training obligations, privacy protections, record exposure, complaint rights, compensation, workload, and the right to refuse unsafe instructions. A job description that says service without naming burden invites

exploitation. A recruitment process that screens for devotion instead of capacity invites groupthink.

Recruitment decisions affect staff applicants, existing employees, participants, households, host residents, public users, and future auditors. Bad hiring can create hidden influence, unsafe care, poor moderation, archive leakage, role confusion, and participant dependence. Good hiring makes the City less charismatic and more reliable (ISO, 2023b; International Labour Organization, 2019a).

Role-specific competencies anchor operational protection. Archivists need provenance and access discipline. Clinicians need independence. Educators need visible reasoning without domination. Security staff need de-escalation and rights literacy. Moderators need public-interface judgment. Maintenance workers need privacy-sensitive movement routes. Executives need refusal tolerance.

Recruitment appeals draw on human resources expertise, labor representation where appropriate, role supervisors, independent ethics review for high-risk positions, background checks consistent with law, and a reconsideration route for applicants treated unfairly. Recruitment should not become an ideological purity test or a prestige funnel.

Realistic preview sessions belong in recruitment, not only inspiring orientation. A candidate should hear how often the role may involve conflict, slow documentation, public misunderstanding, grief, or restraint. A person who declines after

seeing the true burden has helped the City preserve consent (ISO, 2023b; International Labour Organization, 2019a).

Recruitment also protects staff from the aura of the project. People may accept underdefined roles because the mission feels important or because they fear missing a prestigious opportunity. The City should slow that pressure by making load, privacy, conflict, supervision, and exit from employment visible before a staff member accepts the work.

Recruitment must stop for understaffing, unclear role descriptions, unpaid or underpaid training labor, devotion-based selection, missing background or credential checks where required, or hiring plans that depend on staff absorbing undefined emotional load. The remedy is slower hiring, redesigned roles, increased compensation, revised cohort size, or admissions delay (Leveson, 2011; Weick and Sutcliffe, 2015).

33.3.2 — Role-Separation Training

Role-separation training prevents power collapse. In the City, educators, clinicians, archivists, operators, auditors, security staff, mentors, moderators, public-interface staff, and participant advocates all touch the same institution. If those roles collapse into one another, the participant may not know whether they are receiving care, instruction, discipline, surveillance, assessment, or public explanation (Beauchamp and Childress, 2019; Institute of Internal Auditors, 2020).

Scenarios make role boundaries usable under pressure. A clinician cannot become an admissions persuader; an educator cannot quietly control a complaint route; an archivist cannot

decide psychological readiness; a security officer cannot interpret dissent as moral defect; and an auditor cannot depend on the operator for access or favor. Training is complete only when staff can identify the boundary, the lawful handoff, the record required, and the person who reviews an error.

Role confusion burdens participants who need to understand who holds which power, staff who need protection from impossible expectations, households that need trustworthy referral routes, and public users who need records distinguishing education, care, discipline, audit, and interpretation. Role collapse turns visible formation into hidden authority.

Training covers handoff scripts, escalation maps, refusal language, conflict-of-interest practice, documentation boundaries, protected communication routes, emergency exceptions, and correction exercises. The City should practice moments when a participant asks the wrong person for help and the staff member has to route the request without becoming the answer (Reason, 1997; Leveson, 2011).

One drill places a beloved participant's request for a favor at the boundary among mentorship, records, care, and governance. The mentor's refusal should be kind, immediate, and documented where the role requires it, followed by a usable route to the person authorized to decide. Affection remains humanly valuable while losing its power to become an alternate channel around the City's safeguards.

Training gives each role a sentence for when it cannot answer. A clinician should be able to say, this is an advocacy question. An

archivist should be able to say, this is a rights question. A mentor should be able to say, this is a clinical question. These small refusals are how boundaries survive kindness.

Role separation is rehearsed under admiration and urgency, not only under conflict. A participant may admire a mentor and ask for a private shortcut. A journalist may praise an archivist and ask for informal context. A donor may compliment an operator and request a tour detail outside the ordinary route. A frightened family member may ask security to solve a medical question. These moments feel human, and some will be sincere. That is why the training matters. The City should teach staff how to redirect warmly without absorbing power they do not hold (Edmondson, 1999; NIST, 2024a).

Participants and staff can read the role map in ordinary language. A person under the Vow should not need institutional fluency to know who can change a schedule, who can pause a release, who can escalate a care concern, who can receive a complaint, who can decide access, and who can overrule a first answer. Role separation that exists only in governance binders will fail at the counter, in the hallway, and at the end of a long day when people ask the nearest trusted person for help.

Role-separation training fails when the record shows staff confusion over authority, undocumented informal influence, care staff asked to enforce participation, auditors embedded inside operations, or participants unable to identify where to complain. The remedy is retraining, role redesign, separated reporting lines, temporary closure of the affected function, and public correction

if role collapse has already affected the record (Bovens, 2007; Institute of Internal Auditors, 2020).

33.3.3 — Archive Dry Runs

Archive dry runs test whether record systems can carry stress without making people into raw material. Before active records exist, the City should rehearse the entire lifecycle with mock data: capture, custody, classification, access, release, correction, protected summary, delayed release, breach response, public bundle, and long-term review (Reason, 1997; Leveson, 2011).

The rehearsal uses difficult records, not only clean ones. A mock record should contain a protected family detail, a staff complaint, a disputed quote, an ambiguous consent boundary, a machine-summary error, a third-party name, a public-interest item, and a security-sensitive detail. The dry run matters because real archive work begins where categories collide.

The affected persons in the drill are hypothetical, but the future persons are real. Participants will depend on the archive not to expose protected life. Staff will depend on role records not becoming full-life records. Nonparticipants will depend on incidental contact not becoming public material. Public users will depend on summaries that do not replace source context (Weick and Sutcliffe, 2015; Edmondson, 1999).

Each archive decision needs a traceable route. Who classified the item? Who reviewed protected status? Who approved public release? Who noticed the error? How was correction displayed? What was withheld, summarized, delayed, sealed, or escalated?

The dry run should reveal whether the archive can explain its own decisions after memory has moved through the system.

Outside review should include archivists, rights reviewers, technical auditors, affected-person advocates, public-interface specialists, and cybersecurity staff. Red teams attempt to retrieve what should remain protected, conceal what should remain reviewable, and separate a public summary from its source. The archive passes only when both curiosity and institutional self-protection encounter effective limits, logs, correction, and human review.

Archive staff practice explaining an archive decision to a nontechnical public user. If the explanation requires jargon, the public record site will fail under pressure. The test should show whether terms such as captured, delayed, restricted, corrected, source, summary, and right of reply can be understood without weakening the underlying boundary (OECD, 2022b; W3C, 2023).

Time-pressured retrieval is part of the dry run. A public explanation, appeal, or correction may depend on quickly finding the right source. If only senior archivists can locate the truth, the archive is fragile. The City should know how ordinary authorized staff find records without opening what they should not see.

Archive rehearsal stops when staff confuse capture with release, cannot reverse a public error, expose protected details through search, hide correction history from public users, or cannot explain why one record is public while another is delayed. The response is record lockdown, architecture repair, additional dry

runs, affected-person review, and no participant activation until the failure route has been corrected (ISO, 2016a; ISO, 2017; NIST, 2020b).

33.3.4 — Crisis Dry Runs

Crisis dry runs ask whether the City can remain lawful and humane when pressure rises. The first real medical emergency, security threat, mental health crisis, protest surge, cyberattack, power outage, family emergency, or public-record dispute should not also be the first time staff discover who decides. Crisis exposes whether values are operational (Edmondson, 1999; NIST, 2024a).

Crisis rehearsal must combine problems rather than isolate them. A participant becomes medically unstable while a public interface is crowded, a family member requests shielding, a record system slows, and a media inquiry arrives. Single-channel drills create false confidence. City crises will often be layered because visible public-power formation attracts attention precisely when people are most vulnerable.

A crisis drill affects participants, staff, visitors, families, host responders, public users, journalists, protesters, and nearby residents. The route has moved burden outward when it protects the participant by overwhelming local emergency services. It has moved burden downward when public access is preserved by exposing family information (World Health Organization, 2025; ISO, 2019).

The drill identifies decision authority, protected communications, emergency medical handoff, security de-escalation, record status

during crisis, public communication, staff rotation, and post-event review. It should also test silence. Sometimes the correct public statement is limited because care, safety, and rights precede narrative completion.

Crisis review connects emergency services, clinicians, security experts, rights advocates, host officials, cybersecurity reviewers where relevant, and staff who participated in the drill. After-action review should state what failed, what changed, which burdens appeared, and whether the next stage remains authorized.

A crisis drill includes the person who asks the inconvenient question during emergency response. Why is this camera still running? Who has access to the medical hallway log? What is being told to the public? Those questions should not be treated as obstruction. They are how crisis remains under rights (FEMA, 2020b; World Health Organization, 2025; Reason, 1997).

Crisis drills also practice recovery after the emergency. Staff and participants may need debrief, quiet, correction, and records cleanup after the immediate danger is over. A crisis route that ends when the alarm stops may leave the burden in people's bodies, schedules, and public status. Aftercare is part of the drill.

Crisis rehearsal fails when review finds unclear command, delayed care, public explanation that outruns facts, protected information released under pressure, security response that becomes carceral, staff exhaustion treated as devotion, or host responders surprised by City needs. The remedy is revised protocols, additional staffing, host coordination, reduced

operations, admissions pause, or closure of the affected pathway (Leveson, 2011; Weick and Sutcliffe, 2015).

One crisis dry run forces a conflict between speed and rights. The scenario can combine a physical emergency, a communications outage, a false social-media claim, a protected medical event, and an unavailable decision maker. Observers record which role assumed authority, what information was missing, who was exposed, which manual fallback worked, and whether the after-action process corrected the system rather than blaming the slowest person (Reason, 1997; Weick and Sutcliffe, 2015).

33.3.5 — Public Interface Dry Runs

Public interface dry runs test whether citizens, critics, journalists, volunteers, experts, visitors, and affected persons can use the City without becoming record subjects by accident. The public interface is a civic boundary, not a funnel for attention. It should welcome legitimate questions while refusing spectacle, harassment, extraction, and hidden data collection (OECD, 2022b; W3C, 2023; Nissenbaum, 2010).

The operational test covers the record site, visitor route, inquiry route, complaint route, accessibility supports, language access, moderation, protest interface, expert submissions, journalist requests, and public-summary format. Each route should tell the user what is recorded, what is not, what may become public, and how correction or withdrawal works where withdrawal is available.

This decision affects ordinary citizens, critics, participants, staff, volunteers, public users with disabilities, people with limited

digital access, journalists, protesters, and people named in records. Public usability is not proven by supportive readers. It is proven when a skeptical, tired, disabled, angry, confused, or low-trust user can still find the right route without giving up privacy (OECD, 2022b; W3C, 2023; Nissenbaum, 2010).

The dry run presents hostile but lawful questions, accessibility barriers, mistaken identity, pressure for intimate records, volunteer over-identification, a journalist's sensitive request, and a correction claim. The interface should answer by route, not by charisma. It should make boundaries visible without sounding defensive.

Public-interface assurance brings together accessibility experts, civil-liberties reviewers, moderators, public-administration specialists, journalists or media reviewers, affected-person advocates, and ordinary test users. The City should record friction points. A public interface that only works for highly educated supporters will fail the public it claims to serve.

A respectful critic who refuses the City's framing belongs in the public-interface rehearsal. The interface should still help that person find records, file objections, and understand limits. If the route works only for people who already share the vocabulary, the City has built a community portal, not a civic interface (Weick and Sutcliffe, 2015; Edmondson, 1999).

Boredom tests the public interface as surely as crisis. Many civic systems fail not during spectacular conflict but during ordinary confusion: a user cannot find a label, a form times out, a moderator gives a stock answer, a correction route feels buried.

The City should make ordinary friction visible before it becomes public distrust.

Public-interface activation stops when recording notices are unclear, forms are inaccessible, moderation has no appeal, public bundles invite voyeurism, expert input becomes authority without review, volunteer data is captured without need, or critics are routed into silence. The remedy is interface redesign, language revision, access repair, moderator retraining, public correction, and no expansion of public-interface load until usability is real (NIST, 2024a; W3C, 2023).

33.3.6 — Exit Dry Runs

Exit dry runs test the most important promise the City makes before entry: departure remains real. The rehearsal should not assume a grateful participant leaving under ideal conditions. It should test frightened exit, exhausted exit, honorable refusal, changed household burden, health-based pause, disputed misconduct, and emergency de-loading (Reason, 1997; Leveson, 2011).

An exit drill traces every step. Who receives the request? Who explains options? What support continues? Which records are reviewed? What public status label changes? Who protects third parties? How is appeal preserved? How does the person recover ordinary life? The exit route should be visible enough to trust and private enough to protect dignity.

The drill should verify that a public status change can remain nonstigmatizing while role-relevant accountability stays visible. Departure should neither shame the participant nor hide conduct

the public still has a lawful reason to understand (Weick and Sutcliffe, 2015; Edmondson, 1999).

The rehearsal traces financial, housing, healthcare, record, communication, and role consequences. A person who became dependent on City support should not be trapped because exit removes basic stability overnight. At the same time, support after exit should not purchase silence, loyalty, gratitude performance, or future public storytelling.

Exit disputes receive rights advocacy, archive review, staff supervision, clinical review where appropriate, and an independent appeal function. The City should ask the departing person, in protected form, whether the route felt understandable and noncoercive. That feedback should not be treated as public performance.

One exit rehearsal protects a participant whose reasons remain private. The City may need to explain a status change without narrating the cause. That is a difficult public-communication task, and it should be practiced before a real person's privacy depends on it (Nissenbaum, 2010; Wertheimer, 1987). The rehearsal should test whether staff can publish that limited status update without prompting the departing person for a fuller explanation.

Exit drills account for staff emotion. Staff may feel grief, frustration, worry, or institutional defensiveness when someone leaves. Training should teach staff to support departure without persuasion, shame, or subtle loyalty testing. The participant should not have to manage staff feelings in order to reclaim ordinary life. A debrief can record where staff language or delay

created pressure so later training targets the actual friction point.

New admissions and active-record starts must stop when staff cannot explain exit terms, public status language humiliates, aftercare is unavailable, record handling is unclear, appeal depends on the same office being challenged, or the route works only for participants with private resources. A participant's ability to leave must remain available; interim arrangements must protect safety, support continuity, and independent appeal while the failed route is repaired. The remedy is redesigned exit, reserve funding, retraining, admissions pause, and another dry run before activation (Hirschman, 1970; Wertheimer, 1987). Before admissions resume, a second team should be able to complete the revised route from the written procedure alone.

33.4 — Phased Admissions and Early Cohort Growth

Phased admissions protect the first cohort from being used as reassurance. A launch attracts funder expectation, media appetite, supporter vindication, critic attention, and leadership momentum. Under those pressures, early participants can become symbols before the City has earned the right to ask them to carry public burden. The cohort plan therefore names capacity, protected subgroups, recruitment channels, dependencies, exclusion risk, and the reasons a person may pause or leave without becoming evidence of failure (Eldridge et al., 2016; Skivington et al., 2021).

The pilot cohort is small enough to be cared for and large enough to reveal real system behavior. That balance cannot be solved by charisma. It depends on staffing, archive capacity, rights routes, housing, recovery space, food, medical access, host burden, emergency coverage, public-interface load, and exit readiness.

Participation is also not one switch. Orientation, consent, protected rehearsal, active capture, public status, delayed release, office support, public interface, and research eligibility are separate thresholds. A person should not be carried from curiosity to public role burden by one early yes.

Growth is a burden decision before it is a success metric. Every additional participant increases staff load, archive load, household and bystander exposure risk, host pressure, public attention, care demand, and exit obligation. Expansion requires evidence that existing routes remain usable at present load, a forecast of the next load band, protected reserves, minority

findings, and a predeclared reversal point. Enrollment numbers never compensate for rights or staffing failure.

Cohort growth must also resist the prestige created by scarcity. Rare admission can look like honor, and a famous pilot can make participation appear to prove courage or public worth. The sequence therefore separates access from rank, publishes burdens and selection limits, protects refusal and nonselection, and expands only when lived evidence shows that rights, staffing, records, host relations, care, accessibility, and exit remain usable under greater load. A larger cohort is not evidence of legitimacy; it is a larger duty (Skivington et al., 2021; Proctor et al., 2011).

33.4.1 — Initial Cohort Size

Initial cohort size is a moral and operational decision. A small cohort can be overprotected, unrepresentative, and too dependent on exceptional staff attention. A large cohort can overload care, archive, housing, public interface, and exit routes before the City knows how its systems behave. The right size is the size the institution can support without heroics (Moore et al., 2015; Damschroder et al., 2009).

The cohort-capacity model includes staff ratios, housing, healthcare, meals, recovery space, counsel, complaint capacity, archive processing, technical support, public-interface load, maintenance, host services, emergency coverage, and exit reserve. The model should state assumptions plainly and identify which assumption would trigger admissions freeze.

The initial cohort decision affects first participants, households, staff, host residents, public users, and applicants waiting outside

the gate. A cohort that is too large turns the first participants into stress tests without consent. A cohort that is too small and privileged can hide burdens that will emerge only when pathways diversify. The City has to name both dangers (Sitkin, 1992; HM Treasury, 2026b).

Initial cohort size should follow the number of people the City can support, protect, hear, and release well, not the number that would look impressive. Early admissions should test essential pathways under humane limits, including accommodations, complaint load, staff coverage, archive review, host impact, and exit. A modest cohort is not timid when it preserves learning quality and keeps every participant within the institution's real capacity.

Initial-cohort review brings together operations, staff, rights advocates, archive reviewers, host representatives, clinical advisors, accessibility reviewers, and independent auditors. The cohort-size decision should expire. A size that was safe during protected rehearsal may become unsafe after public interface or office support activates.

Daily sequence, not headcount alone, tests initial size. Ten people may be manageable on paper and unmanageable if they all need counsel, medical appointments, archive review, meals, and public-interface support in the same window. Capacity lives in time, not just in totals (Skivington et al., 2021; Proctor et al., 2011).

The first cohort is protected from overobservation by the institution itself. Leaders may want to learn everything because

the pilot is precious. That desire can become internal surveillance. The cohort-size plan should define which observations are necessary, which are optional, and which would add burden without enough operational value.

The cohort-size gate closes when the record shows backlog in rights routes, staff overtime beyond limits, archive delay, participant overload, host complaints above mitigation capacity, public-interface failures, or exit-reserve insufficiency. The remedy is admissions freeze, cohort reduction before activation, delayed pathway opening, additional staffing, or formal pause. Growth should never be the price paid by the first people who trusted the gate (Moore et al., 2015; Damschroder et al., 2009).

33.4.2 — Staged Activation

Staged activation controls the burden of the Transparent Vow by dividing participation into named, separately reviewable stages: inquiry, application, acceptance, orientation, protected rehearsal, pre-activation review, active-record start, delayed-release handling, public-status start, public-interface participation, office-track support where applicable, and exit or transition. A person may be ready for one stage and not the next. Each threshold requires its own consent and review, and the stages must never become a ranking ladder (HM Treasury, 2026b; Eldridge et al., 2016).

Stage transition affects participants, households, staff, professionals, bystanders, and public users. Staged activation protects them because it gives the City time to discover burden before the burden becomes public and harder to unwind. It also

gives participants time to experience the difference between understanding the Vow and living near it (Skivington et al., 2021; Proctor et al., 2011).

Each stage carries a distinct record rule. Application privacy precedes active status; protected rehearsal is separate from public release; capture is separate from access; access is separate from public interface; and public interface is separate from research or model training. These boundaries should be explained in plain language, with examples and correction routes, so that a tired applicant or family member can understand them without specialist help.

Stage-transition appeals draw on participant counsel or advocacy, staff readiness, archive status, household consultation where relevant, clinical review when load is significant, and rights review. A participant should be able to decline the next stage without being described as failing the City. Refusal can be evidence that consent remained alive.

Staged activation includes a point at which the person can restate the terms in their own words. This is not a test of intelligence. It is a test of institutional clarity. If the person describes capture, release, shielding, exit, or public status incorrectly, the City learns that its explanation has not yet earned consent (Damschroder et al., 2009; Sitkin, 1992).

Meaningful waiting periods are part of staging, not merely procedural delays. A person needs time to discuss household effects, sleep on terms, ask embarrassing questions, and notice new fear after the first explanation has faded. A stage that moves

too quickly can preserve formal consent while weakening lived consent.

Staged activation must stop for ambiguous stage boundaries, pressure to proceed, public status before record protections are ready, activation without exit rehearsal, or participants unable to explain what changes at the next threshold. The remedy is delayed activation, repeated orientation, protected pause, revised materials, or withdrawal without stigma (HM Treasury, 2026b; Eldridge et al., 2016).

33.4.3 — Diversity of Pathways

Diversity of pathways tests varied roles without turning people into public decoration. The City forms public-power seekers across different kinds of roles, jurisdictions, cultures, abilities, disciplines, and life circumstances where lawful. The pilot should not depend on one narrow class of polished participants who make operations look easier than they are (Proctor et al., 2011; Moore et al., 2015).

Pilot pathway selection identifies which pathways open and why. A local-office pathway may test host legitimacy and neighborhood interface. A legislative pathway may test deliberation and record traceability. A public-administration pathway may test technical competence. A diplomatic or crisis pathway may be deferred because travel and government-boundary risks are not yet ready.

Pathway design affects participants carrying different burdens, staff supporting different pathways, public users interpreting different records, host residents encountering different forms of

attention, and applicants who may wrongly treat inclusion as rank. A pathway is not a badge of worth. It is an operational test under stated limits (Damschroder et al., 2009; Sitkin, 1992).

Pathway diversity includes disability access, language access, caregiving constraints, household complexity, digital access, and varied educational histories where feasible. The goal is not to force representation for optics. It is to learn whether the City's routes work for more than one kind of person and more than one kind of public-power burden.

Pathway diversity receives outside review from pathway-specific experts, rights reviewers, accessibility experts, host reviewers, staff reviewers, and public communication reviewers. If a pathway requires unsettled legal authority, scientific validation, national rollout, or government reform, the City must defer rather than absorb those domains.

Pathway diversity also tests support systems that do not appear in public biographies. A participant with caregiving duties, a participant with disability accommodations, a participant from a nonelite educational background, and a participant pursuing a technical role may reveal different institutional weak points. The City should welcome those weak points as information, not treat them as inconvenience (Eldridge et al., 2016; Skivington et al., 2021).

Pathway diversity also requires testing the interactions among pathways. Participants on local, regional, national, or specialist paths may carry sharply different public burdens, and shared spaces or record summaries can turn those differences into

prestige hierarchies. Diversity becomes unsafe when it quietly hardens into caste.

Pathway diversity fails when review finds tokenism, unsupported diversity, pathway prestige, inaccessible supports, or expansion into roles the City cannot lawfully or operationally carry. The remedy is narrowing the pilot, adding supports, delaying a pathway, revising public language, or refusing a pathway until later books' domains and lawful review make it possible (Proctor et al., 2011; Moore et al., 2015).

33.4.4 — Cohort Feedback

Cohort feedback is how the first participants tell the City where burden actually lands. Without protected feedback, the pilot hears only what participants can safely say in public or what staff can tolerate hearing. A visible institution needs private channels for truth precisely because participants live under unusual public meaning (Sitkin, 1992; HM Treasury, 2026b).

The working protocol combines confidential interviews, privacy-protective aggregate surveys, protected ombuds meetings, debriefs separated from evaluation, household feedback where consent allows, and public thematic summaries that do not identify private lives. Feedback should be routed to action, not stored as institutional reassurance.

Cohort-feedback design affects participants, households, staff, people named in records, and future cohorts who inherit the design. The first cohort should not become a permanent focus group. Feedback asks them to help repair the City, but it should

not add unbounded unpaid interpretive labor to the burden they already carry (Eldridge et al., 2016; Skivington et al., 2021).

Concrete questions keep cohort feedback from dissolving into general approval. Where did sleep fail? Where did public attention intrude? Which record explanation remained confusing? Which staff or complaint route worked, and which felt unsafe? Which protected zone was hard to reach? Which public interface produced pressure to perform? Answers are linked to decisions and remedies rather than aggregated into a satisfaction halo.

Cohort-feedback review connects independent evaluators, rights advocates, staff reviewers, clinical advisors where load is involved, and a participant-protective method for dissent. Public summaries should report what changed because of feedback. If nothing changes, feedback becomes extraction.

Feedback is also gathered after periods of intensity, not only during scheduled evaluation. A participant may understand the burden only after a public interface session, an archive correction, a family conversation, or a difficult night. The City should create protected moments for feedback when burden is fresh without making disclosure compulsory (Moore et al., 2015; Damschroder et al., 2009).

Feedback includes the right not to discuss a subject. A protected refusal to answer can reveal that the City is asking too much, too often, or through the wrong person. The feedback system should treat nonresponse as information about burden rather than as ingratitude or data loss.

Cohort growth stops when feedback produces retaliation, pressure to praise the City, channels controlled by the staff being criticized, public summaries that expose private facts, or repeated themes without remedy. The remedy is independent review, staff retraining, design change, public correction, admissions pause, or reduction of role burden (Sitkin, 1992; HM Treasury, 2026b).

33.4.5 — Expansion Gate

The Expansion Gate links growth to evidence. The City should not expand because the first weeks were moving, because press coverage improved, because donations arrived, because a political figure praised the experiment, or because critics looked premature. Expansion requires demonstrated capacity under limits (Skivington et al., 2021; Proctor et al., 2011).

Cohort review compares planned thresholds with lived evidence: rights response times, archive backlog, staff load, participant wellbeing, host complaints, public-interface usability, exit readiness, protected nonvisibility incidents, vendor reliability, and unresolved dissent. The gate should distinguish a finding from a feeling. It should also state which uncertainty remains too large for growth.

Expansion protection covers current participants, applicants, staff, households, host residents, public users, and future replicators. Growth can injure current participants by drawing staff away. It can injure applicants by admitting them into weak systems. It can injure host residents by multiplying traffic, attention, and service demand before mitigation has worked (Moore et al., 2015; Damschroder et al., 2009).

The gate avoids single-grade shorthand. It should not reduce readiness to a single grade or public ranking. It should identify conditions: which functions may expand, which remain frozen, which require redesign, which require more observation, and which are outside the City's authority. Narrow permission is safer than broad confidence.

Expansion review brings together independent audit, staff council or labor review, participant-protective feedback, host review, archive and technical review, rights review, and public explanation. A dissenting reviewer should be able to publish or file a protected dissent without being described as hostile to the project.

The public calendar is part of expansion testing. An election cycle, media controversy, donor deadline, or anniversary of the project may create pressure to grow at exactly the wrong time. The gate should be able to say that the date is meaningful but not governing. Dates can orient ambition; gates protect fairness (HM Treasury, 2026b; Eldridge et al., 2016). Gate decisions should publish the evidence that justified expansion or restraint so cohort growth does not become a momentum-based administrative habit.

The Expansion Gate protects applicants from the romance of waiting. A long queue can create pressure to accept terms too quickly when a place finally opens. Public updates should avoid language that makes admission sound like rescue, destiny, or moral elevation. The next cohort must be invited into a burden, not lifted into a myth. Where reviewers disagree, the dissent should remain visible alongside the decision and receive a defined reconsideration date.

Expansion must stop for unresolved backlog, increased staff strain, repeated participant overload, unmitigated host burden, exit weakness, technical instability, or public-interface harm. The remedy is admissions freeze, slower activation, smaller scope, delayed pathway, public explanation, and revised gate design. The City grows only when the next burden can be carried openly (Skivington et al., 2021; Proctor et al., 2011). Expansion is strongest when a smaller next step can test unresolved capacity without committing later cohorts to an unproven scale.

33.5 — Post-Occupancy Evaluation and Rights Audit

Post-occupancy evaluation begins when the building stops being a promise and starts becoming a day. Doors that looked clear on a plan may confuse people in motion. Recovery rooms may be too far from the places where overload occurs. A route can be technically accessible and still fail after fatigue. A public interface can satisfy a specification and remain exhausting or stigmatizing. Evaluation therefore examines intended use, actual use, avoided use, and the protected reasons people withdraw (Preiser, Rabinowitz, and White, 1988; Leaman, Stevenson, and Bordass, 2010; World Health Organization, 2018b).

A rights audit asks a different but related question: did law, dignity, complaint, appeal, shielding, and remedy work after the institution became busy, proud, tired, and public? Rights are easiest to admire before anyone uses them against institutional momentum. They become real when they interrupt a schedule, change a release, discipline a staff member, or pause a pathway.

Post-occupancy evaluation and rights audit are evidence with consequences. The inquiry asks whether the occupied City is usable, humane, lawful, and correctable under ordinary and adverse conditions. It does not ask whether the campus looks successful or whether participants can endure what the design failed to fix (Preiser, Rabinowitz, and White, 1988; HM Treasury, 2026b).

The evaluation calendar is staged because burdens appear at different speeds. Immediate review captures unsafe first use and access failure. Short-cycle review captures workload, confusion,

complaint, and sensory strain. Seasonal and annual review capture maintenance, climate, household effects, host burden, staff turnover, record drift, and whether remedies remain usable after public attention declines.

Methods combine observation, service records, protected testimony, walkthroughs, environmental measurements, workload data, complaint and appeal files, host evidence, and independent challenge. No single metric can establish livability or rights performance. Disagreement among sources remains visible rather than being averaged into a reassuring score.

33.5.1 — Livability Audit

The Livability Audit tests daily human function. A City can satisfy architectural intent and still be hard to live in. Morning routines may collide with record procedures. Meals may become performance zones. Lighting may amplify vigilance. Sound may prevent recovery. Wayfinding may be clear to staff and confusing to a participant under stress (United Nations, 2006; World Green Building Council, 2014).

Livability review covers sleep, food, movement, quiet, accessibility, sensory load, recovery access, residence edges, health appointments, counsel access, staff availability, maintenance response, emergency route clarity, visitor pressure, public-interface spillover, and ordinary human intervals. Livability is not softness. It is the condition that lets visible burden remain humane.

Livability conditions affect participants, staff, household visitors, clinicians, service workers, accessibility users, maintenance

workers, and people whose roles require moving across zones. The audit should not rely only on leadership walkthroughs. A night-shift cleaner, a participant trying to decompress after public questions, and a staff member carrying food through a service route may see different truths.

The livability evidence file includes timed route tests, privacy-protective sleep and noise reports, maintenance logs, incident records, accessibility testing, food-service strain, recovery-space use, and protected qualitative feedback. The City should keep livability evidence tied to obstacles, routes, and repairs rather than reducing daily life to a numerical fitness mark (HM Treasury, 2026b; Preiser, Rabinowitz, and White, 1988).

Livability review draws on post-occupancy evidence, accessibility expertise, participant and staff experience, clinical review where health is implicated, maintenance records, and rights oversight. Public summaries should explain what changed and why without exposing private rhythms, health information, or protected nonuse. A beautiful space that people cannot reach, tolerate, or safely refuse must be redesigned rather than defended as an architectural success.

Livability findings are reported by place, time, activity, and affected group. A building may work for daytime visitors while failing night staff, participants with sensory sensitivity, wheelchair users during an emergency, or families using private routes. Aggregate satisfaction cannot erase a recurring burden concentrated in one corridor, schedule, or group.

Failure-of-ordinary-use observations belong in the livability audit. A door that is technically accessible may be too heavy after fatigue. A quiet room may be unusable if the path to it passes through a public-facing corridor. A meal system may meet nutritional standards while making participants choose between privacy and food. A complaint office may be easy to find while being impossible to enter without being noticed. These are not minor inconveniences in a City built around visible burden. They are places where design decides whether protection is real (World Health Organization, 2018b; United Nations, 2006).

The same review also asks which improvements create new exposure. Adding cameras may solve a security concern while increasing observation load. Adding public signage may improve wayfinding while drawing visitors toward protected edges. Adding a faster digital interface may help citizens while excluding people with disabilities, older users, language barriers, or low trust in machine summaries. Post-occupancy evaluation should therefore review second-order burden, not only first-order fixes.

Livability fails when the record shows persistent sleep disruption, inaccessible routes, maintenance delays in protected zones, recovery spaces that cannot be reached when needed, public spillover into residential life, or food and movement systems that depend on staff improvisation. The remedy is design change, schedule change, staffing change, protected-zone revision, admissions pause, or reduced public-interface load (World Green Building Council, 2014; World Health Organization, 2018b; United Nations, 2006).

33.5.2 — Rights Audit

The Rights Audit tests complaint and appeal under lived conditions. A rights route is not proven by its existence on paper. It is proven when a participant, staff member, household member, visitor, or affected person can use it while pressure is real and the institution would prefer speed, silence, or public confidence (HM Treasury, 2026b; Preiser, Rabinowitz, and White, 1988).

Rights auditing follows complaint intake, emergency shielding, counsel access, appeal timing, retaliation protection, protected-category review, correction, right of reply, public notice, record limitation, and remedy. It should also test whether people understand which route applies. Confusion about where to complain can become a hidden denial of rights.

Rights operations affect participants, staff, family members, professionals, bystanders, public users, and host residents. Rights routes should not belong only to participants. A third party named in a record, a staff member pressured by a participant, or a neighbor harmed by construction spillover may also need review and remedy (United Nations, 2006; NIST, 2020b).

Rights auditing examines actual cases in protected form and simulated cases where real cases do not yet exist. It should ask how long the route took, who had authority, whether the person was heard, what record was created, what remedy followed, and whether a public explanation was needed. Aggregate success rates are not enough if severe cases failed.

Rights auditing draws on an independent rights auditor, ombuds review, legal or ethics review where appropriate, participant

advocacy, staff representation, and public-interest review for public-facing remedies. The office being challenged should not control the final meaning of the challenge.

The rights audit is credible when the first person who invokes a right against a popular decision can use it without retaliation or delay. Reviewers should follow a complaint that pauses a release, contradicts a leader, protects a doubted person, or exposes a costly flaw from notice through decision, appeal, remedy, and correction. Rights that work only for sympathetic claims are reputation management, not institutional protection (United Nations, 2006; United Nations, 2011).

A rights audit closes only when remedy is usable. The file connects each finding to notice, immediate protection, responsible owner, correction deadline, appeal, verification, and recurrence check. A policy revision without evidence that the affected route improved remains an open finding.

Missed response deadlines, appeals controlled by the challenged office, retaliation, inaccessible complaint materials, premature public status changes, or remedies that abandon the affected person require immediate protective action. The activity creating the risk must pause where necessary; complaint intake, independent appeal, urgent care, and protective relief must remain available. The remedy is case repair, public correction where needed, staff discipline where warranted, route redesign, and an admissions or release pause when rights failure is systemic (HM Treasury, 2026b; Preiser, Rabinowitz, and White, 1988).

33.5.3 — Staff Burden Audit

The Staff Burden Audit counts labor strain after the City is no longer theoretical. Staff burden often hides because institutions interpret devotion as capacity. People stay late, answer messages, absorb distress, cover missing colleagues, translate policy into care, and protect participants from systems that should have protected them directly. If that labor is invisible, the City has not learned its own lesson (World Health Organization and International Labour Organization, 2022; United Nations, 2006).

Staff-burden review examines overtime, turnover, injury, sick leave, vacancy duration, emotional-load reports, role creep, complaint handling, staffing ratios, supervision quality, training gaps, pay adequacy, schedule predictability, and staff authority to stop unsafe work. It should include contracted and subcontracted workers where they carry City burden.

Staff burden travels to staff families, participants, visitors, public users, host responders, and future workers. Staff overload can become participant harm, archive error, security escalation, public-interface impatience, maintenance delay, or quiet resentment. A staff injury may not remain inside the staff category (World Health Organization and International Labour Organization, 2022; ISO, 2021b).

Staff-burden review protects candor. Anonymous reporting, worker representatives, confidential interviews, and anti-retaliation protections are essential. Staff should be able to say the City's ideals are becoming unworkable without being accused of disloyalty. The audit should also distinguish ordinary workload

from moral overreach. Some work is hard; some work is being hidden.

Staff-burden appeals draw on labor experts, supervisors, staff councils or representatives, independent auditors, clinical or wellbeing reviewers where appropriate, and operational leaders with authority to change staffing. Public summaries should report aggregate burden and actions, not individual suffering.

The staff-burden review includes service roles least likely to appear in public narrative: cleaners, food workers, maintenance crews, night staff, drivers, schedulers, and intake workers. Their routes often reveal the true institution. If they are invisible, the City's visibility is selective (Preiser, Rabinowitz, and White, 1988; Leaman, Stevenson, and Bordass, 2010).

The staff-burden audit tests whether apparent compliance depends on exceptional people. If a route works only because one experienced worker absorbs overtime, remembers undocumented exceptions, or mediates every conflict, the system has not demonstrated capacity. Resilience requires reproducible work, relief coverage, and protected refusal.

Staff-burden control fails when review finds chronic overtime, role creep across protected boundaries, unfilled posts covered by informal labor, retaliation against staff criticism, high turnover, burnout signals, or participant support depending on unpaid devotion. The remedy is staffing increase, cohort reduction, schedule redesign, role clarification, compensation review, admissions freeze, or function closure (World Health

Organization and International Labour Organization, 2022; United Nations, 2006).

33.5.4 — Nonparticipant Audit

The Nonparticipant Audit tests shielding for people who did not take the Vow. The City's central civic burden belongs to adult participants who voluntarily seek substantial public power. It does not spread to children, partners, dependents, visitors, neighbors, professionals, critics, protesters, volunteers, or incidental contacts because they happen to be near the institution (United Nations, 2006; HM Treasury, 2026b).

Nonparticipant review follows incidental capture, visitor notices, family shielding, child protection, professional privilege, protected correspondence, public-interface logs, media routes, perimeter behavior, protest handling, neighborhood complaint records, and record-site search behavior. It should ask whether nonparticipants can pass near the City, visit lawful spaces, object, work, and leave without becoming public material.

This decision affects children, household members, staff in role-limited records, local residents, visitors, delivery workers, professionals, journalists, critics, protesters, and digital users. Nonparticipant harm can be small and cumulative: a name appearing where it should not, a face caught in background media, a visitor uncertain whether a conversation was recorded, a neighbor repeatedly treated as part of the story (Preiser, Rabinowitz, and White, 1988; Leaman, Stevenson, and Bordass, 2010).

Nonparticipant review tests specific routes. A child visits a protected household edge. A journalist walks a public route. A protester records outside the perimeter. A therapist meets a participant. A delivery driver enters a service zone. A neighbor files a complaint. Each scenario should show what is captured, what is not, what is shielded, and who can correct an error.

Nonparticipant safeguards receive outside review from privacy experts, child-safety reviewers, civil-liberties advocates, professional-privilege experts where needed, host representatives, public-interface staff, and record reviewers. The audit should not rely on the City's belief that it intends to protect ordinary people. It should test whether ordinary people are actually protected.

The ordinary visitor provides another test. A parent comes for a private meal, a lawyer arrives for protected counsel, a neighbor attends a public forum, and a contractor repairs a fixture. Each should know when they are in a public zone, protected zone, staff zone, or record-sensitive threshold without needing insider language.

Nonparticipant findings can change operations, not merely public messaging. Repeated incidental capture, blocked access, service pressure, housing effects, protest-management burden, or inaccessible complaint routes may require redesign, reduced cohort, restricted release, mitigation, compensation, or pause.

Pilot progression stops when nonparticipants are exposed without lawful need, notices are unclear, correction routes are inaccessible, children appear in public artifacts, staff role records

become full-life records, or public-interface data is reused beyond the stated purpose. The remedy is immediate shielding, correction, deletion or sealing where lawful, public notice where needed, route redesign, and public-interface pause when the boundary is failing (United Nations, 2006; W3C, 2013; HM Treasury, 2026b).

33.5.5 — Public Usability Audit

The Public Usability Audit tests the record site and civic interface. The City exists partly because citizens need better evidence about public-power formation, but evidence that cannot be understood, corrected, challenged, or contextualized becomes another form of exclusion. Usability is a fairness condition, not a design luxury (W3C, 2023; World Health Organization, 2018b).

Reviewers test record-site navigation, status labels, source traceability, correction logs, delayed-release labels, protected-summary labels, machine-summary boundaries, search categories, accessibility, language and mobile access, public-question routes, expert submission, and complaint pathways. The public should be able to understand what a record is and what it is not.

Public usability must protect voters, journalists, researchers under separate lawful pathways, civic educators, critics, people with disabilities, people with low digital access, participants, staff, and people named in records. A confusing record site can create false certainty. A slick record site can make machine summaries sound more authoritative than source material (United Nations, 2006; W3C, 2023).

Public-usability review deliberately recruits skeptical and differently situated users. A journalist should trace a public bundle to its source and status; a voter should find limitations; a rights advocate should locate correction history; a person using assistive technology should navigate without losing context; and a critic should reach the relevant evidence without being routed into fandom or silence. Usability is demonstrated through successful challenge, not supportive familiarity.

Public-usability review connects usability experts, accessibility reviewers, public-record specialists, journalists, civic educators, rights advocates, and machine-summary auditors where machine assistance is present. The City should publish revisions made after usability testing and identify unresolved limits rather than selling clarity it has not earned.

One usability test follows a public user trying to correct a misunderstanding after sharing a record summary online. The City cannot control all public interpretation, but it can make correction visible, traceable, and easy to find. Public memory becomes safer when correction travels with the original claim (HM Treasury, 2026b; Preiser, Rabinowitz, and White, 1988).

Interpretive humility is part of usability. The public interface should make the limits of each object as visible as its contents: a summary is not a total life, a readiness bundle is not an office entitlement, a status label is not moral rank, and a search result is not an adjudication. Good design helps readers reach source, context, correction, and uncertainty before a detachable fragment becomes a verdict.

Public release stops when labels are ambiguous, source trace is broken, correction is hard to find, machine summaries outrun records, search reveals protected associations, or accessibility barriers make the site usable only by specialists. Usability is a rights condition because public memory that cannot be understood cannot be meaningfully challenged.

The public-usability audit should produce three outputs: where people can use the space or interface as intended, where they compensate through workarounds, and where they avoid it altogether. Each avoidance pattern should be assigned to a design, staffing, access, or rights owner for correction.

The findings are versioned as decisions rather than filed as impressions. Each material issue needs a source, affected group, threshold, accountable owner, interim safeguard, correction date, retest condition, and public-status rule. Negative results should remain visible at the level necessary for accountability even when personal details are protected. A pilot learns only when evidence changes design, staffing, admissions, or pace; otherwise post-occupancy evaluation becomes a ceremonial tour after the building is already defended as a success (HM Treasury, 2026b; Proctor et al., 2011).

33.6 — What the Pilot Must Demonstrate Before Replication

Replication is the most dangerous word after a successful pilot. A functioning first City can produce admiration, imitation, donor pressure, media momentum, political curiosity, and institutional pride. Those forces can make scale feel like the natural reward for effort. Here, replication remains a new burden decision requiring a separate evidence file, an alternative analysis, host and affected-person review, and proof that the capacities supporting the first site can travel without hidden transfer (Proctor et al., 2011; Eldridge et al., 2016).

The pilot must demonstrate operational capacity, not scientific truth. It may show that a City can protect participants, maintain records, shield nonparticipants, resist capture, and stop when needed. It does not validate the formal hypothesis or any mechanism branch, authorize transition, enact legal architecture, or make the City a model government.

Demonstration remains narrow enough to audit. The phrase the City works is unusable. A defensible finding identifies the function, cohort, load, period, context, comparator, observed exceptions, unresolved risks, adverse evidence, remedy, and confidence, and it names the conditions thought necessary for the result and the settings not tested. Replication should remain ineligible unless the predeclared primary comparison shows a material incremental benefit over the strongest feasible lower-burden alternative without worsening noncompensatory rights, staff, host, selection, or observation burdens. If comparator

quality, self-selection, attrition, or observation effects leave that inference unresolved, the finding should authorize further testing or narrowing, not replication.

Before replication, the pilot has to demonstrate five City-owned functions: humane load, record integrity, protected nonvisibility, anti-capture resilience, and stop capability. Failure to show any one of them under lived use is not proof that the civic ambition was mistaken. It is evidence that replication would be premature. Waiting becomes the responsible conclusion because the unresolved function still has people attached to it.

Replication evidence travels with the conditions that made the pilot interpretable. A later city, campus, foundation, party, or government may imitate a visible feature while lacking the staffing, host compact, legal envelope, reserve, technical control, or failure route that supported it. The demonstration record therefore separates portable mechanism, site-specific condition, uncertain dependency, prohibited inference, and evidence requiring renewal. A copying institution may not claim the result while discarding the conditions (Eldridge et al., 2016; HM Treasury, 2026b; Proctor et al., 2011).

33.6.1 — Humane Load

Humane load is the demonstration that visible public-power formation can be carried without converting participants, staff, households, or host residents into heroic infrastructure. The City does not need to prove that the Vow is easy. It needs to show that the Vow can be bounded, supported, paused, and exited without

normalizing harm (Government Accountability Office, 2020b; Skivington et al., 2021).

The humane-load test examines participant sleep, health, recovery, public-interface exposure, complaint use, exit requests, staff workload, household strain, host complaints, and the distribution of support burden. It should distinguish demanding formation from unsustainable pressure. A burden can be meaningful and still be too much for a given stage.

Unsustainable load reaches participants, staff, families, dependents, clinicians, mentors, public users, host residents, and future cohorts. A pilot that depends on unusual personal endurance is not replicable. If the first cohort survives because it contains unusually resilient people, unusually devoted staff, or unusually supportive families, the City has learned a limit, not a universal permission.

A sufficient evidence record includes protected participant feedback, staff burden audit, rights audit, health and recovery review, schedule review, public-interface data, host burden records, and exit or pause patterns. The City should not interpret low complaint volume as success if participants fear the meaning of complaint. Silence needs interpretation (Morrison, 2014; Proctor et al., 2011).

Humane-load review brings together independent evaluators, clinicians or wellbeing experts where appropriate, staff and participant advocates, host reviewers, and rights auditors. Public summaries should identify the load carried and the actions taken

to reduce it. They should not present suffering endured as proof of civic seriousness.

Humane load includes recovery from public praise. Admiration can be as distorting as hostility when it creates pressure to perform gratitude, endurance, or moral seriousness. The City should notice whether participants and staff can disappoint supporters, request rest, and remain ordinary without feeling they have betrayed the project.

Humane load is evaluated across roles rather than averaged across the pilot. If participants report tolerable load while cleaners work nights without rest, if public-interface staff absorb hostility while educators appear stable, or if the host community carries traffic and noise while internal routines look calm, the average hides the burden route. A pilot demonstration should identify which role carried the heaviest ordinary strain and what changed afterward. The City does not demonstrate fairness by showing that the center held. It demonstrates fairness by showing that the edges were not used as shock absorbers (HM Treasury, 2026b; Government Accountability Office, 2020b).

The humane-load file distinguishes adaptation from health. People often become quieter under strain, more efficient under pressure, and less likely to complain when complaint feels costly. That can look like resilience while masking depletion. The City should therefore treat reduced complaint volume, smooth routines, or calm public presentation as ambiguous signals until checked against sleep, staffing, household strain, exit requests, protected feedback, and independent review. Silence is not load evidence by itself.

The humane-load gate closes when the record shows repeated overload, sleep disruption, staff burnout, household pressure, participant fear of pause, rising host complaint load, or a culture that praises endurance more than correction. The remedy is reduced schedule, smaller cohort, de-loading, additional support, revised public interface, admissions freeze, or pilot pause (Skivington et al., 2021; World Health Organization and International Labour Organization, 2022).

33.6.2 — Record Integrity

Record integrity is the demonstration that the City can remember public-power formation without losing context, truthfulness, correction, or protected boundaries. The archive is one of the City's central promises. It is also one of its central dangers. A flawed memory system can injure a person more permanently than a flawed meeting (ISO, 2016a; ISO, 2017; NARA, 2023).

The working protocol tests provenance, chain of custody, access classes, public bundles, versioning, correction, right of reply, delayed release, protected summaries, breach response, source trace, and machine-summary limits. Integrity includes both preventing tampering and preventing false certainty. A record can be authentic and still misleading if context is stripped away.

Record-integrity failure reaches participants, staff, third parties, public users, journalists, future researchers under separate lawful pathways, and people whose public conduct is interpreted through the archive. A record system that cannot correct itself becomes a monument to its first errors (Eldridge et al., 2016; HM Treasury, 2026b).

Reviewers examine audit logs, correction histories, tamper tests, access reviews, release reviews, breach drills, public-bundle samples, user testing, and affected-person appeal outcomes. The City should report what the archive refused to release as well as what it released, because restraint is part of integrity.

Record-integrity challenges bring together archivists, cybersecurity auditors, rights reviewers, public-record specialists, technical reviewers, affected-person advocates, and external red teams. The archive office should not grade its own trustworthiness alone. Trust arises when source records, review routes, and correction capacity can survive hostile attention.

The record-integrity finding includes errors caught by someone outside the archive office. A participant, staff member, public user, or host reviewer may notice what the system missed. A trustworthy memory system should be grateful for external correction because public memory belongs to more than its custodians (Proctor et al., 2011; W3C, 2013).

Record integrity also includes intelligible absence. Some records will be absent because they were never captured, were lawfully shielded, were lost through failure, were delayed, or were excluded by design. The public should be able to tell which kind of absence is present without being invited to fill the gap with suspicion.

Record-integrity failure triggers an immediate operational response. Unexplained gaps, untraceable edits, protected release, corrections that do not reach public users, untraceable machine summaries, confused breach response, or backlog that makes

public memory selective by delay require record lockdown, affected-person notice, technical repair, public correction, and a release pause. Replication cannot proceed until integrity is restored and independently tested (ISO, 2016a; ISO, 2017; NIST, 2020b).

33.6.3 — Protected Nonvisibility

Protected nonvisibility is the demonstration that dignity safeguards survive public curiosity. The City's answer to hidden public-power formation is not exposure of everything. It is role-bound record with lawful shielding. Replication is unsafe if the first City cannot distinguish public accountability from appetite (HM Treasury, 2026b; Government Accountability Office, 2020b).

Protected nonvisibility is tested against both technical failure and public appetite. Reviewers examine health, counsel, children, intimacy, family life, professional privilege, grief, safety, third-party contact, staff-role privacy, and nonparticipant boundaries under a scenario in which the public strongly wants the story. Shielding is meaningful only when the institution can explain the boundary, preserve the protected person, and withstand attention without converting curiosity into authority.

Protected nonvisibility safeguards participants, partners, children, dependents, clinicians, counsel, staff, visitors, bystanders, host residents, and public users who need trustworthy limits. It must not create secret active public-power formation. Its purpose is to protect domains where exposure would be illegitimate,

disproportionate, or harmful (NIST, 2020b; United Nations, 2006).

The documented record includes incident reviews, shielded-record audits, public-interface requests, media-pressure cases, correction routes, bystander-protection tests, child-safety reviews, and delayed-release decisions. The City should track attempts to pierce boundaries and how staff responded. A boundary untested by curiosity is not yet a demonstrated boundary.

Protected-nonvisibility review draws on privacy experts, child-safety specialists, rights advocates, clinicians where health is involved, professional-privilege reviewers, archivists, and public communication reviewers. Public summaries should say that categories were protected and why the boundary matters without inviting speculation about hidden content.

A public denial of access that the City can explain without apology belongs in the protected-nonvisibility demonstration. Some requests should receive a principled no. If the City cannot defend refusal calmly, it will eventually leak dignity in order to seem open (Proctor et al., 2011; Eldridge et al., 2016).

The demonstration also tests protection against internal curiosity. Staff curiosity can be as dangerous as public pressure if access is broad and role controls are weak. Protected nonvisibility requires role-based access, audit trails, sanctions, and a culture in which looking without need is treated as a breach of trust.

Protected nonvisibility fails when review finds intimate or child-related exposure, protected records searchable by ordinary public

routes, staff role records becoming full-life records, media access overriding dignity, or public summaries that hint at shielded material for drama. The remedy is immediate shielding, public correction, affected-person care, staff retraining, record sealing or deletion where lawful, and replication refusal (HM Treasury, 2026b; Government Accountability Office, 2020b).

33.6.4 — Anti-Capture Resilience

Anti-capture resilience is the demonstration that the City can resist those who would buy, steer, romanticize, or quietly govern it. Capture can come from donors, vendors, founders, staff factions, public officials, political parties, media attention, celebrity participants, host authorities, or the archive itself. The first City should assume drift is normal (Ebrahim, 2003; Pfeffer and Salancik, 1978).

The integrated review tests donor limits, procurement independence, vendor replacement, governance separation, audit of auditors, staff complaints, host leverage, participant voice, public-interface moderation, security boundaries, and archive independence. Anti-capture is not a slogan. It is a set of refusals with records attached.

Anti-capture decisions affect participants, staff, host residents, ordinary citizens, public users, funders, vendors, auditors, and future replicators. Capture often hides by presenting itself as help. A donor offers speed. A vendor offers integration. A public official offers protection. A media partner offers reach. Each offer can move burden into dependency (Proctor et al., 2011; Eldridge et al., 2016).

The decision record includes refused gifts, recusals, contract reviews, audit findings, vendor stress tests, complaint outcomes, governance minutes, public corrections, and instances when the City chose delay over influence. A pilot that cannot point to refusals has not shown resilience. It may simply not yet have met serious temptation.

Anti-capture appeals draw on governance auditors, procurement reviewers, donor-firewall reviewers, vendor-risk reviewers, host-community reviewers, staff representatives, participant advocates, and external red teams. The City should ask not only whether a bad actor could capture it, but whether a supportive actor could capture it by being too useful.

Anti-capture evidence includes uncomfortable minutes. Who recused? Which donor offer was narrowed or refused? Which vendor request was denied? Which staff complaint changed leadership behavior? Which public pressure failed to change an archive decision? These records show independence better than any pledge (Government Accountability Office, 2020b; Skivington et al., 2021).

Gratitude is one of the conditions under which resilience is tested. Capture often appears after someone helps solve a real problem. A donor covers a shortfall, a vendor prevents an outage, a public official shields the City from attack, or a media partner explains the project well. The question is whether gratitude changes access, authority, scrutiny, or memory.

Replication discussion stops when donor influence reaches admissions, vendors control records, founder preference

overrides review, auditors depend on the institution, staff face retaliation, host benefits are exchanged for silence, party or media capture appears, or public communication treats institutional loyalty as civic virtue. The remedy is recusal, contract termination, governance redesign, public disclosure, admissions freeze, pilot pause, or shutdown if independence cannot be restored (Ebrahim, 2003; Pfeffer and Salancik, 1978).

33.6.5 — Stop Capability

Stop capability is the demonstration that the City can pause or close in reality, not only in language. Many institutions say they can stop. Few have prepared the legal, financial, technical, operational, emotional, and public routes to do it without abandoning people. A pilot that cannot stop has already become scale (Eldridge et al., 2016; HM Treasury, 2026b).

The stop design includes pause authority, shutdown conditions, admissions freezes, record lockdown, participant aftercare reserves, staff transition, host mitigation continuity, vendor termination, public explanation, failure memory, and review of what remains open. Stop capability should be rehearsed before it is needed.

Stop capability protects participants, applicants, staff, households, host residents, vendors, public users, funders, and future institutions that may learn from the failure. Stopping without care transfers the burden of institutional restraint onto the people who trusted the institution. Continuing without capacity transfers the burden of institutional pride onto the same people.

The stop-capability file includes shutdown drills, reserve

verification, contract exit clauses, data-portability tests, care-continuity plans, communication tests, public notices, and a decision tree for partial pause versus full closure. The City should know what happens to records, housing, care, employment, public bundles, and host obligations when the pilot stops (ISO, 2019; NIST, 2025b).

Stop capability receives outside review from governance, rights, labor, host, archive, technical, clinical, communications, and independent-audit reviewers as the affected function requires. The stop decision should not depend solely on leaders whose identity is tied to continuation.

Stop capability includes symbolic separation. If the City closes a pathway, public materials should not continue to advertise it as active. If admissions pause, recruitment language should pause too. If a record route is locked down, public summaries should stop implying ordinary access. Public artifacts must stop when the institution stops.

A mundane dependency map is part of stop testing. Which leases continue, which benefits continue, which archive duties survive, which staff are paid, which records remain under custody, which public notices stay live, which applicants receive explanation, which host obligations remain, and which contracts can be terminated without data loss or care collapse? A City can say it is stoppable while its dependencies say otherwise. The map is the point where moral permission meets practical friction (Proctor et al., 2011; Eldridge et al., 2016).

A real stop test places leadership preference in conflict with the

evidence. The rehearsal should assume that founders, funders, or senior operators favor continuation while an independent gate requires pause, then follow authority, notice, care, payroll, records, host duties, and appeal through the decision. The safeguard succeeds when ordinary procedure carries the stop rule without requiring one unusually courageous individual.

Shutdown planning fails without aftercare reserve, vendor contracts permitting safe termination, clear record custody after closure, staff protection, funded host commitments, public explanation, and participant support independent of institutional survival. The remedy is immediate stop-capability repair, reduced scope, admissions freeze, and no replication until closing the City is as governable as opening it (HM Treasury, 2026b; Government Accountability Office, 2020b).

33.7 — Stopping Early as Moral Success

Stopping early can be a moral success when continuation would move burden downward. The value lies in protecting people, preserving evidence, and showing that the City remains answerable after construction, fundraising, public praise, or participant commitment have created sunk-cost pressure. A project designed to make public power corrigible must demonstrate the same corrigibility in its own existence (Staw, 1976; Arkes and Blumer, 1985).

Pause and shutdown require practical dignity. A pause without care abandons participants. A shutdown without explanation breeds distrust. A failure memory without privacy becomes spectacle. A public explanation without protected limits becomes exposure. The City has to stop in ways that protect people, record learning, and refuse mythology.

The pilot therefore treats stop authority as ordinary governance. It has predeclared triggers, decision owners, independent reviewers, immediate protective actions, communication rules, participant and staff support, host obligations, archive custody, contract exit, reserve access, and future learning routes. The plan distinguishes partial pause, admissions freeze, function shutdown, site closure, and public warning. It exists before anyone needs it and is rehearsed before the institution can rely on it.

This final section does not celebrate failure. It dignifies restraint. The City should be willing to lose a timeline, a donor, a headline, a cohort expansion, a building phase, or a public moment rather

than ask less powerful people to carry the cost of institutional pride.

Stopping remains morally useful only when it reduces burden rather than becoming another performance. A pause cannot be converted into a heroic story about humility while participants, staff, hosts, vendors, or records remain unprotected. Its value lies in preserving rights, funding care, maintaining payroll and housing where owed, preventing escalation, explaining status accurately, recording dissent, and carrying lessons forward without turning failure memory into self-praise. The stop file is judged by what it protects, not by how graceful the announcement sounds (Staw, 1976; Arkes and Blumer, 1985; ISO, 2019).

33.7.1 — Pause as Fidelity

Pause as fidelity means restraint is part of the City's loyalty to its own purpose. A pause is not an admission that fairness failed. It may be the clearest sign that fairness is still governing the institution. When a rights route fails, an archive breach appears, staff strain rises, or host burden exceeds mitigation, the fair act is to stop the next burden (Vaughan, 1996; Leveson, 2011).

A credible pause protocol names serious rights complaint, unresolved archive error, staffing insufficiency, host disruption beyond mitigation, vendor instability, public-interface harm, protected-nonvisibility incident, crisis-route failure, and exit weakness as potential triggers. Each trigger should specify what pauses: admissions, activation, public release, public interface, construction, vendor use, office support, or replication consideration.

Pausing a pilot changes the lives and work of participants, waiting applicants, staff, host residents, public users, and supporters who may want momentum. The City must therefore distinguish the decision to pause from the treatment of people during the pause. Care, housing, employment transition, record custody, family support, host communication, and correction remain active even when the pilot does not (Bovens and 't Hart, 1996; Patton, 2011).

A usable pause record states the event or pattern that triggered action, the immediate protection, the scope of the pause, the review owner, the expected clock, the rights of affected people, the evidence still needed, and the public explanation boundary. Vague language creates panic or theater because no one knows what stopped or who can decide. Specificity makes pause protective, reviewable, and reversible.

A pause decision is reviewed through the office empowered to pause, an independent reviewer, affected-person advocacy, staff representation, host input when host burden is involved, and technical review where systems are involved. A dissenting reviewer should be able to argue that pause is insufficient or unnecessary without being framed as opposing fairness.

A pause can also protect the public from false knowledge. If the archive has an integrity issue, the fair act may be to stop public release even when citizens want information. Public accountability depends on trustworthy memory. Speed that spreads uncertainty as fact is not transparency (Staw, 1976; Arkes and Blumer, 1985).

Pause also protects staff from contradictory instructions. During uncertainty, one office may want silence, another reassurance, another continued recruitment, and another legal caution. A pause protocol should tell staff what to say, what not to say, what work continues, what work stops, and where questions go.

Pause fidelity fails when the record shows delay disguised as pause, pause used to suppress criticism, pause without participant care, pause lifted before repair, or public language that treats pause as reputational management. The remedy is clearer trigger rules, stronger independent authority, public correction, extended pause, or shutdown if the institution cannot act faithfully under restraint (Sitkin, 1992; Vaughan, 1996).

33.7.2 — Shutdown Conditions

Shutdown conditions name severe failure before severe failure arrives. A City that names only success creates pressure to reinterpret harm. A City that names closure in advance gives participants, staff, hosts, and the public a truer promise: continuation is not sacred. Protection is (Patton, 2011; Bovens and 't Hart, 1996).

Shutdown review begins when rights failure is systemic, exit is not real, protected nonvisibility repeatedly fails, archive integrity cannot be maintained, staff injury or burnout is structural, host burden exceeds mitigation, vendors control essential functions, serious harm is hidden, governance is captured, or public communication repeatedly misleads. These conditions reach the institution's identity rather than a single correctable defect. The review therefore joins care, records, obligations, compensation,

and orderly closure in one decision rather than treating each as a separate inconvenience. A shutdown plan is part of buildability because it protects people after continuation stops being defensible.

The burden reaches everyone already carrying institutional dependence: participants, households, staff, host residents, public users, vendors' workers, funders, auditors, and future applicants. Shutdown decisions should therefore be careful and humane. Closure should prevent further burden, not scatter existing burden into confusion (Staw, 1976; Arkes and Blumer, 1985).

Shutdown design distinguishes full closure from partial closure, admissions freeze, pathway suspension, record lockdown, public-interface closure, construction stop, vendor termination, or leadership replacement. Not every severe problem requires destroying the entire institution. But some problems require admitting that a narrower repair will not protect people.

Shutdown review brings together external audit, rights review, host review where local burden is implicated, labor review, archive and technical review, participant advocacy, and governance authority capable of acting against leadership preference. The people most invested in continuation should not be the only people deciding whether continuation is allowed.

Shutdown conditions also protect against slow moral erosion. Not every fatal drift begins as a scandal. A City can become less protective by normalizing small exceptions, praising overwork, delaying correction, or treating critics as enemies. The closure

framework should notice patterns before they become irreversible (Vaughan, 1996; Leveson, 2011).

The shutdown list receives scheduled review. A condition that looked theoretical before occupancy may become too narrow after lived use. The City should be able to add, clarify, or tighten shutdown criteria without treating revision as panic. Learning where closure should have been available is part of responsible governance.

Shutdown readiness fails when no credible closure route exists. If the City cannot identify who decides, how people are cared for, what happens to records, how staff are paid or transitioned, how host obligations continue, and how the public is told, then the shutdown plan itself has failed. The remedy is to build that plan before further expansion and to stop any stage that would deepen dependence without closure capacity (Weick and Sutcliffe, 2015; Patton, 2011).

Shutdown conditions need an order of operations. Immediate danger may require stopping capture or occupancy first, followed by care, notification, evidence preservation, access restriction, payroll and housing continuity, host coordination, and public explanation. A closure plan that starts with reputation or asset protection teaches the institution to preserve itself before people. The sequence should be rehearsed and funded before opening (ISO, 2019; NIST, 2025b).

33.7.3 — Public Explanation of Pilot Stopping

The general stopping-notice principles established in Section 4.4.4 become a pilot operating duty here: public communication must identify the affected stage, active protections, review owner, and next update without exposing protected persons or manufacturing certainty (Arkes and Blumer, 1985; Sitkin, 1992).

Public explanation after a stop states what happened at the institutional level, what stage is affected, which gates are paused, what protections are active, what review will occur, what will not be disclosed, what remedies are underway, and when the next public update will come. It should not publish intimate details, personnel gossip, health information, child-related information, or speculation about private motives.

A public stopping notice should point to the relevant gate, the findings that can safely be summarized, immediate protections, corrective work, open questions, review clock, and next decision owner. Unsettled facts remain labeled as unsettled, while protected information is described by category rather than exposed or surrounded by speculation. Traceability lets the public understand why activity stopped without turning affected people into the explanation.

A challenge to the stopping explanation receives rights, communications, legal, archive, host, and affected-person review as the facts require. Public communication should be drafted with hostile cropping in mind. A sentence should not be able to travel alone as proof of surveillance, destiny, coercion, or institutional purity.

The best public explanation will often be less dramatic than the public wants. It may say that admissions are paused because exit rehearsal failed, or that a pathway is closed because staff load exceeded limits. Those statements are powerful because they are ordinary, specific, and checkable (Patton, 2011; Bovens and 't Hart, 1996).

Public explanation separates institutional accountability from personal narrative. The City can say that a rights route failed without telling the public who suffered most. It can say that a vendor function was suspended without revealing attack details. It can say that admissions are frozen without turning applicants into objects of speculation.

Silence after material harm, promotional language during a pause, blame shifted without due process, disclosure of protected details to satisfy curiosity, or vague statements that hide who bears the burden require correction. Misleading promotion and harmful disclosure must stop, while accurate safety notices, affected-person updates, and public explanations continue. The remedy is corrected notice, apology where warranted, revised communication rules, leadership accountability, and delayed reopening until the explanation and its supporting evidence can be independently reviewed (Staw, 1976; Arkes and Blumer, 1985).

33.7.4 — Participant Care After Pause

Participant care after pause prevents restraint from becoming abandonment. When the City stops a function, people may lose routines, supports, public status, housing expectations, healthcare

coordination, educational pathways, staff relationships, or future plans. The fact that pause is morally right does not erase the disruption it creates (Leveson, 2011; Weick and Sutcliffe, 2015).

A credible mechanism includes immediate check-in, plain-language explanation, health and wellbeing support, housing and food continuity where the City created dependence, counsel or advocacy, record-status review, public-status protection, family or household communication with consent, and options for de-loading, exit, or waiting. Pause should make the participant safer, not more exposed.

Participant care after pause begins with a personal dependency inventory. The City should know whether a participant's housing, medical coordination, legal schedule, childcare, family travel, education pathway, staff relationship, public status, income support, or mental health support now depends on the paused function. Without it, the City may pause the risky stage while accidentally abandoning the person at the exact point where the institution has made itself most central to their life.

Aftercare also protects refusal. A paused participant may want to wait, leave, return later, transfer to ordinary life, request record review, or withdraw from public-facing claims. That is how pause remains care rather than managed reputation (Bovens and 't Hart, 1996; Staw, 1976).

Care after pause affects participants, applicants already deep in process, households, dependents, care staff, people named in records, and public users who may misunderstand status changes.

They should receive care because they carried a burden the institution asked them to carry.

The care plan distinguishes pause types. A technical pause may require record restriction and communication support. A shutdown pause may require transition out of the City with material support.

After a pilot pause, participant care should be separated from the continuation decision. Housing, food, health care, advocacy, record-status help, dependent support, and safe exit or transfer should continue long enough to prevent the City from using basic needs as pressure to resume.

Care after pause includes choice about distance. Some participants may want continued contact with staff; others may need a clean break from institutional presence. Sometimes care is a reliable handoff to ordinary services and a respectful retreat.

Participant care after pause fails when review finds loss of basic support, public stigma, unclear record status, pressure to remain, pressure to praise the City, unreviewed household burden, or delayed care because the institution is protecting its image. The remedy is immediate support, public correction where needed, independent advocacy, aftercare reserve activation, and no reopening of the paused stage until care routes work (Leveson, 2011; Weick and Sutcliffe, 2015).

33.7.5 — Pilot Failure Memory

Pilot failure memory should preserve the failed condition, affected function, corrective attempt, stop reason, and evidence needed before any restart or replication. Protected people remain

protected in the learning record.

The failure-memory file uses protected layers. Restricted layers preserve evidence for audit, rights review, technical repair, labor review, or legal obligation. Personal details remain protected unless lawful public accountability requires narrower disclosure.

Failure memory must protect people harmed by the failure, staff who may fear blame, future participants, host residents, auditors who need source records, and future cities that may inherit the lesson. Failure memory has to hold that tension (Arkes and Blumer, 1985; Sitkin, 1992).

Reviewers examine trigger records, findings, dissent, corrective actions, decision points, public notices, care actions, and later verification. A decision not to expand, not to release, not to accept a donor condition, or not to reopen can be part of the memory of fairness.

Failure-memory disputes draw on archivists, rights reviewers, affected-person advocates, labor reviewers where staff burden is involved, host reviewers where local burden is involved, and future accreditation reviewers. Failure memory should be searchable by institutional lesson, not by personal humiliation.

Failure memory also records gratitude without possession. The institution can be grateful to people who revealed a flaw, but it should not claim them as heroes, martyrs, or symbols. Their contribution should reduce future burden without increasing their exposure (Leveson, 2011; Weick and Sutcliffe, 2015). Future reviewers should be able to see which lesson changed a rule and which remained unresolved.

Accreditation can carry failure memory forward as a standard without carrying inherited shame. The private pain of the people who made the lesson visible remains protected; institutional learning does not require permanent possession of their story. Retained memory should distinguish institutional learning from personal attribution wherever the latter is unnecessary.

Failure memory fails when lessons are deleted, private suffering is displayed, blame has no route, or memory is used to prove virtue. The next City should inherit the warning, not the wound (Patton, 2011; Bovens and 't Hart, 1996). That separation lets the next pilot inherit evidence without inheriting ownership of another person's story.

Chapter 34 — Accreditation and Replication

Replication is where the City becomes most tempting to admire and most necessary to discipline. One site can become scarce, mythic, or too important to correct; many can spread weak standards, centralize records, or create accreditation theater. Chapter 34 treats plurality as comparative learning before growth.

Replication begins with a severe question: where does the new load go? One site may concentrate access and prestige; weak replicas may transfer risk to participants, staff, hosts, regulators, funders, and residents. A network is justified only when safeguards travel more reliably than prestige.

Accreditation refuses two easy extremes: that the first City is the only true form, and that a copied name can inherit trust. It reviews defined institutional functions for a fixed term under stated evidence, rights, appeal, suspension, withdrawal, and requalification rules.

Accreditation is a practical governance instrument, not a spiritual mark, legal enactment, scientific proof, professional license, or institutional halo. It says nothing about personal virtue, office merit, PTV, or authority beyond local law. Each public statement names the reviewed scope, dates, evidence, exceptions, unresolved risks, decision body, appeal, and expiry.

Replication creates public risks. Maps can imply world government, accreditation marks can resemble moral seals, corridor diagrams can suggest hidden dossiers, and comparisons can rank places or people. Public artifacts must survive hostile cropping, keeping status, local authority, limits, correction, expiry, and withdrawal visible.

Scale discipline begins with scarcity. One prestigious site can favor the wealthy, visible, connected, or mobile even under formally fair admissions, creating symbolic monopoly and political fragility. A second site may reduce scarcity or merely multiply the myth. That difference must be tested.

Scarcity is not solved by automatic multiplication. A weak replica can injure trust more deeply than no replica. Resemblance cannot excuse poor labor, thin privacy review, weak exit, confused archive release, or vendor dependence. Replication waits until protective invariants can survive different law, culture, climate, language, labor, and institutional history.

Local translation is separated from constitutional drift. A City in a hot coastal region, dry inland region, multilingual democracy, post-authoritarian society, federal legal order, or community with a history of surveillance cannot treat place as decoration. Materials, circulation, climate systems, language access, legal contracts, host review, and public explanation may change. The core protections do not. Translation is legitimate when it improves fit without reversing the direction of rights, burden, human authority, correction, or exit.

Field experts should recognize the seriousness of the problem. Accreditation requires scope, evidence, independence, competence, periodic review, complaint routes, conflict-of-interest controls, surveillance after approval, and withdrawal of standing. Urbanists will look for host burden, infrastructure fit, climate reality, land use, and public interface. Privacy and records specialists will look for lifecycle separation, interoperability limits, provenance, correction, deletion, sealing, and no central

dossier. Public administrators will look for role boundaries, authority routes, auditability, and remedy.

A network needs a language of standing that is narrow, conditional, and non-mythic. A City may be accredited for a particular scope, under named conditions, at a particular time. It may enter heightened review, lose new-admission authority, be restricted from corridor participation, be barred from certain public claims, or be decertified. Standing is therefore not a permanent blessing. It is a continuing burden backed by public reasons and review (Teubner, 1998; W3C, 2013).

The first City receives no founding exemption. Its failures remain inspectable, unsafe practices correctable, archive rules revisable, and public claims challengeable after admiration arrives. Later sites and the network must be able to name shrine, spectacle, capture, or hidden authority without treating criticism as betrayal. Founding status adds responsibility rather than immunity.

The network also remains non-sovereign. A coordinating body may maintain standards, compare failures, publish accredited scope, and warn the public against misuse of the name. It may not govern states, replace courts, command local governments, rank nations, decide who deserves office, require participation in the Religion of Fairness, authorize transition, or determine PTVC's truth. Coordination is useful only while it leaves lawful authority with the institutions that actually possess it.

The strongest sign of a healthy network is not the number of Cities it can name. It is whether the network can refuse a beautiful copy, suspend a popular site, warn the public against a prestigious

donor-backed project, preserve participants through closure, protect staff who report misconduct, and retain failure memory without turning failure into propaganda. Humility becomes operational when it costs the institution something (Braithwaite, 2002; Ostrom, 1990).

Plurality remains useful only while it resists destiny. One City is insufficient when singularity creates scarcity and myth; many Cities are unsafe when standards thin, local burden disappears, records centralize, or loss of standing becomes impossible. Replication becomes fair when correction travels with the name and can still defeat the name. That is the chapter's governing test.

The accreditation instrument begins with scope because a single seal invites overreading. A site may demonstrate housing, training, public-interface, archive, or corridor functions at different levels and times. The public register therefore names the exact function, site, term, operating load, exclusions, conditions, evidence date, reviewer, appeal status, and expiry. Narrow scope permits a targeted suspension without pretending that every function or every person has been judged (ISO/IEC, 2017; ENQA et al., 2015; ISEAL Alliance, 2025).

Accreditation creates its own capture risks. The accreditor may become dependent on fees, founders, prestige, or expansion. Auditors may normalize practices they see repeatedly. Standards may reward what is easy to document and displace what is hard to observe. Public measures can reshape behavior until institutions optimize the rating rather than the protected purpose (Power, 1997; Espeland and Sauder, 2007; Campbell, 1976). The

accreditor therefore needs conflict rules, rotation, complaint, appeal, audit, and decertification of its own functions.

The worked second-site review in Section 34.2 establishes the central distinction between translation and drift. Heat-resilient architecture, local language, labor law, public hearing form, and lawful governance structure may differ. Staff complaint independence and human control over public machine summaries may not. Denial is scoped, reasoned, public, appealable, and non-stigmatizing. The second site can repair and return; the original receives no immunity from the same test.

34.1 — Why One City Is Not Enough

The first City will carry symbolic force even if its designers try to prevent it. People will visit it, criticize it, cite it, misunderstand it, and build stories around it. Supporters may see it as the proof that public power can be formed differently. Critics may see it as the evidence that transparency has become a danger. Both reactions can make the original site too heavy for one institution to carry (Ostrom, 2010; Provan and Kenis, 2008).

Singularity also creates practical unfairness. A person who lives near the first City has a different pathway than a person who must cross borders, pay for travel, navigate language, uproot dependents, leave work, or enter a hostile media environment. The City exists to move public-power burden upward, not to create a rare civic gate available mainly to those already able to reach it.

Disciplined plurality is not expansion by appetite. It becomes credible only after the first site has shown that safeguards can survive use. The question is whether more than one City can reduce scarcity, correct mythology, improve learning, respect regional fit, and prevent single-point failure without becoming a brand network or civic empire (OECD, 2026b; OECD, 2025d).

The first replication question is therefore how to distribute access, symbolic pressure, comparison, and failure risk without manufacturing a race toward scale. Plurality is worth examining only when it can reduce scarcity, expose local variation, preserve independent criticism, and prevent a single site from becoming both bottleneck and oracle. The same design must also make it

easier to refuse a weak copy than to protect the prestige of the network (Ostrom, 2010; Provan and Kenis, 2008).

34.1.1 — Scarcity Risk

Scarcity begins as a capacity problem and becomes a fairness problem when access to visible public-power formation is shaped by wealth, geography, language, media attention, or institutional familiarity. A single City can publish fair admissions rules and still be practically narrow. Travel cost, legal advice, family disruption, disability accommodation, translation, and the ability to withstand public scrutiny can quietly select for people already protected by privilege (Ansell and Gash, 2008; OECD, 2026b).

The first mechanism against scarcity is not a larger waiting list. It is an access-burden review attached to the replication question. Reviewers should ask who is being deterred by distance, legal uncertainty, language, visa status, caregiving responsibilities, disability barriers, public-risk fear, or cost. If the only people able to apply are those already close to elite channels, the City has moved a different burden onto the very public it intends to serve.

Scarcity also affects host communities. When one site is treated as the only place where the future of public power is being formed, nearby land, services, security, transport, media attention, and civic identity may be bent around it. Host residents may carry disruption while the benefits are described in global language. A fair replication analysis counts this local load before singular prestige turns it into the cost of history.

The scarcity record is public enough to be inspectable and protected enough not to expose applicants. Aggregate admission

routes, refusal reasons, access barriers, accommodation requests, and regional reach can be published without turning applicants into public material. Individual applicant privacy remains protected until active status begins. The review question is whether the pipeline is narrow by necessity or narrow because the design has externalized access burden (OECD, 2019a; Ostrom, 2010).

Scarcity is answered by redesigning access, not by lowering safeguards. It should answer scarcity by redesigning pathways, translating materials, supporting dependents, creating lawful regional review routes, limiting prestige shortcuts, and refusing donor or political channels that buy practical access. The remedy for an unfair access pattern may be delayed replication, a regional preparatory office, changed support rules, or refusal to grow until the access burden is understood.

The gate fails on a clear condition: if scarcity makes the first City an elite gateway, replication pressure will become morally confused. Growth then looks like fairness while carrying elite habits into new sites. Accreditation should treat access-burden evidence as part of the replication file, not as a public-relations appendix. A network that begins by copying elite access has already drifted.

A useful accreditation review would look past the first cohort and examine the path a less connected applicant would actually travel. Does the applicant learn about the City through a public route rather than a private introduction? Can they understand the Vow without hiring elite counsel? Can a caregiver apply without abandoning dependents? Can a person with disability reach

screening without becoming a spectacle? These are operational questions, not sentimental questions (Emerson, Nabatchi, and Balogh, 2012; Ansell and Gash, 2008).

Scarcity also tempts a network to create symbolic substitutes such as observer, associate, patron, or honorary status. Each category needs a bounded function, published access rule, expiry, conflict review, and proof that it does not open side doors to staff, records, participants, donors, or prestige without the corresponding public burden. Accreditation should retire any status whose primary product is proximity to the original City.

The access review repeats after every cohort because scarcity changes shape. Early scarcity may be travel cost; later scarcity may be reputation, language, alumni networks, political party familiarity, or fear that only already public people can survive the record. A City that studies scarcity only once will miss the point at which the gate becomes cultural rather than logistical (OECD, 2026b; OECD, 2025d).

34.1.2 — Shrine Risk

A shrine risk appears when firstness becomes protection from criticism. The first City may develop founding rooms, early participant stories, famous failures, memorable architecture, and a public mythology of courage. Those things may be humanly understandable. They become dangerous when they make the original site feel untouchable or make later sites feel derivative, less pure, or less legitimate (OECD, 2019a; Ostrom, 2010).

Shrine logic can form without religious language. It can appear in tours that celebrate origin more than safeguards, donor materials

that treat proximity to the first site as moral status, staff culture that discourages criticism of founding decisions, or public summaries that cite the original City as the measure of all later Cities. When this happens, the burden of protecting the symbol lands on participants, staff, auditors, and host residents who need freedom to tell the truth.

The mechanism against shrine risk is origin demotion by design. The first City should be historically documented, not sacredly preserved. Founding choices should be versioned, reviewed, criticized, and revised. Later Cities should be allowed to improve on the original without being treated as disloyal. Accreditation files should record which founding practices were retained, which were changed, and why the change protected people better.

Shrine risk harms concrete people. A staff member who finds unsafe record practice at the first site should be able to report it without carrying the fate of the whole project. A participant experiencing overload should not be told that the original discipline is the pure form, and a host resident should not be made to feel that local complaint insults global hope. Shrine risk silences local truth by wrapping it in reverence (Emerson, Nabatchi, and Balogh, 2012; Ansell and Gash, 2008).

Safe replication requires an origin that can criticize itself. Failure memory, revision memory, dissent, and staff experience should stand beside achievement so that admiration never becomes immunity. The first City earns continuing standing by remaining inspectable after its founding story becomes valuable. A network should not ask later sites to copy an original that cannot publish correction, retire a practice, or accept loss of standing.

The original site is protected from overvisitation as well as from neglect. Constant tours, ceremonies, anniversary events, and media pilgrimages can make daily life performative for participants and staff. A shrine is built not only by words, but by traffic. Accreditation should review whether public access to the original site teaches the system or consumes it.

Every public account of the origin carries at least one correction history. The founding story should show a decision changed, a safeguard strengthened, a design element retired, or an early assumption narrowed. That kind of memory trains the public to see the City as accountable work rather than as a finished sacred object (OECD, 2025d; OECD, 2019a).

Shrine risk is especially likely when critics attack the City unfairly. Supporters may respond by defending every founding detail instead of defending the right principles. Accreditation should distinguish defense of people from defense of old design. The City can protect participants and staff from hostile distortion while still admitting that the original institution must change when evidence requires it.

The best antidote to shrine logic is not iconoclasm. It is ordinary governance. The first City should be reviewed on schedule, audited by outsiders, corrected in public, and able to lose standing. Regular procedure demystifies origin better than dramatic denunciation (Ostrom, 2010; Provan and Kenis, 2008).

34.1.3 — Comparative Learning

One City can demonstrate only one context. It can teach how a particular campus, legal envelope, host community, staff model,

archive stack, and admissions pathway behave under particular pressures. It cannot, by itself, show how the model travels across climate, law, language, culture, political history, disability access, regional media, or labor markets. Comparative learning is the disciplined reason to consider plurality (Emerson, Nabatchi, and Balogh, 2012; Ansell and Gash, 2008).

Comparative learning cannot become ranking. The network should not ask which City is best, which population is most transparent, which culture adapts most easily, or which jurisdiction is most fair. Those questions turn variation into prestige. The useful questions are narrower: which safeguard failed under what condition, which record-stage rule prevented harm, which staff model reduced burnout, which host review caught a burden early, and which translation preserved the invariant most clearly.

A shared learning file carries every finding with its local context attached. A rule carries its climate, law, staff ratio, public interface, visitor policy, technology stack, emergency infrastructure, and host-community history. Context turns a lesson from a slogan into a portable proposition that later sites can test rather than worship.

Affected persons have standing in comparative learning. Participants can describe whether the active record burden remained livable. Staff can report workload, moral injury, retaliation risk, and role confusion. Host residents can report disruption, service pressure, local trust, and complaint route effectiveness. Public users can report whether the record site was understandable without becoming voyeuristic. These voices

belong in learning, not as testimonials for growth but as evidence of where burden landed (OECD, 2025d; OECD, 2019a).

The record stage matters because comparison can easily become exposure. Aggregate and contextual reporting may be appropriate; individual records should not be used to create cross-City comparisons of worth, virtue, capacity, or public desirability. A learning file should distinguish operational evidence about institutional performance from personal records about participants. This separation keeps the network from turning people into case material for institutional ambition.

Comparison becomes corrupt when it is used as prestige. If a network publishes league tables, celebrates high-performing sites without naming tradeoffs, hides weak sites to protect the brand, or treats local hardship as proof of commitment, comparative learning has become a ranking culture. The remedy is to withdraw the harmful artifact, issue corrected context, and revise reporting rules so learning serves correction rather than applause.

Comparative learning also requires common vocabulary for failure. If one site calls an event a privacy incident, another calls the same event a release irregularity, and a third calls it a communication issue, the network will not see the pattern. Accreditation should require a shared incident taxonomy while allowing local narrative context. Standard categories make harms visible; local detail explains why they happened (Provan and Kenis, 2008; Emerson, Nabatchi, and Balogh, 2012).

The most valuable comparison may be between a site that grows slowly and a site that pauses. If the paused site protects staff,

records, and host trust better than the faster site, the network should be able to learn that restraint worked. Plurality should therefore compare choices not taken as well as programs launched. A refused expansion can be one of the network's strongest lessons.

Learning accounts for the burden created by measurement itself. If one site collects more staff reports than another, the difference may reflect heavier documentation burden rather than better culture. If one record-site receives more public complaints, it may be more usable rather than less safe. Comparative learning must therefore interpret counts through context, not convert them into crude institutional grades (Ansell and Gash, 2008; OECD, 2026b).

34.1.4 — Regional Fit

Regional fit is not architectural flavor. It is the recognition that the City enters a living place with law, weather, water, labor, language, memory, politics, religion, media, emergency services, disability infrastructure, and local fears. A design that ignores regional fit shifts burden outward. It asks the host environment to absorb what the model refused to learn (OECD, 2025d; OECD, 2019a).

Heat stress may require different circulation, sleep protection, outdoor timing, energy systems, water strategy, and recovery spaces. A City in a multilingual region may need record-site interpretation, legal notices, staff language capacity, and public explanation in more than one language. A region with a history of state surveillance may need stronger public education around

nonparticipant privacy, archive limits, and complaint routes before trust is possible.

Before accreditation, a regional fit dossier records the conditions that local translation cannot ignore. The dossier covers host law, land and environmental burden, labor conditions, public services, cultural and language access, disability access, family impacts, media exposure, and objection routes. Promoters do not write it alone; host reviewers, independent auditors, local rights advocates, staff representatives, and affected public institutions can challenge the assumptions and conclusions.

Regional fit also protects applicants. A participant who can carry the active record burden in one cultural or media environment may face a different kind of risk in another. Public shame, family retaliation, political violence, religious pressure, or targeted harassment can change the burden of visibility. Admission standards and support models must reflect those local risks without lowering the invariant standards that protect privacy and voluntariness (Provan and Kenis, 2008; Emerson, Nabatchi, and Balogh, 2012).

A region may also be unsuitable. That sentence must remain available. If local law cannot protect ordinary privacy, if the host government demands improper access, if water or housing burden would be unjust, if security conditions would force carceral design, or if the public record site would become a tool of factional intimidation, the appropriate answer is not adaptation. It is refusal, delay, or relocation.

A copied City fails when it belongs nowhere except to the brand. Regional misfit will first appear in maintenance strain, staff exhaustion, local resentment, participant withdrawal, inaccessible public interfaces, emergency weakness, or confusion over lawful records. Accreditation should treat these as design facts, not public-relations problems. A City that cannot belong to its place cannot fairly ask its place to host it.

Regional fit also includes political temperature. A City placed inside a polarized environment may become a target for factions that want either to capture it or destroy it. The accreditation file should ask how protest, media attention, campaign pressure, and local party structures will affect participants, staff, and ordinary residents. A region may be lawful and still unsafe for this burden at a given time (OECD, 2026b; OECD, 2025d).

The host review answers a hard question: what does the region gain that is more than symbolic? Local labor, education, infrastructure, public interface, research boundaries, and civic services may create benefits, but those benefits must not be used to purchase silence about burdens. Regional fit is stronger when the host community can say both yes and no without being cast as an enemy of fairness.

Regional fit is revisited after public attention arrives. A site may seem locally compatible during planning and then change the neighborhood's media exposure, housing market, security posture, and civic identity once participants become prominent. Accreditation should treat post-opening regional effects as part of fit, not as regrettable side effects after the decision is already irreversible (OECD, 2019a; Ostrom, 2010).

34.1.5 — Resilience Through Plurality

Plurality can create resilience only when it reduces dependency rather than multiplying fragility. One City can be shut down by disaster, legal attack, political capture, vendor collapse, scandal, cyber compromise, donor withdrawal, or a single serious institutional failure. If the entire model rests on one site, every pressure on that site becomes pressure on the whole idea (Provan and Kenis, 2008; Emerson, Nabatchi, and Balogh, 2012).

A network can distribute learning, emergency support, staff training, archive recovery, and local legitimacy. It can allow one site to pause without ending the entire project. It can let a climate lesson travel from one region to another. It can protect participants during relocation if a City becomes unsafe. But this resilience requires standards before coordination. Otherwise plurality merely creates more places to fail.

Plurality becomes resilient when redundancy remains bounded by purpose, custody, and authority. Archive continuity cannot give one center ownership of every record; emergency hosting cannot authorize open transfer of protected material; staff exchange cannot create an informal hierarchy; and shared standards cannot become command. The network should publish what can travel, what remains local, what needs separate consent or lawful authority, and how temporary support ends.

Scale narratives often hide the people carrying their contingency. Cleaners, nurses, translators, archivists, security staff, host residents, responders, and participants may absorb the workload or displacement created by expansion. Resilience plans count

these burdens before crisis language makes them disappear (OECD, 2026b; OECD, 2025d).

Record-stage clarity is central. Backups, mirrored metadata, emergency contact files, corridor logs, public notices, and protected records have different access rules. A resilience plan that treats all record categories as one data pool becomes a dossier plan. The network should design continuity around minimum necessary transfer, local custody, time-limited access, and after-action review.

Plurality fails when network mythology replaces single-point mythology, or when shared faculty, vendors, designers, advisers, and auditors create correlated dependencies that no independent reviewer can challenge. Shared expertise is compatible with resilience only when conflicts are disclosed, critical alternatives remain available, and each site can obtain genuinely independent review. Accreditation makes plurality answerable through local criticism and outside cross-review.

Resilience requires public patience. After failure, the network should explain what failed, what remains protected, and what review precedes expansion instead of displaying another site as reassurance. Trust is earned by slowing down when the public wants a replacement symbol (Ostrom, 2010; Provan and Kenis, 2008).

A plural network may remain smaller than planned; pausing candidates can be fairer than forcing openings before capacity and safeguards are ready (Emerson, Nabatchi, and Balogh, 2012; Ansell and Gash, 2008).

34.2 — Accreditation and Nonnegotiable Standards

Accreditation in this book is a revocable public finding about a defined institutional function, site, term, and evidence set. It is not a certificate of virtue, judgment of personal worth, office credential, or proof that the City model is generally successful. Scope, conditions, exclusions, expiry, and appeal belong in the first sentence of every status statement. Public interpretation should never have to search later pages to discover what the accreditation did not cover (ISO/IEC, 2017; ISEAL Alliance, 2025).

A credible system separates standard setting, technical assistance, assessment, decision, complaint, and appeal enough to manage conflicts. One body may coordinate the architecture, but no consultant should certify its own advice and no funder should decide the standing of a recipient that depends on its money. Competence and independence are assessed by function.

The evidence file shows requirement, indicator, method, sample, source version, finding, severity, affected people, corrective action, reviewer competence, conflict declaration, minority view, and decision. The status is no stronger than the file that supports it. Audit volume cannot substitute for a usable chain of reasoning (ISO, 2026; Power, 1997).

Accreditation's narrow scope and nonnegotiable safeguards are defined here. Adult voluntary entry, the transparent Vow, ordinary privacy, staff dignity, human authority over Artificial Intelligence, record correction, host standing, exit, and decertification are institutional conditions, never personal rank.

Each condition has its own evidence and stop consequence, so apparent strength in one function cannot compensate for failure in another (ISO/IEC, 2017; ISO, 2026; ISEAL Alliance, 2025).

The scoped accreditation and decertification instrument turns these safeguards into a narrow public status rather than an institutional halo. It names the reviewed functions, evidence date, conditions, unresolved risks, reviewer, complaint route, appeal route, expiry, and circumstances of suspension or withdrawal. Nothing in that status transfers to a person's worth, office eligibility, trustworthiness, or moral standing.

34.2.1 — Adult Voluntary Entry

The instrument below accredits no person and grants no public authority. Each line distinguishes the invariant, permitted local translation, evidence, affected-person route, reviewer, public status, expiry, and consequence of nonconformity. Complaint, appeal, suspension, decertification, correction, requalification, and review of the accreditor receive equal standing with initial approval (ISO/IEC, 2017; ISO, 2026; ISEAL Alliance, 2025).

Adult voluntary entry is the first invariant because the City's burden is too severe to place on children, dependents, coerced persons, employees under threat, debtors under leverage, patients seeking care, refugees seeking safety, or people whose social world gives them no real refusal. The City may ask adults seeking substantial public power to accept additional public burden. It may not turn vulnerability into recruitment material (United Nations, 2006; ISO/IEC, 2017).

Consider a hypothetical second site with strong climate adaptation, lawful host approval, multilingual materials, impressive financing, and a widely admired design. During review, however, staff contracts deny independent complaint access and the search vendor retains authority to generate public participant summaries without named human approval. Local leaders describe both choices as cultural and technical adaptation.

A credible accreditation review requires an entry file that proves age, legal capacity where relevant, plain-language explanation, counsel or independent advice access, cooling-off time, health and load review, household consultation where appropriate, and a real withdrawal route before activation. The file should not become public biography. Applicant privacy remains protected until activation, and even then only the active public-power formation role enters the Total Record Rule.

The instrument refuses that description. Staff dignity, protected complaint, human authority, correction, vendor exit, ordinary privacy, and decertification are invariants. Protection defeats prestige without making firstness sacred.

Voluntariness is not only a signature. It can be weakened by debt relief, fame, political pressure, movement loyalty, family expectation, donor sponsorship, escape from public scandal, or the promise of elite access. Reviewers should ask whether the offer is structured so a person can decline without shame, deprivation, retaliation, or loss of ordinary dignity. A refusal route that exists only on paper is not voluntary entry.

Accreditation must protect applicants and nearby people from exposure, relocation pressure, incidental capture, recruitment pressure, and prestige bias. That requires separation among recruitment, support, public messaging, and acceptance review (Strathern, 2000; ISO/IEC, 2017).

Table 34.1. Scoped Accreditation and Decertification Instrument.

Accredited scope	Evidence, review, and failure response
Voluntary entry and no-advantage	Show real refusal, no office or service preference, conflict-screened review, complaint access, a fixed term, and public status limited to institutional scope. Failure suspends admissions until repair, remedy, re-review, or decertification.
Vow and active record	Show explicit purpose, stage, capture, access, shielding, correction, expiry, exit, and independent records and privacy review. Failure disables or narrows record functions and may require correction, migration, or decertification.
Ordinary privacy	Show that no local translation expands City visibility into ordinary life and that bystanders and hosts have complaint and remedy routes. Harmful capture or release is suspended immediately; requalification requires independent verification.
Staff and role separation	Show safe workloads, voice, rest, complaint, care, role separation, worker representation, and aggregate review. Hidden labor that sustains compliance triggers caps, pause, remedy, or decertification.

Accredited scope	Evidence, review, and failure response
AI and vendors	Show purpose, approval, security, fallback, and vendor exit. Failure disables the tool or requires vendor replacement, record migration, or decertification.
Host and accessibility	Show host voice, accessibility, mitigation, lawful authority, complaints, and visible minority findings under local law. Displaced burden triggers paused growth, mitigation, narrowed scope, or decertification.
Interoperability	Show bounded corridor, archive, and record-site protocols without a central dossier, hidden status transfer, command dependency, or funding dependency. Failure suspends exchange functions and isolates records until retest.
Term and withdrawal	Accreditation expires unless renewed on current evidence. Maintain independent review, complaints, appeals, conflict registers, corrective actions, and exact public status. Persistent failure triggers heightened review, suspension, decertification, funded continuity, public warning, and new-evidence requalification.

Voluntary entry receives outside review through independent pre-activation review, ombuds access, legal boundary review, disability accommodation review, and a no-fault pause path. If an applicant later alleges coercion or misunderstanding, the City should be able to reconstruct what was explained, who explained it, what alternatives existed, what pressures were present, and whether refusal was genuinely available. That record protects the applicant and the institution.

Soft recruitment through honor also falls within accreditation review. A person may be told that entering the City proves courage, seriousness, or readiness for public service. That language can pressure refusal even without direct coercion. Accreditation should review recruitment scripts, public ceremonies, admissions interviews, and donor materials for any implication that refusal is cowardice or lesser civic worth.

An adult applicant can leave the pathway with dignity before activation. The refusal record should remain private except for minimal aggregate reporting, and support already provided should not become leverage. A City that turns pre-activation support into debt, loyalty, or shame has weakened voluntariness. Entry is legitimate only when non-entry remains a respected outcome (ISEAL Alliance, 2025; ENQA et al., 2015).

The review treats enthusiasm as a risk factor as well as a strength. A person can be sincerely inspired and still underestimate the cost of visible life. The City should not exploit the hour when public hope feels larger than fatigue, family consequence, or long-term record anxiety. Cooling-off time protects the person from the institution's beauty and from their own momentum.

Voluntary entry also governs re-entry. A former participant may return only through a fresh, pressure-screened decision that accounts for changed health, household, finances, public exposure, and prior exit. Neither nostalgia, institutional need, donor interest, nor promised office advantage may convert a past yes into continuing consent.

34.2.2 — Transparent Vow and Total Record Rule

The Transparent Vow and total-record rule can be accredited only as a bounded active institutional function. The assessment identifies when capture begins, which role activities are included, which protected categories remain nonpublic, how access and release differ, how correction works, when the record ends, and what survives exit. A camera count is not evidence of lawful transparency.

Accreditation requires a record architecture that distinguishes capture, custody, access, release, interpretation, correction, sealing, research use, Artificial Intelligence use, and retention. Total Record Rule while active does not mean raw public release. It means active public-power formation is captured and governed under the record lifecycle. A site that cannot keep those stages separate is not ready for replication.

The public is an affected party here. Citizens are asked to trust that public-power formation is not being recreated in unrecorded channels. Staff and advisors are affected because their influence may enter role records. Nonparticipants are affected because incidental contact cannot become public material. The accreditation standard must protect all three interests at once: public memory, source integrity, and protected nonvisibility.

A later City may not localize this invariant into partial record by convenience. It cannot say that local politics require private influence rooms, that donors require off-record dinners, that party leaders need unlogged strategy, that mental health review should disappear without status, or that Artificial Intelligence summaries

can replace provenance. Gaps may occur through failure; they cannot be authorized as design (ISEAL Alliance, 2025; ENQA et al., 2015).

The remedy for violation depends on severity. A continuity break may require repair, public status labeling, affected-person notice, and temporary limitation of release. Intentional off-record active formation may require suspension, participant review, audit of advisors and staff, and possibly decertification. The name of the City is justified only while public-power formation remains under bounded memory.

Scenario rehearsal tests this invariant before accreditation. Reviewers should ask what happens when a participant receives an off-site call from a party strategist, when a mentor gives advice during a medical visit, when a donor tries to host a dinner, when a staff member sends informal notes, or when a device fails during a deliberation. The Total Record Rule becomes real only when ordinary evasion routes are anticipated.

The rule defines repair language for unavoidable gaps. A technical failure, emergency shelter move, legal privilege issue, or protected health episode may interrupt ordinary capture. The City should know how to mark the gap without pretending it did not occur and without exposing protected material. A public status label should tell the truth about record quality without turning uncertainty into accusation (Power, 1997; Strathern, 2000).

Assessment includes an adversarial end-to-end trace: create a role event, classify it, shield a protected element, release the permitted

portion, challenge the classification, correct an error, preserve provenance, and complete exit handling. A standard that is clear in policy but unusable under dispute does not pass.

The status is suspended when continuity gaps, hidden capture, missing logs, role creep, overbroad access, unreviewable summaries, or unresolved release harms make the active record unreliable. The response is containment and correction before communication, not a softer description of the same failure.

34.2.3 — Ordinary Privacy Protection

Ordinary privacy protection is assessed by testing the boundary from the outside inward. Reviewers begin with partners, children, dependents, neighbors, clinicians, counsel, staff, visitors, and nonparticipants, then ask whether any City process captures, infers, links, or releases more than the public role requires. The burden of proof rests on the institution.

Institutional standing depends on a privacy architecture that names protected nonvisibility categories, incidental-contact rules, redaction review, delayed release, summary substitution, lawful shielding, child protection, professional privilege, health and intimacy boundaries, family safeguards, and complaint routes for affected persons. The record system should be designed so privacy is not repaired only after exposure has already harmed someone.

The privacy route includes impact review before opening, periodic audit after use, record-site testing, protected-category training, technical access controls, and sanctions for improper exposure. A later City should be able to show how a host resident,

visitor, child, family member, or professional can object, receive notice when appropriate, seek correction, and obtain remedy.

Ordinary privacy also limits replication marketing. A new site may not attract attention by promising raw transparency, total access, intimate revelation, celebrity records, family visibility, or public entertainment. The public interest in public-power formation is real, but public appetite is not the standard for release. Accreditation should review public-facing language before the site opens because dangerous expectations can damage the institution before any record is captured (Power, 1997; Strathern, 2000).

Exposure creep disqualifies the privacy function. If a site repeatedly captures or releases protected ordinary life, treats bystanders as data, weakens child shielding, uses public curiosity as a release reason, or makes correction too slow to matter, it should lose the relevant standing until repair is proven. Privacy protection is not an ornament on the City. It is one of the conditions that makes the City a City rather than surveillance.

Privacy protection is measured partly by what the public never sees. A well-governed City will have many records of review, redaction, shielding, delay, and summary substitution that produce no dramatic public artifact. That absence is not secrecy. It is the visible result of a system deciding that public-power accountability does not require ordinary-life exposure.

Accreditation begins with adversarial privacy testing. Reviewers should attempt to reconstruct a child's school, a partner's medical condition, a visitor's identity, a staff member's off-duty pattern,

or a host resident's location from released bundles and metadata. If protected information can be inferred too easily, the release standard has failed even if no raw private field appears on the page (ISO, 2026; ISEAL Alliance, 2025).

Privacy performance begins with noncollection where a purpose can be met without capture, then tests inference and linkage as well as direct recording. Search, metadata, schedules, location, household patterns, small-cohort statistics, model outputs, and combined datasets can expose protected life without showing a private conversation. Cross-architecture dossier tests therefore remain part of accreditation.

The privacy standard binds researchers, journalists, documentarians, experts, and visitors as well as City staff. Wrongful exposure triggers immediate restriction, affected-person notice where safe, correction, remedy, root-cause review, and scope reassessment. Continued accreditation requires evidence that the route was repaired and that similar records were examined.

34.2.4 — Accreditation Standard for Staff Dignity

Staff dignity is an accredited operating condition, not an employment-policy appendix. Review examines wages, classification, workload, relief coverage, role separation, psychological safety, complaint, anti-retaliation, care, training time, contractor parity, and whether hidden labor is carrying the institution's public promises (ISO, 2021b; World Health Organization and International Labour Organization, 2022).

An acceptable accreditation record requires staffing ratios, workload standards, compensation review, safety rules, privacy boundaries, complaint routes, anti-retaliation protections, role-separation training, professional independence, and a staff voice mechanism. The staff standard should be reviewed before activation and again after lived use. A staffing model that looks efficient on a budget sheet may be dangerous under daily visible burden.

Staff visibility remains role-bound and rights-bound. Conduct that materially affects public-power formation may be logged where relevant, but employment does not place a worker inside the participant's full active record. A clinician's independent judgment, a cleaner's private life, a translator's family, and a security worker's off-duty life remain outside public material unless a separate lawful basis applies. Accreditation fails when transparency for public power becomes exposure for the people supporting it.

A later City demonstrates how staff can object to unsafe workloads, participant pressure, donor interference, abusive public attention, unclear role records, clinical-independence breaches, security overreach, and vendor dependency. The review route should not require staff to complain to the same managers who benefit from the burden being hidden (ISO, 2026; ISEAL Alliance, 2025).

Accreditation should refuse or suspend a site when public-memory functions depend on hidden staff extraction or when staff-role records drift into full-life exposure.

Staff dignity is reviewed during quiet weeks and crisis weeks. Many institutions look humane when schedules are normal and become extractive when a public controversy, cyber incident, participant breakdown, or media storm arrives. Accreditation should require surge staffing plans, rest protections, trauma support, and authority to slow operations when staff load becomes unsafe.

Staff disagreement is itself a protected accreditation condition. A clinician, archivist, teacher, or security worker may object to a participant's preferred release, a leader's timeline, or a donor's request. If institutional culture treats staff objection as disloyalty to the City's mission, the City has built hidden labor into its moral language. Staff who say no are part of the safeguard, not obstacles to it (ISO, 2021b; World Health Organization and International Labour Organization, 2022).

Accreditation review asks whether staff have protected recovery infrastructure of their own. The City may build recovery spaces for participants while expecting staff to absorb the same atmosphere without decompression, counseling, rest, or privacy. That imbalance would make care hierarchical. A humane City designs recovery for everyone whose work requires proximity to visible burden.

Assessment includes roster and workflow evidence, protected worker testimony, turnover, overtime, leave, vacancy, complaint latency, role conflicts, subcontracting, and tasks missing from formal charts. A calm public surface can coexist with dangerous hidden labor; direct worker routes are therefore indispensable.

Staff-scope status is conditional or suspended when compliance depends on chronic overtime, prohibited role combinations, retaliation risk, unpaid emotional labor, unsafe contractor conditions, or insufficient staffing for rights and care routes. The site may reduce cohort or function while repair occurs; workers are not the continuity reserve.

34.2.5 — AI Subordination

Artificial Intelligence subordination is assessed at the function level. The file identifies purpose, data, model or service, human decision owner, affected people, allowed output, prohibited inference, logging, source trace, challenge, fallback, vendor exit, retirement, and the exact action that a person rather than a system must authorize (NIST, 2023a; Government Accountability Office, 2020b).

A credible accreditation review requires an Artificial Intelligence scope register before a site opens. The register should state which tools are used, what data they access, what outputs they create, who reviews outputs, how errors are corrected, how models are audited, whether vendors can access records, what training is prohibited, and what functions are barred. No tool should quietly move from search assistance to decision authority.

Machine authority affects many classes of people. Participants can be harmed by false summaries. Staff can be disciplined by automated pattern claims. Nonparticipants can be exposed by weak redaction. Public users can be misled by confident machine language. Host communities can be profiled through interface analytics. Accreditation should therefore ask not whether

Artificial Intelligence looks efficient, but who bears the error when it is wrong.

Artificial Intelligence outputs need explicit stage labels. A generated summary is not the source archive, a search result is not an official finding, a risk alert is not an adjudication, a translation draft is not final notice, and generated public explanation is not lawful review. Each output should show provenance, purpose, model or service version, human decision owner, limitation, challenge route, correction status, and fallback proportionate to the risk (NIST, 2023a; W3C, 2013).

Vendor capture belongs inside this invariant. A City should not depend on a private model, proprietary record format, inaccessible audit trail, undisclosed training practice, or vendor-controlled identity system in a way that prevents suspension, migration, investigation, or decertification. Technical continuity is a governance issue. A vendor that can make records unusable has more power than a vendor should have.

Machine authority disguised as convenience disqualifies the Artificial Intelligence function. If a site lets Artificial Intelligence decide release, rank participants, score readiness, interpret protected categories, summarize without correction, train on operational records without separate permission, or obstruct audit, accreditation should pause the relevant function and possibly the site. The City may use tools. It may not become governed by them.

Assessment includes failure and refusal tests. The system is asked to abstain when evidence is insufficient, preserve disagreement,

survive unavailable vendor service, route a challenge to a competent person, and support manual operation. A tool that is useful only when everyone accepts its output is not subordinate.

Machine-generated summaries remain subordinate to source records and must disclose provenance, uncertainty, correction status, and human review. Technical-scope accreditation is suspended when outputs imply readiness, loyalty, credibility, worth, inner state, or scientific truth, or when correction cannot propagate. Disable first, investigate second, restore only after independent retest.

The Artificial Intelligence standard includes public education. Citizens using the record-site should understand when a machine helped search or summarize and why that help does not settle meaning. Without this education, even a well-designed tool may be received as an oracle. Subordination is partly technical and partly interpretive: the public must know where machine authority ends (ISEAL Alliance, 2025; ENQA et al., 2015).

34.2.6 — Decertification Possibility

Decertification possibility is itself a nonnegotiable standard. Every accredited scope has a term, surveillance plan, complaint route, suspension authority, public-warning rule, continuity obligation, appeal, and requalification pathway. Status that cannot be withdrawn is branding rather than assurance (ISEAL Alliance, 2025; ISO/IEC, 2017).

The decertification standard exists before any site opens. It should name triggers, evidence classes, initiators, interim measures, participant care, staff protection, host notice, record stewardship,

public warning, appeal where appropriate, requalification requirements, and failure memory. A network should not invent removal rules after a popular or politically protected City has already harmed people.

Initiation routes are plural. Participants, staff, ombuds, auditors, affected persons, host communities, external inspectors, legal authorities where relevant, and network reviewers may each see different failures. A removal pathway controlled only by insiders will not be trusted when the failure implicates reputation, donors, founding figures, or network leadership.

A credible decertification process is bounded by evidence, due process, lawful review, appeal, protection against bad-faith campaigns, and safeguards for affected people. Those controls prevent factional punishment, ideological discipline, donor retaliation, and public spectacle without making removal impossible. A standard has practical meaning only when it can be applied to a prestigious site under pressure and still produce a reasoned, reviewable decision (ISO/IEC, 2017; ISO, 2026).

The record consequences of decertification need care. Losing the name should not mean abandoning participants, deleting failure evidence, exposing protected records, or scattering archive custody. The site may lose the right to admit new participants, use public claims, participate in corridors, publish accredited record-site bundles, or represent itself as a Transparent City while still retaining duties to care, correct, preserve, and lawfully transfer.

Permanent standing is itself a failure. If the rules make decertification practically impossible, accreditation should not be

granted. The City's name belongs only to institutions that can lose it. That loss is not a sign that the whole project has failed. It is evidence that the project built a standard strong enough to protect people against itself.

Public materials disclose decertification possibility from the beginning. Applicants, staff, donors, host communities, and public users should know that standing can be lost. This protects trust because it prevents later removal from looking like a betrayal or surprise. A name that can be withdrawn teaches the public that safeguards are stronger than reputation (ENQA et al., 2015; ISEAL Alliance, 2025).

Decertification authority binds the accreditor as well as the site. If the accreditation body ignores credible complaints, develops conflicts of interest, protects famous sites, or becomes dependent on fees from Cities it reviews, it too must be reviewable. A network that audits Cities but never audits accreditation will recreate hidden power one level higher.

Vendor, donor, staff, participant, and host agreements must anticipate suspension and decertification, including data custody, service continuity, funding, notice, portability, and exit. The public decision states the exact scope lost, effective time, reasons, evidence limits, protections, appeal, and next review without issuing a verdict on every person at the site.

Reviewers must disclose appointment, payment, competence, conflicts, and prior assistance. Continuity planning then protects participants, staff, complainants, hosts, public users, records,

care, and corridors when standing ends. Decertification cannot destroy evidence, strand people, or force unsafe disclosure.

Accreditation standards should state the condition that triggers suspension or decertification and point to Section 34.5 for the requalification pathway. Requalification is not part of the initial standard itself. A site that loses one accredited function should not automatically lose unrelated functions that still satisfy their standards; scope should contract precisely to the failed control. Repeated failure across scopes should instead trigger review of whether the common governance layer, rather than a single program, is defective.

34.3 — Local Translation Without Constitutional Drift

Local translation is a condition of seriousness rather than a weakness. A City needs land, water, utilities, courts, labor, transit, emergency services, languages, customs, media, public trust, and a host community. Replication that refuses translation makes local people carry the cost of a universal aesthetic. Translation remains legitimate when it improves usability and preserves the same direction of burden, rights, records, human authority, and exit (Acharya, 2004; Merry, 2006).

Constitutional drift is the opposite danger. A site can invoke climate, law, culture, language, or local politics to loosen the core. It may say that younger entry is normal, that family exposure is expected, that public trust requires more intimate release, that local elites must hold more discretion, or that Artificial Intelligence interpretation is necessary because staff are scarce. Translation becomes drift when it changes the City's type.

Local translation begins with one rule: form may adapt, but a safeguard may not be weakened merely to make launch easier. Section 34.3.5 supplies the working translation matrix and the list of protected invariants.

A translation record shows how each local change protects the same burden in a different setting. Climate, law, culture, language, labor, accessibility, public memory, and host institutions may alter form, but the record identifies the invariant served, affected people, legal basis, evidence for local fit, risk of dilution, reviewer, public explanation, monitoring rule, expiry,

challenge route, and authority to refuse the variation. Translation is credible when it makes protection more usable, not merely when it makes launch more convenient (Acharya, 2004; Merry, 2006).

34.3.1 — Climate Translation

Climate translation begins with the physical truth that built environments do not carry burden evenly. Heat, cold, flood, drought, fire, storm, snow, wind, air quality, daylight, darkness, insects, water stress, and energy reliability affect sleep, work, staff safety, archive continuity, public access, emergency routes, and host-community cost. A campus copied for beauty can become a burden machine in the wrong climate (Dolowitz and Marsh, 2000; Teubner, 1998).

Climate translation is documented before design approval. The file should include hazard maps, water demand, energy load, material durability, maintenance capacity, emergency-service compatibility, outdoor exposure, sensory load, accessibility during weather events, archive continuity, and environmental burden on the host region. Beauty remains welcome, but the decisive demonstration is humane operation under likely conditions. A design that cannot protect people in its actual climate has not translated the City at all.

Affected persons are concrete. A participant cannot carry public-power formation well if sleep is broken by heat. Maintenance staff should not become the hidden shock absorbers of underbuilt climate systems. Host residents should not lose water, grid reliability, transit capacity, or emergency response because the

City copied a design from elsewhere. Climate translation asks who pays when architecture ignores weather.

Translation may change form. A hot region may need shaded circulation, different public-interface hours, deeper cooling reserves, and water-sensitive landscape. A cold region may need enclosed commons and snow-safe service routes. A fire-prone region may need defensible space, smoke filtration, and evacuation design. These changes do not weaken the City if they protect the same rights and records under local conditions (World Bank, 2025; Acharya, 2004).

Climate cannot justify secrecy or hierarchy. A site may not use environmental hardship to close itself into an elite fortress, hide active public-power formation, deny public review, or overexpose workers in maintenance zones. The review route should ask whether climate adaptation has preserved legibility, accessibility, record continuity, and ordinary privacy. If climate demands total enclosure or constant security, the site may be wrong for this institution.

Civic beauty cannot excuse hidden environmental burden. If a proposed City requires unsustainable water use, unsafe labor, fragile archive systems, inaccessible public interfaces, or emergency dependence on a host community that has not consented to the load, accreditation should be withheld. Climate translation succeeds when local difference protects people rather than decorating a copy.

The review includes ordinary days, not only extreme events. Heat that makes sleep shallow every night may damage the City more

than a rare disaster. Glare that creates sensory overload, long indoor routes that isolate people, or constant mechanical noise can change the lived burden of visibility. Climate translation must therefore examine daily function as well as emergency survival (Levitt and Merry, 2009; Dolowitz and Marsh, 2000).

Climate lessons do not become aesthetic trophies. A clever water system, shaded court, or resilient archive vault may be worth sharing, but the network should explain the conditions that made it necessary. Otherwise later sites may imitate the feature where it is unnecessary and ignore the underlying burden where it is urgent. Learning travels best when it carries the problem with the solution.

Climate translation requires cost transparency. A cooling system, fire buffer, storm hardening, flood elevation, or water-reuse design can protect people, but it can also create capital and operating burdens. Climate adaptation cannot become an excuse for extravagance. The relevant test is whether the design protects local people at a cost the host and institution can honestly carry (Teubner, 1998; OECD, 2025d).

34.3.2 — Legal Translation

Legal translation recognizes that the City exists inside law. Entry, consent, records, labor, health, disability, privacy, family protection, public access, procurement, security, land use, emergency authority, and data transfer are governed differently across jurisdictions. A City cannot import one legal envelope and pretend it is universal (World Bank, 2025; Acharya, 2004).

Institutional standing depends on a legal compatibility opinion that is independent enough to be trusted and plain enough to be understood. It should identify the host jurisdiction, controlling laws, unresolved legal risks, record-release limits, staff protections, nonparticipant remedies, family and child safeguards, professional privilege, data transfer restrictions, public notice duties, and court or regulator routes. The opinion should also state where the design cannot proceed without legal change or leadership decision.

Legal translation begins with the limits of City authority. The City can prepare candidate standards, identify protected functions, and require jurisdiction-specific review, but only lawful institutions can enact or interpret binding law. *The Constitution of Fairness* retains model legal architecture, while actual authorities determine validity in each jurisdiction. Replication remains unavailable where lawful protection, remedy, labor status, privacy authority, or exit cannot be secured.

Legal translation cannot become legal opportunism. A site should not choose a jurisdiction because privacy law is weak, labor remedies are thin, public records can be hidden, donors can control entities quietly, or vulnerable applicants have fewer rights. The accreditation question is not where the City can get away with most. It is where the City can carry its burden under law without weakening dignity (Levitt and Merry, 2009; Dolowitz and Marsh, 2000).

Affected persons need reachable routes. A staff member should know where to take a retaliation complaint. A nonparticipant should know how to challenge exposure. A participant should

know how exit, record correction, health protection, and dependent support interact with local law. A host resident should know what forum can hear local burden complaints. Legal translation is real only when recourse is legible.

Legal review identifies conflicts between the City's vocabulary and local legal categories. A term such as public record, participant, release, consent, or protected summary may carry different legal consequences in different places. Accreditation should require translation not only of language but of legal meaning, so the public is not misled by familiar words doing unfamiliar work.

Where law is uncertain, the City avoids heroic improvisation. A launch plan that depends on unresolved privacy authority, weak labor status, ambiguous child shielding, or untested cross-border transfer should be treated as not ready. Legal courage is not the same as legal recklessness. The City should accept delay before it asks people to live inside unresolved authority (OECD, 2025d; World Bank, 2017a).

Legal translation defines what follows when law changes. A privacy statute may be amended, emergency powers may expand, labor law may shift, or political authorities may demand more access. Accreditation should require legal-change triggers so the City pauses affected functions when the legal envelope that justified them no longer holds.

Legal translation also affects public expectation. A record category that can be released in one jurisdiction may be sealed in another. Public summaries should explain lawful difference

without implying secrecy, weakness, or superior transparency. Legal variation should be clear before comparison begins (Acharya, 2004; Merry, 2006).

34.3.3 — Cultural Translation

Cultural translation begins with respect for context and suspicion toward excuses. Communities differ in public trust, shame, family role, religious practice, gender expectations, political memory, media habits, attitudes toward institutions, and histories of surveillance or colonization. A City that ignores those differences may frighten the very people it claims to serve (Levitt and Merry, 2009; Dolowitz and Marsh, 2000).

Accreditation begins with a cultural burden review before launch. The review should include local historians, rights advocates, disability representatives, language communities, religious and nonreligious perspectives, labor voices, host residents, and people who are skeptical of the City. The purpose is not to assemble symbolic approval. It is to discover where the City's visibility rules may land differently than designers expect.

Cultural translation can change how the City explains itself, how families are consulted, how public interface spaces are designed, how modesty and intimacy protections are communicated, how staff are trained, how conflict is mediated, and how public record summaries are contextualized. It can also change the pace of launch. A community with fresh memory of surveillance may require deeper public education before any record-site interface is trusted.

But culture cannot be used to remove protected nonvisibility, lower adult entry, overexpose families, silence women, weaken staff complaint, excuse caste or class gatekeeping, permit donor patronage, or allow local elites to control who becomes visible. Respect for context does not mean surrender to local power. The City's burden always moves toward adults seeking public power and away from ordinary life (United Nations, 2006; World Bank, 2017a).

Local fit fails when it becomes local capture. If a site's cultural adaptation mainly protects elite families, political patrons, religious gatekeepers, dominant groups, or public appetite, then translation has drifted. The remedy may be redesign, delayed launch, changed governance, independent host review, or refusal. The City belongs to fairness only when local respect protects the vulnerable against local domination.

Cultural translation includes dissenting members of the culture, not only official representatives. Local elites often present their own preferences as tradition. A serious review asks women, minorities, disabled people, young adults, secular residents, religious minorities, workers, migrants, and critics how the City's visibility could affect them. The goal is to hear the burdens that polite consultation often misses.

Replication cannot be presented as a civilizing mission. A site does not arrive to teach a community that it lacks fairness; it arrives, if accepted, as a bounded institution willing to carry a public-power burden under local law and local scrutiny. Cultural humility begins with the practical possibility of refusal (Merry, 2006; Levitt and Merry, 2009).

Cultural review examines the City's effect on local meaning. A Transparent City may alter how a community speaks about ambition, shame, public duty, privacy, and leadership. That influence is not automatically bad, but it is real. Translation should notice when the institution's language begins to pressure ordinary residents into visible virtue even though they never accepted the Vow.

A sound cultural translation plan changes under feedback. Early community meetings may miss burdens that appear only after operations begin. The City should keep consultation open, not as endless veto, but as continuing evidence that the institution remains answerable to its place (Dolowitz and Marsh, 2000; Teubner, 1998).

34.3.4 — Language Translation

Language translation is not cosmetic. It determines who can understand the Vow, consent, exit, complaint, record status, public summaries, warning labels, staff rights, visitor rules, and accreditation standing. A City that operates in a language people cannot use shifts burden to translators, families, staff improvisation, and the most educated members of the public (United Nations, 2006; Acharya, 2004).

An acceptable accreditation record requires a language access plan covering applicant materials, activation documents, public record-site labels, complaint forms, privacy notices, staff training, emergency instructions, host-community updates, public warnings, and decertification notices. The plan should name which languages are supported, who verifies translation quality,

how terminology is controlled, and how disputes over meaning are corrected.

Plain language is part of the safeguard. The City's vocabulary can be precise without becoming inaccessible. Terms such as Transparent Vow, Total Record Rule, protected nonvisibility, Covenant Status Portability, suspension, decertification, public bundle, and role-bound active record should be explained in ordinary language wherever they affect rights. Complexity should not become a gatekeeping device.

Artificial Intelligence may assist translation but cannot own it. Machine translation can miss legal nuance, cultural risk, idiom, disability needs, and protected categories, so high-risk materials require human review, version control, correction logs, and accountable signoff. A mistranslated exit rule or privacy notice is not a cosmetic defect. It can become coercion (Merry, 2006; Levitt and Merry, 2009).

Public users are affected alongside participants. Public users need to understand status and limitation, host residents need to read burden notices, staff need complaint routes that do not depend on supervisors as translators, and nonparticipants need a clear objection route when they are exposed. Usability is part of accountability, not a cosmetic layer.

Language inequality makes a transparency institution opaque. If only insiders can understand status labels, if translations lag behind releases, if warning notices are unavailable in local languages, or if machine translation errors remain uncorrected, the City's openness is false. Language translation supports public

usability because a right that cannot be understood cannot be fairly used.

Network-wide terminology control need not become centralized command. A shared glossary can protect rights by keeping key terms stable across record-sites and public notices. Local language teams can then adapt examples, syntax, accessibility supports, and cultural references. Stability belongs to the right; flexibility belongs to comprehension (Teubner, 1998; OECD, 2025d).

The language plan includes disagreement over translation. If a participant, staff member, or public user says a translated term misstates a right, the City should not treat the complaint as stylistic preference. High-risk language disputes need review, versioning, and public correction where reliance may have occurred. A wrong word can move real burden.

Language review examines the emotional force of words. A technically accurate term may sound accusatory, sacred, bureaucratic, or punitive in another language. Because the City touches dignity, translation should preserve tone as well as content. Precision without humane register can still move burden unfairly (Acharya, 2004; Merry, 2006).

34.3.5 — Core Invariant Protection

Core invariant protection is the line that keeps translation from becoming drift. Every later City maintains a translation matrix distinguishing institutional identity from adaptable form. Form may include materials, climate systems, schedules, language, public education, legal instruments, local advisory structures, and

spatial expression. Identity includes adult voluntary entry, role-bound active record, ordinary privacy, staff dignity, human authority, lawful record lifecycle, host standing, complaint, exit, and decertification. Each proposed variation is coded as adaptable, jurisdiction-specific, prohibited, or unresolved (Merry, 2006; Levitt and Merry, 2009).

A credible review also requires a variation register. The word waiver is avoided where it could imply permission to weaken a core safeguard. Each allowed variation names the local reason, affected persons, legal basis, record stage, reviewer, evidence, public explanation, monitoring rule, expiry, failure condition, and route for challenge. An unresolved variation cannot be converted into a permanent practice through use. Silent variation is where drift begins.

Some corridor requests are nonstarters rather than negotiation points. Younger admission, inherited visibility by family, off-record active public-power formation, unrestricted raw release, public ranking, Artificial Intelligence authority, donor influence, staff retaliation, hidden governance, and permanent accreditation are not local translations. They are changes in type. A site that needs them should not use the name.

Core invariant protection requires affected-person standing. A participant, staff member, host resident, public user, nonparticipant, worker representative, or auditor can challenge a claimed translation when it weakens the safeguard protecting them. The review route does not assume that leadership can see all burdens from above. Local people often notice drift first because they carry it first, and the matrix must record how their

evidence was considered, rejected, or used to change the design (Teubner, 1998; OECD, 2025d).

Public explanations replace nervous disclaimers with operational terms. A later City should be able to say: this design differs because heat changes sleep protection; this release notice differs because local law requires a different route; this public interface differs because language access requires layered labels; this family consultation process differs because local household structures affect consent. The explanation should show that difference protects the same core.

Respect becomes drift when local adaptation weakens a core invariant. If local adaptation weakens the direction of burden, hides active public-power formation, exposes ordinary life, captures staff, or protects reputation against review, accreditation should pause or fail. A City may belong to many places. It cannot belong to any place by abandoning what makes it the City.

A variation that appears safe at launch may behave differently under public attention, staff turnover, political pressure, climate stress, emergency, or changing law. Periodic and incident-triggered review asks whether it still protects the invariant, whether new people carry the burden, and whether its evidence has expired. If the answer becomes unclear, the function narrows or pauses while review proceeds (Acharya, 2004; Merry, 2006; ISEAL Alliance, 2025).

The public can learn and restate the protected core. A host resident should be able to understand why one adaptation is allowed and another is forbidden. The network does not need to

expose every legal memo, but it should explain the invariant in plain terms. Public legibility keeps local translation from becoming an insider privilege.

The invariant matrix must be simple enough to audit without becoming simplistic. An independent reviewer should trace each local form to its protected function, evidence, affected people, legal basis, monitoring rule, and stop condition. If only founders can explain safety, the network has created interpretive dependence; if public explanation hides hard questions, it has created symbolic compliance (Levitt and Merry, 2009; Dolowitz and Marsh, 2000; Power, 1997).

34.4 — Corridor, Archive, and Record-Site

A network becomes real when movement begins. A participant may transfer for training, office duties, health, family, safety, emergency hosting, or regional legitimacy. A record may need continuity across jurisdictions. A public user may compare status labels. Without corridor, archive, and record-site standards, these moments become off-record exceptions. Every movement therefore begins with a declared purpose, lawful authority, minimum necessary information, provenance, affected-person notice where appropriate, correction, expiry, and a return or deletion rule (W3C, 2013; ISO, 2016a).

Interoperability is necessary and dangerous. It can help safeguards travel with a person or record, and it can create a hidden central dossier, network command, vendor dependency, or record pool that no local person can challenge. The City coordinates without becoming a sovereign data system. Each transfer states what travels, what remains local, who may access it, which law and authority govern, who can object, how provenance survives translation, and how error or harm is repaired (W3C, 2013; NIST, 2020b; NIST, 2024a).

Cross-site coordination remains functional rather than sovereign: no corridor, archive, record-site, portability rule, or emergency protocol authorizes central rule or scientific proof (OECD, 2026b; NIST, 2024a).

Each cross-site movement is limited to a declared function. Corridors move people under specified safeguards; archives preserve lawful continuity; record-sites preserve public status and

correction; portability preserves role-bound standing; emergency interoperability preserves care and safety. Provenance, access, objection, correction, expiry, and local authority travel with the function, while whole-person dossiers, hidden ranking, automatic status transfer, central funding control, and network command do not (W3C, 2013; ISO, 2016a; NIST, 2020b).

34.4.1 — Corridor Standards

Corridor standards govern planned movement between Cities. A corridor may be physical, legal, administrative, technical, or professional. It may cover travel for study, office interface, deliberation, health support, emergency relocation, diplomatic preparation, or temporary hosting. The standard should prevent movement from becoming the place where hidden influence returns (Provan and Kenis, 2008; OECD, 2026b).

The corridor file names purpose, duration, sending City, receiving City, legal jurisdiction, record continuity, privacy limits, staff roles, host burden, security rules, gift and contact rules, emergency contact, and return review. The receiving City should not treat the participant as an unstructured guest. The sending City should not use transfer to evade its own failures.

The corridor touches people all along the route. Transportation workers, interpreters, host staff, temporary household members, local officials, clinicians, counterparties, and public users may encounter the transfer. Corridor design minimizes incidental capture, supplies notice where appropriate, protects nonparticipants, and specifies what happens when a protected person enters the active-record environment by accident.

The record stage must be exact. Travel purpose may be logged. Active public-power formation during corridor time may be captured. Protected health, counsel, intimacy, family, and incidental contacts remain subject to shielding. Not every movement record is public release, and not every public explanation needs route detail. The corridor is transparent about public-power formation, not about every human movement (W3C, 2013; ISO, 2016a).

Review covers pre-approval for planned corridors, emergency approval for urgent movement, after-action review, and participant appeal when conditions become unsafe or overexposing. Staff should be able to object if corridor duties exceed safe workload. Host communities should have notice of repeated corridor burdens if the pattern affects local services or security.

Corridor opacity defeats the purpose of interoperability. Private strategy rooms, unlogged donor access, informal political meetings, uncontrolled media exposure, jurisdictional evasion, or unexplained record gaps are reasons to pause corridor participation. A corridor exists to preserve the Vow across movement, not to suspend it. When movement weakens the record and rights architecture, the corridor has become an escape route.

Corridor standards define informal contact. Movement creates waiting rooms, vehicles, hotels, meals, local guides, brief greetings, and accidental meetings. These small spaces can become influence channels or exposure traps if no one has named the rule. Training should teach participants and staff what to do

when public-power conversation begins where corridor capture is weak (Provan and Kenis, 2008; OECD, 2026b).

Corridor rules govern entry into non-City institutions such as courts, agencies, hospitals, universities, diplomatic venues, and campaign offices. Those places have their own rules. The City should preserve record continuity where lawful without asserting control over institutions it does not govern. The corridor is a boundary negotiation, not a conquest.

Corridor standards also define when movement is inappropriate. If travel would create too many record gaps, too much host burden, unsafe media exposure, or legal uncertainty, the participant may need to delay or use another route. The existence of a corridor does not make every movement fair (NIST, 2024a; W3C, 2013).

34.4.2 — Archive Standards

Archive standards protect record continuity across a network without creating one central soul-like archive. Each City should maintain lawful custody of its records under its legal envelope, but shared standards are needed for provenance, chain of custody, tamper resistance, status labels, correction, retention, sealing, deletion review, emergency backup, and transfer protocols. Interoperability should protect memory, not own persons (W3C, 2013; ISO, 2016a).

Record-stage portability begins with common minimum metadata for capture, custody, access, release, interpretation, correction, research request, Artificial Intelligence request, retention, sealing, and transfer. That metadata should be sufficient to

maintain accountability across sites without exposing protected content. A receiving City should know what it is allowed to see and what it must not claim to possess.

Archive standards must also handle failure. A sending City may be suspended, hacked, flooded, captured by vendors, or legally constrained. The network needs escrow, backup, continuity, and lawful transfer rules before such events occur. But emergency continuity cannot become a permanent central copy of everything. Minimum necessary access remains the governing rule.

Record portability affects participants, staff, nonparticipants named in protected material, and public users who rely on context. A participant keeps correction rights after transfer; a nonparticipant keeps shielding when metadata changes; a staff member does not become more exposed because a network archive is easier to search; and public users retain reliable context. Continuity is measured by preserved rights, not merely by successful data movement (Provan and Kenis, 2008; OECD, 2026b).

Archive continuity is reviewed through access-log audits, transfer signoff, independent technical inspection, affected-person complaint, and public status labeling when continuity is compromised. A continuity break should be visible enough to prevent false confidence and protected enough to avoid turning technical failure into public humiliation.

Convenience becomes capture when archives consolidate into a shared person-level system. If shared standards become a central

database of persons, if vendors control the format, if local correction rights disappear, if protected material travels without need, or if archive tools produce cross-City dossiers, accreditation should suspend the function. Memory is lawful only while custody remains bounded and challenge remains reachable.

The archive standard prepares for decertified sites. If a City loses standing, its records do not become ownerless, and the network does not automatically become their master. Custody, lawful preservation, correction rights, protected material, and public status labels should remain governed. Decertification changes public standing; it should not create archive chaos (W3C, 2013; ISO, 2016a).

Archive standards include format migration. Records that cannot be read, authenticated, or corrected twenty years later will become ceremonial memory rather than lawful memory. A City should plan for obsolete media, vendor disappearance, cryptographic transitions, and accessibility changes. Long-term dignity requires that the archive remain usable without becoming more exposed.

Network restoration must satisfy the recovery standard established in Section 8.1: records are recovered, authenticated, and returned to their correct access, status, and correction rules after disruption. Accreditation requires evidence from an actual restoration drill, not a paper backup claim (ISO, 2019; Provan and Kenis, 2008).

34.4.3 — Record-Site Standards

The public record-site is the citizen-facing interface. In a network,

record-site standards prevent each City from inventing labels so different that the public cannot understand them, while also preventing comparison from becoming a leaderboard. The standard should make records legible, contextual, correctable, accessible, and clearly bounded by status (Provan and Kenis, 2008; OECD, 2026b).

The record-site standard defines public bundle types, status labels, versioning, correction logs, right of reply, protected exclusions, delayed-release labels, machine-summary warnings, accessibility, language options, public warnings, and decertification status. The public should be able to know whether a City is accredited, suspended, restricted, or decertified without mistaking that status for a moral ranking of participants.

Affected persons need usable routes inside the site. A participant should be able to challenge context. A staff member should be able to flag a role-record error. A nonparticipant should be able to request review of exposure. A public user should be able to understand what is source record, what is summary, what is disputed, and what is shielded. Usability is a rights issue, not interface polish.

At the record site, Artificial Intelligence assists navigation without acquiring verdict authority. Machine summaries should remain linked to source records, status, limits, human review, and correction history; search results should expose provenance; and generated fragments should resist decontextualized sharing. The interface should make uncertainty, dispute, and revision easier to carry with the content rather than easier to crop away (W3C, 2013; ISO, 2016a).

Public review fails when it becomes spectacle or rank. A record-site that drives traffic through comparison, hides warnings, buries corrections, overstates accreditation, exposes protected context, or presents machine summaries as authority should lose its public-release function until the defect is repaired. The site exists to make public-power formation answerable. Its design should deepen source, context, correction, and human judgment rather than stage a performance.

Record-site standards require user testing with skeptical and nonexpert readers. A public interface that only insiders understand will be misread by journalists, voters, host residents, and hostile critics. Testers should be asked what they think an accreditation mark means, what they think a disputed bundle means, and whether they mistake a summary for a source record. Their misunderstandings are design data.

The public site preserves correction dignity. A corrected record should not look like an erasure, and an error label should not look like a moral stain. Versioning should explain what changed, why it changed, who reviewed it, and what remains uncertain. This lets public memory stay honest without turning correction into spectacle (Provan and Kenis, 2008; OECD, 2026b).

Record-site interoperability allows local emphasis without local confusion. A City facing language diversity may foreground translation labels; a City recovering from a privacy incident may foreground release status; a City under requalification may foreground conditions. Variation is acceptable when the public can still identify the same core statuses across sites.

The record-site standard places current decertification status beside older materials. A public bundle released while a site was accredited may later need a status banner if the site loses standing. Historical accuracy should not become present-tense reassurance (NIST, 2024a; W3C, 2013).

Interoperability exchanges provenance and status, not a universal profile. A receiving site may verify that a document came from a named source, under a declared version and correction history, without importing unrelated records or adopting the sender's interpretation. This is the practical difference between interoperable memory and a central dossier (W3C, 2013; ISO, 2016a).

34.4.4 — Covenant Status Portability

Covenant Status Portability handles the participant who moves between Cities without allowing the burden to disappear or multiply unfairly. Portability does not mean that one City's approval automatically binds another City. It means that the participant's active status, rights, record obligations, support needs, protected categories, and limits travel through a defined review rather than through improvisation (W3C, 2013; ISO, 2016a).

The portability file includes current Covenant status, activation date, role pathway, record-continuity status, protected-nonvisibility restrictions, health and load considerations, household and dependent supports where relevant, bounded complaint information, active restrictions, open corrections, public-bundle status, and receiving-City readiness. The file

should separate what the receiving City must know from what remains protected.

The receiving City also has duties. It should verify equivalence or stronger safeguards before accepting active status. It should not accept a participant merely for prestige, public attention, political value, or donor interest. It should not use transfer to avoid its own admission standards. Portability is a burden transfer, not a shortcut.

Interoperability affects staff, host residents, families, and public users. Staff, host residents, families, and public users therefore have standing in the review. If the move would overload the site or expose protected people, delay or refusal may be the fair answer (Provan and Kenis, 2008; OECD, 2026b).

Portability fails through either a record gap or a double burden. A gap appears when active public-power formation becomes off-record during transfer. Double burden appears when the participant is forced to repeat exposure, consent, or public explanation beyond what the role requires. Portability should preserve continuity without turning movement into punishment or evasion.

Portability includes the right to refuse transfer. A participant may decide that a receiving City's climate, language, staff model, legal context, or public exposure would change the burden too much. Refusal should not be treated as breach or weakness. A Covenant continues only where the person can carry it under conditions they understand.

Portability also requires protection against prestige transfer. A famous participant moving from the original City to a new City may bring attention that overwhelms the receiving site. Accreditation should allow the receiving City to refuse or delay the transfer if the move would turn a pilot into a stage. The participant's public value does not override institutional readiness (W3C, 2013; ISO, 2016a).

Unresolved complaints travel only through bounded, purpose-specific review. A participant should not move to another City in a way that strands a complaint at the sending site or hides a pattern from the receiving site. At the same time, the transfer should not turn disputed allegations into public punishment. The portability file needs status, context, and protection, not rumor.

Support obligations become portable only through review. Debt relief, healthcare, housing, dependent care, disability accommodations, and clinical support cannot be assumed to function identically elsewhere. A transfer that preserves record burden but loses support would be unfair (ISO, 2019; Provan and Kenis, 2008).

34.4.5 — Emergency Interoperability

Emergency interoperability is the standard for crisis before the crisis arrives. Fire, flood, cyberattack, civil unrest, medical emergency, infrastructure failure, legal order, political threat, or host disruption may require one City to support another. The network should know in advance how to protect life, records, privacy, and public explanation when ordinary operations are interrupted (Provan and Kenis, 2008; OECD, 2026b).

Care comes first in emergency operation. Participants, staff, visitors, and host residents should be moved to safety before archive perfection becomes the priority. But care-first does not mean memory disappears. Emergency exceptions should be logged, explained later, and reviewed for repair. A humane emergency plan protects people immediately and records departures from ordinary rules after the danger is stabilized.

Artificial Intelligence, vendors, and public interfaces are high-risk during emergencies. A model may misclassify records under stress. A vendor may request broad access to repair systems. A public site may auto-post incomplete warnings. A receiving City may ingest data too widely. Emergency interoperability should identify who can authorize technical actions and how those actions are reviewed after the event.

Emergency assistance reaches people who never joined the City. Host emergency services may carry load, nearby residents may face transport or security effects, families may need information, and nonparticipants may appear in evacuation or temporary-shelter records. Local public agencies and host review belong in the plan, while lawful authority remains outside the City (W3C, 2013; ISO, 2016a).

Emergency interoperability fails when crisis normalizes exception. If emergency access persists after the emergency ends, if temporary transfers become permanent without review, if public warnings are delayed to protect reputation, if protected records leak during triage, or if a receiving City cannot support the load, corridor and interoperability standing should pause. A

network is trustworthy only if it can behave well when conditions are bad.

Emergency drills include failure of communication itself. A storm may disable ordinary network channels, a cyberattack may corrupt status labels, or civil unrest may make public notice unsafe for a time. The standard should define who can act when central contact is unavailable and how the action is later reviewed. Emergency resilience cannot depend on perfect connectivity.

Emergency interoperability protects host communities from surprise. If a receiving City may host evacuees, store temporary records, or absorb staff support from another site, local emergency partners should know the conditions in advance. A crisis does not make the host community an invisible reserve for the City (Provan and Kenis, 2008; OECD, 2026b). Mutual-aid agreements should name host capacity limits in advance so emergency support never becomes open-ended dependence.

Emergency standards define moral triage among records. In a crisis, some information is necessary for care, some for safety, some for continuity, some for later accountability, and some should remain shielded until normal review returns. Staff need this distinction before adrenaline makes all information feel urgent. Minimum necessary use is hardest and most important under pressure. Drills should test whether staff can make those distinctions under degraded information and time pressure. Drills should include a partially degraded receiving site so mutual aid is not tested only under ideal counterpart conditions.

The emergency plan admits that the network itself may be the source of risk. A shared vendor compromise, accreditation failure, or public artifact panic may affect multiple Cities at once. Interoperability should therefore include independent local fallback, not only mutual aid (NIST, 2024a; W3C, 2013). Local fallback should be exercisable without permission from the same shared system whose failure triggered the emergency. Each site should define a refusal threshold for aid requests that would endanger its own essential duties.

34.5 — Decertification and Suspension

Suspension and decertification are not signs of embarrassment. They are signs that the City's name is accountable to something beyond reputation. A network that cannot pause an unsafe site has become a protective shell around itself. The question is not whether removal harms public confidence. The question is whether refusing removal harms people (Ayres and Braithwaite, 1992; Braithwaite, 2002).

Suspension and decertification are different controls. Suspension temporarily restricts a defined site or function while evidence, risk, or corrective action remains unresolved. Decertification withdraws standing when failure is severe, repeated, concealed, unremedied, or incompatible with a core invariant. Each decision names scope, threshold, reviewer, conflicts, immediate protection, notice, appeal, record and host consequences, and the next review date. Neither status becomes a moral judgment on participants, staff, or place.

Loss of standing never ends the site's human duties. Participants may still need care, housing, privacy, correction, and exit support. Staff may still be owed wages, severance, grievance protection, and safe handoff. Records require lawful custody, status labels, access controls, correction, migration, and preservation. Hosts require explanation, mitigation, and continuity for shared services. Donors and vendors require controlled termination rather than informal abandonment. Decertification is therefore accompanied by a funded continuity plan, not merely a public notice (ISEAL Alliance, 2025; ENQA et al., 2015; ISO, 2019).

Revocability becomes real only when loss of standing changes conduct before scandal makes the decision unavoidable. Suspension, admissions freeze, function isolation, public warning, interim protection, appeal, remedy, record disposition, requalification, and network memory activate through named authorities and time limits. The site may contest the finding, but appeal does not automatically suspend urgent protection. A standard that cannot protect people while a site is popular is not an operational standard (Ayres and Braithwaite, 1992; Braithwaite, 2002; ISEAL Alliance, 2025).

34.5.1 — Suspension Conditions

Suspension is a temporary restriction on a defined accredited function while risk, evidence, or corrective action remains unresolved. It identifies what stops, what may continue, who is protected, who decides, which evidence is preserved, how the public is warned, and when the status expires. The clarity of that file separates suspension from an indefinite period of institutional concern (ISEAL Alliance, 2025; Ayres and Braithwaite, 1992).

Common suspension triggers include credible rights violations, record integrity failure, continuity breaks, staff retaliation, child or nonparticipant exposure, unlawful release, Artificial Intelligence overreach, vendor compromise, security breakdown, host-community burden not addressed, governance conflict, donor interference, or evidence that entry has not been genuinely voluntary. The trigger should be specific enough to act and broad enough not to miss emerging harm.

A suspension order is scoped to the failing function whenever protection permits. A record-site release function can be suspended without closing housing. New admissions can pause while participant care continues. Corridor participation can stop while archive custody remains. Artificial Intelligence search can be disabled while human retrieval operates. Scoped suspension protects people by isolating the failed function rather than using all-or-nothing drama as an excuse for delay.

Suspension notices should be tailored to the people and functions affected. Participants need to know what changed and which rights remain; staff need workload, complaint, and employment protections; public users need the review status of record-site material; and host communities need a clear account of local implications. Notices should be plain, time-stamped, versioned, corrected as facts develop, and linked to assistance and appeal (Power, 1997; Ayres and Braithwaite, 1992).

Review independence excludes the managers whose decisions are under question. Emergency suspension may be imposed quickly, but continued suspension should require defined evidence review, status updates, appeal where appropriate, and care planning. The City should not use suspension to hide criticism, punish whistleblowers, or quietly remove an unpopular participant.

A protective pause has to work at the speed of the risk. Suspension rules fail when they are so slow that harm continues, so vague that they become political weapons, or so reputation-focused that public warning is delayed. A sound system acts early, preserves evidence, protects affected people, and still subjects the decision

to lawful human review. Early action and accountable authority therefore strengthen one another rather than compete.

The suspension record includes the first concern date, evidence threshold, immediate restriction, affected persons, review body, next review date, and public-notice plan. This record should be internal where protection requires it and public where reliance requires it. Without timelines, suspension becomes drift with a better name (ISO/IEC, 2017; ISO, 2026).

A suspended function returns only after the corrective route has been independently tested under the condition that caused failure. A revised policy, new manager, or completed training is evidence of action, not evidence of effectiveness. The decision file must show what changed in operation and what remains uncertain.

When the required evidence cannot be produced before expiry, suspension does not quietly lapse into normal operation. It is renewed with reasons, narrowed, converted to decertification, or retired. Unresolved status cannot become a permanent gray zone.

34.5.2 — Decertification Conditions

Decertification ends standing for a defined scope because the function no longer meets a nonnegotiable requirement or because repeated, systemic, concealed, or unremedied failure makes continued reliance unsafe. The decision distinguishes site, function, term, and people; it does not issue a moral verdict on every participant or worker.

Decertification conditions include intentional off-record active public-power formation, coerced or non-adult entry, repeated protected nonvisibility breaches, child exposure, systemic staff

retaliation, falsified archive records, corrupt donor or vendor control, Artificial Intelligence authority over release or ranking, refusal of external audit, repeated host-community harm, loss of lawful authority, or inability to secure records. Some conditions may require immediate action. Others may follow failed suspension and repair.

The process distinguishes institutional failure from individual misconduct. A participant may commit misconduct without the City losing standing if the institution responds lawfully and effectively. A City may deserve decertification even if no single person becomes the villain, because the system itself made harm likely, hidden, repeated, or unrepaired. The burden analysis should follow structures, not only scandals.

Decertification must be public enough to warn and bounded enough to avoid spectacle. The notice should state the scope of removal, general reasons, operational implications, participant protections, record status, complaint routes, and requalification possibility if any. It should not expose protected details merely to satisfy curiosity or punish the failed site (ISO/IEC, 2017; ISO, 2026).

A site too important to remove has already defeated decertification. If donors, founders, political allies, public supporters, or network leaders can make decertification impossible, then the entire accreditation system is compromised. A City that cannot lose the name has become a shrine, a brand, or a power center. The real test of institutional humility is whether removal remains possible, not whether the City can restate its founding ideals.

Cumulative failure also belongs in the network's review field. One small privacy error, one staffing overload, or one confusing label may be repairable. A pattern of small unresolved failures can show that the City cannot learn. Decertification conditions should therefore include repeated near misses and ignored warnings, not only dramatic public harms.

Decertification protects against asset capture. A site losing the name should not transfer records, buildings, marks, donor lists, or public interfaces to a successor controlled by the same failed interests without review. Otherwise decertification becomes rebranding. The network must be able to tell the difference between repair and disguise (ENQA et al., 2015; Power, 1997).

The decision weighs severity, duration, recurrence, concealment, affected-person harm, remedy failure, independence failure, and continuing evidentiary reliability. Strong performance in another function cannot compensate for a failed nonnegotiable condition.

Decertification is complete only when continuity duties operate: records are secured, public status is corrected, dependent services are transferred or ended safely, staff and participants receive support, host obligations continue, and the failure enters network memory. Withdrawal of standing does not withdraw responsibility.

34.5.3 — Public Warning

Public warning is a precise status instrument. It states the affected scope, current risk, effective time, protective action, evidence basis and limits, service consequence, appeal, and next update. It

avoids euphemism, sensationalism, and language that converts an institutional defect into a judgment about people.

The warning standard uses plain, visible, time-stamped, scoped labels that resist misleading crops. Labels such as under review, suspended for admissions, record-site release paused, corridor participation suspended, decertified, or requalification pending should be defined. They should not sound like marketing language or moral condemnation. They are public-risk signals.

Warnings travel to the places where reliance occurs. A notice buried in a governance archive is not enough if applicants are reading admissions pages, donors are viewing summaries, journalists are using record-site bundles, or public users are watching excerpts. The public interface should not continue to present a site as fully accredited while a serious restriction is active.

Affected persons require tailored communication. A participant may need private explanation before a public notice. A staff member may need anti-retaliation assurance. A nonparticipant harmed by exposure may need protected notice. A host community may need a public meeting. A public user may need context for a corrected record bundle. Warning is not one broadcast; it is a set of duties to people differently affected (ENQA et al., 2015; Power, 1997).

A public warning should be correctable, timely, and strong enough to change behavior before harm. A site may challenge factual error, an affected person may argue that risk is understated, and an auditor may require stronger language; the

goal is accuracy, not embarrassment. Warning that waits for litigation, scandal, or hostile reporting protects institutional reputation rather than the public, while language too vague to alter decisions is merely ceremonial.

Warnings avoid moral panic as well as understatement. A suspended City is not automatically a failed person, failed participant, failed host, or failed idea. The public warning should direct attention to institutional status and practical reliance. It should not invite harassment of participants, staff, critics, or host residents. Protection and precision belong together (Braithwaite, 2002; ISO/IEC, 2017).

Warnings are corrected and versioned as facts change. The original notice remains traceable, but the current status must be easy to find. Search results, summaries, corridor systems, and partner sites should not continue displaying an obsolete warning or an obsolete clearance.

Warnings change when risk changes. A stale warning can become either unfairly damaging or dangerously reassuring. The status page should show review dates, changes in scope, and next expected action where it can do so without harming protected persons (ISO, 2026; ISEAL Alliance, 2025).

Failure to warn when people are making decisions is itself an assurance failure. So is a warning so broad that it exposes protected information or destroys unrelated functions. The review tests timeliness, necessity, proportionality, accessibility, and correction.

34.5.4 — Requalification Pathway

Requalification is a new decision on new evidence. The applicant submits a root-cause account, corrective actions, recurrence controls, affected-person remedies, updated risk assessment, independent test results, conflicts, and a statement of what cannot yet be shown. Prior accreditation creates no presumption of return.

The requalification plan names the failure, corrective actions, responsible parties, independent reviewers, affected-person consultation, staff protections, participant care, host review, technical audits, warning updates, and monitoring period. It should also state what cannot be repaired by policy language alone. Some harms require material remedy, leadership change, or closure.

Requalification depends on changed conditions rather than the failed site's desire to resume. Participants, staff, host communities, auditors, public users, and other affected people should be able to report whether repair altered lived conditions. Evidence must show that staff can safely use the new route, nonparticipants can understand the privacy rule, data and services can leave the old vendor, and correction reaches prior public material. Paper compliance without usable change is not repair.

The public record of requalification is contextual rather than celebratory. A site may return under conditions, probation, narrowed scope, heightened review, or limited functions. The notice should not erase the failure that required repair. Failure memory should travel with reinstated standing because future

trust depends on knowing what changed and what remains watched (Braithwaite, 2002; ISO/IEC, 2017).

Refusal remains a possible outcome of requalification. If a site cannot regain lawful protection, if staff trust is irreparably broken, if host legitimacy has collapsed, if records cannot be secured, if leadership remains captured, or if the public would be misled by return, requalification should fail. The network should be able to say that repair was attempted and closure remains the fairer route.

A cooling period belongs in every serious requalification pathway. Immediate relaunch after a highly visible failure can satisfy public appetite while leaving staff, participants, host communities, and records unsettled. The network should be able to require time for care, investigation, rebuilding, and trust repair before any public claim of return.

A requalified City carries its conditions in public view. If it returns under narrowed scope, heightened audit, restricted admissions, changed record rules, or a new staff model, the public should see those conditions. Conditional return teaches the network that repair is specific. It also prevents supporters from pretending that the failure never mattered (ISEAL Alliance, 2025; ENQA et al., 2015).

Requalification may be narrower than the former scope, time-limited, or subject to enhanced review. Some functions may remain retired. A site that can operate safely only under permanent exceptional supervision has not demonstrated ordinary conformity.

The pathway cannot become a ritual of paperwork. Reviewers should seek operational evidence from the failed route, workers, affected persons, records, and adverse scenarios. Compliance language produced by the same system that concealed failure deserves heightened scrutiny.

34.5.5 — Network Failure Memory

Network failure memory preserves enough structure for another site to recognize the same pathway without copying protected personal detail. The record includes trigger, context, mechanism, detection, affected people, response, remedy, evidence limits, recurrence signals, and the decision to suspend, decertify, requalify, or retire.

Failure memory is most useful when searchable by mechanism rather than scandal. Future reviewers should be able to find all cases involving corridor gaps, language failures, vendor lock-in, staff retaliation, child shielding, heat stress, archive continuity, public warning delay, or Artificial Intelligence overreach. Patterns teach more than names. The network learns when the same mechanism is recognized before it harms again.

Affected persons are not used as permanent symbols of failure. A participant, staff member, nonparticipant, or host resident harmed by a City should not become the face of a lesson without consent and protection. Failure memory can preserve the institutional fact while shielding the person. The archive should remember enough to prevent repetition without turning suffering into public material.

The learning route changes standards. A failure should trigger review of accreditation questions, staff training, public artifacts, technical controls, corridor rules, host review, and decertification thresholds. If failure memory does not change future gates, it is only an archive of regret. The network's memory is valuable only when it alters later design (ISEAL Alliance, 2025; ENQA et al., 2015).

Success becomes dangerous when it erases failure memory. As the network grows, pressure will rise to show smooth maps, confident summaries, and clean stories. Failure memory keeps the map honest. A network that hides failure so the name remains attractive has become a brand. A network that remembers failure precisely remains governable.

Two opposite failures threaten the record: secrecy and voyeurism. Too little detail repeats harm; too much detail exposes people again. The file should preserve mechanisms, decisions, dates, routes, and lessons while shielding protected identities and unnecessary pain. A well-built failure memory is sober, not dramatic.

Periodic audit asks whether failure memory is becoming institutional theater or weaponized history. Standards should cite previous failures when rules change. Training should include anonymized mechanisms. Public reports should identify categories of recurring concern. If failures sit in an archive but never alter practice, memory has become another room where burden is hidden (Ayres and Braithwaite, 1992; Braithwaite, 2002).

Failure memory is periodically reviewed for drift. A lesson may become obsolete when law, technology, climate, staffing, or institutional design changes. The network should preserve the historical record while clearly marking which controls remain current, superseded, or uncertain.

A network that remembers only success will reproduce preventable harm. A network that remembers failure as humiliation will teach sites to hide it. The fair archive treats adverse events as protected evidence for correction, public accountability, and the freedom not to repeat the same mistake (Sitkin, 1992; Reason, 1997).

34.6 — A Conditional Network of Cities, Not a Shrine

Network humility requires more than a closing principle. The City may become plural, but plurality does not mean inevitability. It may coordinate, but coordination does not mean sovereignty. It may compare, but comparison does not mean ranking. It may receive attention, but attention does not become proof, mandate, or destiny. Every shared function remains limited by purpose, local authority, affected-person standing, correction, expiry, and the possibility of refusal (Ostrom, 1990; Ostrom, 2010; Provan and Kenis, 2008).

The network's purpose is modest and difficult: preserve the safeguards that make bounded visible public-power formation possible across more than one place. It should protect local accountability, compare failures, maintain narrow standards, warn the public, and refuse growth when conditions are not ready. It should never ask the public to admire scale as a substitute for care.

A conditional network is defined by the refusals it can sustain. It can deny sacred firstness, central empire, weak local copies, donor-driven growth, public appetite, and a beautiful site whose law, labor, privacy, climate, or host conditions cannot carry the burden. Each refusal protects a person, place, record, or public promise that expansion would otherwise subordinate. Restraint is therefore not pessimism at scale. It is the moral architecture that keeps scale answerable (Brunsson and Jacobsson, 2000; Bütte and Mattli, 2011).

The final network test is whether coordination remains subordinate to local accountability and human protection. A credible network can criticize its first site, deny a weak replica, publish a suspension, preserve minority findings, move assistance without moving sovereignty, separate provenance from dossiers, and stop growing without treating restraint as defeat. Plural learning and mutual aid matter only while every site and every shared function remain corrigible, replaceable, term-limited, and free of sacred firstness (Ostrom, 1990; Ostrom, 2010; Provan and Kenis, 2008).

34.6.1 — No Sacred Original

No sacred original means that the first City receives no permanent interpretive, financial, technical, or accreditation privilege. Its records may be historically important, but later sites may improve the design, reject its practices, or surpass its evidence. Origin does not confer exemption from review.

The first City publishes revision history for its own practices. When a rule changes, the record should explain what was learned, what burden moved, who was affected, and why the change better protects the City's purpose. Versioning protects against myth because it shows the original as a learning institution rather than a perfect object.

Founding figures do not become doctrinal authorities over accreditation. The people who created or first governed the City may offer memory, evidence, and caution, but they should not be able to veto correction because correction feels disloyal. The

standard belongs to the burden the City carries, not to personal prestige.

Later Cities are free to improve on the first. A stronger climate adaptation, better language interface, safer staff model, more accessible public record-site, or clearer host review should not be described as deviation from purity. It should be described as learning. The original earns trust by making itself surpassable (Espeland and Sauder, 2007; Campbell, 1976).

Origin immunity is shrine logic in institutional form. If criticism of the first site becomes taboo, if later improvements are treated as disrespect, if founding donors control the narrative, or if the original cannot be suspended, the network has developed shrine logic. The remedy is direct: demote firstness back to history and return the original to ordinary review.

Later Cities may peer-review the original. That reversal is important. If later sites can only learn from the first and never review it, hierarchy has entered the network. A mature system lets improvement move in every direction. The first City should be able to receive correction from a smaller, newer, or more local site.

No sacred original also protects the founder from being turned into infrastructure. A project that depends on one person's continuing authority or charisma will pressure that person and distort the institution. Accreditation should ask whether the City can explain itself, correct itself, and govern itself without founder presence. That is not disrespect. It is institutional maturity (Ostrom, 2010; Provan and Kenis, 2008).

Symbolic importance makes the original site especially eligible for suspension and correction. Founder access, donor memory, archive control, and public mythology belong in its conflict register. A first site that cannot be judged by the rules it helped create has become a shrine.

Historical preservation remains compatible with institutional equality. The network can document where an idea began while refusing a headquarters theology. Provenance tells the truth about origin; governance prevents origin from becoming sovereignty.

34.6.2 — No Accreditation Empire

No accreditation empire means that assurance cannot become a remote authority that owns local Cities. The network sets bounded common requirements and recognizes evidence; lawful local institutions retain operation, host accountability, labor duties, and the authority granted by their jurisdictions. No network status creates public office or legal power (Ostrom, 2010; Provan and Kenis, 2008).

The coordinating body, whatever form later governance authorizes, has limited powers written in negative space. It should not appoint governments, certify candidates for office, command lawful jurisdictions, require public voting systems, demand ordinary-citizen data, enforce participation in the Religion of Fairness, authorize research outside science governance, or declare that a country is ready for transition. Those domains belong elsewhere and require their own authority.

Centralization can arrive through technical convenience. A shared identity system, common archive format, public map, search

portal, vendor contract, or accreditation seal can become practical sovereignty if every local City depends on it. The network should design exit, interoperability, open review, and vendor independence so central tools remain tools rather than masters.

Local law remains real. A City operating in one jurisdiction cannot use network standards to evade local courts, regulators, labor law, privacy law, disability rights, land-use rules, or emergency authority. The network may require stronger safeguards before granting standing, but it cannot declare itself above the host legal order. Legal humility is part of anti-empire discipline (Ostrom, 2010; Provan and Kenis, 2008).

Coordination becomes empire when it turns into command. If local Cities cannot object to central tools, if host communities cannot reach remedies without going through network leadership, if public users are pushed into one global portal, or if accreditation status becomes political authority, the network should be redesigned or paused. The City can coordinate memory. It cannot become empire.

The no-empire rule appears in bylaws, contracts, public maps, and technical architecture. A stated principle is not enough if the software, funding, and governance all centralize power. Anti-empire discipline must be built into who can change standards, who owns infrastructure, who appoints reviewers, who holds records, and who can object.

Coordination also avoids diplomatic overreach. Sister-City language, corridors, or reciprocal hosting should not imply recognition as public authority. Governments remain

governments, courts remain courts, and lawful institutions keep their own mandates. The City may form public-power candidates under bounded visibility. It does not become the international system (Brunsson and Jacobsson, 2000; Bütte and Mattli, 2011).

The network center has a deliberately narrow function: maintain standards and versions, recognize competent independent review, publish exact status, coordinate bounded appeals, preserve failure memory, and support interoperability. Admissions, local leadership, budgets, records, employment, public authority, and ideological commitments remain with their lawful and local owners. The center's legitimacy depends on how much control it refuses to accumulate.

Network funding must not create the empire that governance language disclaims. Sites should disclose financial dependence, shared vendors, pooled reserves, technical control, and conditions attached to support. A central body that can punish dissent by withdrawing indispensable infrastructure already possesses more power than its charter admits.

34.6.3 — Local Accountability

Local accountability begins with the people who carry the site's daily burden. Participants, staff, neighbors, host services, complainants, public users, and nonparticipants need routes that can change local operation without waiting for a network crisis. Accreditation supplements those routes; it does not replace them.

Local accountability also means the host community is not scenery. The City should report land, utilities, emergency services, media pressure, security burden, local labor,

environmental effects, public interface traffic, and unresolved complaints. Host review should be able to trigger accreditation questions. A network that treats host communities as interchangeable sites has already lost the City's burden question.

Participants need local accountability because their burden is lived in place. A record rule may be identical across Cities, but sleep, care, media, family support, accessibility, staff culture, and public pressure can differ. A participant should not be told that the network standard is sufficient if the local City is failing in daily function. Local experience is evidence of institutional performance.

Staff accountability includes independent reporting and protection from both local retaliation and network disregard. A staff complaint may reveal a pattern that matters to accreditation. It may also reveal a local management problem that can be repaired without network drama. The route should be able to distinguish these levels without silencing either (Brunsson and Jacobsson, 2000; Büthe and Mattli, 2011).

Local accountability evaporates when every burden is pushed upward. If every complaint is sent to a central body, every public question is answered with global language, every host burden is minimized as local resistance, and every staff warning is treated as internal noise, accountability has moved away from the people carrying the cost. The remedy is to return review to the site while keeping network standards strong enough to act when local routes fail.

A host community retains the right to say that cumulative burden has exceeded the original promise. Traffic, housing pressure, media presence, emergency services, protest management, water, waste, labor markets, and public identity can change over time. Host consent should not be treated as a one-time signature that permanently absorbs all later load.

The local route protects critics as well as supporters. A journalist, civil-liberties advocate, neighbor, former staff member, or public user may raise concerns that embarrass the City. If local accountability treats critics as threats to the project, it will miss the burdens critics are often best positioned to see. The City should be difficult to defame because it is precise, not because criticism is socially punished (Campbell, 1976; Ostrom, 1990).

Global admiration cannot suspend local evidence. A resident facing service pressure, a worker carrying hidden overtime, or a public user unable to understand a record label may be closer to institutional performance than distant supporters. Status review should be designed to hear proximity without assuming that every local objection is decisive.

Ordinary time is part of local accountability. A City may host major public meetings, but residents and staff need regular, predictable routes that do not depend on crisis attention. The burdens of daily life rarely wait for a grand review session to become real (Ostrom, 2010; Provan and Kenis, 2008).

34.6.4 — Plural Learning

Plural learning is the network's strongest justification. Different climates, laws, languages, staffing models, host relationships,

record systems, and daily rhythms can reveal what one site cannot. A lesson travels with its mechanism, conditions, affected-person evidence, and uncertainty, not as a universal rule (Dolowitz and Marsh, 2000; Acharya, 2004).

Learning is organized around mechanisms: admission burden, staff workload, privacy-breach patterns, corridor gaps, archive continuity, warning effectiveness, language access, climate stress, host legitimacy, Artificial Intelligence errors, and decertification thresholds. These are the patterns that help later reviewers see trouble earlier. They are not rankings of virtue.

Comparative reports use narrative, context, and bounded indicators rather than league tables. A report can say that one City's language access process prevented a complaint backlog, that another City's heat design created staff strain, or that a corridor protocol failed during emergency transfer. It should not say one City is more fair as a total institution or that one population is more ready for transparency.

Plural learning includes negative results. If a translation failed, if a public artifact misled, if a donor restriction was too weak, if an Artificial Intelligence tool produced false confidence, or if a local review route was inaccessible, the lesson should travel. The network's value rises when weak points are named early (Campbell, 1976; Ostrom, 1990).

Affected persons help define what counts as a lesson. Participants may notice load patterns that audits miss. Staff may notice role collapse. Host residents may notice service pressure. Public users may notice confusing labels. Nonparticipants may notice privacy

risk. Learning is plural not only because there are many Cities, but because there are many legitimate viewpoints on burden.

Plural learning fails when learning is converted into prestige. If reports highlight only success, hide local context, punish sites that report failure, or use comparison for fundraising, the network will train Cities to perform rather than disclose. Plural learning should reward candor, not polish. A site that reports a near miss may be more trustworthy than a site that has learned to hide one.

Non-replication is also a source of learning. A region that refuses, a site that fails legal review, a donor proposal rejected for capture risk, or a climate plan deemed too burdensome can teach as much as a successful launch. The map of Cities should be accompanied by a memory of places where not building was the fairer decision (Provan and Kenis, 2008; Timmermans and Epstein, 2010).

Learning must be slow enough to separate mechanism from circumstance. A safeguard may appear successful because a cohort was small, a crisis never came, public attention was low, or exceptional staff absorbed the burden. Replication claims should state what was tested, what varied, what remained fixed, and which rival explanations survive.

Unsuccessful sites retain dignity when they report honestly. If candor is punished in public tone, future sites will hide more. The network should make failure reports disciplined, humane, and useful rather than theatrical (Brunsson and Jacobsson, 2000; Bütte and Mattli, 2011).

34.6.5 — Humility at Scale

Humility at scale is a governance requirement. Expansion begins only after the network can name the burden addressed, burden created, affected people, legal authority, staff capacity, host recourse, record boundary, financing dependency, interoperability need, and stop condition. Those answers turn scale into a reviewable decision. Without them, growth is momentum wearing the language of evidence.

Public appetite, donor demand, founder prestige, media fascination, political urgency, and the desire to fill a map can show interest. They do not show readiness. Readiness requires operational evidence about the institution and the protections around it; it is not proof of the Law, spiritual resonance, legal enactment, or transition authorization. The network should therefore publish interest and readiness as different objects.

Public language carries the same humility as governance. A network should say accredited for this scope, under these conditions, subject to review, and it should say suspended, decertified, not yet, or no when those are the true statuses. Conditional words are not evasions here. They are the grammar through which the network keeps promise, evidence, and authority aligned.

Some regions may not be able to host a City under current conditions. A legal system may demand excessive access, a climate may make humane operation too costly, a political environment may make nonparticipant privacy impossible, a funding environment may create capture, or a host community

may reasonably refuse the burden. Humility accepts those answers without treating the place or its people as deficient. A network that cannot accept no has already made expansion its higher value (Provan and Kenis, 2008; Timmermans and Epstein, 2010).

Scale creates dependence, and dependence makes self-protection tempting. Once donors, staff, participants, officials, vendors, and supporters rely on the network, stopping one site or halting expansion becomes harder. Stoppability must therefore be written into the network before reliance grows. Pause, refusal, suspension, decertification, failed requalification, and closure are not betrayals of the project; they are proof that the project remains answerable to people outside its ambition.

The argument closes where it began. Singularity can create scarcity and shrine, while scale can create empire and uncontrolled imitation. The defensible form is conditional, local, decertifiable, non-sovereign, and nonranking, with enough shared memory to learn and enough independence to stop. Its strength lies in refusing both sacred origin and compulsory expansion.

A culture of enough protects that form. Site count, cohort size, offices reached, records captured, funds raised, and media attention are not success by themselves. The governing question is whether public-power formation becomes more answerable without making ordinary life less private, staff less protected, hosts less heard, or correction less possible. Growth that weakens those conditions is not progress in the City's own terms (Espeland and Sauder, 2007; Campbell, 1976).

Failure memory preserves hope without protecting the institution. A paused corridor, rejected site, suspended function, or decertified City does not show that answerable public power is impossible. It shows that evidence and rights retained the power to defeat momentum. The network becomes more credible when adverse results remain visible enough to guide the next design.

The final test is whether the network can disappoint its own ambition. A refused donor, slowed expansion, denied site, retired tool, or closed function may frustrate people who expected visible progress. Accepting that disappointment without punishing affected people is part of the City's claim to fairness. An institution that can survive a negative answer is more trustworthy than one that needs every answer to be yes.

Part X — Objections and Final Synthesis

At a final public review, the first microphone belongs to the critic. A civil-liberties advocate asks whether a record-bearing campus will make ordinary people easier to watch; a staff representative asks whether visible leadership will rest on hidden exhaustion; a parent asks what happens when a child is captured at the edge of a public event. Part X gives those questions authority over what happens next. The City reaches its final pages only after opposition has been allowed to narrow, redesign, pause, decertify, or defeat it.

The relevant question is no longer whether transparent public-power formation can be described attractively. It is whether the design remains answerable after it acquires land, staff, records, participants, families, vendors, donors, visitors, critics, imitators, and routines. Institutional ethics begin where noble intention stops being enough, because those surrounding systems decide who carries the cost when the design is praised, pressured, or afraid to stop.

Objections function here as design evidence. A privacy complaint, family objection, labor report, host-community grievance, technical incident, or refusal to participate can reveal that harm has already entered a rule, route, record, or public artifact. The institution earns no presumption that those signals are mistaken. A project that treats them as disloyalty has begun protecting itself from the people it claims to protect.

The City's central promise is narrow and demanding. Adults who seek consequential public roles may voluntarily accept a more visible, role-bound burden while ordinary citizens, children, families, staff, visitors, host communities, and private life remain

protected from involuntary exposure. Every objection in this Part tests whether that asymmetry survives pressure.

The surveillance objection asks whether records intended to illuminate public-power formation would normalize watching people who never chose the Vow. The captivity objection asks whether voluntary entry could harden into practical confinement. The cult and spectacle objections ask whether meaning, loyalty, narrative, and public appetite could turn a civic institution into obedience or entertainment.

The human-load objection examines the body, mind, household, and long horizon of visible life. The government and elite-gate objection asks whether formation becomes shadow rule, office entitlement, or a prestigious credential. The archive and Artificial Intelligence objection asks whether technical systems become new authorities precisely because their judgments arrive quickly and fluently.

The intimate-life objection begins with people who never chose participant visibility: partners, children, dependents, clinicians, attorneys, friends, and future family members. The support-ecology objection follows money, contracts, infrastructure, staff labor, and host burden to test whether a hidden City grows beneath the visible one.

Replication poses a different danger. The first City may attract attention before it has earned transport. Its language may travel farther than its safeguards, and its prestige may make correction feel like retreat. The final objection therefore asks whether the

institution can refuse growth, remember failure, and accept decertification without rewriting the past.

None of these concerns is answered by reassurance. They require inspectable mechanisms: rights boundaries, record stages, independent review, complaint and appeal, de-loading, real exit, child shielding, staff protection, donor and vendor firewalls, host standing, public correction, and stop authority. The answer must remain visible when leadership is tired, embarrassed, financially dependent, or celebrated.

The governing fairness test is directional. When the City protects itself, where does burden move? A self-preserving institution transfers exposure, exhaustion, cost, delay, or irreversibility downward. An answerable institution moves scrutiny upward toward the people and systems exercising authority and makes repair easier for those carrying consequences.

Public artifacts receive the same scrutiny as operating rules. Covers, tours, diagrams, donor pages, summaries, websites, record interfaces, videos, and social excerpts can compress uncertainty into false certainty. A polished artifact that hides refusal, privacy, staff burden, review, or failure conditions can mislead more efficiently than a flawed policy paragraph.

Critics participate in institutional safety when their arguments are allowed to change the institution. Civil-liberties advocates, family-rights and disability reviewers, workers, privacy specialists, host representatives, religious critics, and skeptical readers each see burdens that an internal design team can miss. Their contribution is demonstrated when an objection narrows

scope, strengthens a remedy, reallocates authority, or activates a stop rule rather than merely receiving a courteous reply.

Only after that scrutiny does synthesis begin. What survives is not a declaration of victory, but a more credible civic possibility: public-power formation may become more knowable while ordinary life remains protected, correction remains visible, and refusal remains dignified. The City may prove workable, require substantial revision, or prove unworthy of continuation. Hope is earned here through corrigibility rather than confidence alone.

Chapter 35 — Objections and the Tests They Create

The final red-team hearing opens without a presentation from the City. A privacy advocate begins with a bystander whose image became searchable, a staff representative describes an unsafe workload hidden behind participant success, and a host resident asks why local cost was discovered after public celebration. Only then may the institution answer. Chapter 35 gives critics structural authority to identify the first point at which a chosen public-role burden becomes an imposed burden on someone else.

The Chapter uses an objection defeat-test register rather than a sequence of rebuttals. Each objection states the critic's strongest case, the evidence that would make it right, the City's response, residual risk, credible alternatives including nonadoption, the defeat condition, responsible owner, and required consequence. Surveillance, captivity, overload, technical sovereignty, collateral exposure, capture, labor harm, host burden, and replication drift can therefore change the proposal.

The objections are stated at full strength. Civil-liberties advocates may distrust a record-bearing institution; families may fear collateral exposure; disabled participants may doubt that accommodation will survive pressure; workers may suspect visible service rests on hidden labor. Technical reviewers may fear machine judgment, and hosts may ask who pays for another institution's ambition.

Benevolent purpose cannot answer those concerns. The City has to show, in inspectable records and lived practice, that authority is role-bound, entry and exit remain practical, record stages are distinguishable, protected life stays protected, review is independent, and remedies can inconvenience leadership. Where

a simpler reform, narrower institution, or decision not to build carries less burden while achieving the relevant public purpose, that alternative belongs inside the comparison.

Every section therefore asks what would make the critic correct. If nonparticipants become easier to watch, the surveillance objection succeeds. If exit leaves a person homeless, untreated, indebted, or publicly punished, the prison objection succeeds. If dissent is recoded as disloyalty, the cult objection succeeds. If public curiosity governs release, the spectacle objection succeeds.

The consequences must match the failure. A bounded defect may require correction, compensation, retraining, or a delayed release. A severe defect may require pause, shielding, or suspension. Repeated concealment, broken rights, coerced participation, child exposure, or uncorrectable technical dependence may require decertification or closure. Continuation is not the default verdict.

The same directional burden test governs each objection. A defense fails when it preserves institutional confidence by moving fear, workload, cost, exposure, or irreversibility onto people with less authority. Confidence begins to become deserved only when affected people can object without retaliation and when their objections can alter records, resources, access, timing, or continuation.

Evidence and authority remain separate. Operational evidence may show whether the City performs its civic-formation functions under declared safeguards. It cannot prove PTVC, certify inner worth, establish moral rank, appoint anyone to office, enact law,

or authorize expansion. Institutional coherence remains a local design result.

A red-team answer earns space only when it exposes an operating chain: signal, standing, record, independent decision owner, interim protection, remedy, review clock, and the threshold that pauses or ends the function. Danger is answered by making detection and consequence stronger than institutional self-protection, not by declaring that failure will never occur.

The objections require different evidence. Surveillance is tested through privacy and record-use boundaries. Captivity is tested through the material reality of exit. Cult risk is tested through dissent, pluralism, and freedom from pressure to participate in the Religion of Fairness. Human load is tested through sleep, health, family, and long-term burden. Technical sovereignty is tested through audit, appeal, portability, and shutdown.

Public artifacts are included because public meaning can outrun internal controls. A donor page may imply certainty, a tour may convert life into performance, a graphic may imply rank, a machine summary may flatten dispute, and a social excerpt may detach a promise from its conditions. High-reach communication requires its own review and withdrawal route.

An objection that can defeat the design contributes to the inquiry. It prevents the institution from redefining voluntariness after exit becomes costly, privacy after ordinary people are exposed, or accreditation after safeguards stop traveling. A critic who forces nonadoption, redesign, or a narrower claim has produced civic knowledge.

The status quo is not treated as harmless merely because the City is risky. Hidden pathways into public power already impose cost, obscure influence, and make correction difficult. The comparison is therefore between imperfect alternatives under common rules, not between a dangerous proposal and an imaginary world without institutional burden.

This Chapter remains loyal to the people the City might serve and adversarial toward every route by which it could harm them. It grants no institution trust in advance and does not treat ordinary reform or nonadoption as costless. The comparison asks which arrangement imposes less unjustified burden and remains easier to correct. Criticism matters when it can change records, resources, access, timing, design, or continuation.

35.1 — "This Is Authoritarian Surveillance"

The surveillance objection is not an outsider's misunderstanding. It is the first serious test of the City. Any institution that uses capture systems, public records, record sites, visitor boundaries, media rules, and Artificial Intelligence tools must assume that civil-liberties critics will look for the moment when civic accountability becomes routine surveillance (Solove, 2006; Richards, 2013).

The answer begins by reversing the usual direction of visibility. The City does not make ordinary citizens transparent to power. It asks whether adults seeking substantial public power should carry a bounded and voluntary burden that ordinary people do not carry. If that direction is lost, the City's central moral architecture is lost with it.

Five distinctions carry the surveillance answer: ordinary privacy, chosen role burden, downward visibility, record use, and legal review. A City that cannot maintain these distinctions would deserve the surveillance label. A City that can maintain them still needs constant review, because surveillance drift often appears as administrative convenience before it appears as open abuse (Marwick and boyd, 2011; Council of Europe, 2018b).

The strongest surveillance critic begins with ordinary citizens. A City that makes nonparticipants easier to watch would not be a reform of hidden power. It would be a prestige version of the very problem it claims to answer.

35.1.1 — Ordinary Privacy Answer

The ordinary privacy answer is therefore absolute in direction. The burden of visibility moves upward toward adults who voluntarily seek substantial public power. It does not move downward onto voters, neighbors, host residents, service workers, protesters, journalists, family members, or passersby (Solove, 2006; Gandy, 1993).

A privacy perimeter around nonparticipants is the operative mechanism. Incidental appearances are routed into shielding, redaction, protected summaries, delayed review, or deletion where lawful and necessary. The public record site cannot use ordinary citizens as explanatory material for a participant's story.

Affected persons need a plain route to object. A host resident who appears in a corridor record, a visitor captured during an emergency, or a critic shown in a public-interface clip should know where to report exposure, request review, and receive correction without becoming more visible by complaining.

The surveillance objection succeeds whenever ordinary life becomes more observable because the City exists. The failure condition is not only mass release. It is also chilling effect, behavioral pressure, dossier drift, or a public habit of treating proximity to the City as consent (Marwick and boyd, 2011; European Union, 2016).

The required design consequence is restriction or suspension of the offending capture, interface, tour, media practice, or record-release route. Ordinary privacy is not a courtesy extended by the

City. It is the condition that keeps the City from becoming authoritarian surveillance in civic clothing.

Evidence of ordinary privacy would include rejected incidental captures, masking logs, visitor and protester privacy tests, public-bundle samples, and complaints resolved before ordinary-person material reaches public view. These signs matter because a safeguard that never leaves evidence cannot be tested by outsiders.

Consider a public meeting where a host resident sharply criticizes the City and later asks whether their face, address, and tone will become searchable. The answer should be available before the meeting begins: the complaint may enter host-burden review, but the resident does not become a public object because they challenged the institution (Nissenbaum, 2010; Lyon, 2001).

The human-scale threshold is whether opposition, work, visitation, or accidental proximity forces an ordinary person to develop a new privacy strategy. A resident who avoids a hearing, a journalist who changes a route, or a visitor who withholds a question because the City may absorb them has already paid a civic cost. Ordinary privacy has failed before any spectacular breach when people begin reorganizing lawful life around fear of capture.

Consider a livestream that automatically indexes every speaker and creates searchable clips. The public may need the participant's answer and the issue debated, but it rarely needs the resident's enduring identity. The City should disable person-level indexing for ordinary attendees, publish a protected transcript or

masked clip, and provide a correction route before the material propagates. If the release architecture makes criticism discoverable as a personal dossier, ordinary privacy has already failed.

35.1.2 — Chosen Role Burden Answer

The second answer is that the Vow attaches to a chosen public-power formation role, not to a person's metaphysical worth. The participant is not saying, "my whole being belongs to the public." The participant is accepting a bounded burden because sought authority changes what the public may fairly ask to know (Ball, 2010; United Nations, 1966).

The record scope must be written before activation. It identifies the active period, role pathway, formation activities, public interfaces, protected nonvisibility categories, staff contact rules, professional boundaries, household protections, and exit route. Scope cannot be widened later by enthusiasm, scandal, donor pressure, or media demand (Ball, 2010; United Nations, 1966).

Chosen role burden remains chosen only if refusal remains real. Applicants must be able to decline before activation without public shame. Participants must have exit routes after activation. A person who continues only because departure would ruin housing, care, reputation, or family stability has not retained meaningful voluntariness.

Standing extends to the participant and everyone close to the participant. A partner did not choose the Vow by loving someone. A child did not choose it by being born into the household. A staff

member did not choose full-life exposure by accepting employment.

The City loses this argument when the chosen role expands until it consumes ordinary humanity. That can happen through vague definitions, active-period creep, off-site monitoring, relationship pressure, or public shaming of protected gaps. The remedy is scope correction, release halt, independent review, and, when necessary, de-loading or exit (Citron, 2019; Nissenbaum, 2010).

A role-bound record is severe enough without becoming total life ownership. The City's moral coherence depends on keeping the participant's visible public-power formation distinct from the person's entire existence. If that distinction fails, the Vow has drifted from burden into domination.

A credible scope file leaves inspectable evidence of restraint: signed role boundaries, cooling-off records, access to counsel, capacity review, denials of protected-domain release, and cases in which a participant's willingness to disclose did not authorize publication. The Vow becomes trustworthy at its edge, where the City can show that enthusiasm, consent, and public appetite were each refused because the material lay outside the role-bound burden.

One revealing red-team case involves an applicant with strong public promise but obvious pressure from sponsors, family expectation, debt, online attention, or party recruitment. The review should slow down at exactly the moment excitement demands speed. Chosen burden is credible only when the person can leave admiration, opportunity, and institutional approval on

the table without losing ordinary dignity (Deci and Ryan, 2000; United Nations, 1966).

Material voluntariness, rather than the elegance of a consent form, decides the issue. Refusal has to preserve dignity, care continuity, financial stability, future options, family security, and ordinary social standing. A person who can decline only by surrendering housing, health support, livelihood, belonging, or a viable return path has not chosen the burden in the institutionally relevant sense.

Consider a participant who says, under pressure, that they are willing to release a protected counseling note, intimate message, or family exchange because they want to appear transparent. The City should refuse the release if the material belongs to a protected domain or implicates another person's dignity. Consent under reputational pressure can become self-exposure as performance. A role-bound Vow protects the participant from that pressure as well as protecting the public from hidden formation.

No downward visibility is the anti-surveillance hinge of the City. It says that transparency may increase around public-power formation, but not around ordinary citizenship. The direction of exposure matters as much as the amount of exposure (Council of Europe, 2018b; Solove, 2006).

35.1.3 — No Downward Visibility Answer

Downward visibility can appear quietly. A public record page may identify host residents to explain a conflict. A volunteer platform may expose users who interacted with a participant. A corridor rule may track visitors too broadly. A public interface

may reward people for attaching themselves to visible candidates (Council of Europe, 2018b; Solove, 2006).

The design mechanism is directional review. Every capture route, release route, public artifact, visitor rule, volunteer system, media protocol, and machine summary is asked whom it makes more visible. If the answer includes people outside the active role without necessity and lawful protection, the route is narrowed or stopped.

Record-stage discipline protects the answer. Capture is not release, release is not research, research is not model training, and model training is not public authority. A nonparticipant's incidental presence should encounter review gates before any public interface treats it as information for citizens.

The surveillance critic is right when the City produces a civic culture in which ordinary people perform around the record. The harm may appear as avoidance, self-censorship, fear of visiting, reluctance to protest, refusal to seek help, or the feeling that every contact with public power now has a camera behind it (Gandy, 1993; Marwick and boyd, 2011).

The response cannot be another privacy slogan. It requires route closure, technical minimization, deletion where lawful, protective masking, independent audit, affected-person notice, and public correction. The City must be able to demonstrate that it has reduced downward visibility rather than merely announcing an intention to do so.

A serious bystander review reaches masking audits, staff-role reviews, child-shielding checks, incident samples, and public

releases in which context was preserved without making collateral persons identifiable. Directional burden has to be demonstrated in inspectable evidence rather than inferred from good intention.

A mixed-role staff corridor provides a concrete test: a participant, a cleaner, a security worker, and a visiting family member all appear in the same technical capture. The system should not ask a later reviewer to improvise categories. It should already know whose role is visible, whose role is limited, and whose presence requires shielding (European Union, 2016; Nissenbaum, 2010).

The operational threshold asks whether the least powerful person in the frame receives the strongest default protection. If the City protects the participant's public narrative more carefully than the bystander's privacy, the burden has moved in the wrong direction.

A second operating test follows a staff member, critic, or visitor who appears repeatedly around a participant and becomes easier for public users to identify through the participant's record. The City should ask whether the repeated appearance teaches anything about public-power formation that cannot be preserved through summary, masking, or category description. If the bystander becomes narratively useful, danger has already begun. The City must resist the temptation to make surrounding people explanatory objects.

A surveillance system often becomes dangerous when one permission is quietly treated as every permission. The City must resist that collapse with record-use distinctions that are visible to staff, participants, public users, auditors, and affected persons

(Lyon, 2001; Ball, 2010).

35.1.4 — Record-Use Distinction Answer

A captured record is not automatically a public record. A public bundle is not a raw archive. A protected summary is not permission to expose the underlying source. A research pathway is not model-training permission. A machine summary is not an official finding (Lyon, 2001; Ball, 2010).

Separate authority governs capture, custody, access, release, interpretation, research use, training use, retention, sealing, correction, and deletion. Each stage has a purpose, reviewer, record of decision, affected-person route, time review, and failure consequence. The stages cannot be merged for convenience.

Direct consequences fall on participants as well as collateral persons. A participant may accept active capture but still contest public release, inaccurate interpretation, or machine-generated context. A nonparticipant may have a remedy even if the underlying record must be preserved for accountability.

The record-use distinction collapses if the City says “full record” and then behaves as if full record means unlimited public access. The failure route is especially serious when public attention, journalism, donor curiosity, or platform metrics reward more exposure than the public interest requires (United Nations, 1966; Citron, 2019).

The institutional consequence is use separation in architecture, software, staff training, public labels, and audit. Every high-risk record carries a status label understandable to a lay reader: captured, restricted, reviewed, public, corrected, under appeal,

sealed, or unavailable. The record exists to serve answerability, not appetite.

Implementation leaves evidence of separate permissions for access, release, research, reuse, and model training, together with logs showing that possession of a record did not become permission to use it elsewhere. Stage separation is one of the principal ways the City demonstrates that capture is not surveillance.

One adversarial scenario involves a controversial incident that triggers public demands for everything. The City should be able to say which materials are source records, which are under protected review, which may become public bundles, which contain collateral persons, and which require appeal before interpretation. The answer should not be invented during outrage (Nissenbaum, 2010; Richards, 2013).

Stage separation is credible only when staff and citizens can understand a record's status without learning protected content. A label should convey enough to prevent false certainty while preserving people whose exposure is not justified.

The daily operating test is an archive item captured for continuity that a researcher, journalist, vendor, or public-interface team later wants to reuse because it would be efficient. Efficiency is exactly where permission laundering begins. The City should require a new purpose review, new affected-person analysis, and a new record-stage decision. If the requester says the record already exists, the answer should be that existence is not authorization.

The surveillance answer ends in legal humility. Benevolent

theory does not make a capture system lawful. The City must operate within applicable privacy and data-protection rules, child and labor protections, professional privilege, public-record limits, accessible review, and enforceable remedy, with the actual jurisdiction controlling whenever internal policy is weaker or inconsistent (Venice Commission, 2025; Council of Europe, 2018b).

35.1.5 — Legal Review Answer

Legal and rights review begins while alteration is still possible. Counsel, privacy and records specialists, disability and labor advocates, child-protection experts, host officials, and independent civil-liberties critics examine capture systems, release rules, consent language, visitor routes, media protocols, and public artifacts before participants and bystanders carry the resulting burden. The review file should preserve disagreements, unresolved questions, required changes, and the authority capable of stopping implementation (Venice Commission, 2025; Council of Europe, 2018b).

The legal-review record states the legal basis, jurisdictional limits, affected rights, protected categories, purpose limits, emergency exceptions, retention periods, appeal route, and unresolved issues. It is structured, contestable, and specific rather than hidden behind general approval.

Legal review loses credibility when it becomes ceremonial. A City that asks lawyers to bless an already chosen design has confused review with decoration. A City that uses private contracts to weaken public rights has turned law into leverage.

Correction may require redesign, delayed activation, narrower release, independent counsel, regulator consultation, host review, or refusal to operate in that jurisdiction. A lawful version that cannot be built is not rescued by beauty or ambition (Solove, 2006; Gandy, 1993).

Legal review does not transfer City authority into *The Constitution of Fairness* or *The Government of Fairness*. It keeps implementation separate from aspiration: the City may imagine civic formation, while actual law decides whether and how any institution may operate.

The audit trail includes legal-envelope files, privacy impact reviews, child-protection, employment, professional privilege, and documented refusals. The City must show evidence of restraint, not only moral ambition.

A cross-jurisdictional rehearsal tests participant travel, vendor transfers, journalistic requests, and family-law conflicts. Because records and human life are mobile, another legal system's rights and remedies cannot be treated as edge cases (European Union, 2016; Council of Europe, 2018b).

Legal review is authoritative only when unresolved legality can stop momentum. A serious conflict involving privacy, labor, disability, child protection, professional privilege, or public records should trigger a written hold, identified decision owner, affected-person protection, and a route to external adjudication where required. Continuing because donors, media, applicants, or partners expect launch would convert review into ceremony (Venice Commission, 2025).

If a host jurisdiction's privacy, employment, child-safety, public-record, or professional-privilege law forbids a desired practice, the City changes the practice, chooses another design, or does not operate there. Private contract cannot create authority that public law withheld, and innovation does not confer legality (Venice Commission, 2025; Council of Europe, 2018b).

35.2 — "This Becomes a Prison, Cult, or Reality Show"

The second objection concerns three distinct forms of institutional possession. Prison risk arises when residence and dependence make departure unreal; cult risk arises when loyalty, shared language, or meaning becomes a condition of belonging; spectacle risk arises when public attention governs what a person must reveal. Each asks whether the City values human beings less than its own continuity, identity, or audience (Goffman, 1961; Barker, 1984).

The answer cannot be architectural warmth or better branding. A garden can sit inside a coercive system. A soft voice can carry cultic pressure. A noble website can host spectacle. The only serious defense is structural: exit, dissent, nonparticipation in the Religion of Fairness, anti-spectacle release, complaint, appeal, and artifact review.

Each accusation must be answered on its own terms so the City cannot hide behind one general defense. Voluntariness answers captivity only if exit works. Dissent answers cult risk only if disagreement remains ordinary. Purpose-limited release answers spectacle only if public attention cannot drive exposure. Rights answer all three only if they can defeat institutional preference (Andrejevic, 2004; Goffman, 1961).

The prison objection should be stated strongly: residence, gates, record, rules, staff authority, and restricted release can resemble captivity if the City forgets that voluntariness must remain active

after admission. A humane appearance does not answer that concern.

35.2.1 — Prison Objection

The first mechanism is real exit. Exit requires more than an unlocked door. It needs housing transition, healthcare continuity, dependent support, record-status clarity, reputational protection, financial stabilization, counseling if desired, and a public explanation that does not frame departure as guilt or failure (Goffman, 1961; Lalich, 2004).

The second mechanism is restraint refusal. Security protects boundaries, not institutional possession. Physical restriction, retaliatory monitoring, punitive isolation, forced participation, medicalized obedience, or informal pressure to remain would move the City toward carcerality.

Direct exposure falls on participants who are exhausted, misfit, ashamed, politically attacked, dependent on City supports, or afraid that leaving will make them look unready. They also include families who may be pressured to persuade the participant to stay because the institution has become invested in the participant's story.

The proposal violates its own standard when departure becomes practically impossible or socially ruinous. An exit audit should treat unexplained delay, staff language that calls leaving betrayal, record pages that imply departure means unfitness, and support systems that vanish when a participant refuses continued visibility as evidence of coercion rather than administrative friction (Andrejevic, 2004; Deci and Ryan, 2000).

Institutional response requires immediate exit review, ombuds intervention, support continuation, public-status correction, independent inspection, and suspension of admission if exit failures repeat. A City that cannot let people leave with dignity has ceased to be a voluntary public-power formation institution.

Evidence of real exit includes departures without retaliation, pause files that do not shame participants, material-support transitions, exit rehearsal results, and public explanations that protect trust without punishing departure. Exit is real only when a person can use it while the institution would prefer them to stay.

The design should assume that a participant may want to leave on the worst possible day: after a public error, before a major release, during family conflict, or while staff believe departure will damage trust. The exit route must still work. A fair exit exists for inconvenient departures, not only for graceful ones (Lifton, 1961; Hirschman, 1970).

The decisive question is whether a participant can leave without the City punishing the meaning of departure. Public status may need accuracy, but it must not imply cowardice, guilt, betrayal, or failure simply because the institution hoped the person would continue.

35.2.2 — Cult Objection

The cult objection is not answered by saying the City is civic rather than religious. Cultic dynamics can arise in secular institutions through founder devotion, insulation from criticism, confession pressure, loyalty tests, humiliation, sleep disruption,

controlled relationships, and the moralization of doubt (Barker, 1984; Lalich, 2004).

The City's answer begins with freedom of conscience. Participants do not have to accept the optional spiritual path described in The Religion of Fairness, join any religious or spiritual practice, revere the founder, praise the series, or interpret their suffering through the formal Law. The City may receive the root vocabulary it needs without turning belief into membership (Hirschman, 1970; United Nations, 1966).

Dissent must be ordinary inside the institution. Participants may criticize the City, the Law, the Vow, staff decisions, architecture, archive rules, public summaries, donors, vendors, and leadership. Dissent records should not be treated as evidence of disloyalty unless the conduct independently violates lawful rules.

Outside ties protect participants rather than threaten the institution. Counsel, clinicians, family contacts, religious or nonreligious advisors, journalists under proper boundary rules, and independent advocates should not be framed as contamination. A City that fears outside interpretation is already drifting toward closed authority.

Meaning has become coercive when devotion is demanded as evidence of fitness. A cult-risk audit looks for required testimony, pressure to confess inner states, ritualized gratitude, public shaming for refusal, insider language that blocks outside scrutiny, and the habit of explaining every criticism as impurity or misunderstanding (Foucault, 1977; Barker, 1984).

Repair may require language review, dissent protection, outside access, staff retraining, leadership separation, clinical review, religious-freedom review, and public correction. The City can have seriousness without sacred obedience. Its civic formation must remain compatible with unbelief.

A serious pilot should preserve skeptical participants in good standing, dissent channels used without retaliation, clear protection for nonparticipation in the Religion of Fairness, public materials without devotional hierarchy, and admissions records free of belief preference. The City should be able to show that refusal of belief does not reduce dignity or standing.

Pluralism is tested when a participant publicly rejects the Law of Fairness while continuing to accept the civic Vow. The City should not treat that rejection as scandal. It should show that the role concerns public-power formation, not metaphysical agreement (United Nations, 1966; Hirschman, 1970).

Acceptance depends on whether critics can remain nearby without being domesticated into approved opposition. A serious critic should be able to wound the institution's confidence, expose a weakness, and still be treated as a contributor to safety rather than a threat to mission.

A grounded review needs to examine a participant who publicly declines the Religion of Fairness, criticizes its spiritual claims or the formal Law, refuses a solemn ceremony, or says the City is useful but philosophically wrong. Their standing should depend on conduct, rights, load, and role formation, not reverence. Staff should not mark dissent as instability, ingratitude, or hidden

hostility. The public should see that disagreement can live inside the City without becoming a tolerated performance staged for legitimacy.

35.2.3 — Reality-Show Objection

The reality-show objection is devastating if the City turns public accountability into public consumption. A record meant to help citizens understand public-power formation can become entertainment if release follows drama, intimacy, conflict, collapse, romance, embarrassment, or scandal (Lalich, 2004; Andrejevic, 2004).

The anti-spectacle mechanism is purpose-limited release. Public material must explain public-power formation, influence, reasoning, conduct, correction, and readiness claims. It should not reward voyeurism, humiliation, sexual curiosity, family conflict, illness scenes, breakdown, or the private pain of collateral persons (Goffman, 1961; Lalich, 2004).

Public-interface design must refuse attention incentives. Clips should not be selected because they are dramatic. Record pages should not use teaser language. Campus tours should not stage private life. Summaries should not turn participants into characters. Public education is not a show format.

Standing belongs to participants who might perform, staff who might be asked to curate narrative, families who might become plot devices, and citizens whose political judgment might be pulled toward fascination rather than evidence. Spectacle harms by changing the reason people look.

Spectacle drift is visible when the City becomes memorable as content rather than accountable formation. Fan culture, outrage-ready quote packages, traffic incentives, donor videos built around personal drama, and media access that converts protected life into civic theater are not harmless publicity choices (Andrejevic, 2004; Deci and Ryan, 2000).

Repair may require release withdrawal, narrative audit, hostile-crop review, media restriction, public explanation, staff discipline, and revision of record-site rules. The City must be willing to be less viral in order to remain fair.

Public evidence should include refused dramatic releases, sober public bundles, media rules that limit spectacle, and release logs showing public-interest reasons rather than attention pressure. A useful test is whether a release would still be justified if no one found it entertaining.

The release rule is tested by a moment that would make the public care more but understand less: tears after family conflict, a visible panic response, an intimate apology, or a staff member absorbing anger. The City should be able to withhold or summarize such material even when release would make the project more emotionally compelling (Andrejevic, 2004; Citron, 2019).

The working test asks whether the public record teaches judgment instead of fascination. A citizen should leave the record site understanding patterns of power, influence, correction, and care, not feeling that they have watched a person become available.

The hardest release decision may involve a conflict, apology, or painful correction that would become compelling public material.

The City should ask what citizens need to understand about public-power formation and what can be summarized without staging humiliation. A less dramatic release may carry more civic truth because it refuses entertainment. If the institution starts selecting the version that people will share most widely, it has converted record into spectacle.

35.2.4 — Rights Objection

The rights objection asks whether justice can be used against the institution that created the burden. Participants and collateral persons need intelligible complaint, interim protection, counsel or advocacy, health and disability accommodation, record correction, protection from retaliation, independent appeal, and a remedy capable of changing practice. A right that cannot inconvenience the first decision maker is an internal promise rather than a usable protection (Venice Commission, 2025; United Nations Human Rights Committee, 1996).

Route separation is the practical mechanism. The person who receives the complaint should not be the same person whose office is accused. The appeal should not be controlled by the operator whose decision is challenged. The ombuds route should have independence, confidentiality limits, escalation power, and public reporting of patterns (Bovens, 2007; Lindberg, 2013).

Rights routes must be usable by collateral persons as well. A partner, family member, staff member, visitor, host resident, protester, journalist, professional, or ordinary citizen may be harmed by exposure or institutional pressure. They need remedies without being forced into participant status.

The record stage matters. A complaint may be recorded for accountability while details remain shielded. An appeal may produce a public correction without exposing medical, family, legal, or intimate information. A rights system that requires humiliation to obtain remedy is not a rights system.

An appeal route becomes a maze when the injured person must decipher the institution while carrying the harm. Inaccessible forms, crisis-period deadlines, undefined jurisdiction, retaliation fear, delayed interim protection, opaque evidence rules, and settlements that erase recurring patterns all shift administrative cost downward. Accessibility therefore includes navigation assistance, deadline flexibility, protected contact, a named owner, and a written explanation of what happens next (Venice Commission, 2025; United Nations, 2006).

A usable rights remedy begins with immediate intake repair, deadline relief, advocacy support, independent review, pattern audit, public summary where safe, and suspension of the function that produced repeated rights injuries. The City cannot claim fairness while making remedy difficult to reach.

Independent review leaves an auditable pattern. Complaint volumes, response times, interim protections, appeal reversals, ombuds independence, retaliation findings, remedies, repeat failures, and decisions made against operational preference should all be inspectable in privacy-preserving form. Rights become credible when they can expose a favored program, delay a release, or discipline a powerful actor without weakening the complainant's standing.

Consider a complaint against a beloved leader, donor-backed program, popular participant, or indispensable vendor. Rights systems become credible when they can disturb prestige. A complaint route that works only against low-status errors is not a rights route (Bovens, 2007; Power, 1997).

The operative threshold asks whether a complainant can obtain interim protection before final judgment. When exposure, retaliation, health risk, or family harm is active, a slow promise of review can be another form of burden.

A concrete test arises when a complaint slows a popular participant's public release or interrupts a donor-backed program. Rights are real when they work against momentum. The complainant should have intake, protection, review, appeal, and remedy without being accused of harming the project. If staff treat the complaint as a nuisance rather than evidence of possible burden, the City has begun to defend itself instead of the people it affects.

Public artifacts can become the City's most dangerous texts because they travel without the chapter that explains them. A cover phrase, diagram, short video, donor paragraph, campus photograph, guide image, public record label, or excerpt can imply coercion, holiness, ranking, inevitability, or proof (Lalich, 2004; Andrejevic, 2004).

35.2.5 — Public Artifact Objection

Hostile-crop review is the operational answer. Every high-reach artifact is tested against the worst plausible fragment, including what it could imply about surveillance, human worth, children,

the Religion of Fairness, public rank, authority, scientific validation, or transition readiness (Goffman, 1961; Lalich, 2004). Artifacts therefore need correction and withdrawal routes because popularity cannot preserve a graphic, donor claim, or record-site label that creates false certainty.

Context must travel with public packaging that could injure vulnerable readers, sharpen distrust, or turn participants into symbols. Artifact discipline fails when material resembles a shrine, prison, elite academy, reality show, proof site, or loyalty movement because that image changes what the public believes the City authorizes (Andrejevic, 2004; Deci and Ryan, 2000). Before release, reviewers apply status labels, plain-language captions, anti-rank design, and correction routes so each compressed object carries its safeguard.

Pre-release records preserve crop tests, withdrawals, corrected summaries, status labels, and public changes. A diagram that cannot survive separation from context should not carry public meaning, and a beautiful artifact can still convey false authority: a glowing map, clean archive diagram, heroic participant image, or donor promise therefore receives adversarial review (Andrejevic, 2004; Fox, 2007).

Hostile-crop review ultimately asks whether an artifact stays accurate alone. If an image, caption, donor line, or clip implies authority, rank, or compulsion, redesign or withdraw it. Case review may change any artifact because small errors endure. Surveillance limits do not resolve captivity, dependence, or overload. Exit fails when it destroys housing, care, livelihood, or belonging. A humane design must test life under the Vow across

work, illness, relationships, audience pressure, and the practical freedom to leave. A representative first-view test should record what authority, rank, or promise an unfamiliar reader infers before seeing supplementary explanation. Repeated misreadings are evidence that the artifact itself needs redesign, not a longer disclaimer, and should be treated as a release defect until the false inference is removed.

35.3 — "No Human Can Survive the Record"

The human-load objection is not anti-transparency by itself. It asks whether a body and mind can live under continuous public-power record without becoming hypervigilant, performative, exhausted, alienated, or broken. The City cannot answer by admiring endurance (Karasek, 1979; Edmondson, 1999).

A record changes the room before anyone reads it. People speak differently when they expect later interpretation. They sleep differently when public disputes remain open. They relate differently when private support may be confused with public evidence. Those costs must be designed around before real participants carry them.

Survivability should be treated as operational evidence rather than as a private test of character. Humane load, sleep protection, identity support, de-loading, and long-term evaluation are not therapeutic decorations. They are the conditions under which voluntary visible formation can remain voluntary and human (Dinges et al., 1997; Hobfoll, 1989).

The load objection deserves full force. Visible life can produce vigilance, self-monitoring, social threat, archive anxiety, relationship strain, identity pressure, and fear of future interpretation. A City that treats this as mere weakness has already failed the human being under the Vow.

35.3.1 — Load Objection

Humane burden design is the City's answer. The day, week, semester, and year must include recovery space, low-stimulation

intervals, protected support, role clarity, workload ceilings, public-interface limits, counsel access, health review, disability accommodation, and the ability to pause before load becomes injury (Karasek, 1979; Maslach and Leiter, 2016).

Load review must examine real life, not only schedules. It asks how the participant sleeps, eats, relates, studies, argues, apologizes, recovers, and handles public feedback. It also asks how staff, family, and dependents experience the participant's load.

The rights-holders most directly implicated include candidates with trauma history, neurodivergence, chronic illness, disability, caregiving duties, public threat exposure, or family instability. The City cannot use a single heroic model of endurance and call everyone else unfit.

The critic prevails when the City selects for people who can perform under observation rather than people who can govern well. A humane-load audit looks for polished hypervigilance, fear of unscripted speech, overwork praised as discipline, and participants concealing distress because any disclosure may become public interpretation (Dinges et al., 1997; World Health Organization and International Labour Organization, 2022).

The first corrective steps are de-loading, schedule redesign, health review, public-interface reduction, mentor intervention, temporary pause, exit support, and pilot suspension if load injuries pattern across participants. The City's burden must be carryable, or its moral direction has failed.

The external evidence set includes cohort load reviews, de-loading requests, staff overtime patterns, participant feedback, clinical flags, and schedule changes made because ordinary endurance was being exceeded. A crisis should not be the City's first reliable indicator that the burden is too heavy.

The practical design appears in the participant who appears calm while the support ecology is straining. A smooth public interface can hide skipped meals, shortened recovery, staff triage, family worry, and rising correction requests. Load review should look behind composure (Karasek, 1979; Maslach and Leiter, 2016).

What matters is whether lowering burden is treated as good governance rather than embarrassment. A City that publicly honors de-loading, delay, and role reduction will select for honesty more effectively than one that praises endurance.

Another operational test is a cohort that functions well in public but shows rising de-loading requests, more staff overtime, shorter sleep, more conflict, and quieter private distress. No single incident may look severe. The pattern is the evidence. The City should lower public-interface windows, add recovery, slow admissions, or redesign routines before the burden becomes a story of individual weakness. Humane load design notices the slope before the break.

35.3.2 — Sleep Objection

The sleep objection is not a small wellness point. Sleep is the first place a public record can become bodily unfairness. If a participant lies awake rehearsing how every moment will be

interpreted, the record has entered the nervous system (Dinges et al., 1997).

The controlling mechanism is sleep protection as civic infrastructure. Quiet hours, light control, sensory design, late-night record limits, emergency-only interruptions, public-interface cutoffs, clinical review, and recovery days should be built before activation. Sleep cannot be left to individual willpower under public pressure (Van Dongen et al., 2003; ISO, 2021b).

Sleep degradation belongs in the institutional evidence record. Repeated insomnia, nightmares, night work, public feedback loops, or staff expectations that invade rest should trigger load review. The question is not whether the participant is strong. It is whether the institution has made rest possible.

Permanent reachability would burden partners, children, dependents, roommates, night staff, clinicians, security staff, and public users. A City that makes participants permanently reachable will push sleep burden across the whole support ecology.

Sleep protection is fictional when the record follows participants into the hours meant for recovery. Late-night footage review, after-hours staff messaging, public controversy that repeatedly displaces sleep, and recovery spaces that exist symbolically but not operationally are direct evidence that rest has become another performance demand (Deci and Ryan, 2000; McEwen, 1998).

The corrective response includes mandatory rest intervals, device boundaries, record-review limits, clinical stop authority, staff

schedule correction, and public explanation that nonresponse during protected rest is not evasion. Public power needs rested judgment more than continuous exposure.

Sleep protection needs its own operating evidence: protected quiet hours, emergency-interruption logs, night-shift staffing review, recovery exceptions, schedule changes, and instances in which public-interface demand was delayed rather than transferred into exhaustion. These records show whether rest remains a design condition when the City is busy, embarrassed, or short-staffed. Sleep is part of institutional competence, not a private reward after performance.

Crisis week supplies the useful stress case. Media pressure rises, a public error needs explanation, a family issue demands attention, staff coverage thins, and every actor can explain why one more late night seems necessary. The sleep rule matters precisely then: emergency authority must be narrow, interruption must be logged, recovery must follow, and repeated exceptions must trigger staffing or interface redesign rather than becoming culture (Van Dongen et al., 2003; ISO, 2021b).

The ordinary-day test is a night when a public controversy, emergency alert, or media cycle tempts the City to keep participants responsive. The sleep rule should not disappear because the public wants immediacy. Staff can issue status notes, hold matters for morning review, or use emergency protocols only under narrow conditions. A City that trains future leaders to sacrifice sleep for optics may be teaching the same distorted urgency it claims to improve.

35.3.3 — Identity Objection

The identity objection asks whether living under record changes a person into the role. A participant may begin to experience every gesture as evidence, every doubt as a future quote, every relationship as a public interpretation problem, and every mistake as permanent identity (Deci and Ryan, 2000; McEwen, 1998).

The institution must protect support and exit before a participant's identity fuses with the institution. Participants need mentors, clinicians, counsel, peer review, private protected spaces, ordinary activities, reflective practices without religious requirement, and routes to say that the Vow is changing them in a harmful way (Hobfoll, 1989; Siegrist, 1996).

The record site should avoid totalizing language. It may describe decisions, influences, corrections, public reasoning, and active conduct. It should not summarize a person as good, bad, pure, corrupt, ready in essence, or permanently defined by a season of formation.

Identity pressure reaches participants under public admiration as well as public criticism. Praise can distort identity as much as attack. A participant who becomes dependent on the City's moral image may lose the ability to hear correction.

The book uses identity capture for a design risk in which the City produces institutional selves rather than public servants. Review should look for approved-language dependence, fear of ordinary privacy, treatment of the record as the whole person, and continued participation because life after exit has become difficult to imagine.

Identity repair combines support, role-language correction, protected ordinary life, public-status humility, normalized exit, and removal of record-site language that freezes the person into a civic character. The record follows a role. It does not own the person.

Identity strain should leave a protected institutional trace before it becomes a public episode. The record should support care and redesign without converting private therapeutic material into a new object of public interpretation.

A useful rehearsal follows a participant whose speech has become perfectly institutional. Reviewers should treat that fluency as an ambiguous signal rather than maturity by definition, then ask whether ordinary humor, dissent, privacy, and unperformed friendship remain recognizable (Hobfoll, 1989; Siegrist, 1996).

Identity review should treat the recognizability of protected ordinary life as decisive. A participant must be able to remain funny, conflicted, private, mistaken, embarrassed, bored, affectionate, and uncertain without those human traits becoming material for public interpretation.

A participant whose apologies become too polished, friendships become cautious, and ordinary uncertainty begins to look like a risk to manage exposes the design. The City should prefer a person who remains ordinary under strain to a person who has become perfectly compatible with the record.

35.3.4 — Breakdown Objection

The breakdown objection asks what happens when the record becomes too much. The City's design must allow for misfit,

exhaustion, panic, depression, conflict, trauma response, or public attack.

De-loading is the central mechanism. It can reduce public interface, pause activation, narrow schedule, change housing conditions, add clinical support, reduce study burden, delay release, shield vulnerable records, or move the participant toward dignified exit. De-loading should not be framed as shame (Maslach and Leiter, 2016; Dinges et al., 1997).

The review route must be clinically and legally serious. Operators should not decide alone whether a person is merely uncomfortable or in danger. Independent clinicians, disability experts, counsel, ombuds, and the participant's chosen support contacts should be available under protected conditions.

Those entitled to challenge the arrangement include staff who notice distress, families who bear spillover, fellow participants who may be affected by crisis, and public users who may demand explanations. The City must protect the person first and explain only what public trust lawfully requires.

Breakdown has become institutional content when distress is narrated as resilience, care is delayed because the record is considered interesting, staff minimize warning signs, or crisis material is released in the name of transparency. At that point the City is no longer documenting burden; it is exploiting it (World Health Organization and International Labour Organization, 2022; Karasek, 1979).

City governance must answer through immediate care, release halt, protected review, schedule reduction, safe exit, staff after-

action learning, and public correction if the City overexposed distress. It is one of the tests of the City.

Procedural evidence carries the breakdown answer: early-warning signals that produced action, de-loading before crisis, protected health classification, independent clinical judgment, release holds, post-incident review, and redesign that attributes preventable distress to the institution when warranted. The record should show how care altered the schedule or system, not turn suffering into a morality tale about courage.

One foreseeable stress case involves a breakdown partly caused by the City itself. The participant may be vulnerable, but the schedule, release timing, staff signals, public pressure, or mentor practice may have converted vulnerability into crisis. The review must be permitted to blame design (Maslach and Leiter, 2016; Dinges et al., 1997).

The design passes only if the first institutional action is care and containment rather than narrative management. Public explanation can wait until human safety, protected records, family notice where appropriate, and clinical review are stabilized.

The mechanism becomes concrete when distress first appears as irritation, withdrawal, insomnia, overcompliance, or fear of being misread. A quiet pause before spectacle demonstrates more integrity than a public rescue after the institution has allowed distress to become content.

35.3.5 — Long-Term Cost Objection

The long-term cost objection asks what the City does after novelty fades. A participant may appear stable for weeks while

accumulating strain that surfaces months later: relationship erosion, chronic sleep loss, public self-consciousness, decision fatigue, or fear of future office life (World Health Organization and International Labour Organization, 2022; Karasek, 1979).

Longitudinal care must be built into pilot evaluation. Early cohorts should be followed through activation, pause, exit, office campaigns where applicable, reintegration, family adjustment, staff burden, and record-site impact. The City must count delayed costs rather than declaring success at launch (ISO, 2021b; Deci and Ryan, 2000).

The evaluation produces operational evidence about whether participants remain humane, rested, supported, rights-protected, able to exit, and able to sustain relationships. Its judgment concerns City feasibility and human burden; it neither measures human worth nor supplies a PTVC verdict.

Former participants carry the longest tail of this failure. A City that celebrates active records but forgets people after exit shifts burden into the future. Reintegration, employment, care continuity, family repair, public-status correction, and record-context review should remain part of the institution's obligation.

Delayed injury is easy to miss when evaluation ends with the active period. Former participants avoiding public life, families reporting lingering strain, staff turnover dismissed as ordinary churn, and alumni needing unplanned support should be treated as evidence that the pilot exported costs beyond its declared window (McEwen, 1998; Van Dongen et al., 2003).

The consequence may include slower admissions, post-exit care, staff-ratio correction, record-release revision, clinical review, family support, and refusal to replicate until long-term evidence shows that the burden remains supportable under the tested conditions. A pilot that stops because people are carrying too much has succeeded morally by refusing denial.

Pilot evidence should preserve former-participant follow-up, reintegration outcomes, family-burden data, staff-retention patterns, delayed complaint review, and public summaries that admit unresolved costs. A pilot that looks humane only during the supervised period has not answered the long-term objection.

A useful stress case appears after applause ends. A former participant may struggle with ordinary privacy, a staff team may report moral fatigue, or a family may describe years of vigilance that looked invisible during the pilot. Long-term review should search for costs that success stories suppress (ISO, 2021b; Deci and Ryan, 2000). The pilot should therefore declare its follow-up horizon before launch rather than choosing it after favorable early results.

Acceptance turns on whether replication waits for post-exit evidence. The City should not expand on the basis of active-period impressions alone, because some harms appear only when a person tries to become ordinary again. Replication gates should include delayed indicators of reintegration, staff recovery, family burden, and record persistence.

The case-level test appears after exit, when a former participant returns to ordinary work, family life, campaign life, or public

criticism. The former participant is not a data source by default, but their experience is a warning against judging the pilot only while support systems are still nearby. The human-load objection changes the design because rights on paper are insufficient when bodies, families, and identities cannot carry the institution. Any credible answer must show that support, pause, refusal, and exit still work when strain is highest. Former participants should also be able to challenge public summaries of post-exit outcomes without being drawn back into active participation.

35.4 — "The City Becomes Government or an Elite Gate"

The government and elite-gate objection asks whether the City will become more powerful than it admits. Public-power formation is close to public authority by design. That closeness can become dangerous if the City begins to act as shadow government, office pipeline, moral credential, or gate over democratic legitimacy (Michels, 1962; Rivera, 2015).

The City need not become weak to remain bounded. Its strength must remain in the right place. The City can make formation knowable. It can help the public evaluate a record. It can support visible preparation. It cannot appoint, elect, govern, entitle, rank, or rewrite law by institutional confidence.

The political objection has two parts that must not be collapsed: government replacement and elite gatekeeping. Voters remain voters. Offices remain offices. Law remains law. Readiness remains narrow and contestable. Nonparticipants remain legitimate public actors. The City's work matters only if it refuses to become the thing it prepares people to enter (Mansbridge, 2003; Young, 2000).

The government-boundary objection asks whether the City becomes a state without saying so. A residential institution that forms candidates, manages records, hosts public interfaces, and supports officeholders could begin to look like a parallel public authority.

35.4.1 — Government Boundary Answer

Formation and sovereign power must remain separate. The City may educate, record, support, audit its own functions, and publish bounded readiness material. It may not legislate, adjudicate public rights, command agencies, replace elections, control public services, or govern people outside its lawful institutional scope (Michels, 1962; Collins, 1979).

Officeholders who operate from the City remain bound by the offices they hold. Their legal duties, public records, secrecy rules, emergency powers, staff obligations, and constitutional limits belong to government and law. The City's record continuity cannot override lawful state authority.

The people protected by the government boundary include voters, civil servants, agency staff, courts, parties, opposition groups, journalists, regulated persons, and ordinary residents. They are entitled to know whether a decision came from lawful office, delegated authority, informal advice, donor pressure, or City affiliation. Public administration cannot answer to a formation institution's prestige, internal vocabulary, or founder story.

Shadow government begins when City operators are obeyed because of institutional prestige rather than lawful office. City review treated as superior to public process, agencies deferring to City staff, or participants invoking City discipline as governing entitlement are boundary breaches, not signs of influence well used (Mansbridge, 2003; Dahl, 1989).

Restoring the government boundary may require legal notice, office-interface restriction, external audit, public clarification,

and refusal to host office functions that cannot remain lawfully separate. The City forms people for power. It does not become the power.

Boundary memoranda, refusals of unofficial command, public corrections of overstated City status, and records showing that lawful offices remain outside City authority should all be visible. The City's proximity to government must leave evidence of restraint.

The issue becomes concrete in a public official quietly asking whether City records can assist appointment, clearance, crisis staffing, or political vetting. The City should have a refusal script and a lawful referral path before such requests arrive. Boundary protection is easier when it has been rehearsed (Venice Commission, 2025; Mansbridge, 2003).

One practical test is a crisis in which an officeholder seeks help from City staff. If a government office, party, or campaign can obtain special interpretation because cooperation seems useful, the City has become a backstage actor in public authority.

A concrete review should examine a public official who asks the City to settle a governing dispute because its record seems more trusted than ordinary institutions. The answer should be refusal unless a lawful advisory role exists outside City authority. The City can explain records, provide public materials, and preserve continuity. It cannot become a shortcut around offices, agencies, courts, legislatures, or elections. Boundary is easier to defend before people praise the City for crossing it.

The office-entitlement objection asks whether City participation becomes a claim on appointment, nomination, ballot access, party support, donor confidence, or public office. That would turn formation into a gate over democracy (Pitkin, 1967; United Nations Human Rights Committee, 1996).

35.4.2 — Office Entitlement Answer

Elections, appointments, qualifications, and public legitimacy remain outside the City's grant. A participant may become better known through the record, but known does not mean chosen. Citizens, lawful institutions, parties, jurisdictions, and office rules retain their own authority (Pitkin, 1967; United Nations Human Rights Committee, 1996).

Readiness language must be narrow. A record bundle may say that a person completed a defined pathway, demonstrated certain competencies, corrected certain errors, or is not yet ready for a particular office type. It cannot state that the person deserves office or outranks nonparticipants.

Candidates outside the City can also be harmed by this failure. Ordinary public servants, organizers, advocates, local leaders, experienced officials, and people who cannot or should not enter the City must not be treated as inferior by absence. Nonparticipation carries no civic stain.

The office-entitlement objection succeeds when City status becomes an unofficial prerequisite for trust. Parties that require participation, donors who fund only accredited candidates, media that treat nonparticipants as suspect, or record pages that imply

readiness equals entitlement create a parallel eligibility regime (Venice Commission, 2025; Mills, 1956).

The answer is public-status correction, narrower readiness language, anti-caste design, refusal of office-guarantee claims, and consultation with election-law and public-administration experts. The City can inform democratic judgment. It cannot replace it.

Democratic-boundary review verifies that readiness labels remain conditional, parties and voters may reject City participants without institutional retaliation, and public materials avoid entitlement language. The public retains the right to say no.

Democratic independence is clearest before the vote, when the City refuses to describe participation as a reason for preferment. Public materials should neither imply that completion deserves nomination nor present nonparticipants as untested alternatives. The record may inform judgment, but it must not preload the verdict (Rivera, 2015; Manin, 1997).

The key test is whether the City can accept public rejection without moralizing it. If the City releases only material that supports readiness, the record has become campaign infrastructure instead of democratic evidence.

A clean democratic test occurs when a participant completes formation and then loses an election, nomination, appointment, or public endorsement. The City records the result without treating refusal as public blindness, corruption, or failure to recognize virtue. If staff, alumni, donors, or supporters use City formation

to delegitimize the lawful decision, participation has become an entitlement claim and the objection is sustained.

The elite-access objection asks whether the City becomes a prestige caste even if it remains formally voluntary. Cost, geography, language, disability, family obligations, immigration status, political connections, media polish, and donor attention can decide who enters long before the Vow begins (Young, 2000; Michels, 1962).

35.4.3 — Elite Access Answer

Anti-caste design is the practical answer. Discovery, application, support, accessibility, translation, debt relief, dependent care, disability accommodation, local legitimacy review, and delayed or redirected pathways must prevent the City from selecting only those already near power (Young, 2000; Michels, 1962).

Admission should not reward perfect presentation. The City is not looking for sanctified biographies. It is looking for adults who can carry role-bound visible formation without shifting harm onto others. Mixed motives, ordinary background, delayed readiness, and nontraditional experience may all matter.

This mechanism directly affects those excluded by invisible filters. A rural organizer, disabled advocate, low-income parent, former caregiver, local administrator, or person without elite credentials may be closer to public burden than a polished applicant with prestigious sponsors.

Elite closure appears when the City becomes a finishing school for people already selected by wealth, class, media access, or political inheritance. Donor-backed applicants, costly preparation

ecosystems, elite referral pipelines, and admiration of institutional scarcity should be read as access failures rather than proof of quality (Collins, 1979; Mansbridge, 2003).

The response must reach recruitment, support, admissions, credential language, public explanation, and public-interface design. A City that moves burden upward must not first require people to have climbed near the top.

Admissions equity should be visible in regional discovery, disability accommodations, support packages, applicant appeals, equity audits, and refusals to treat polish as public virtue. Anti-caste design is not a mood; it is an admissions and support system.

Consider a brilliant applicant who cannot safely accept visibility because of immigration status, disability, family danger, trauma, poverty, local repression, or justified cultural distrust. Nonparticipation cannot be translated into lower seriousness, courage, or civic worth. The better inquiry is whether the City can reduce exposure, improve support, or offer a different pathway without lowering the person's standing (Young, 2000; United Nations, 2006).

The final local test asks whether the City honors public service outside the City. A society with only one prestigious route to office has not democratized formation. It has renamed gatekeeping.

The test becomes concrete in an applicant with public promise but limited credentials, a disability, caregiving obligations, regional distrust of the City, or a communication style unlike elite institutions. The City should ask what support, accommodation,

pathway, or delay would make role-fit assessment fair. It should not confuse polish with capacity. If the admissions room rewards comfort with prestige signals, the City will reproduce the hidden pipeline under cleaner language.

The credential-halo objection asks whether a City record becomes a glow around the person. Once a participant has lived under visible burden, the public may overread endurance as virtue, visibility as honesty, and archive presence as trustworthiness (Bourdieu, 1986; Pitkin, 1967).

35.4.4 — Credential Halo Answer

The defensible position is a narrow status claim. A readiness bundle describes what was observed, what remains uncertain, what errors occurred, what corrections were made, what role was tested, and where the person is not yet ready. It is not a certificate of character (Bourdieu, 1986; Pitkin, 1967).

Public labels must resist halos. They should avoid terms that sound like honor ranks, moral grades, purity levels, verified souls, trusted persons, or guaranteed leaders. The record should show context and contestability, not a simplified mark that the public can treat as a seal.

The people entitled to object include the participant, who may be harmed by exaggerated praise, and citizens, who may rely on the halo instead of judgment. It also affects nonparticipants, who may be unfairly compared to a credential they never sought.

Credential halo has taken hold when City status becomes shorthand for superior worth. Descriptors such as City-certified leader, donor pages that foreground status over record, party

screening based on completion, and participants invoking the City to silence critics convert formation into caste (United Nations Human Rights Committee, 1996; Venice Commission, 2025).

The credential halo is corrected through label revision, public education, release correction, refusal of endorsement language, and audit of how readiness material is used. The City can make formation more legible. It cannot turn visibility into virtue.

A public-language audit should preserve inflated claims that were corrected, right-of-reply use, record-site caveats, campaign or party misuse notices, and cases in which City participation did not shield a person from criticism. These materials reveal whether the institution teaches readers to examine evidence or encourages them to substitute affiliation for judgment.

The design is exposed when a third party says, in effect, ‘this candidate went through the City, therefore trust them.’ The institution should challenge that shorthand even when it benefits a participant. A record is evidence to interpret and contest, not an aura that migrates from formation into character, office entitlement, or civic rank (Mills, 1956; Rivera, 2015).

The decisive failure occurs when process status becomes a proxy for character or entitlement. Any mark, label, bundle, or summary that can be used without reading the underlying record is too close to halo.

Credential halo often begins in a headline, party memo, campaign advertisement, employer profile, or donor description that calls someone City-certified, fully transparent, or proven trustworthy. Correction should be prompt and public: state what period and

role the record covers, identify contested or unavailable material, and reject any character guarantee. Process status must not become a certificate of essence.

The final boundary answer is domain discipline. The City does not own the full design of government, enacted constitutional rights, public administration, or lawful route-record-remedy architecture. Those domains belong to *The Government of Fairness*, *The Constitution of Fairness*, and actual expert legal review (Manin, 1997; Young, 2000).

35.4.5 — Government and Legal Deferral Answer

Deferral is not evasion. It prevents the City from presenting itself as a complete civic order. The City can name the boundaries an office interface must respect, but it cannot settle every legal question about officeholding, secrecy, emergency powers, procurement, public employment, or electoral status (Manin, 1997; Young, 2000).

Unresolved legal questions belong in the record rather than beneath it. Labels such as “pending legal review,” “jurisdiction-specific,” and “not authorized here” make the institution more trustworthy because they refuse to let coherent architecture masquerade as settled law.

Legal confusion would burden officials, agencies, courts, voters, public employees, and citizens whose rights depend on institutions outside the City. They should never be told that City participation changes their legal position unless actual law says so.

The City may explain its curriculum, record design, safeguards, limitations, and operational evidence. It must not claim that participation creates lawful preference, public entitlement, superior civic status, or a transferable certificate of trust. Legal validity and public authority remain external questions governed by the relevant jurisdiction (Venice Commission, 2025; United Nations Human Rights Committee, 1996).

The appropriate answer is legal deferral, jurisdictional limits, public correction, independent constitutional review, and refusal to operate contested functions until lawful routes exist. The City's strength is boundedness. It weakens itself whenever it pretends to be the whole civic order.

The implementation record should show cross-domain review, explicit deferral notes, science-status checks, legal-status labels, and corrections when City materials borrow authority from law, science, religion, government, or transition. A boundary that never corrects language will not hold under public excitement.

The boundary should be legible in every office-interface agreement, record label, public summary, and crisis protocol. The disciplined answer is that this book supplies institutional design and safeguards, while actual public adoption requires lawful authority and belongs to the appropriate legal and government domains (Mansbridge, 2003; Dahl, 1989).

The control passes only when the City can say not mine without sounding evasive. Deferral should be clear enough that public actors know which questions remain unanswered and which title or real-world review process owns them.

A second practical test examines a public summary claiming that a functioning City validates the Law, creates a legal model, proves readiness for transition, or shows that governments should adopt a City standard. The correction should name the proper owner domain. A City can generate operational lessons about bounded public-power formation. It cannot carry scientific, constitutional, governmental, religious, or transition authority merely because its design feels coherent. The answer should identify the measurable operational evidence the City can supply while leaving legal, governmental, and scientific conclusions with their proper owners.

35.5 — "Archives and AI Become New Sovereigns"

The archive and Artificial Intelligence objection arises because the City's memory systems will shape what later readers can know. Search, summary, comparison, correction, release, sealing, and long-term preservation can influence public judgment more powerfully than any single speech. Technical convenience therefore belongs inside governance, not outside it (Schwartz and Cook, 2002; Narayanan and Shmatikov, 2008).

The governing rule is subordination at every layer. The archive preserves institutional memory but does not own the person. Artificial Intelligence may assist bounded tasks but may not determine worth, readiness, intent, credibility, guilt, or office entitlement. Vendors may supply infrastructure but may not control institutional meaning, correction, or exit.

Technical systems are sites of delegated power. Accuracy and security matter, but they are not enough. The City must also govern authority, purpose limitation, contestability, human review, appeal, procurement dependence, version change, incident response, and the ability to suspend a tool whose reach has exceeded its warrant (Selbst et al., 2019; Parasuraman and Riley, 1997).

The archive-governance objection asks when memory becomes command. A complete institutional record becomes dangerous when users treat it as the person, the final context, the superior interpreter, or an oracle about motives that no record can directly contain.

35.5.1 — Archive Governance Answer

Memory must remain separate from authority. The archive preserves source material, provenance, chain of custody, correction history, access decisions, status labels, and review records. It does not decide human worth, spiritual status, office entitlement, trust by itself, or final interpretation of a life (Schwartz and Cook, 2002; International Council on Archives, 1996).

Archive governance requires human roles with separation: custodian, access reviewer, correction reviewer, privacy reviewer, technical security, rights advocate, public-interface editor, auditor, and appeal body. A single archive office cannot both preserve, interpret, release, and defend its own decisions without conflict.

This choice directly implicates participants, staff, families, incidental contacts, journalists, public users, future researchers, and the dead. Long-term records can outlive the context that made them intelligible. Governance must therefore include time review and posthumous dignity safeguards.

Archive governance becomes ceremonial when the record is treated as a superior identity layer. Claims that the archive 'knows' a person, staff deference to summaries over documented correction, or later readers treating old context as final despite new evidence show that memory has begun to govern the person (Selbst et al., 2019; Gebru et al., 2021).

The archive remedy route includes status-label revision, contextual supplementation, right of reply, lawful sealing,

correction history, access restriction, external audit, and removal of public language that makes the archive sound like soul access. The archive remembers. It does not rule.

Outside review should be able to inspect correction latency, right-of-reply use, seal and unseal decisions, summary changes, access denials, and instances in which an archive search result was narrowed because it created unjustified exposure. The archive earns trust when it shows its own limits.

Archive accuracy does not guarantee moral completeness. A file may preserve a harsh sentence without the protected weeks surrounding it, a correction without the private repair that made it possible, or a decision without privileged advice that cannot lawfully be disclosed. Governance must therefore label context, absence, dispute, and access limits so a true fragment does not impersonate the whole person or whole event (International Council on Archives, 2012; UNESCO, 2021b).

Archive independence also requires protection from institutional appetite. Public memory should be trustworthy enough to challenge power and humble enough to avoid claiming final possession of the person.

The lived test is a disputed record where the archive contains source material that looks damaging but the participant, staff member, or affected person offers context. Governance should preserve both the source and the contest. It should not hide the record, but it should not pretend the record interprets itself. Public memory becomes fairer when users can see provenance, dispute, correction, and limitation in the same frame.

A prominent risk is output authority. Search rankings, machine summaries, clusters, anomaly flags, and generated narratives can look more settled than the underlying record. Every assisted output should disclose source scope, transformation, uncertainty, disputed context, and human approval, and should remain open to correction or withdrawal (NIST, 2024b; Council of Europe, 2024).

35.5.2 — AI Subordination Answer

Subordination begins with task boundaries. Artificial Intelligence may retrieve records, identify possible inconsistencies, prepare draft summaries, flag release conflicts, or translate material under review. It may not make eligibility, readiness, guilt, character, credibility, intent, worth, or entitlement decisions, and it may not convert behavioral traces into a hidden civic score (Kroll et al., 2017; Mitchell et al., 2019).

Before deployment, every system needs a documented purpose, lawful data boundary, model and vendor identity, version history, evaluation plan, accountable human decision owner, prohibited uses, incident route, challenge process, retention rule, cybersecurity review, and shutdown authority. A material change in purpose, model, data, audience, autonomy, or consequence reopens approval rather than inheriting it silently. Governance burden should rise with the gravity and reversibility of the output (NIST, 2024b; Council of Europe, 2024; OECD, 2024a; ISO/IEC, 2023).

Automated misreading can harm people whose speech, emotion, disability, accent, culture, trauma response, or communication

style falls outside the system's assumptions. Artificial Intelligence can turn pattern recognition into false certainty faster than a human reviewer notices.

Human review is nominal when staff repeat that a system found the truth, publish machine summaries without accountable approval, deny affected people a meaningful contest, or accept vendor changes without a City-controlled change record. The human actor may remain visible while authority has migrated to the tool. Real review requires enough information, time, competence, and power to reject the output and alter the workflow (NIST, 2024b; Council of Europe, 2024).

A proportionate response can include output withdrawal, human re-review, participant or affected-person notice, model restriction, vendor escalation, correction of related cases, independent audit, and suspension of the tool class. Artificial Intelligence remains useful only while the institution can narrow or stop it without bargaining away rights.

Procedural evidence should show that human authority is real: override logs, rejected recommendations, contested summaries, source-linked outputs, query-class limits, incident findings, disabled models, and decisions in which review changed what the public saw. A nominal human in the loop is not enough when workload or culture makes disagreement unrealistic.

One pilot test should use a machine summary that sounds balanced while overweighting what is easiest to detect. Formal meetings, written revisions, and explicit conflict may dominate quiet restraint, care, uncertainty, or protected consultation.

Human review must identify the system's blind fields before its polished language acquires public authority (Selbst et al., 2019; Mitchell et al., 2019).

The acceptance question is operational: can an authorized human overrule, correct, disable, and explain the system without vendor permission, unusual technical heroics, or institutional embarrassment? A tool that cannot be contradicted in practice has acquired authority that the City did not lawfully grant.

A machine-generated inconsistency flag provides the revealing case. It arrives with a precise score and a confident explanation, yet the source may be incomplete, the comparison class may be wrong, or the model may have compressed a protected context. The reviewer must trace provenance, inspect limitations, invite contest, and decide whether the flag has any legitimate role in public meaning. The danger lies in social obedience to confidence after uncertainty has disappeared from view (NIST, 2024b; OECD, 2024a).

Human audit is not a signature placed beneath a machine report. It is accountable review by people with authority, training, conflict limits, adequate time, access to evidence, and responsibility for consequences. Without those conditions, technical systems become the City's hidden administration (Narayanan and Shmatikov, 2008; Raji et al., 2020).

35.5.3 — Human Audit Answer

The audit program follows consequence across the full lifecycle. It samples outputs, tests edge cases, compares false positives and false negatives, examines disability and language variation,

reviews protected-category effects, inspects public summaries and access decisions, and traces how machine assistance changed human action. Higher-impact outputs require stronger evaluation, documentation, challenge, and monitoring rather than deference to vendor convenience (NIST, 2024b; OECD, 2024a).

Auditors need independence from vendors and operators. A vendor cannot be the only party evaluating its own system. An operator cannot be the only party deciding whether the tool made operations easier at the cost of rights. Audit must be able to embarrass the system.

The people carrying the first-order risk include those whose records are summarized, searched, flagged, or translated. They also include staff who may be pressured to trust automation because workloads are high. Human audit protects staff from becoming silent carriers of machine authority.

Audit has become post hoc justification when logs are missing, templates escape review, model or data changes occur without notice, explanations are too thin to contest, appeals are inaccessible, or proprietary claims block inspection. Assurance must exist before an output hardens into a public conclusion and must continue after deployment as the system, audience, and consequences change (NIST, 2024b; OECD, 2024a).

An adverse audit should trigger an action matched to consequence: expand testing, freeze the tool, shield the affected output, correct workload and training, label machine assistance, notify affected persons where required, or suspend the function. Human oversight is demonstrated when a reviewer can say the

system was wrong, prevent further reliance, and make the correction travel to every downstream surface.

A serious pilot preserves auditor access to logs and source records, vendor-independent testing, incident findings, corrective action, and a record of what auditors could not inspect. An audit that hides its blind spots becomes part of the problem it reviews.

Audit independence is tested by unwelcome findings. The reviewer must be able to delay launch, narrow a function, expose a conflict, anger a donor, or weaken public confidence without losing access, funding, or authority. An inspector welcomed only when findings are convenient is performing assurance theater rather than independent audit (Institute of Internal Auditors, 2020; IIA, 2024).

Acceptance turns on whether audit changes behavior. The evidence is concrete: releases delayed, tools disabled, model functions narrowed, training or staffing revised, workloads reduced, appeals reopened, and public explanations corrected because the audit identified a risk. A report that leaves the operating system unchanged has supplied documentation, not accountability.

One operating test begins when a vendor or internal technical team says that deeper inspection is impractical, proprietary, or unnecessary. That answer should not satisfy the City. Human audit requires enough access to test the system that shapes rights, release, search, and public interpretation. When the system is too opaque to inspect, the responsible answer may be restriction, replacement, or shutdown rather than trust.

Appeal is the route by which a technical output loses false finality. Participants and affected persons must be able to challenge summaries, labels, search results, translations, access decisions, release choices, or machine-assisted findings before an accountable human with power to change the outcome. The route needs notice, access to the relevant basis, interim protection where delay could magnify harm, a reasoned decision, and propagation of correction (Council of Europe, 2024; European Union, 2024; Venice Commission, 2025).

35.5.4 — Appeal Answer

Contestability must exist at the point of use. Public record pages should identify when material is machine-assisted, reviewed, corrected, appealed, restricted, or provisional. People should never have to guess whether they are challenging a human decision, a machine output, or a combined process.

Appeal should include access to enough explanation to be meaningful. That does not require exposing protected systems or unrelated records, but it does require the person to know what output affected them, what source material was used, what reviewer approved it, and what remedy is available.

A usable challenge route must be open to collateral persons whose visibility might be shaped by automated processing. A family member wrongly included in a summary, a staff member misclassified as influence source, or a host resident flagged in an access log deserves recourse.

Appeal is not real when 'the tool generated it' is accepted as a complete explanation, the appeal body cannot inspect the relevant

process, no responsible decision owner can be named, or technical complexity is used to delay correction. Opacity may describe a difficulty; it cannot settle the case (International Council on Archives, 2012; Kroll et al., 2017).

A harmful machine output requires suspension of the affected use where necessary, a corrected summary, public notice where needed, and review of similar cases. Technical correction should address the demonstrated cause; it may involve source repair, retrieval changes, revised instructions, access controls, or a different model. Retraining is an option only under separate lawful authority and appropriate data permissions. A contestable output is not harmless by default, but it is less likely to become sovereign.

A contestable public record includes disputed outputs, interim shielding, corrected summaries, public notice of material correction, and appeal decisions that change record-site presentation. Contestability has to change what the public sees when correction is warranted.

Appeal must remain usable by the person who distrusts the system. A record appeal should not require technical fluency, insider access, or institutional loyalty. Plain-language notice, independent help, deadline relief, interim protection, and a human decision are necessary when the automated or archival system is itself disputed (Venice Commission, 2025; Kroll et al., 2017).

Correction must arrive soon enough to interrupt reliance. When the public has already absorbed a wrong summary, the institution has not completed repair merely by changing the source page. It

must also correct the public-facing pathways, derivative summaries, and status labels through which the error continues to travel.

Consider a machine-assisted public summary that mischaracterizes a staff member, former partner, protester, or participant. The appeal route should provide immediate shielding when further spread could harden the error, preserve the contested version and provenance, give the affected person a meaningful response, and publish the correction wherever the statement travelled. Speed is part of remedy because public memory can become irreversible before a slow appeal concludes (Council of Europe, 2024; Venice Commission, 2025).

Vendor capture exists when the City cannot operate, inspect, migrate, explain, correct, or shut down a technical function without a private provider's permission. That is delegated institutional sovereignty created by dependency rather than by law (Council of Europe, 2024; ISO/IEC, 2023).

35.5.5 — Infrastructure Vendor-Capture Answer

Technical independence requires portability, audit access, data segregation, exit assistance, security review, breach notice, subcontractor disclosure, deletion verification, migration rehearsal, and procurement discipline. The City needs a tested path to operate safely during replacement or shutdown. Vendor convenience cannot become the condition of institutional continuity or the reason a safeguard is unenforceable (NIST, 2024b; ISO/IEC, 2023).

Staff need enough technical and records knowledge to recognize complexity used to hide risk. Independent experts need lawful access to architecture, logs, model behavior, security posture, and contract terms.

A breach, model reuse, cloud lock-in, subcontractor abuse, or proprietary opacity can expose participants, families, staff, hosts, and public users. Vendor failure is therefore a rights event, not merely a service interruption.

Vendor sovereignty exists when the provider can veto correction in practice. Failed exports, missing audit logs, opaque updates, secondary use, weak subcontractor control, and emergency dependence indicate that a private system has acquired public consequence without public standing.

The response may require procurement halt, migration, contract enforcement, public warning, technical rebuild, external audit, or suspension. The City may use vendors, but it may not outsource sovereignty over memory, rights, or correction.

Independent inspection confirms portability, migration drills, subcontractor disclosure, exercised audit rights, and replaceable contracts. Technical exit has to work before crisis makes departure expensive.

Functional expansion receives renewed review even when performance is strong. Search can become summary, summary can become interpretation, and interpretation can become recommendation; each change expands institutional authority and requires fresh purpose, rights, and error analysis.

The practical threshold is whether termination remains credible. If leadership hesitates to enforce a safeguard because a vendor is too embedded, capture has already begun. Vendor-independence review should estimate the practical time and cost of exit, not merely confirm that termination language exists.

A migration drill supplies the clearest operating test. The City should be able to export essential records in usable form, revoke credentials, preserve correction history, maintain protected layers, rebuild search without loss of provenance, and continue service after a vendor failure. A system that cannot leave its vendor is not institutionally independent (NIST, 2024b; ISO/IEC, 2023). Technical power can make the City look clean while moving authority into archives, models, summaries, contracts, and interfaces. Those systems remain tools only when human review, correction, contestability, and nonparticipant rights can still constrain them. A migration drill should also test failure before vendor cooperation, when contractual rights are hardest to execute.

35.6 — "Sex, Children, and Families Make This Impossible"

The family objection should slow the reader down. If the City cannot protect children, intimacy, partners, dependents, reproductive health, household conflict, and nonparticipant dignity, then no amount of public-power accountability can save the design. The collateral edge is not secondary. It is where the City is most likely to injure people who never volunteered (United Nations, 1989; Westman, 2001).

The answer cannot be full exposure with tasteful language. It must be absolute where absolute protection is required and careful where professional review is needed. Children do not become visible because an adult seeks power. Intimacy does not become spectacle because a participant accepts role-bound record. Families do not become hidden support systems without recourse.

The section's work therefore names the hardest protected zones and gives them mechanisms: child shielding, intimacy dignity, household burden review, professional interfaces, and nonparticipant remedy. A City that cannot protect these zones should not proceed (Nissenbaum, 2010; United Nations, 1989).

The child-protection objection is the hardest collateral-person objection because children cannot inherit a participant's burden. A City that exposes children to satisfy adult transparency has failed before any other safeguard is considered.

35.6.1 — Child Protection Answer

Nonnegotiable shielding is the defensible answer. Children are not participants, public evidence, campaign texture, family proof,

or record-site material. Their images, locations, schooling, friendships, health, emotions, conflicts, and private development require protective routing and professional review (United Nations, 1989; Committee on the Rights of the Child, 2021).

Child protection depends on child-specific privacy rules, household-zone controls, school and caregiver separation, incident review, parental and guardian limits, child-advocate consultation, release prohibitions, and emergency intervention where exposure risk appears. Adult consent does not authorize child exposure.

The people whose rights are at stake include children of participants, visiting children, host-community children, minors interacting through public platforms, dependent siblings, and children named in third-party material. A child's proximity to public power does not change the child's status.

Child protection has failed when childhood becomes legible to strangers. Family scenes used to humanize participants, record-site references that identify routines, summaries that describe children's reactions, and school or safety information entering civic narratives are not minor disclosure errors (Nissenbaum, 2010; Committee on the Rights of the Child, 2021).

The response begins with immediate removal, shielding, notice to guardians where safe and lawful, child-advocate review, staff discipline, public correction without further exposure, and suspension of any function that repeatedly risks minors. No public-power formation benefit outweighs child protection.

Outside review should test whether child protection can override adult preference, publicity pressure, donor interest, and record convenience. The audit should verify protected routing, release denials, advocate access, incident response, and corrective action without making the child publicly legible.

Consider ordinary parenting, not scandal. Homework, bedtime, illness, school conflict, custody logistics, childhood embarrassment, and affectionate dependence are precisely the areas a record system may treat as incidental. Child protection says they are not incidental to the child (United Nations, 1989; Committee on the Rights of the Child, 2021).

The child-protection test is whether a young person can grow without becoming evidence in an adult participant's public explanation. Childhood cannot be reconstructed later after searchable images, schedules, health clues, or family conflict have travelled. The City should prefer a partial public account, or no account at all, to a more complete narrative purchased with a child's present privacy and future autonomy (Committee on the Rights of the Child, 2021).

The concrete test examines a participant whose child appears in an event, message, school matter, custody question, or health-related schedule. The City should protect the child without requiring the child to justify that protection. Children are not public-power actors because an adult in their family accepted a civic role.

The intimacy objection begins where ordinary institutional language becomes most dangerous. Terms such as transparency,

accountability, and public interest can sound principled while swallowing sexual history, reproductive health, bodily exposure, private conflict, or another person's identity. The City needs purpose-specific rules before such material is ever captured or released (Citron, 2019; Nissenbaum, 2010).

35.6.2 — Intimacy Dignity Answer

The practical mechanism separates active public-power formation from intimate life. Intimate conduct is not public content. Relationship effects that matter for public-power formation may be handled through protected summaries, delayed review, restricted access, or professional evaluation, not voyeuristic release (Citron, 2019).

Partners and former partners retain their own rights. Their participation, refusal, complaint, counsel, privacy, and remedy routes do not depend on the participant's ambitions. No one becomes visible through affection, marriage, breakup, pregnancy, sexual health, or household proximity.

Partners, spouses, former partners, people dating participants, clinicians, reproductive-health professionals, and family members each retain separate rights and duties. The City must not reward a participant for disclosing more than the role requires or treat intimate exposure as proof of honesty. Transparency architecture is fair only when it protects a collateral person from another adult's desire to perform completeness.

The public rarely needs the intimate detail itself. It may need a role-relevant fact: a conflict of interest, misuse of power, coercion, a public contradiction, or an institutional failure. The

record should state that fact with the least exposure necessary and preserve the protected source material only under lawful, purpose-limited custody (Citron, 2019; Nissenbaum, 2010).

An intimacy breach calls first for release block, protected summary, expert review, lawful sealing, partner notice and remedy, staff discipline, and public correction. The City's honesty is tested by what it refuses to show.

A robust intimacy audit preserves restricted-access decisions, protected-summary substitutions, partner objections honored, clinical confidentiality findings, and releases refused because curiosity exceeded public relevance. These records make restraint visible without republishing what was protected. The institution should be able to disappoint an audience and explain the governing principle without apologizing for the existence of private life (Committee on the Rights of the Child, 2021; Nissenbaum, 2010).

A correction route is essential because intimacy-related error is unusually hard to reverse. Misidentification, misleading context, an obsolete claim, or a machine-generated inference can become a permanent reputational fact once indexed. Rapid restriction, human review, contextual correction, and propagation notice should therefore precede ordinary publication clocks (Citron, 2019; Nissenbaum, 2010).

The operational threshold asks whether a partner or intimate counterpart can stop being material. Their refusal, privacy, body, health, and dignity should not have to compete with the participant's wish for public vindication.

One concrete review follows an intimate conflict that affects a participant's formation but would humiliate another person if released. The City should ask whether a protected summary, delayed review, category note, or no release can preserve public relevance without violating bodily or relational dignity. If the public demands more, the City should resist. Public curiosity is often strongest exactly where public interest is weakest.

Family burden is not sentimental background. A participant's visible role can change household schedules, school routines, caregiving load, safety planning, travel, finances, conflict, emotional regulation, public attention, and the sense of home (Greenhaus and Beutell, 1985; Nissenbaum, 2010).

35.6.3 — Family Burden Answer

Household burdens must be counted without exposing the household. Before activation, the City should review partners, dependents, elders, disability needs, caregiving duties, custody orders, housing arrangements, emergency contacts, and support needs under protected conditions (United Nations, 1989; Greenhaus and Beutell, 1985).

Household protection requires consultation where appropriate, independent support for collateral persons, dependent-care plans, conflict mediation, emergency safety routes, privacy boundaries, and periodic burden review. Family support is not a favor to the participant; it protects nonvolunteers from carrying the Vow.

The closest exposure is borne by partners who did not seek public life, dependents whose routines change, elders needing care, disabled household members, former spouses, co-parents, and

relatives who become exposed through conflict. Their burdens may be hidden precisely because the participant's record is so visible.

Family burden often arrives through schedules and logistics rather than formal rules. A partner may absorb childcare, relocation, public scrutiny, emergency availability, social exclusion, or emotional decompression. The City must track those loads without converting the family into a participant record or assuming that support payments settle the burden (Greenhaus and Beutell, 1985; Westman, 2001).

City practice should answer with support adjustment, schedule change, dependent-care expansion, protected mediation, activation pause, participant de-loading, or exit. A City that makes families pay invisibly for public transparency has repeated the unfairness it was created to oppose.

Operational evidence includes household consultations, dependent-support adjustments, nonparticipant complaints, mediation outcomes, school-protection measures, and activation delays caused by family-burden review. The household is not background infrastructure for visible public formation.

A household review can reveal when City demands have become structurally unsustainable. The review should examine time, privacy, transport, schooling, care, safety, public attention, income dependence, and the family's ability to refuse further involvement. Its purpose is to change institutional conditions, not to evaluate the family's loyalty or resilience (Greenhaus and Beutell, 1985; Westman, 2001).

Family protection is real only when an objection can change City practice. If household feedback produces sympathy but no schedule change, shielding, support, or role review, the family has been heard without being protected.

A second operating test begins with a partner or caregiver who says the participant's schedule, record, relocation, public attention, or emotional strain has made ordinary household life unworkable. The City should not treat that person as obstructing civic purpose. It should count the burden, provide support where appropriate, adjust the role, pause activation, or reconsider participation. A fair record cannot be built on a private household quietly absorbing the cost.

Sensitive family and intimacy decisions require competence the institution cannot manufacture through confidence. Legal counsel, clinicians, child advocates, disability specialists, reproductive-health professionals, privacy experts, and trauma-informed reviewers need authority to interrupt a procedure, require a less-exposing route, or stop a release when collateral harm is plausible. Their disagreements and conflicts should remain in the decision record rather than being collapsed into a single institutional voice (Committee on the Rights of the Child, 2021; Nissenbaum, 2010).

35.6.4 — Professional Review Answer

Professional review should be protected from record appetite. A clinician's judgment, legal counsel, reproductive-health consultation, child-protection concern, or family-law review may shape institutional decisions without becoming public narrative.

Professional interfaces are safeguards, not content streams (Citron, 2019; Nissenbaum, 2010).

The institutional mechanism defines privileged or protected pathways, conflict rules, emergency exceptions, consent boundaries, documentation limits, and escalation routes. The City should know when it is permitted to receive a conclusion without receiving the details that produced the conclusion.

Professional review should be independent of the City office seeking access, release, or interpretation. Doctors, lawyers, therapists, clergy, counselors, mediators, teachers, and advocates should not be pulled into full exposure because they served someone near the City. Professional protection preserves the independence of care and counsel.

Professional boundaries are being overridden when staff press for source notes, public summaries of clinical or legal advice, waivers framed as proof of sincerity, or disclosure from relationships governed by independent duties. Professional judgment is not an obstacle to transparency; it is part of the rights architecture that keeps transparency lawful and humane (Committee on the Rights of the Child, 2021; Westman, 2001).

Repair may require a different reviewer, narrower purpose, stronger shielding, delayed action, corrected public status, compensation, or abandonment of the proposed use. The governing principle is data and narrative sufficiency: the City receives only what is necessary to perform its role and no more than it can protect. Responsibility does not require consumption of protected life.

The audit trail needs to show reviewer qualifications, conflict checks, expert disagreements preserved, delayed releases pending expertise, and escalation records when high-risk material exceeds staff competence. Expertise should be visible as a gate, not invoked after harm.

One adversarial scenario involves a conflict between institutional transparency and professional duty. A clinician, lawyer, teacher, clergy member, social worker, or child-safety professional may hold information the public wants but the City has no right to expose. Professional review should be empowered to block civic overreach.

Professional privilege and duty supply the decisive external test. Counsel, clinicians, educators, archivists, and other regulated professionals must be able to identify the rule that governs them, preserve confidentiality and independence, and refuse an incompatible City instruction without retaliation. When staff begin treating professional limits as obstacles to transparency, the role boundary has failed and the function requires suspension and redesign.

The daily operating test is a record touching custody, reproductive health, disability, trauma, legal counsel, clinical care, or a protected professional relationship. The City should not ask general administrators to improvise. Qualified review may slow release, narrow the record, or require withholding. The delay is not bureaucratic weakness. It is what prevents institutional confidence from trespassing into domains where specialized duties already exist.

35.6.5 — Nonparticipant Remedy Answer

Nonparticipant remedy must give collateral persons more than sympathy without requiring them to become participants, public figures, or theory objects. It should provide protected complaint intake and evidence submission, advocate support, privacy-preserving review, correction, shielding, lawful deletion, compensation where appropriate, apology, public correction where needed, and anti-retaliation protection. Remedy should reduce burden without multiplying exposure (United Nations, 1989; Nissenbaum, 2010; Citron and Solove, 2022).

Remedies should be designed for practical use. A family member in crisis, a host resident with limited time, a staff member fearing job loss, or a visitor embarrassed by exposure may not navigate complex procedures. The route must be plain, humane, and available in accessible formats.

The people at risk are those who never chose the burden: children, partners, ex-partners, dependents, visitors, host residents, professionals, staff, critics, volunteers, and public users. Their injury may be reputational, emotional, legal, financial, safety-related, or relational.

The remedy system must itself remain answerable. Pattern failures should trigger external audit, public summary where safe, and redesign of the route that caused harm. The City's fairness is measured by how people outside the Vow can make it stop hurting them.

Remedy is credible only when it can change the public or operational state that caused the harm. Remedy follows injury, not membership.

A serious pilot should rehearse a nonparticipant who was harmed by a lawful participant record. Even lawful records can misrepresent, pressure, or expose collateral persons. Remedy must reach harm, not only illegality (Citron and Solove, 2022). Remedy staff should be independent enough to act even when the participant or program leadership disputes the nonparticipant's account. Remedy notices should use a protected contact route so seeking correction does not create another exposure. A rehearsal should also test whether temporary shielding can be activated outside normal business hours, when delay may be most damaging.

The mechanism earns trust only when nonparticipants can obtain repair without becoming public examples. A complaint route that requires the injured person to narrate their injury publicly repeats the exposure in the name of remedy. The route should make emergency shielding available before final findings when continued exposure could deepen the harm. Where a derivative record spread the harm, repair should track the copies that can still be reached. The repair log should identify which downstream systems confirmed correction and which remain unreachable, so closure does not overstate what was fixed.

One case that exposes the design involves a former partner, staff member, neighbor, or visitor who finds themselves implicated in a record and wants repair without becoming more public. Intake should be simple and protective. The person should not need to

persuade the participant, perform trauma for the City, or navigate insider categories. A remedy route that protects the complainant's privacy is more important than one that protects the City's ease of explanation. The family objection changes the design because City accountability must stop at the edge of another person's life and still remain effective against hidden public-power influence. Completed cases should feed design review and record the preventive changes made. Aggregate review should distinguish recurring source failures from recurring propagation failures, because they require different prevention.

35.7 — Donors, Vendors, and Staff

The City's own support ecology can become the hidden pipeline of power. Money decides what can be built. Vendors decide what can be operated. Staff carry the daily burden. Host communities absorb spillovers. If these systems are hidden, the City will expose participants while concealing the conditions that shape them (Pfeffer and Salancik, 1978; OECD, 2025c).

This objection is especially important because capture often appears as help. A donor funds a program. A vendor solves a technical problem. Staff work longer to protect participants. A host community tolerates disruption because the project feels important. Burden moves quietly under the language of support.

Donors, vendors, staff, hosts, and auditors belong inside the fairness architecture. The City is not only what happens in classrooms, records, and public interfaces. It is also what happens in contracts, payroll, cleaning routes, procurement files, staff grievances, water use, emergency services, and local streets (OECD, 2017a; ISO, 2021c).

Donor capture begins when money buys influence without appearing as command. A donor may not write curriculum, choose participants, influence record release, shape public summaries, pressure replication, or obtain privileged access, yet still bend the City through dependency.

35.7.1 — Donor Capture Answer

Anti-capture finance is the operating answer. Gifts, grants, capital support, operating reserves, naming rights, access privileges,

emergency funds, and donor communications need limits, disclosure, conflict review, refusal authority, and contingency plans for withdrawal. Money must not become hidden governance (Pfeffer and Salancik, 1978; OECD, 2015).

A donor-integrity record discloses conditions, rejected conditions, conflicts, concentration risk, related-party transactions, advisory contacts, and remedial action. Public disclosure should inform without turning donors into saviors or participants into sponsored figures.

The immediate rights-bearing group includes participants who might feel indebted, staff whose salaries depend on funder preference, host communities promised benefits, and public users who may not see how financing shapes institutional priorities.

Donor capture is visible when programs bend toward a funder's interests, donors gain participant access, launch schedules accelerate under financial pressure, failures become harder to publish, or naming practices create moral ownership. The test is whether the City can refuse money without losing the ability to act independently (OECD, 2017a; INTOSAI, 2007).

The institution may need to refuse the gift, restrict or divest the relationship, conduct independent finance review, correct the public record, redesign reserves, or suspend the affected program. A City that moves burden upward cannot be financed by hidden leverage.

A serious donor review should examine both explicit conditions and the softer expectations carried by gratitude, access, naming,

and institutional dependence. A City that cannot refuse money cannot credibly refuse influence.

Donor capture often arrives without a written condition. A funder may expect access, naming, gratitude, influence, favored interpretation, or informal deference because everyone understands what the gift was supposed to mean. Conflict review, communication logs, naming limits, refusal authority, and governing-body recusal should treat that social expectation as seriously as contract language (ISO, 2021c; Pfeffer and Salancik, 1978).

The relevant acceptance condition asks whether the City can return money after becoming dependent on it. If refusal is possible only before acceptance, donor limits are moral aspiration rather than operating infrastructure.

Donor independence becomes visible when the City refuses a useful gift. A proposed wing, scholarship, archive tool, or public interface may be financially attractive while quietly shaping who is seen, which work is funded, what is released, or whose criticism receives attention. Recording the refusal, the reason, the decision owner, and the alternative funding consequence provides stronger anti-capture evidence than a general promise of independence.

Vendor capture is not only a technical problem. A food provider, security contractor, health platform, cloud service, archive system, translation vendor, construction firm, or public-interface provider can shape daily life and institutional possibility (OECD, 2015; OECD, 2017a).

35.7.2 — Contracting Vendor-Capture Answer

Procurement should disclose beneficial interests, conflicts, subcontracting, material dependencies, change rights, data access, intellectual-property limits, audit rights, termination assistance, and continuity obligations. A clean bid at award does not prevent capture through later amendments, proprietary lock-in, or emergency exceptions (OECD, 2025c; UNCITRAL, 2011).

Change control matters because vendor power often grows after selection. Material amendments should trigger independent review, conflict checks, updated risk assessment, and public explanation at the level the change warrants. Renewal should never become automatic because migration is inconvenient (OECD, 2025c; OECD, 2015).

Vendor failure reaches staff who must work inside proprietary systems, participants whose records depend on them, host residents affected by supply chains, and ordinary users whose interactions pass through vendor platforms.

Infrastructure continuity requires more than backup files. The City needs tested export formats, credential transfer, administrator independence, alternative hosting, replacement staffing, transition assistance, escrow where appropriate, and a funded exit plan. The vendor's failure, acquisition, policy change, or insolvency should not become the City's constitutional crisis (OECD, 2025c; Pfeffer and Salancik, 1978).

Vendor capture may require contract enforcement, replacement, open export, escrow activation, emergency procurement, public warning, and external technical review. The City may buy

services. It may not let a provider become the institution's hidden sovereign.

Public accountability requires visible evidence of procurement competition, data-export tests, emergency replacement drills, staff reports on tool burden, and public incident notices when vendor failure affects trust. Vendor usefulness should not become vendor rule.

Vendor accountability is tested when an employee sees a protected weakness before City leadership does. Vendor workers need complaint routes too, because subcontracted labor may be closest to infrastructure failure. Procurement ethics includes the voice of people inside the contract (McGoey, 2015; UNCITRAL, 2011).

The acceptance threshold asks whether vendor replacement protects affected persons during transition. Leaving a vendor should not break records, expose data, strand staff, interrupt care, or create emergency shortcuts that burden the people the City is supposed to protect.

Vendor power becomes visible when staff rely on a tool so deeply that criticism feels like a threat to daily operation. Review should test whether an alternative exists, whether data and logs can migrate, whether workflows can be rebuilt, whether proprietary categories are shaping judgment, and who carries service risk during exit. A system that makes inspection or replacement practically impossible has crossed from service into institutional power (NIST, 2024b; ISO/IEC, 2023).

Staff exploitation is the easiest hidden burden for the City to miss because staff make the institution appear humane. The objection is answered only if workload, privacy, complaint, influence, recovery, and labor protections remain visible across roles (Institute of Internal Auditors, 2020; International Labour Organization, 2022a).

35.7.3 — Staff Exploitation Answer

Staff dignity must function as infrastructure. Staffing ratios, pay, schedules, rest, training, complaint rights, anti-retaliation, union or worker-representation compatibility where lawful, safety protections, psychological support, role boundaries, and workload audits should be in place before participants arrive (ISO, 2021b; Edmondson, 1999).

Staff records should distinguish role accountability from full-life exposure. A staff member's professional conduct may be reviewable. Their private life does not become public because they work in a transparent institution. Staff should not be made visible to make participants seem supported.

The direct burden reaches contractors and low-status workers as much as senior professionals. A City that protects mentors while exhausting cleaners, security guards, cafeteria workers, or archive processors is not carrying burden fairly.

The labor objection succeeds when visible participants are sustained by invisible harm to workers. Unpaid overtime, high turnover, fear of complaint, emotional depletion, opaque outsourced labor, and public materials that erase the people holding the City together are evidence of downward burden

transfer (Reich, 2018; World Health Organization and International Labour Organization, 2022).

The response may require workload reduction, hiring correction, pay adjustment, rest protection, grievance investigation, contractor sanctions, and safe aggregate reporting of labor conditions. The City's first labor ethic is that no one becomes scenery for transparency.

A reviewer outside the implicated chain should be able to verify workload audits, staff complaints, staffing-ratio gates, overtime reductions, anti-retaliation findings, and admissions slowed because labor capacity was not ready. A calm public interface can hide a tired workforce unless the City makes labor visible to review.

Staff exploitation may hide inside devotion to the mission. The City should not rely on personal devotion to detect exploitation. Workload data, complaint access, peer review, and outside labor inspection should catch what loyalty conceals (Power, 1997; ISO, 2021b).

The operative threshold asks whether staff can criticize the City without being framed as insufficiently committed. A labor complaint is not a betrayal of the mission. It may be the mission telling the truth about itself.

Hidden labor becomes visible in the quiet night after a public day: participants are recovering, public pages look orderly, and staff are still correcting metadata, preparing meals, securing doors, cleaning rooms, answering anxious families, or resolving access errors. If that labor is invisible to governance, the City has hidden

a burden. Staff dignity requires the institution to count labor before it praises transparency.

35.7.4 — Host Burden Answer

Host burden asks whether the surrounding community pays for the City's ambition. Traffic, housing pressure, water use, policing demand, emergency services, protest management, tourism, media presence, labor displacement, land-value changes, and political stigma can all land outside the campus (Ostrom, 1990; OECD, 2017a).

The answer has to be built through local review with standing. Host residents, local officials, service providers, disability advocates, environmental reviewers, schools, small businesses, emergency responders, and community organizations need routes to inspect burden, object, propose conditions, and trigger review (Pfeffer and Salancik, 1978; OECD, 2015).

Host review should be specific rather than ceremonial. It should examine utilities, transportation, housing, emergency response, environmental impacts, local labor, public gathering, protest space, media overflow, record-site interaction, and local complaint history. A town hall after decisions are settled is not local legitimacy.

Standing belongs to people who may never read the book. A bus driver, clinic scheduler, neighbor, school principal, protest marshal, water authority worker, or local tenant may feel the City before they understand its theory.

Host legitimacy has collapsed when the surrounding community becomes a backdrop. Local inconvenience treated as public-

service sacrifice, prestige overriding objections, unmanaged tourism, strained emergency services, and rising costs dismissed in the name of higher purpose all show that consent has been replaced by institutional self-importance (OECD, 2017a; INTOSAI, 2007).

The City may need mitigation funding without donor capture, operational limits, host review, traffic redesign, service agreements, public notice, an admissions pause, or site rejection. The City cannot be fair by displacing burden into the place that hosts it.

A reviewable host file should contain service-use data, traffic and event impacts, utility burdens, complaint patterns, compensation or mitigation decisions, emergency-service agreements, and objections that changed the design. Host review should be able to alter the campus, not merely comment on it.

Host-community recourse cannot depend on the City's goodwill. Residents need notice, understandable information, accessible hearings, challenge routes, monitoring data, named decision owners, mitigation duties, and remedies that can alter operations. A host relationship is credible only when local objection can change the project (UNECE, 1998; Ostrom, 1990).

The controlling test asks whether host review can slow or limit the City. A community process that cannot affect operations is outreach, not accountability.

A concrete test involves a neighborhood experiencing traffic, rent pressure, noise, protest overflow, water strain, emergency-service demand, or media disturbance while the City speaks about public

trust. Local inconvenience is not automatically decisive, but it is evidence. A host review route should be able to force mitigation, schedule changes, expansion delay, or site redesign. The host is not obligated to subsidize symbolism.

A credible outside audit inspects donor refusals, vendor replacement drills, staff grievance patterns, overtime, host complaints, procurement exceptions, and corrective actions that imposed real cost on the institution. Donors, vendors, staff systems, and host relationships each create conflicts that internal reassurance cannot resolve.

35.7.5 — Audit Answer

The audit mandate spans the City's actual dependency system: money, procurement, labor, records, privacy, complaint routes, public artifacts, technical infrastructure, host burden, child and family protection, retaliation, and separation among capture, release, research, and model use. Red teams need access, independence, protected reporting, follow-up authority, and permission to find a result serious enough to stop the function (UNCITRAL, 2011; Institute of Internal Auditors, 2020; IIA, 2024).

Auditors must be independent enough to report against leadership interests. They need access to evidence, protection for whistleblowers, publication rules, appeal routes for affected persons, and the ability to recommend pause, suspension, or decertification.

A cosmetic audit harms critics who supply evidence, staff who risk retaliation, participants whose pathways may be interrupted,

and a public that needs trustworthy summaries. Audit should protect people, not merely certify procedure.

Audit has become theater when findings cannot change conduct. Predictable conclusions, inaccessible reports, friendly reviewer selection, restricted evidence, absent follow-up, and reassuring public summaries indicate that the institution is displaying inspection rather than submitting to it (Rose-Ackerman and Palifka, 2016).

A compromised audit requires auditor replacement, expanded scope, public correction, whistleblower protection, board-level review, regulatory consultation where applicable, and an operational pause for severe findings. The City should fear hidden burden more than unfavorable audit language.

External assurance should expose adverse findings, conflicts, missed deadlines, repeat observations, weak corrective action, audit-of-audit results, and pre-scandal sanctions. Reviewer independence is credible only when access survives disagreement and findings trigger consequences without leadership invitation (Institute of Internal Auditors, 2020; IIA, 2024).

Repeated small findings form a pattern: missed redactions, delayed complaints, overtime spikes, or vendor-access anomalies may each be repairable, but recurrence demands detection (Reason, 1997; Weick and Sutcliffe, 2015).

Audit independence turns on equal access to the attractive and the boring parts of the institution. Institutions often hide failure in paperwork, maintenance, scheduling, procurement, and queue backlogs, not only in dramatic events. Audit sampling should

revisit repaired areas later to test whether the same burden returned under a new label, vendor, or workflow.

An auditor who finds retaliation fears, drifting release decisions, recurring host complaints, or excessive vendor access must issue findings with corrective deadlines and refer urgent restrictions to the body holding stop authority. Reporter protection must remain available through an independent route. The responsible bodies must implement the remedy, and the auditor must verify closure without auditing its own operational decisions. If leadership can praise the report and continue unchanged, inspection is ritual. The practical test is whether rights, host standing, audit independence, and stop authority survive success. Public audit status should identify unresolved recommendations, the responsible decision-maker, and the reason they remain open.

35.8 — "The First City Will Drift Before It Replicates"

The last objection concerns time. A City may begin with clear boundaries and still drift before replication. Success can be more dangerous than failure because success attracts admiration, money, excuses, urgency, and defenders who do not want the story interrupted (Mahoney and Thelen, 2010; Ebrahim et al., 2014).

This final red-team question connects accreditation to the problem of institutional drift. Drift recognition, accreditation, decertification, failure memory, and no scale without correction are not bureaucracy. They are the difference between a City that can learn and a City that becomes a shrine to its own first version (Reason, 1997; Sitkin, 1992).

Drift is gradual failure with a friendly face. It begins when an exception becomes convenient, a label becomes flattering, a delay becomes normal, a reviewer becomes loyal, a public artifact becomes promotional, or a participant's story becomes too useful to interrupt.

35.8.1 — Drift Recognition

The first defense is naming drift early. The City should keep a living drift register for privacy creep, record-stage collapse, staff burden, donor influence, vendor dependence, family exposure, public-interface spectacle, credential halo, legal overclaim, and replication pressure (Mahoney and Thelen, 2010; DiMaggio and Powell, 1983).

Affected persons may detect drift before leadership does. Staff, participants, families, host residents, critics, journalists, auditors, and vendors under pressure should have protected routes to report small failures before they become institutional culture.

Drift recognition has failed when the first City treats criticism as betrayal rather than information about the design. Defensiveness, language cleanup without mechanism change, exclusion of critics from review, and success metrics used to silence caution are early signs that prestige is outrunning correction (Reason, 1997; Columbia Accident Investigation Board, 2003).

The first response is drift review, public correction where safe, standards revision, staff retraining, operational pause, and escalation to the accreditation authority. A City that cannot recognize gradual failure will eventually call failure tradition.

Drift detection begins with ordinary operational residue: exception logs, repeated near misses, staff warnings, public misunderstanding reports, delayed-audit notices, unresolved conditions, and red-team findings. These signals should be reviewed across time and across sites before any single event is explained away as local variation. Drift is most dangerous while each deviation still appears small enough to normalize.

The practical design appears in praise. The more the first City is admired, the harder it becomes to hear weak signals. Drift recognition should be strongest when confidence is highest, because reputation can sedate review (Aarons et al., 2011; Skivington et al., 2021).

Near-miss recording is one of the clearest tests of drift recognition. A breach prevented at the last minute, a release almost made, a staff warning barely heeded, or a donor condition quietly rejected should enter failure memory before it becomes a larger event.

Another operational test is a pattern of small exceptions: one urgent release, one donor meeting, one delayed complaint, one public summary that stretches status, one staff shortage accepted as temporary, one protected category handled informally. None is dramatic. Together they describe drift. The City should have a regular practice of reading its exception log as moral evidence, not as administrative clutter.

35.8.2 — Accreditation Answer

The first City should not accredit itself by origin. It must pass the same or stricter review applied to later Cities. Firstness gives history, not immunity. The founding site may be the place where the most dangerous habits appear because admiration accumulates there first (Perrow, 1984; Vaughan, 1996).

The accreditation record should examine adult voluntary entry, role-bound active record, ordinary privacy, protected nonvisibility, staff dignity, child protection, record-stage separation, Artificial Intelligence subordination, vendor independence, donor limits, host burden, exit, and complaint routes.

Accreditation should remain provisional enough to be challenged by the people affected by the accredited function. Participants, staff, families, host residents, public users, and critics should be

able to submit evidence. The review should not rely only on leadership reports or curated site visits.

Accreditation has become a prestige badge when standards merely describe what the first City already does, reviewers are chosen for loyalty, reports contain no meaningful adverse findings, or status language migrates into donor marketing. An accreditation regime that cannot surprise its founders is not independent (Damschroder et al., 2009; Moore et al., 2015).

Accreditation failure requires more than reputational concern. The response may include independent standard revision, reviewer rotation, a public warning, narrower scope, corrective conditions, suspension of affected functions, or loss of standing. Accreditation earns value by making admiration harder to misuse and by giving noncompliance a consequence that cannot be negotiated away through prestige.

The accreditation file should show conditional standing, unresolved-risk disclosures, reviewer dissent, site-specific limits, corrective deadlines, appeal routes, and application of the same standard to the founding City. Readers need to distinguish accredited scope from unreviewed activity and current standing from inherited reputation. The mark constrains prestige only when its limits travel with it.

The most revealing case is the founding City failing a later standard it helped inspire. An independent accreditor must be able to state that the origin site no longer qualifies, identify the affected scope, protect people during transition, and set the conditions for restoration or closure. If firstness shields the first City,

accreditation has become a shrine mechanism rather than a discipline (Staw, 1976; Meyer and Rowan, 1977).

Accreditor governance must itself be inspectable. Funding, conflicts, reviewer selection, standards, evidence access, decision reasons, appeals, conditional marks, suspensions, and revocations should be available in a form that protects affected people without hiding institutional dependence. Every condition needs an owner, deadline, verification method, and stated consequence if it remains unmet.

The ordinary-day test is the founding City itself seeking renewal after praise has made criticism harder. Accreditation should ask the same questions it would ask of a less famous site. Has privacy held? Has exit worked? Are staff safe? Has host burden changed? Are technical systems subordinate? Are families protected? A standard that bends for the original will eventually bend for every powerful copy.

35.8.3 — Decertification Answer

Decertification is the answer critics should demand before replication is trusted. If a City can keep the name no matter what it becomes, the name is not a safeguard. It is a shield for drift (Perrow, 1984; Vaughan, 1996).

Decertification removes or narrows standing when failures are severe, repeated, concealed, uncorrected, or incompatible with core invariants. Decertification can apply to the whole City or to functions such as admission, archive release, public interface, corridors, office hosting, or accreditation authority (Sitkin, 1992; Chambers et al., 2013).

The decision record should state what failed, who was affected, what evidence was reviewed, what safeguards were breached, what remedies were attempted, why lesser action failed, what public warning is required, and how participants and staff will be cared for afterward.

Decertification affects participants, staff, families, hosts, donors, vendors, governments, and public readers who may have relied on the City's status. Participants need safe transfer or exit. Staff need labor protection. Families need continuity. Host communities need explanation. Public users need clarity about which records remain reliable.

Decertification is fictional when probation never ends, severe harm receives only private correction, leadership negotiates status after the fact, or reviewers fear that removal will damage the project's image. A standard without a credible loss-of-standing route is an endorsement system, not a safeguard (Leveson, 2011; Selznick, 1949).

Decertification matters only if the institution is willing to use it against itself and its allies. Losing standing can protect participants, workers, hosts, readers, and later sites while teaching the network what the name no longer guarantees. Severity is the point: the credible possibility of losing the mark prevents origin, scale, and reputation from becoming mythology.

The evidentiary test is procedural: tabletop decertification drills, public standing notices, transfer plans, contract clauses permitting loss of status, and examples where reputation did not block removal. The name means little if it cannot be withdrawn.

Pilot review should rehearse decertification during public admiration. The hardest City to remove may be the one that still looks inspiring. The decertification route must protect affected persons against the public's desire to keep believing (Ebrahim et al., 2014; Weick and Sutcliffe, 2015).

A decertification rule is meaningful only if it can be used against the first and most admired City. Participants, staff, families, host residents, and record subjects need orderly protection after decertification, because institutional failure should not become their second injury.

A tabletop exercise in which the most admired site violates a core rule exposes the design. Participants need care, records need stabilization, staff need protection, the public needs warning, and the name may need withdrawal. If the exercise feels politically impossible, decertification is not ready. The City should practice losing standing while no one is yet being harmed by the delay.

Failure memory belongs to the institution's public learning architecture. A privacy breach, staff retaliation pattern, public artifact mistake, family exposure, donor pressure, vendor dependency, or host burden failure should become a design lesson that travels (Sitkin, 1992; Chambers et al., 2013).

35.8.4 — Failure Memory Answer

The operative mechanism is a failure memory system governed by privacy and dignity. It records categories of failure, conditions that enabled them, affected groups, safeguards that did not work, remedies tried, unresolved questions, and standards changed. It does not turn harmed people into exhibits (Skivington et al., 2021;

Mahoney and Thelen, 2010).

A usable failure record preserves causes, warning signs, affected-person accounts where consent and safety permit, failed safeguards, correction attempts, reviewer disagreement, consequences, and re-review conditions. A future City should be able to determine whether a local design resembles a known failure without exposing the people who first endured it.

The rights-holders most directly implicated include those harmed by earlier failure and those protected by later learning. The City owes the first group dignity and remedy. It owes the second group memory strong enough to prevent repetition.

Failure memory has been captured by reputation management when settlements remain private without pattern review, lessons become vague, public summaries erase severity, or leaders call a general mechanism a local anomaly. The archive then preserves innocence instead of learning (DiMaggio and Powell, 1983; Reason, 1997).

The response to a failure-memory breach may include removal of identifying detail, corrected summaries, access restriction, apology, and redesign of how cases are used. Failure memory is not punishment. It is the refusal to let future people pay for the institution's embarrassment.

Pilot evidence should preserve protected failure files, public summaries, recurrence checks, affected-person review, updated standards, and network alerts that prevent the same injury from being repeated elsewhere. Memory should protect the future without displaying the people who paid for the lesson.

One predictable test is leadership turnover. New leaders may want a fresh start, but affected persons live with old injuries. Failure memory should be durable enough that no new administration can erase inconvenient lessons by changing tone (Columbia Accident Investigation Board, 2003; Aarons et al., 2011).

Acceptance turns on whether later designs can point to specific failures they avoided. A lesson that cannot change a future floor plan, release rule, vendor contract, staffing ratio, or accreditation condition has not become memory in the operational sense.

A grounded test begins with a privacy breach or family-burden failure that leadership wants to summarize vaguely to protect trust. Trust is not protected by vagueness. The City should publish what can be published, protect those harmed, preserve source lessons, update standards, and tell other sites what would prevent recurrence. Failure memory is the opposite of spectacle because it learns without displaying injury.

35.8.5 — No Scale Without Correction

Scale is prohibited when correction cannot travel. Replication cannot proceed because the first City is admired, funded, beautiful, politically useful, or emotionally compelling. Growth waits for safeguards that have survived use and for failures that have produced correction (Skivington et al., 2021; Mahoney and Thelen, 2010).

Expansion is governed by a noncompensatory gate, not a growth target. It tests correction latency, resources, local authority, humane load, privacy, records, child and family protection, staff dignity, host legitimacy, donor and vendor independence, legal

compliance, Artificial Intelligence subordination, complaints, exit, suspension, and decertification readiness (Meyer and Rowan, 1977; Perrow, 1984).

The expansion record must pair successes with pauses, failures, refused sites, unresolved decisions, staff and host findings, artifact corrections, breaches, repairs, remaining uncertainty, and stop conditions. Recording only growth turns expansion into a misleading artifact.

Scale pressure becomes coercive when public language suggests every region should adopt the City, refusal is backward, participants deserve office, the network proves the Formal Law, or the first City has solved public trust. Replicable institutions invite examination rather than obedience. Admiration, urgency, or early success must never become an obligation to reproduce the institution elsewhere (Vaughan, 1996; Damschroder et al., 2009).

Replication drift may require refusal to scale, public correction, tighter standards, decertification, and protection of local refusal. The City's strongest defense is humility backed by institutional authority to stop. Growth that cannot wait for correction is not evidence of success; it is momentum seeking moral language. Delayed replication can therefore demonstrate discipline rather than weakness.

The public record should disclose delayed replication, paused admissions, withdrawn launches, unresolved risks, dissent, and expansion denials. An institution unable to disappoint supporters

will be governed by their enthusiasm, especially when demand exceeds its capacity to learn.

Demand for a second City may feel urgent, and supporters may describe delay as irresponsible. Yet urgency without correction simply exports unfinished problems in a new form (Moore et al., 2015; Staw, 1976). The network proves its maturity when it can refuse growth while staff strain, privacy failures, family complaints, technical dependencies, or unresolved harms remain active. Trust is worth more than expansion purchased through preventable risk. The final answer turns objections into evidence requirements, defeat tests, remedies, and consequences. Serious objections must change architecture, protect a person, move authority, or close the proposal. The final objection is valuable because it forces the City to remain alterable: replication should follow earned confidence in the safeguards, not attachment to the first design.

Chapter 36 — Answerability, Not Triumph

The final Chapter opens in a review room rather than at a ribbon-cutting. Participants, staff representatives, family and host delegates, critics, auditors, and the owners of adjacent project domains sit around the same table with authority to say what remains, what changes, and what ends. Their task is not to admire the City. It is to determine whether every power, record, promise, protection, and handoff still has an answerable owner.

Ten ordinary objects lie before that assembly: a threshold, a protected room, a record label, a hearing docket, a classroom draft, an office-boundary file, an audit report, a lifecycle budget, a stop decision, and an exit plan. Together they reveal more than a skyline or mission statement. They show whether the City has become a built civic institution whose boundaries can be walked, questioned, corrected, and, when necessary, closed.

One question continues to govern the whole design: where does burden land while public power is being formed? The City contributes only when greater scrutiny follows chosen public responsibility and when the institution itself carries the costs of privacy, care, correction, host reciprocity, and safe exit. It fails when nearby people become involuntary payers or when institutional prestige makes their objections harder to hear.

Answerability is necessary because the City's strongest features are also its most dangerous. A full active record can become surveillance. An archive can become an identity authority. Formation can become credential caste. Support can become dependence. Public explanation can become mythology. Replication can become expansion before learning.

Answerability is therefore an operating arrangement, not a virtue claimed at the end. Participants need routes to pause and leave. Staff need labor rights and anti-retaliation. Families and children need protection before exposure. Host communities need standing. Public users need provenance and correction. Review bodies need power to inconvenience leadership.

The ending preserves the series architecture by returning every borrowed question to its proper owner. Receive, apply, and return is not editorial etiquette; it is the jurisdictional discipline that keeps one coherent institution from becoming a master explanation.

Without clean handoffs, coherence would become expansion. The City could begin to speak as though Government should obey it, law should ratify it, voters should prefer it, science should confirm it, religion should bless it, ordinary life should imitate it, material systems should fund it, transition should accelerate it, or utopia should be defined by it. The final synthesis replaces that inflation with thresholds a reader can inspect.

The closing must remain legible to supporters and skeptics at the same time. Supporters need to hear that admiration is not authorization. Skeptics need to see that design has not been confused with destiny. Every detachable summary should preserve voluntariness, ordinary privacy, rights, review, real exit, domain limits, and failure conditions.

The people most likely to disappear beneath participant visibility return to the center. Staff may be exhausted by another person's formation. Families may inherit scheduling, anxiety, reputational

spillover, or care work. Children may be exposed through proximity. Host residents may carry cost, displacement, or symbolic burden without choosing the project.

The City's dignity is tested in those consequences. If less powerful people become invisible infrastructure, the project fails even when participants appear more accountable. If rights become administrative inconvenience, the project fails even when records are complete. If correction depends on goodwill, the project fails even when intentions remain sincere.

The forbidden futures can now be expressed as observable stop conditions. Ordinary-life surveillance, practical captivity, coerced belief, spectacle, proof inflation, shrine logic, network empire, elite caste, donor monument, vendor platform, and substitution for democratic authority each name a pattern that can be detected in records and consequences. Once such a pattern appears, the question is which function must be corrected, narrowed, decertified, or closed, not how to preserve the City's image.

The final synthesis can still be hopeful. Public-power formation may become more knowable; chosen role burden may move scrutiny upward; ordinary life may remain private; records may become more correctable; and staff, family, and host burdens may become visible before they harden into custom. These gains are modest beside the scale of public power, but they are consequential because they make earlier correction possible.

A mature City would keep its operating statement available to participants, workers, applicants, families, host residents,

journalists, auditors, critics, visitors, and people who never enter. That statement would explain what the City contributes, what it refuses, who can challenge it, which records can change, which alternatives remain available, and who can halt a function. Public understanding becomes part of answerability when the routes are clear enough to use without insider permission.

The Chapter is best remembered as a constraint on future confidence. The City closes by promising neither triumph nor innocence, but an institution that remains inspectable, contestable, correctable, and stoppable. It accepts that fidelity may require the design to become smaller, quieter, fundamentally different, or finished. The reader remains free to reject the proposal, borrow only its safeguards, or demand a better institution.

36.1 — The City in One View

The City in one view is not a skyline or a heroic image of a transparent leader. It is the connected set of thresholds, rooms, records, hearings, classrooms, office boundaries, audits, budgets, stop files, and exits through which adults may voluntarily prepare for substantial public power while ordinary life remains protected. That definition matters because every attractive summary must preserve the objects that make refusal, correction, and lawful handoff real (Bovens, 2007; Meijer, 2009).

The final macro view has five parts. The City is built, not merely imagined. Entry is adult and voluntary, not inherited by citizenship or proximity. The record is full while active within the chosen public-power formation role, not unlimited release of a whole person. Ordinary privacy remains protected. Answerability remains operational rather than ornamental.

The section also gives future readers a way to test every simplified description of the City. If a summary omits voluntariness, it is unsafe. If it omits ordinary privacy, it becomes surveillance. If it omits record-stage discipline, it becomes spectacle or data extraction. If it omits correction, it becomes propaganda. The one-view definition is therefore an anti-misuse instrument (Ostrom, 2010; Bovens, 2007).

The governing rule must remain built enough to inspect and bounded enough to refuse. It is shaped by rooms, schedules, corridors, staff ratios, food systems, health support, access gates, public interfaces, archival custody, visitor rules, security paths,

recovery spaces, and the legal envelope around them. A campus is not decoration here. It is the physical grammar of burden.

36.1.1 — Built Civic Institution

Calling the City built also prevents it from becoming a mood or brand. A slogan can say that public leaders should be more transparent. A built institution must decide who cleans the hall, who can enter the archive, how a staff member complains, how a family visit is shielded, where a journalist stands, where an emergency vehicle goes, and which record is sealed pending review. Fairness becomes testable at the level of operations (Bovens, 2007; Fox, 2007).

Approaching the City should feel like crossing a defined civic threshold, not entering a moral hierarchy. Construction workers, host residents, staff, clinicians, teachers, security teams, visitors, counterparties, journalists, critics, applicants, families, and ordinary citizens encounter different boundaries and carry different risks. Any final definition centered only on participants would conceal the support ecology that makes visible formation possible. Institutional honesty begins by naming the people whose labor, land, privacy, and care hold the City up.

Jurisdiction is as important as architecture. The City forms people for substantial public power; it is not ordinary citizenship, a universal civic camp, a religious settlement, a research colony, a private prison, or a campaign resort. That boundary tells builders what to design and tells critics where to look. If the institution cannot explain why a function belongs to public-power

formation, the function should not be smuggled in under the City's name.

A built institution is credible only when its safeguards change physical and administrative reality. Site selection, host review, labor standards, procurement, environmental impact, access routes, archive design, AI procurement, and emergency planning must leave reviewable traces. A City cannot make participants visible while keeping its own formation hidden. Its first public-power record is the record of how the City itself was made (Ostrom, 2010; ISO, 2021c).

Built-institution failures require physical and administrative repair, not rhetoric alone. A dangerous corridor is redesigned. A labor violation triggers a procurement response. A host-community burden opens local review. A privacy weakness closes an access path. A record-site defect stops release. A civic institution is answerable because its mistakes can change walls, gates, routes, schedules, contracts, staffing, and authority.

A final inspection of the built City should therefore look less like a ribbon-cutting and more like a walk-through with people who can stop the tour. The facilities manager should be able to name maintenance weak points, the ombuds should be able to show complaint intake, the host reviewer should be able to point to mitigation records, and the archivist should be able to separate source custody from public interface. The building is fair only when those practical routes are as real as the public halls.

That is why the final definition should include mundane evidence. A locked maintenance closet, a bilingual complaint form, an

accessible path around a crowded hall, a procurement disclosure, a shaded waiting area for visitors, and a clearly marked protected zone may do more to demonstrate buildability than a visionary rendering. The institution's ethics are written into practical details (Lindberg, 2013; Ostrom, 1990).

The City's entry condition is adult voluntary burden. No child is recruited into the Vow. No family member inherits the Vow by relationship. No staff member carries the participant's full active record. No ordinary resident becomes visible because a future office-seeker wants formation. Voluntary entry is the line between public-power discipline and civic coercion.

36.1.2 — Adult Voluntary Burden

Practical voluntariness is tested over time, not only at entry. Housing, care, debt relief, status, relationships, professional opportunity, or fear of public interpretation can make exit formally available but materially punishing. The City must maintain cooling-off, pause, independent advice, transition support, and a dignified return to ordinary life (Deci and Ryan, 2000; Hirschman, 1970).

First-order risk falls on applicants with weak alternatives, participants whose support depends on continued status, families whose housing or care arrangements change, and nonparticipants who may feel indirect pressure to join. Partners, dependents, elders, employers, clients, professional counterparties, and family members can all be affected before activation. The decision file must therefore include household and livelihood consequences,

refusal capacity, independent advice, and a route to pause when the Vow would reorganize lives that did not choose it.

Public-power formation is the City's role. The participant accepts additional burden because the participant seeks authority that can affect others. That burden is not a badge of higher worth. It is not a spiritual purification. It is not a pathway for ordinary people to prove virtue. It is a role-specific cost attached to a role-specific ambition.

The operating record for adult voluntary burden begins at application and changes at activation. Applicant privacy protects people before acceptance. Review before activation protects capacity and informed refusal. Activation marks the public-power threshold. Exit or de-loading protects reversibility. Each stage needs different records because consent before acceptance, consent before activation, and consent during visible life are not the same event (Schedler, 1999; Meijer, 2009).

The decisive failure is any pathway that makes entry socially coerced, economically trapped, reputationally mandatory, religiously pressured, politically required, or functionally irreversible. When such a pattern appears, the City must pause admission and repair the pathway. A voluntary institution that cannot preserve refusal has begun to imitate the very hidden power it was built to challenge.

The City also has to respect the person who decides that the burden is not for them. An applicant who withdraws after learning the real cost should not become a failed candidate, a coward, or a public anecdote. The refusal file should be protected, the reason

should not be harvested for publicity, and the person should be able to return to ordinary life without a shadow record following them through employers, parties, platforms, or future relationships.

The full active record is the City's central participant burden. While active, a participant has no authorized off-record public-power formation life. Deliberation, instruction, influence, revision, office preparation, public interface, crisis training, and role-relevant conduct must be captured and governed through the record lifecycle. The point is not curiosity about the person. The point is answerability for the formation of power.

A signature at entry does not secure voluntariness across time. Health, income, family responsibility, reputation, dependency, and the availability of ordinary work can all change the cost of refusal or departure. The City must therefore monitor exit conditions independently, provide care and support continuity, preserve a viable return path, and avoid treating continued participation as proof of satisfaction. The Vow remains chosen only while alternatives stay real enough that withdrawal is not reserved for the wealthy, healthy, or socially insulated (Deci and Ryan, 2000; Hirschman, 1970).

36.1.3 — Full Active Record

Full active record is not unlimited public release. Capture, custody, access, redaction, delay, public bundle, interpretation, correction, reply, research use, AI training, retention, sealing, and time review are separate stages. The City fails if it collapses those stages into one bright word called transparency. The public needs

accountable memory, not raw exposure (Bovens, 2007; Fox, 2007).

The full active record affects participants and everyone incidentally caught near them. A mentor's advice may belong in an influence log, while a clinician's private care belongs under protected review. A family conversation may affect scheduling without becoming public theater. A visitor's incidental image may trigger redaction. Full active record applies to the participant's role burden; it does not erase collateral-person dignity.

Public-power formation can be subtle, so the boundary must be visible before any status claim hardens. A quiet dinner with a donor, a staff suggestion, a draft revision, a simulated crisis decision, a private message about office strategy, a favor offered through a family connection, or a recurring advisor influence can shape power. The record must be strong enough to see formation without becoming a license to expose life that does not belong to formation.

A record-stage passport should travel with every material record item. A captured archive item should not be described as public. A public bundle should not be described as whole truth. A machine summary should not be described as judgment. A readiness release should not be described as entitlement. Labels are not cosmetic. They are the language by which the City refuses archive-as-authority (Ostrom, 2010; International Council on Archives, 1996).

A failure condition appears when hidden formation becomes normal or when public release outruns lawful shielding. If participants are able to route influence through unrecorded channels, the City has lost the active-record burden. If the City publishes protected life to satisfy public fascination, it has lost the dignity boundary. Both failures require correction, notice, remedy, and possible pause.

A good record office would train readers as much as it records participants. It would teach the difference between a source item, a delayed item, a protected summary, a public bundle, a correction, a reply, and a research-forbidden artifact. That literacy is part of the safeguard. If the public learns to treat every visible fragment as final truth, the record site has failed even if its storage system is technically accurate.

The full active record should also preserve silence honestly. A pause for sleep, counsel, clinical care, child protection, or protected recovery is not off-record evasion when it is lawfully classified and reviewable. The archive should be able to say that protected time occurred without turning that protection into public exposure. That distinction keeps the record strong without making it cruel (Lindberg, 2013; Ostrom, 1990).

36.1.4 — Ordinary Privacy

Ordinary privacy is the other half of the City's definition. The City moves burden upward toward people seeking public power; it does not move visibility downward onto ordinary citizens. A society does not become fairer by watching everyone. It becomes

more answerable by placing heavier public burdens on those who seek authority while protecting those who do not.

Ordinary privacy remains the default condition around the City. Neighbors, family members, staff, visitors, critics, clinicians, counsel, contractors, and people encountered in daily life do not become public material by proximity. Record systems should therefore minimize incidental capture, separate role-relevant facts from personal context, and provide remedy before unwanted visibility becomes durable (Nissenbaum, 2010; Solove, 2006).

Participants also retain ordinary privacy in domains that lie outside active public-power formation and remain protected by law and dignity. Health care, counsel, intimacy, child care, family grief, reproductive health, disability support, and safety needs require protected nonvisibility categories. Protected nonvisibility is not secret public-power formation. It is the dignity floor without which the record becomes cruelty.

Ordinary-privacy review is chiefly a filtering and remedy process. Incidental capture must be reviewed. Protected categories must be labeled. Public bundles must remove or summarize collateral material. Affected persons need a way to find out when they were exposed, to object, to seek correction, and to obtain remedy where harm occurred.

A host resident passing an open public interface clarifies the boundary. That person should not become searchable in a participant's record. A staff member helping a participant after a panic episode should not become an object of public fascination. A spouse's refusal to appear should not be treated as obstruction.

Ordinary privacy means the City builds filters before exposure, not apologies after it (Schedler, 1999; Meijer, 2009).

The operative privacy failure is any pattern in which ordinary people become more observable because the City exists. Cameras, access logs, public tours, donor materials, AI search, or record-site interfaces that make nonparticipants easier to identify, profile, shame, or follow require immediate channel restriction, affected-person notice, repair, and independent review. The burden direction is restored only when the practice stops and downstream copies or inferences are addressed.

The final definition should therefore be usable by a skeptical neighbor who asks one practical question: will I be easier to watch because this City exists? The answer must be no in architecture, data policy, visitor routing, public summaries, Artificial Intelligence search, public events, and emergency procedures. Ordinary privacy is not established by a paragraph. It exists only when the City creates no new route for making nonparticipants legible.

Ordinary privacy should be defended even when the ordinary person criticizes the City. A protester outside the gate, a journalist investigating defects, or a neighbor angry about traffic should not lose privacy because they are inconvenient. The City's restraint is most credible when it shields people who are not sympathetic to it (Dewey, 1927; Bovens, 2007).

36.1.5 — Operational Answerability

Operational answerability means that correction can reach the places where the City actually operates. It is not enough to say the

City values accountability. A person must know where to complain, which record will be created, who reviews the complaint, how retaliation is prevented, what remedy is available, and what happens if the institution refuses to learn.

Answerability should also reach people who may never enter the City's internal complaint system. Nonparticipants need notice and repair, journalists and critics need lawful interfaces, and auditors need access capable of testing institutional claims (Bovens, 2007; Fox, 2007).

The boundary concerns institutional role, not moral worth. The City is not answerable because it claims superior virtue. It is answerable because it carries power over applicants, participants, staff, records, visitors, and host communities. The more serious its burden-shifting experiment becomes, the more visible its own correction routes must be.

Answerability requires a complaint, review, remedy, and memory sequence. A complaint should produce a docket or protected review file. Review should identify the responsible office. Remedy should be tied to the harm. Public notice should appear when public trust or affected-person safety requires it. Failure memory should preserve the lesson without turning harmed people into public examples.

Institutional humility becomes visible through answerability. An answerable City can say that a policy failed, a release was premature, a participant load was excessive, a staff structure hid influence, a host burden was underestimated, a vendor gained too much leverage, or a public artifact misled. It can say these things

before enemies force the admission (Ostrom, 2010; Bovens, 2007).

Institutional self-protection becomes defensive closure when leadership buries complaints, punishes staff, narrows remedies, hides audit findings, attacks critics, or treats public concern as misunderstanding by default. At that point, answerability has yielded to image management. External inspection, leadership consequences, suspension of the practice, and, where necessary, loss of standing are the appropriate responses.

The final definition is therefore not ‘transparent life’ but governed public-power formation with differentiated response. A public typo can move through ordinary correction; a child exposure, unlawful release, retaliation risk, or host-safety hazard requires immediate restriction. The City needs triage rules that distinguish routine correction, urgent shielding, emergency suspension, external referral, and public notice without allowing urgency to become a pretext for secrecy.

Answerability is easier to imagine as several doors than as one grand complaints office. Participants need appeal; staff need labor and retaliation routes; families need exposure review; hosts need burden recourse; public readers need correction; technical incidents need specialized response; and external reviewers need independent access. A single intake may route the matter, but it cannot collapse unlike harms, owners, confidentiality rules, or remedies into one institutional queue (Lindberg, 2013; Ostrom, 1990).

Operational answerability also has a time dimension. A complaint that can be filed but not heard before the harmful release, staffing decision, or public artifact circulates is formally available and practically useless. The City should therefore publish response clocks for urgent shielding, ordinary correction, appeal, vendor suspension, staff protection, and host-community review. Those clocks are not promises of a predetermined outcome. They are limits on institutional delay, with reasons required when a deadline cannot be met. The relevant evidence is the distance between signal and protection, not simply the number of complaints eventually marked closed. This distinction prevents a mature record system from becoming a warehouse of recognized harms whose remedies arrive after the burden has already become irreversible (Bovens, 2007; Lindberg, 2013; Fox, 2007).

36.2 — What the City Changes About Public Power

The City's central contribution is to move part of public-power formation from managed opacity into review. It does not require perfect leaders or omniscient voters to matter. It makes the route into power more knowable where role-based authority justifies added visibility, while elections, law, administration, and public judgment retain their own authority. The gain is earlier evidence and earlier correction, not a substitute for democracy (Bovens, 2007; Mansbridge, 2003).

Public power is rarely formed only on a debate stage. It is formed by schools, donors, family advantage, party networks, consultants, private rooms, media rehearsal, favors, crisis training, social class, credential systems, platform incentives, and the ordinary human desire to be admired. The City makes some of that formation traceable before office, so citizens and institutions are not forced to infer everything from performance.

Five changes define the City's claimed contribution. Formation becomes knowable. Burden moves upward. Persona weakens. Public record deepens. Correction becomes visible. Each change is real only if attached to mechanisms, affected-person protections, record-stage clarity, and failure routes. Without those details, the same words would become a closing slogan (Young, 2000; Bovens, 2007).

Formation becomes knowable when the public can see more than the polished outcome of a person's rise. A candidate's public face often arrives after influence has already done its work. By the time citizens see the speech, they may not see the donors,

mentors, private humiliations, family advantages, crisis habits, intellectual dependencies, or shortcuts that shaped the person who now asks to govern.

36.2.1 — Formation Becomes Knowable

The City does not promise total knowledge. It promises structured knowledge of active public-power formation under a voluntary role burden. Classes, deliberations, advisor influence, revision history, stress exercises, public interface, office preparation, and correction can become part of a governed record. That record gives citizens more context while still admitting that no record contains a whole soul (Bovens, 2007; Pitkin, 1967).

The affected people include citizens who now have more information, participants whose formation becomes public, staff whose influence becomes traceable, families and hosts who carry collateral effects, and officials who must distinguish City records from official authority. Citizens deserve information that is contextual rather than theatrical. Journalists need source integrity. Critics need access to records without needing to become scavengers. Participants need correction and right of reply. Staff and collateral persons need their own protections so that making formation knowable does not make every nearby life available.

Knowability is legitimate only because the governing role is bounded. A person who does not seek substantial public power should not be asked to live under this burden. A person who does seek such power can be asked to make the formation of that power more knowable because the office sought will shape the lives of others. The burden follows the authority, not the person's worth.

The record stage matters because knowability can be distorted. Draft notes, advisor comments, simulation records, public summaries, correction logs, crisis exercises, and machine summaries each need labels. A rough draft is not a final belief. A simulation choice is not a real-world order. A corrected error is not a hidden scandal. A public bundle must teach interpretation, not invite lazy judgment (Young, 2000; Dewey, 1927).

A record that produces false confidence marks design failure. If the public sees fragments without context, or if the City curates formation into flattering narrative, the record becomes another persona. The remedy is stronger status labeling, correction access, independent audit, public explanation, and, where distortion becomes systematic, suspension of the release format.

The best use of knowability is comparative rather than theatrical. A public reader should be able to see how a participant handled disagreement in January, revised a position in March, received expert criticism in May, and corrected a public claim in August. That continuity matters more than any single impressive moment. Formation becomes knowable when time, influence, and correction can be followed without turning the participant into a spectacle.

Formation becomes knowable only when the institution's influence is visible alongside the participant's conduct. Curriculum, mentors, staff norms, public-interface incentives, recovery design, peer dynamics, and record pressure all shape what appears in the archive. The City must therefore preserve pedagogy, advice, resource, and revision traces sufficient to show

how judgment was formed without turning private support into public spectacle (Meijer, 2009; Dahl, 1989).

The most important shift is directional. The City asks people seeking public power to carry more of the burden of being known, questioned, corrected, and reviewed. It does this so ordinary citizens do not have to carry as much guesswork, manipulation risk, crisis surprise, hidden influence, and post-election regret. Fairness here is not a mood; it is a relocation of load.

Making formation knowable does not mean maximizing data volume. More capture can make public understanding worse when it overwhelms context, privileges what machines can index, or buries the decisive influence inside a mass of trivial detail. The City's epistemic task is selective in a disciplined sense: preserve the records needed to reconstruct reasons, influence, revision, and responsibility while minimizing collateral exposure and interpretive noise. Public bundles should therefore be designed around questions a citizen can actually ask, such as who proposed the option, what evidence changed the decision, which objections were unresolved, and who held authority at each stage. Transparency becomes answerability only when the record can support those questions and when affected persons can contest the account (Meijer, 2009; Fox, 2007; Schwartz and Cook, 2002).

36.2.2 — Burden Moves Upward

Upward burden includes visible preparation, influence disclosure, record continuity, error correction, public explanation, pause, exit, and readiness limitation. It asks the participant to accept inconvenience before power rather than making the public

discover hidden formation after harm. This is not punishment for ambition. It is the cost of seeking authority that can bind others (Dahl, 1989; Ostrom, 2010).

The institution also carries burden upward. The City cannot place all weight on the participant while hiding its own funding, staff ratios, archive design, vendor dependencies, host impacts, audit failures, and public artifacts. A civic institution that makes participants visible while staying opaque would repeat the unfairness it criticizes.

The people affected include participants who carry the burden and ordinary citizens who should not. If staff absorb impossible workloads, burden has moved sideways. If families reorganize their lives without support, burden has moved outward. If host communities pay in noise, rent pressure, policing, traffic, or symbolic pressure, burden has moved down. The City's answerability has to trace those movements.

The public evidentiary record for upward burden includes admission review, activation consent, staff logs, host-impact records, procurement records, audit findings, public correction logs, and decertification memory. The point is not to build a master file on everyone. The point is to make the institution's burdens visible enough to correct them (Fox, 2007; Mansbridge, 2003).

The failure condition appears when the City's public burden is performed by the powerless. If an office-seeker looks transparent because staff are exhausted, family members are exposed, host residents are ignored, vendors control infrastructure, or donors

shape priorities, the City has not moved burden upward. It has repackaged downward burden in civic language, and the response must be redesign, compensation, repair, restriction, suspension, or closure.

Upward burden also changes the ethics of institutional convenience. If a new shortcut saves staff time by making families more visible, it is not a fair shortcut. If a new AI tool makes public search easier by increasing nonparticipant exposure, it is not a fair tool. If a donor-funded expansion helps participants while straining local services, it is not a fair expansion. Direction decides whether efficiency is a gain or a hidden transfer.

Burden should move upward before any public record is released. Admissions gates, funding restrictions, staff ratios, privacy architecture, host review, care capacity, and authority to stop an unsafe pilot are the earlier evidence. Publication cannot retroactively repair a system that made weaker people carry risk during formation. The design is fairer when restraint is built into resources and decisions rather than added as explanation afterward (United Nations Human Rights Committee, 1996; Bovens, 2007).

36.2.3 — Persona Weakens

Persona weakens when public readers can compare a person's polished claims with a longer record of learning, correction, failure, advice, pressure, and conduct. Modern public power often rewards performance under lights. The City does not eliminate performance, but it makes performance harder to detach from

formation. A person who changes position can show the path of revision rather than only a new slogan.

This change matters because persona is one of the cheapest substitutes for knowledge. A confident voice can hide dependence. A humble image can hide manipulation. A crisis pose can hide panic or cruelty. A biography can make accident look like virtue. The City's record does not abolish public storytelling, but it gives the story more friction (Bovens, 2007; Pitkin, 1967).

This choice reaches voters, journalists, parties, institutions, opponents, and the participant. Voters receive a deeper archive. Journalists receive traceable materials. Opponents can criticize with evidence rather than rumor. Participants are protected from being reduced to a single clip because correction, context, and right of reply remain part of the record.

Weakening persona does not require humiliation. The record boundary should exclude ridicule, intimate consumption, and dramatic fragments whose civic value depends on embarrassment. Public meaning belongs to patterns relevant to formation for power: how a person reasons, revises, receives influence, handles dissent, respects limits, learns from error, and carries burden. An institution that gains attention by exposing shame has replaced answerability with spectacle.

The record stage must distinguish image from evidence. A public summary should not turn a participant into a character. A machine summary should not flatten years of formation into a flattering or damning profile. A readiness bundle should be an evidentiary

interface, not a campaign advertisement. Public artifacts must make interpretation easier without selling the person (Young, 2000; Dewey, 1927).

Personality theater under a transparent brand is the decisive failure. If the City's releases create celebrities, fan cultures, shame cycles, heroic arcs, or downfall narratives, persona has not weakened; it has changed costume. The remedy is anti-spectacle review, release redesign, audience-interface limits, media rules, and stronger separation between public interest and public appetite.

The City's answer to persona is not anti-charisma. Some people communicate beautifully, inspire trust, and carry public hope. The problem is not vivid public presence; the problem is public presence without traceable formation. A strong record lets charisma remain human without becoming the whole evidence. It gives admiration something to check against and gives criticism something better than suspicion.

There is also a mercy inside this weakening. A person is not trapped forever in one polished self or one exposed mistake. A deep record can show growth, apology, changed judgment, and the difficulty of learning in public. Persona flattens people into images. A disciplined record can restore time (Meijer, 2009; Dahl, 1989).

36.2.4 — Public Record Deepens

Public record deepens when reasons, influence, revision, dissent, and correction become traceable without turning the person into a public possession. A single scandal, speech, debate, apology, or

endorsement rarely shows how power was formed. A deeper record can show patterns: who influenced whom, how ideas changed, how errors were handled, how stress changed judgment, how staff contributed, and where boundaries held.

Depth is not volume. Dumping more data into public view can make the public less informed. The City's record deepens democratic context by organizing provenance, status labels, correction, reply, time sequence, affected-person protections, and public bundles. The deeper record should be more intelligible, not merely larger (Dahl, 1989; Ostrom, 2010).

The challenge route must remain open to the public and to people described by the record. Public readers need accessible summaries. Participants need context integrity. Staff need role protection. Collateral persons need redaction and remedy. Critics need preserved dissent. Future researchers, where separately authorized, need clear separation between operational records and research use.

A civic dossier culture begins where public record ceases to be role-bound. The City's record is about a voluntary public-power formation role. It is not a model for universal public memory. It is not a tool for employers, schools, insurers, parties, or platforms to rank ordinary people. It is a narrow record designed for a narrow public-power purpose.

Audit-ready records for depth include source archive, public record site, status labeling, versioning, correction, reply, provenance, release delay, and time review. Each stage prevents a different failure. Provenance prevents fabrication. Correction

prevents stale error. Reply prevents one-sided meaning. Delay and shielding prevent unlawful exposure. Time review prevents permanent public punishment where law and dignity require restraint (Fox, 2007; Mansbridge, 2003).

Depth without mercy or context is the operative failure. A record that remembers everything badly can become more unfair than forgetting. If the City keeps material beyond its lawful or civic purpose, releases protected context, refuses correction, or allows old fragments to dominate current understanding, it must seal, contextualize, correct, restrict, or delete according to the proper review route.

Deep record also changes how apologies are read. In ordinary politics an apology may be a tactical sentence drafted after exposure. In the City, the public should be able to see whether the apology followed internal recognition, staff warning, affected-person complaint, peer challenge, or audit finding, and whether it led to changed practice. Depth turns apology from mood into sequence.

Depth should make disagreement better, not smaller. Citizens may still argue sharply over what the record means. One reader may see courage in a correction; another may see repeated bad judgment. The City's job is not to force agreement. Its job is to make disagreement more anchored in traceable formation and less dependent on rumor (United Nations Human Rights Committee, 1996; Bovens, 2007).

The first corrective step is to put the original decision, objection, changed reasoning, and implementation result into one traceable

sequence. Public power should not only show confidence. It should show how error is found, admitted, reviewed, repaired, and remembered. The City's record can make correction part of trust by showing whether a person and institution learn under pressure.

36.2.5 — Correction Becomes Visible

Correction becomes visible when the public can trace an acknowledged error from finding through remedy and follow-up rather than receiving a polished apology as the endpoint. Traceable correction can become public learning (Bovens, 2007; Pitkin, 1967).

The people affected by visible correction include those harmed by the original decision, participants whose record may change, staff whose advice is exposed, and public readers who need to know whether the institution learned. A participant may need a record corrected. A staff member may need retaliation protection. A family member may need a release restricted. A host resident may need mitigation. A public reader may need a visible update to an earlier summary. Correction must begin with the person carrying the harm, not with the institution's desire to restore trust.

A correction is complete only when it changes more than the sentence announcing it. The record must be revised, downstream copies and summaries updated, affected people given remedy, responsible staff or leadership held to account where warranted, and the operating process changed to reduce recurrence. External review should be able to verify propagation and closure. Humility is not the output; stopped repetition and repaired harm are.

A complete correction file preserves the original state, trigger, evidence considered, decision owner, affected-person input, remedy, implementation, and follow-up review. A public correction log can show what changed without disclosing protected details, while a notice can explain institutional error without converting the harmed person into the story.

One useful case is a policy that passes internal review, harms a nonparticipant, and then changes after complaint. If the City publishes apologies but leaves the pathway unchanged, or if it corrects public language while preserving hidden incentives, visible correction becomes another persona. The remedy is audit of the remedy itself, staff and affected-person verification, public status updates, and escalation when repeat failures show that ordinary correction is insufficient.

Visible correction should make the institution less brittle. A brittle City treats each error as a threat to legitimacy. An answerable City treats some errors as information about stress points, weak training, poor design, bad incentives, missing review, or a participant who needs de-loading. The question is not whether errors appear. The question is whether the record shows that the City becomes safer after seeing them.

Leadership decisions not to correct should be visible as well. When leadership rejects a complaint or declines a proposed change, the public record should show the basis, limits, and appeal route where public status permits. Trust is not built only by saying yes to critics. It is built by making the reasons for yes and no reviewable (Meijer, 2009; Dahl, 1989).

Visible correction changes institutional memory only when the first version does not quietly retain prestige over the corrected one. The record site should place corrections beside the original claim, identify the reason for change, preserve the affected person's reply where appropriate, and prevent search or summary systems from continuing to surface the superseded account as if nothing happened. A mature institution does not hide its errors, but neither does it preserve them in a form that repeatedly harms the person who secured correction. Learning and remedy are therefore joined: the institution remembers enough to prevent recurrence while controlling how an inaccurate or injurious version continues to travel (Reason, 1997; Weick and Sutcliffe, 2015; International Council on Archives, 2012).

36.3 — What the City Does Not Change

The City's limits preserve the value of its contribution. Law remains law, government remains government, voters remain voters, ordinary life remains private, and science remains separate. Because those boundaries remain intact, the City can make one route into public power more answerable without claiming jurisdiction over domains it does not own. These boundaries are part of the institution's structure, not an afterthought (Ostrom, 1990; Mansbridge, 2003).

Each boundary has a mechanism. Legal questions require legal review. Government authority requires lawful office and administration. Democratic choice remains with voters. Ordinary life remains outside the Vow. Scientific validation remains with scientific governance. If these boundaries are not reflected in records, training, public artifacts, and stop conditions, they will not survive admiration (United Nations Human Rights Committee, 1996; Venice Commission, 2025).

Law remains law because the City cannot make itself lawful by describing a beautiful purpose. Rights, duties, jurisdiction, privacy, labor, contracts, liability, emergency authority, criminal law, constitutional limits, family law, and public-record obligations require actual legal structures. Civic seriousness is not legal authority.

36.3.1 — Law Remains Law

The City may design lawful interfaces, prepare participants for office, create record systems, support public explanation, and identify legal questions. It may not declare its own rules superior

to the legal order. If a City practice is unlawful, the practice must change, remain dormant, or be refused in that jurisdiction (Venice Commission, 2025; Pitkin, 1967).

Affected people need enforceable rights and remedies from lawful institutions, not confidence generated by the City's moral language. A participant needs due process. A staff member needs labor rights. A family member needs privacy and family-law protection. A host resident needs lawful remedy. A critic needs external rights. The more impressive the City becomes, the more important it is that no person be trapped inside City-created remedies alone.

Consent remains meaningful only while lawful authority stays outside the City's self-description. The Transparent Vow is a civic commitment, not a waiver of all legal rights. Consent under high ambition, institutional dependence, public pressure, and financial stabilization still requires review. The City cannot use voluntary entry to justify domination, unsafe exposure, or legal shortcuts.

Legal-boundary evidence includes jurisdictional review files, status labels, rights notices, counsel-access records, external complaint routes, public-record classifications, and unresolved-issue registers. A matter that has not been reviewed should remain visibly unresolved rather than quietly treated as permissible (Venice Commission, 2025; United Nations Human Rights Committee, 1996).

A legal-status record should identify actual authority, jurisdiction, rights affected, review route, and whether the City's design is

model, contract, policy, or enacted law. If the City treats its ethical purpose as enough to bypass law, or if operators say that review can wait because the institution is urgent, the City has crossed a line. The remedy is suspension of the practice, external legal review, public correction where needed, and refusal to operate until lawful authority is clear.

Legal humility should be audible in the City's own language. Terms that resemble private lawmaking, sacred charter, superior jurisdiction, or emergency exemption blur the boundary between internal covenant and public authority. When a question concerns rights, standing, enforcement, secrecy, or remedy, the institution stands before applicable law and review rather than above them. Precision here protects both ambition and restraint.

The closing should also avoid treating legal review as an enemy of moral speed. Slow review can be frustrating, but law often protects the person least visible in the room. A child, employee, patient, protester, or host resident may depend on precisely the procedural delay that an impatient institution wants to bypass (Venice Commission, 2025; United Nations Human Rights Committee, 1996).

Government remains government because the City does not rule. It is not an executive office, legislature, court, administrative agency, election body, civil service, or constitutional source of authority. It may form people who later enter public roles. It may support lawful office interfaces where authorized. It does not become the state.

36.3.2 — Government Powers Remain Separate

This boundary matters because the City's office interface can look powerful. Office suites, staff influence logs, public explanations, civic servers, crisis protocols, and record continuity may make governance more visible. They do not transfer sovereignty to the City. Lawful authority still comes from public law and legitimate institutions (Manin, 1997; Fox, 2007).

Public employees, service users, contractors, regulated parties, voters, and people subject to state power carry the risk when the boundary blurs. They must not find that an unelected City office, archive team, donor, vendor, advisor group, or participant cohort is practically deciding matters without lawful responsibility.

Formation becomes knowable, but lawful operation remains with government institutions. The City may help a participant explain, record, and reflect on public decisions where lawful. It may not command agencies, run procurement, direct enforcement, control official records, decide benefits, manage public crisis response, or replace public administration.

Inspection of the government boundary should make influence visible without making the City a chain of command. Logs should show advice, coordination, information flows, and lawful office decisions. They should also show when government secrecy, emergency authority, national security, procurement law, or administrative process requires a separate lawful path (United Nations, 1966; Manin, 1997).

Shadow government appears when City staff, donors, vendors, advisers, volunteers, or archive operators effectively make public

decisions without lawful office or delegation. The response is immediate boundary repair: stop the arrangement, preserve the record, disclose improper influence where lawful, protect affected persons, and return operation to the authorized public body. Formation cannot become an informal route around democratic and administrative law.

The office-boundary test is clearest when a participant becomes an officeholder and City staff remain nearby. The City may make certain movements into and out of government more visible where lawful, but it does not sit at the end of the corridor as the source of command. Records can accompany authority without creating it. That distinction should remain visible to officials, staff, participants, journalists, and citizens receiving public services.

Operational design should cultivate officials who are more answerable, not officials who are more dependent on the City. A participant who leaves for office should be able to serve lawfully in public institutions, receive criticism from outside the City, and separate official duty from City loyalty. Formation should strengthen public office rather than bind it to a private ecology (Fox, 2007; United Nations, 1966).

36.3.3 — Voters Remain Voters

Voters remain voters because the City does not decide democratic trust. A readiness bundle may inform citizens, parties, journalists, and institutions, but it does not command them. The public may read the record and still reject the participant. Another reader may

see seriousness where a critic sees risk. Democracy remains interpretive.

This boundary protects nonparticipants most directly. A participant may complete formation, carry the Vow, produce a deep record, and still not be owed office. Participation is not a vote. Readiness is not victory. A public claim remains a claim, and it must enter argument, opposition, law, and election like any other claim (United Nations Human Rights Committee, 1996; Mansbridge, 2003).

Ordinary voters also bear risk when the City's halo pressures their judgment. A person may oppose a City-trained candidate without opposing fairness. A person may distrust the record. A person may prefer a private candidate. A person may regard the City's burden as admirable but not politically decisive. That freedom is part of democratic dignity.

A clean record of voter independence includes explicit no-advantage language, campaign-use limits, correction of endorsement claims, public explanation of nonparticipation, and evidence that parties or institutions cannot use City status as a gate. The City can produce evidence of formation; it cannot define who is fit to rule in a way that overrides local law, election rules, appointment authority, party processes, or public judgment. It should make readiness more discussable, not office more automatic.

City messaging must remain restrained. Readiness bundles should say what they are: public claims supported by an institutional record and limited by role, office, jurisdiction, time,

and uncertainty. Where lawful and ratified, public-approval mechanisms remain bounded input; crowd enthusiasm does not convert formation into entitlement.

Credential halo becomes a democratic failure when parties, donors, media, employers, or the City treat completion as entitlement to trust, nomination, appointment, or office. The institution must correct the label, restrict misleading releases, and challenge public uses that convert a formation status into a character or eligibility claim. Better records do not justify a prestige caste.

The boundary also preserves democratic pluralism. A public that senses a new credential class will resist even good records. Voters should never feel that the City has pre-decided their judgment. The record can be offered as deeper context, but the final democratic act remains free, argumentative, local, and plural. A system that cannot accept voter refusal should not call itself democratic.

The same restraint applies to public education. The City may help voters understand how to read a readiness bundle, but it should not teach them what conclusion to reach. Civic literacy is not persuasion hidden under a neutral label. The record gives materials for judgment; it does not become the judge (Mansbridge, 2003; Nissenbaum, 2010).

Ordinary life remains private because the City's Vow is role-specific and chosen. It is a specialized institution for adults voluntarily seeking substantial public power. The existence of the City does not lower the privacy rights of neighbors, workers,

children, families, critics, voters, journalists, or readers who never enter.

Voters remain free to distrust, disregard, or reject the City's record. A record site may make formation more inspectable, but the City must not present participation as an official endorsement, a ballot qualification, or a presumption that nonparticipants are less prepared. Its publications, licenses, and affiliation agreements should prohibit claims that City participation certifies fitness for office. Misleading claims by outside campaigns, media organizations, or parties should receive a clear public correction; any legal remedy must rest on applicable law and external legal authority. The democratic value of the record lies in adding evidence to public judgment. Representation remains a relationship authorized through democratic and legal institutions, not a credential conferred by a campus (Pitkin, 1967; Mansbridge, 2003; United Nations Human Rights Committee, 1996).

36.3.4 — Ordinary Life Remains Private

The boundary protects society from the claim that public virtue requires total visibility. A person who refuses visibility is not less fair. A private citizen may want an unrecorded meal, a quiet marriage, a hidden grief, a private argument, a private faith, or a life outside public-role burden. Ordinary life is not a defect to be corrected by transparency (Nissenbaum, 2010; Richards, 2013).

Privacy burdens fall first on people who never sought power: family members, neighbors, workers, visitors, critics, patients, students, and ordinary users of public services. The City must preserve shields for children, intimacy, counsel, health, disability,

grief, family conflict, safety, and private recovery. These shields are not loopholes. They are what make the active public-power record humane.

Ordinary privacy also prevents the City from becoming a cultural hierarchy. It is not consciousness, citizenship, identity, virtue, salvation, research status, or lifelong eligibility. The participant's record exists because of a public-power formation commitment, and ordinary life remains outside unless a specific role-relevant event is lawfully captured and governed.

The inspectable record of ordinary privacy includes incidental-capture review, protected-category classification, redaction, delayed release, protected summaries, affected-person notice, sealing, and time review. These stages must be staffed and funded. Privacy that depends on heroic individual discretion will collapse under pressure (Nissenbaum, 2010; Council of Europe, 2018b).

Cultural spread is the critical failure. If schools, employers, political parties, platforms, donors, or governments begin treating ordinary people as suspect for remaining private, the City has become an unsafe symbol. The remedy is public correction, stronger artifacts, refusal of derivative misuse, and explicit defense of nonparticipation dignity.

The City's praise for ordinary privacy should be active enough to shape public culture. Its guides, summaries, tours, and interviews should make nonparticipation honorable. The ordinary person who wants no archive, no civic role, no public interface, no theory, and no symbolic place in the project should hear a clear

affirmation of refusal. Privacy is not merely protected from the City; it is honored by the City's restraint.

Public artifacts carry this boundary beyond the book. The City should never imply that visible life is more courageous, purified, honest, or evolved than private life. Many people serve fairness by remaining ordinary: caring for a parent, raising a child, doing paid work with dignity, resting, grieving, dissenting, or refusing public identity (Pitkin, 1967; Nissenbaum, 2010).

36.3.5 — Science Remains Separate

Operational evidence evaluates the City's civic performance; apparent coherence or humane operation does not by itself establish PTVC, phenomenal-value representation, or truth-level endpoint assumptions. Separating those questions protects participants from involuntary research and keeps inquiry independent of institutional enthusiasm. Scientific testing must expose claims to failure and serious rivals (Popper, 1959; Lakatos, 1970); for PTVC, the science architecture additionally requires protocol-fixed design, documented preregistration where applicable, observation and missingness models, measurement ethics, replication, adverse results, and typed verdicts. City records serve accountability, rights, correction, and civic formation unless a separately governed research pathway authorizes another use.

Science separation is visible through research-use gates, consent classification, de-identification limits, prohibitions on Artificial Intelligence training absent separate authorization, data-governance review, institutional review, and public status labels.

A record item should not travel from archive to research corpus because it is interesting (Fox, 2007; United Nations, 1966).

Proof drift marks design failure. If the City's existence, pilot success, public enthusiasm, participant performance, AI summary, archive coherence, or replication is presented as scientific validation, the City must correct the claim. If records are used for research without separate authority, the practice must stop, affected persons must be notified where required, and data governance must be repaired before any further use.

Evaluation reports should name the civic outcome being measured, the decision the result is intended to inform, and the evidence class used. The report should also identify the authority that can revise the civic program in response, preventing measurement from floating free of decision ownership.

Scientific separation also protects negative results. If later research narrows or defeats the formal claim, the City does not become worthless; its civic design remains assessable on its own terms. It should survive scientific humility because validation was never its source of authority (Manin, 1997; Fox, 2007). Civic practices should therefore be retained, revised, or rejected according to their own declared outcomes even as scientific conclusions change. A negative scientific result should trigger review only of City features whose stated rationale actually depends on the affected claim, leaving independently justified rights and safeguards untouched.

City records may support later research under separate authority, consent, privacy protections, and scientific design. Their

relevance to PTVC depends on an explicit measurement bridge and a test capable of distinguishing rival explanations. *The Science of Fairness* develops those requirements. Any such bridge should identify the dataset boundary and responsible research owner before records leave the civic archive. Research handoff should therefore record the exact source set and version transferred so later scientific claims can be traced back to the governed civic record. Research-return agreements should specify how later corrections or withdrawals are propagated back to the civic archive without rewriting the historical record.

36.4 — Duties to Staff, Families, and Hosts

The City's closing obligations begin with the people easiest to hide. Public readers may focus on participants, but every visible participant stands on staff labor, family adjustment, child protection, host-community tolerance, professional care, and nonparticipant shielding. This Section applies ordinary-life, family, care, and labor knowledge to the active civic role while returning broader private-life authority to *The Life of Fairness*. Those surrounding people are not support scenery; they are rights-bearing claimants whose burdens can defeat the design (International Labour Organization, 2022a; Committee on the Rights of the Child, 2021).

A fair City cannot build an ethic of public burden by creating private exhaustion around it. It must count the people who make visible formation possible. It must protect the people who did not choose the Vow. It must give recourse to those who are harmed by proximity. Its final answerability begins where admiration is least likely to look.

Five owed duties anchor this section. Staff dignity must count operational burden. Family protection must prevent collateral exposure. Child protection must remain absolute. Host-community recourse must preserve local legitimacy. Nonparticipant remedy must repair exposure harm. Each duty tests whether the City's burden actually stays upward.

Staff dignity is not a secondary labor issue. If the people who educate, care for, secure, maintain, interpret, and audit the City become invisible, its public record will rest on hidden labor.

36.4.1 — City Duty to Staff Dignity

The staff burden is not the participant's burden. Staff may have role records, influence logs, conflict disclosures, and professional accountability, but they do not accept full active-period public-power formation records by employment. The City must distinguish staff accountability from participant transparency so that labor does not become coerced visibility (ISO, 2021b).

The affected group includes educators, clinicians, mentors, security, maintenance, archive staff, technical staff, moderators, food-service workers, cleaners, translators, auditors, contractors, and volunteers. A mentor may notice role collapse. A nurse may see sleep deprivation. A moderator may see harassment patterns. A maintenance worker may see a security blind spot. Staff dignity requires safe routes to report without retaliation, status loss, or being accused of disloyalty to the project.

Educator, operator, clinician, auditor, security, mentor, and participant functions require separate authority and conflict rules. No staff member should be asked to serve simultaneously as confessor, handler, political strategist, therapist, and record judge. Role separation protects staff and participants together.

An answerable labor record includes role definitions, staffing assumptions, workload and shift measures, staff-to-participant ratios, fatigue and psychosocial-risk review, complaint and appeal outcomes, turnover, protected reporting, external inspection, and corrective action. The record should show who absorbed after-hours work, emotional labor, security pressure, and record burden. An institution that cannot account for staff

cost has not accounted for the cost of visible leadership (World Health Organization and International Labour Organization, 2022; ISO, 2021b).

Staff exploitation or staff capture is the decisive failure. If staff are exhausted, silenced, underpaid, forced into visibility, pressured by participants, controlled by donors, dependent on vendors, or punished for complaints, the City must repair labor conditions before expanding. If leadership treats staff strain as the price of a noble mission, the City has already moved burden downward.

A serious institution asks whether workers can stop unsafe practices without losing employment or status. Who misses breaks? Who handles night emergencies? Who is asked to absorb participant distress? Who reads disturbing records? Who manages public hostility? Who is responsible when an AI tool fails? Who has authority to slow an unsafe process? Dignity begins when those questions produce staffing, training, pay, rest, and complaint routes rather than gratitude speeches.

Staff dignity should be visible to participants as well. A participant trained to carry public burden must learn not to treat staff as scenery. They should understand the labor cost of records, meals, safety, health, translation, cleaning, interface moderation, and emotional support. Formation for power includes learning how not to hide the people who support one's formation (International Labour Organization, 2022a; ISO, 2021b).

Staff dignity and family protection meet at the point where backstage burden travels beyond the formal schedule. Sufficient

staffing, predictable recovery, role clarity, protected professional judgment, and a credible route around an implicated supervisor reduce the chance that unresolved work strain will be transferred into participant households. Independent labor review should therefore examine overtime, emotional labor, public hostility, secondary trauma, schedule instability, and recurring exceptions before those costs reappear as family exhaustion. A City that looks humane because workers and households silently carry its contradictions has failed the upward-burden principle (World Health Organization and International Labour Organization, 2022; ISO, 2021b; Edmondson, 1999).

36.4.2 — Family Protection

Family protection begins from a simple fact: participants do not live as isolated civic instruments. They have partners, spouses, children, dependents, elders, siblings, friends, former partners, household conflicts, grief, illness, and obligations outside public formation. The City's record can touch those lives even when the family never chose public exposure.

The family burden includes scheduling, emotional strain, reputational spillover, care work, fear of exposure, relocation pressure, security procedures, public misunderstanding, and the ordinary discomfort of living near someone whose public role is intensely reviewed. The City cannot treat those costs as private inconvenience outside its concern. It must count them as collateral burdens of the institution (Greenhaus and Beutell, 1985; Schulz and Sherwood, 2008).

Affected partners, former partners, spouses, co-parents, caregivers, dependents, and household members need their own rights routes rather than access only through the participant. A spouse should have a protected route to challenge unnecessary exposure. A dependent should not lose privacy because a participant's daily life is recorded. An elder receiving care should not become public context. A family member who objects should not be framed as obstructing fairness.

Participant record and household life belong to different record regimes. Some household effects may be relevant to public-power formation, especially if they show conflict of interest, dependency manipulation, corruption pressure, or role fitness. But relevance does not mean unlimited release. Protected summaries, delay, redaction, counsel, and family review are tools for handling boundary cases without turning household life into theater.

A usable family-protection file begins before activation. It records household consultation, dependency and care impacts, protected categories, objection routes, release review, delayed or substituted summaries, interim shielding, and remedy after harm. These stages should exist before a family member is exposed, because later apology cannot restore every relationship, inference, or searchable trace (United Nations, 1989; Committee on the Rights of the Child, 2021).

Collateral inheritance of the Vow is the operative failure. If family members must become visible, move, perform loyalty, accept public scrutiny, or lose privacy in order for the participant to function, the City has not kept the burden voluntary. The

remedy is de-loading, shielding, schedule change, release restriction, support, exit, or pause.

Family protection also means the City should not romanticize sacrifice by loved ones. A spouse who absorbs loneliness, a parent who manages public pressure, a child who changes routines, or a dependent who receives care through a more complicated schedule is not automatically serving the public good. Those burdens need support, privacy, and sometimes the authority to force de-loading. Love should not become an unrecorded subsidy.

Families must not become character witnesses. A partner's praise, a parent's tears, or a child's affection may be emotionally powerful, but public power should not harvest intimacy as credibility. Family voices belong in protected consultation or voluntary, carefully reviewed public contexts, not as pressure to trust the participant (Nissenbaum, 2010; European Court of Human Rights, 2026; Citron and Solove, 2022).

36.4.3 — Child Protection

Child protection is absolute because children neither choose the Vow nor control how adults use their lives in public narratives. Children do not enter the Transparent Vow. They do not consent by being born, adopted, dependent, related, nearby, photographed, mentioned, or loved by a participant. A child's life is not public-power formation material by default.

The child-protection burden is not only about images or names. It includes school routes, friendships, health, custody, development, family conflict, disability, grief, online safety, harassment risk, and long-term digital trace. A child exposed today may carry

consequences for years after the participant's role has ended. The City must design for that future child, not only the adult reader's curiosity (Nissenbaum, 2010; Committee on the Rights of the Child, 2021).

Children, guardians, educators, clinicians, and caregivers are direct rights-holders in this design. Protective defaults, child-rights impact review, age-appropriate notice where relevant, privacy-preserving settings, and independent safeguarding must not depend on a participant correctly anticipating every risk while pursuing public ambition. The child's best interests and evolving autonomy remain separate from the adult's desire to explain a complete story (Committee on the Rights of the Child, 2021).

Child protection requires a strict City boundary. When an adult's role-relevant conduct unavoidably involves a child, any public summary must be minimally necessary, nonidentifying, and reviewed for indirect as well as direct identification. Expert review does not authorize publication of an identifiable child merely to complete a participant's public-power narrative. Any legally required safeguarding or court disclosure must use the appropriate protected external route, with access limited to its lawful purpose.

Child exposure is the critical failure. If a child becomes searchable, narratively exploited, visually identifiable, pressured to perform, or functionally drafted into the participant's public story, the City must treat the event as severe. Remedy may require removal, notification, legal review, public correction, disciplinary action, technical restriction, and suspension of the release pathway that allowed it.

Children should not become evidence that the City works. It may arrive through photographs, school rumors, metadata, visitor glimpses, family anecdotes, social media fragments, or attempts to infer identity from schedules. Child protection has to be anticipatory. Waiting until a child is identifiable is not protection; it is a delayed acknowledgment of failure.

A child-protection office should be able to overrule public-interest arguments. If a release would help explain the participant but risk a child's dignity, the default should favor the child. Public readers can live with less context. A child may have to live with exposure long after the public has forgotten why it wanted the detail (Committee on the Rights of the Child, 2021; United Nations, 1989).

36.4.4 — Host-Community Recourse

Host-community recourse preserves local legitimacy. A City is never placed on empty land in a social vacuum. It arrives in a jurisdiction with roads, water, housing, schools, emergency services, labor markets, culture, political history, environmental pressures, and neighbors. If those neighbors cannot object, the City becomes an imposed symbol rather than a civic institution.

The host burden may be physical, economic, administrative, reputational, environmental, and symbolic. Traffic may change. Housing pressure may rise. Security routes may alter ordinary movement. Protests may spill over. Public attention may distort local life. Water, energy, waste, noise, and land use may create costs that are easy for founders to call incidental because the campus looks noble (UNECE, 1998; Ostrom, 1990).

Host standing should exist before site choice, during operation, and after expansion. Residents, workers, Indigenous or historically burdened communities where applicable, businesses, agencies, emergency responders, schools, religious communities, disability advocates, environmental groups, and critics must be able to contest burden without being treated as obstacles.

Host law and City operation remain distinct authorities. The City may work within a legal envelope but never owns the place or overwhelms local governance through philanthropy, prestige, security language, or hope. Legitimacy requires local review, not ceremonial listening.

Host recourse relies on siting records, environmental and burden reviews, public meetings, mitigation agreements, construction transparency, emergency coordination, complaint dockets, audits, and public responses. Residents should understand the file without reading the whole book (UNECE, 1998; Ostrom, 1990).

Host extraction is a site-level defeat. Housing, traffic, utility, security, environmental, or service burdens cannot be shifted onto residents while the City celebrates fairness. Remedy may require limits, funds, service support, redesign, pause, or rejection of the site (UNECE, 1998; ISO, 2021c).

Host recourse must survive leadership change. Agreements, budgets, audits, reports, and expansion gates should carry the route forward. Local standing cannot depend on one director's manners.

Benefits do not buy silence. Jobs, infrastructure, research, or civic events may help a region, while recourse remains necessary when

burdens persist. A fair host relationship can name both help and harm (UNECE, 1998).

Nonparticipant remedy tests ordinary privacy in practice. People who never chose the City may still be recorded, named, misidentified, drawn into controversy, exposed through another's story, affected by perimeter rules, or burdened by host operations.

Host recourse begins before injury. Residents need plans, understandable impact information, participation, and independent escalation before traffic, housing pressure, security, construction, environmental burden, or public events harden into fact. After opening, the route should publish service standards, response times, mitigation duties, and authority to suspend a practice. Objections need not create a universal veto, but place-based burden must come with real power to alter it (UNECE, 1998; Ostrom, 1990; United Nations, 2011).

36.4.5 — Nonparticipant Remedy

An affected person may be a visitor, misidentified protester, exposed family member, burdened host, misrepresented worker, or reader harmed by machine output. Record sites, perimeter notices, host offices, staff contacts, and public artifacts must state where to object, how urgent protection starts, who owns review, its clock, and how further exposure or retaliation is prevented (Venice Commission, 2025; United Nations, 2011).

One boundary controls remedy: nonparticipants do not carry the participant's burden. Incidental contact never makes a whole person public material. Dignity outranks curiosity.

The remedy file records protected intake, exposure classification, temporary restriction, review, correction or removal, notice, support or compensation, and the lesson preserved in failure memory. Repair cannot require more exposure.

A contractor's name may enter a public bundle through a participant's procurement discussion. The contractor did not consent to that story. Rapid restriction, context review, correction, and clarification should occur without forcing a public fight (Nissenbaum, 2010; United Nations, 2011).

Remedy without reach is failure. Hidden, slow, costly, retaliatory, or symbolic routes transfer record risk downward. Remedy must be funded, staffed, audited, visible, and able to restrict the harmful channel.

A mature system publishes pattern-level lessons without republishing the harmed person. Residents, visitors, and workers need clear next steps and temporary protection without mastering institutional theory.

Staff and participants should treat nonparticipant complaints as central to legitimacy. People outside the Vow often see downward burden most clearly and may prevent the City from becoming what it denies (Nissenbaum, 2010; Edmondson, 1999). The City's debts now lead to its forbidden futures: surveillance without purpose, captive dependence, moral rank, spectacle, parallel government, scientific overclaim, founder rule, donor capture, and records that outlive their legitimate use. These are concrete forms of drift rather than rhetorical warnings.

36.5 — What the City Must Never Become

The book's positive case becomes credible only if its forbidden futures have consequences. Five failures organize the final boundary: ordinary-life surveillance, prison or cult, spectacle, proof-object inflation, and shrine or empire. Each names a mechanism with a stop condition, affected people, evidence requirement, and remedy route, so critics and affected persons can trigger repair, suspension, withdrawal, or closure before drift becomes tradition (Solove, 2006; Andrejevic, 2004).

The test is always practical. Who is newly visible? Who can leave? Who can dissent? Who is watching for entertainment? What claim is being inflated? What institution is becoming sacred? If the answers show downward burden or borrowed authority, the City must correct itself before it continues (Solove, 2006; Andrejevic, 2004).

Ordinary-life surveillance is the first forbidden future. It is the central public-risk boundary. The City exists to move a defined visibility burden upward toward adults seeking substantial public power. It does not exist to normalize observation of citizens who want private lives.

36.5.1 — Never Surveillance of Ordinary Life

Ordinary-life surveillance can arrive quietly. Visitor logs become searchable. Host residents appear in footage. Family members become narrative context. Staff role records become personal records. Public interface data becomes behavioral profiling. AI tools make incidental mentions discoverable. A security exception becomes routine. The danger may look like technical

efficiency before it looks like surveillance (Solove, 2006; Lalich, 2004).

The directional burden test is decisive. Ordinary citizens, host residents, visitors, children, families, staff, professionals, critics, and anyone else whose proximity could be converted into data need a privacy perimeter that is technical, legal, spatial, and cultural. A promise not to misuse data is too weak when the data should not have been exposed or retained in the first place.

Correction begins by restricting the surveillance channel, notifying affected people where appropriate, deleting or sealing material when lawful, correcting the record, clarifying public meaning, and auditing how the route entered the design. Capture is justified only by the chosen role burden attached to sought authority. Once a practice cannot be traced to that purpose, necessity, and lawful authority, technological convenience is no defense.

The reviewable operating file for this prohibition includes data minimization, incidental-capture filtering, protected nonvisibility classification, access limits, release review, AI search restrictions, deletion or sealing review, and nonparticipant remedy. Each stage should ask whether ordinary life has become easier to see because the City exists (Council of Europe, 2018b; Solove, 2006).

Any pattern of ordinary-life exposure is the operative failure. If the City's systems increase surveillance outside the participant's role burden, the practice must stop. Remedy may require deletion, sealing, public notice, access rollback, vendor restriction, external

audit, and, if the pattern is structural, suspension of the system that created the exposure.

This prohibition should be rehearsed in procurement and engineering meetings, not only ethics pages. A vendor offering better analytics should be asked whether the tool increases collateral visibility. A security proposal should be asked whether it stores unnecessary movement data. A public-interface feature should be asked whether it invites search of bystanders. Surveillance drift often enters through useful features.

Imitation is another route to surveillance and must be refused. A school, employer, platform, party, or agency may claim to borrow City transparency for ordinary people. The City's public language should make such borrowing visibly false. Its burden belongs to voluntary public-power formation, and any copy that points downward is not a faithful copy (Goffman, 1961; Schwartz and Cook, 2002).

Prison and cult drift are operating patterns, not labels to deny. Prison drift appears when exit becomes unreal, movement becomes punitive, dissent is treated as disorder, or security controls more than safety requires. Cult drift appears when loyalty, doctrine, founder reverence, group pressure, spiritual interpretation, or approved language becomes a condition of belonging. The response depends on records of actual dependency and consequence, not on the institution's preferred identity.

36.5.2 — Never Prison or Cult

The two drifts are different, but they can reinforce each other. A participant who fears shame for leaving may remain even without locked doors. A staff member who doubts leadership may stay silent because critics are framed as enemies of fairness. A family member may worry that refusal will be read as betrayal. Control can become social before it becomes physical (Schwartz and Cook, 2002; Barker, 1984).

This arrangement directly affects participants, applicants, staff, families, visitors, and critics. They need real exit, dissent, outside relationships, external counsel, independent complaint routes, religious freedom, nonparticipation in the Religion of Fairness, and the right to say the City is wrong. A City that cannot tolerate refusal has ceased to be voluntary.

Cult logic is blocked by keeping belief, dissent, exit, and civic role separate. The Transparent Vow is a civic burden for public-power formation, not a total identity. A participant may belong to any religion or none, agree with the formal Law or not, and criticize the City while inside it. Formation does not require spiritual uniformity or founder loyalty.

The prison or cult route includes exit audit, independent rights review, support continuation, dissent protection, outside access, public correction, and possible suspension of participation or leadership. These records should reveal whether departure and dissent are practical, not merely written (Nissenbaum, 2010; Andrejevic, 2004).

Constrained departure or coerced belief is a closure-level failure. If people cannot leave without disproportionate ruin, dissent without punishment, refuse participation in the Religion of Fairness without exclusion, consult outsiders freely, or criticize leadership safely, the City must protect affected persons, pause the implicated function, open independent review, and consider closing the structure that produced control. Continuation cannot be justified by the number of people who remain.

Softer language can hide captivity just as effectively. Phrases that treat departure as failure, criticism as betrayal, outside relationships as distraction, or doubt as weakness can create coercion before any rule changes. A healthy City should hear a participant say, I need to leave, and respond with care, logistics, records, and reintegration, not moral drama.

Visible disagreement is safer than perfect harmony. Participants can argue, staff can challenge, families can object, critics can use designated routes, and leadership can lose a decision without treating conflict as institutional injury. The City's calm response to dissent provides better evidence of bounded authority than any statement about openness. A system that needs reverence has already made correction fragile (Hirschman, 1970; Lalich, 2004).

36.5.3 — Never Spectacle

City governance must never become spectacle. Public interest in power formation is legitimate; public appetite for exposure is not. The record exists to support accountability, context, correction, and democratic judgment. It does not exist to entertain, shame,

idolize, humiliate, or sell the lives of participants and people near them.

Spectacle often begins with packaging. A dramatic clip circulates without context. A record-site summary becomes a character arc. A donor video turns burden into inspiration. A tour route frames visible life as an exhibit. A public interface rewards outrage. A machine summary produces a memorable but unfair label. None of these requires bad intent to damage dignity (Solove, 2006; Lalich, 2004).

Spectacle exposes participants, staff, families, children, host residents, and public readers. Public readers are harmed when accountability becomes entertainment because they learn to consume rather than judge. Participants are harmed when they are turned into roles in a civic drama. Collateral persons are harmed when they become supporting characters without consent.

Public accountability must remain distinct from performance for an audience. The City may release relevant, contextual, status-labeled records. It should not amplify exposure because it drives attention. The public record site should be sober, navigable, correctable, and restrained. It should not borrow the grammar of reality television, scandal feeds, hero worship, or downfall culture.

An anti-spectacle audit includes public-interest review, hostile-crop review, summary review, media rules, caption control, visitor-route limits, donor-material review, platform moderation, and correction of misleading excerpts. Public artifacts should be designed so that a cropped fragment still shows boundaries,

uncertainty, and non-spectacle purpose (Andrejevic, 2004; Solove, 2006).

Attention replacing accountability marks design failure. If public attention, donor demand, media excitement, participant celebrity, or social outrage begins to shape release choices, the City must restrict artifacts, pause publication, revise summaries, reduce audience incentives, and strengthen oversight. A City that feeds public appetite has lost the difference between record and display.

Spectacle review should include people trained to distrust beautiful framing. A filmmaker, designer, media officer, or donor writer may produce material that feels moving and still damages the institution. The reviewer should ask what a hostile crop would imply, whether a person becomes a character, whether a child or family edge is exposed, and whether public appetite is being mistaken for public interest.

Spectacle also includes noble spectacle. The City should be wary of making pain, exhaustion, apology, or service into emotionally polished proof of seriousness. Readers can be moved without being manipulated. The prose, images, and public releases should preserve human texture without turning vulnerable moments into civic advertisement (Goffman, 1961; Schwartz and Cook, 2002).

36.5.4 — Never Proof Object

The governing rule must never become a proof object. It may show that a civic design can move some burden upward under defined conditions. It may produce operational evidence about buildability, rights, record integrity, staff load, host burden, and pilot function. It cannot prove the formal Law by existing,

inspiring people, improving public discourse, or producing coherent records.

Proof-object drift is especially tempting at the end of a book. The architecture feels complete. The safeguards feel serious. The institution feels more humane than hidden leader formation. A reader may want that coherence to count as validation of the deeper theory. The chapter refuses that move. Applied coherence is not scientific proof (Fox, 2007).

Vulnerable readers, participants, researchers, critics, staff, and public audiences all have rights at stake. A vulnerable reader should not hear that suffering is meaningful because the City works. A participant should not have operational records converted into science. A scientist should not be asked to treat civic success as evidence for PTVC. A critic should not be told that objection is denial of proof.

Scientific validation requires independently assessable methods, evidence, and criticism. The Science of Fairness develops the project's scientific framework for testing the Law; the City is an applied civic institution. Its operational records can help investigate the City's own performance, but they do not, on their own, establish claims about consciousness identification, stream individuation, terminal valence closure, or truth-level endpoint structure. Any research use requires separate authority, permissions, and an explicit measurement bridge of the kind described in §36.3.5.

The traceable record for this prohibition includes status labels, research-use gates, public-summary controls, AI-output labels,

donor-material review, and correction of overclaims. Any sentence that says the City proves the Law should be treated as a public-risk error. Any visual that implies proof through light, scale, halo, ranking, or inevitability should be withdrawn (Nissenbaum, 2010; Andrejevic, 2004).

Proof drift in official or high-reach artifacts is the decisive failure. If a guide, website, social post, donor summary, caption, archive label, public speech, or participant claim presents the City as validation, the correction should be immediate and public enough to follow the claim. Repeated proof drift should trigger artifact suspension and leadership review.

Proof drift often begins with small phrases: this shows, this confirms, the City proves, the record demonstrates the Law, or the pilot validates fairness. Each phrase should be replaced by the proper status: operational evidence, civic demonstration, design result, public-risk finding, or research question. Precision keeps public language inside the evidence.

The safest public explanation is conditional. If the City works, it may show that a particular institution can relocate certain public-power burdens under defined safeguards. That is enough. The sentence does not need to climb into metaphysics. Ambition becomes more credible when it stops where its evidence stops (Fox, 2007).

Shrine and empire drift begin when origin or scale acquires authority. Shrine logic treats the founder, first campus, earliest cohort, or original records as sacred sources that later evidence cannot displace. Empire logic turns replication into expansion of

brand, control, prestige, or network sovereignty. Both weaken local refusal, independent standards, and the right of a later City to reject the origin's design.

Institutional beauty creates a special risk of epistemic inflation because a campus is easier to photograph than a failure condition. Successful operation may provide evidence about feasibility, humane formation, staff safety, host benefit, record quality, and correction under tested conditions. It does not establish PTVC, identify the City as the unique fair civic form, or certify the inner character of participants. Covers, diagrams, donor materials, websites, and summaries must therefore carry the same evidence role, limits, correction owner, and withdrawal route as the underlying record (Fox, 2007).

36.5.5 — Never Shrine or Empire

The shrine risk can appear even in sincere admiration. Visitors may want to stand where the first Vow was signed. Donors may want their names attached to origin buildings. Participants may describe the original City as morally higher than later translations. Staff may resist correction because tradition feels protective. A civic institution cannot let origin prestige outrank current review (Solove, 2006; Lalich, 2004).

The empire risk appears when network logic becomes central command. Accreditation becomes brand protection instead of safeguard protection. Local translation becomes obedience. Corridor rules become hierarchy. Origin-city staff begin to supervise distant contexts they do not understand. A network that

cannot lose members or learn from local failure becomes expansion under a fair name.

Local translation affects later cities, host communities, legal systems, cultural translators, critics, and participants outside the origin City. They need accreditation that protects invariants without imposing mythology. They need decertification that can reach the original City if it drifts. They need plurality without prestige caste.

Replication remains conditional on safeguards that travel. A City using the name must preserve nonnegotiable safeguards, but it need not imitate origin architecture, culture, climate response, language, governance details, or public rituals where lawful variation is needed. The City's identity is not the original campus. It is the set of bounded protections that travel (Chambers et al., 2013; Reason, 1997).

Scale without humility is the operative failure. If the original City becomes unreviewable, if the network ranks cities by prestige, if local objections are dismissed as disloyalty, if replication outruns safeguards, or if decertification cannot touch powerful members, the network must pause. A City that cannot be removed from good standing cannot safely multiply. Decertification and local refusal should remain usable against the founding site itself, not only against later members of the network.

Scale humility should be visible in the treatment of origin stories. The first City may deserve historical memory, but not reverence. Its early failures should be displayed with as much integrity as its early insights. A network that preserves only founding beauty

teaches later cities to hide their own defects. A living model needs origin memory without origin worship. Successor sites should be free to document where they intentionally depart from the original design and why the change better protects local burden.

The first City should therefore plan for its own demotion. It should prepare successors to improve it, critics to expose it, auditors to constrain it, and later translations to differ from it. Origin dignity is not preserved by reverence. It is preserved when the original is allowed to become one fallible ancestor among many (Goffman, 1961; Schwartz and Cook, 2002). Domain boundaries matter because the City becomes more credible, not less, when government, constitutional law, science, religion, and private life retain authority the City cannot absorb. The final safeguard is institutional replaceability: no site, founder, or narrative should become necessary to preserve the principles the network claims to serve.

36.6 — Handoff to Government and the Wider Project Domains

The City occupies one bounded room in the series architecture. It owns a built civic institution for voluntary adult public-power formation under a role-bound active record, together with the local rights, care, staff, host, audit, and exit interfaces needed to make that institution answerable. Every borrowed object is used only for that work. The handoff returns broader authority before conceptual coherence can become jurisdictional expansion.

A handoff is an operating threshold. It identifies the object being transferred, the receiving owner, the condition under which the transfer may occur, the record that accompanies it, and the authority that remains outside the City.

Nine owner routes keep the final synthesis legible. The Law of Fairness receives the public root; *The Science of Fairness* receives scientific adjudication; *The Life of Fairness* receives ordinary private life; and *The Religion of Fairness* receives optional spiritual doctrine and practice. *The Government of Fairness* and *The Constitution of Fairness* receive operation, lawful authority, rights, and remedy, while *The Peace of Fairness*, *The Transition of Fairness*, and *The Utopia of Fairness* receive material systems, movement, and mature synthesis. The City can illuminate burdens in formation without acquiring power to govern, legislate, validate, sanctify, finance, authorize, or define the wider future.

The government handoff sends operating government to *The Government of Fairness*. The City can form adults who seek

substantial public power. It can host a lawful office interface where authorized. It can preserve record continuity. It can make public explanation more visible. It cannot run departments, administer services, control official records, manage public procurement, or command crisis response.

The handoff discipline prevents one attractive institution from becoming a master system. Each receiving title applies its own evidence, authority, rights, and safeguards, and each may later return findings that narrow, revise, or retire a City mechanism. Naming an interface transfers no warrant. The City demonstrates competence partly by yielding clearly and by reopening its design when the rightful owner returns a contrary result (Venice Commission, 2025; Bovens, 2007).

The handoff remains substantive even for a reader who never opens another volume. This section identifies what the City owns, what it merely interfaces with, which condition governs transfer, and what authority it lacks. The City has not enacted law, operated government, established PTVC, required religion, governed ordinary private life, solved material capacity, authorized transition, or defined utopia. Standalone clarity and disciplined deferral protect one another.

36.6.1 — Government Handoff

Review rights extend to citizens who rely on government services, public employees, elected officials, appointed officers, agency counsel, contractors, regulated parties, and people subject to state power. They need lawful administration rather than City charisma. A benefits office, immigration case, police decision,

health agency rule, emergency order, or procurement dispute cannot be governed by a formation campus unless law has actually authorized the arrangement (Bovens, 2007; United Nations, 1966).

Support ends where sovereignty begins. A participant who holds office may use City-supported record continuity where lawful. Staff may assist with explanation, scheduling, public interface, and archival coherence. But official decisions remain inside legitimate government structures. The City's record can show influence; it cannot become the place where authority secretly moves.

Day-to-day records for the government handoff include office-interface labels, lawful authority records, government transparency-zone boundaries, secrecy exception logs, public explanation files, and influence records. Those records should show when the City is supporting public authority and when public authority has left the City's domain.

Government drift is corrected by separation. If City staff are effectively directing official action, the arrangement must stop. If the public cannot tell whether a decision came from lawful government or City influence, labels and records must be corrected. If a participant uses the City to evade official accountability, government-domain review must take over (Venice Commission, 2025).

This boundary preserves the City's usefulness. A City that tried to run government would become another hidden center of power. A City that forms and supports officials while preserving the

government boundary can make public power more answerable without stealing the authority it is supposed to illuminate.

The return route should be reciprocal. Governments that admire the City should not copy its record practices into ordinary administration without the City's protections and role boundary. A public agency that uses visibility tools on benefit recipients, students, patients, migrants, or ordinary employees would invert the City's burden direction. The government handoff therefore carries a warning as well as an invitation.

This handoff should make future collaboration cleaner. A mayor, minister, legislator, judge, or agency head interacting with the City should be able to identify which hat is being worn at each moment. Official authority, participant formation, public explanation, private counsel, and City record support should not blur into one opaque role (United Nations, 1989).

36.6.2 — Constitutional Handoff

The constitutional handoff sends legal architecture to *The Constitution of Fairness*. The City needs rights, routes, records, remedies, public privacy, lawful visibility, status labels, and review processes. But a civic design does not enact itself. Constitutional validity, statutory authority, jurisdiction, due process, equality, privacy, labor protection, family protection, and remedies require legal architecture.

Anyone whose rights may be touched by the City has standing to demand legal clarity: applicants, participants, staff, family members, children, host residents, visitors, journalists, protesters, counterparties, and public readers. They need enforceable

protection, accessible review, and remedy under the competent authority rather than reliance on internal goodwill. Legal reviewers should be able to inspect the institution's actual records and dependencies before any admirer assumes legality (Venice Commission, 2025; United Nations Human Rights Committee, 1996).

Model design and enacted law must remain separate. The City can describe the legal questions it must answer and the safeguards it should carry. It cannot declare that those safeguards are legally sufficient in every jurisdiction. It cannot use the word rights as if it has already created enforceable rights by naming them.

The record needed to review constitutional handoff includes unresolved-legal-issue registers, rights notices, remedy maps, jurisdictional status, external counsel review, public-record classifications, due-process routes, appeal structures, and correction mechanisms. These records should make legal humility operational. They should show what is enacted, what is proposed, what is pending, and what is forbidden until law is clear.

Constitutional drift requires legal review and restraint. A practice that touches rights without proper authority pauses. A public artifact that implies enacted law where only model design exists is corrected. A participant, donor, official, or operator who uses City language to bypass legal process must be refused cooperation (Venice Commission, 2025).

This return route also prevents *The Constitution of Fairness* from becoming decoration. Legal architecture deserves its own

discipline. The City can make the need vivid, but it must not pretend that vivid need is enforceable law.

The constitutional handoff should remain visible in any future charter-like document. If a public summary lists City rights, it should not imply those rights are enacted everywhere. If a pilot operates under a host agreement, the agreement's status should be clear. If a remedy depends on future law, it should not be sold as present remedy. Legal architecture begins with status honesty.

Constitutional objection belongs at the beginning, not the end. A legal critic who sees a flaw before the pilot opens has given the City a gift. The proper response is not defensiveness but routing: identify the right legal owner, pause the affected practice, and preserve the objection in the unresolved-issue record (Venice Commission, 2025).

36.6.3 — Material Systems Handoff

The material systems handoff sends finance, labor, infrastructure, debt, public cost, enoughness, climate, migration, corruption drag, and material dignity to *The Peace of Fairness*. The City has costs and anti-capture rules, but it does not own the whole material order. It cannot solve poverty, public finance, climate infrastructure, or labor systems by forming public leaders under record.

The first-order exposure reaches workers, taxpayers, donors, host residents, suppliers, construction crews, maintenance staff, regional communities, and people whose material conditions shape political possibility. A City that ignores material burden would become elite theater. A City that claims to solve all

material burden would become inflated and unbuildable (United Nations Human Rights Committee, 1996; Ostrom, 2010).

Within that boundary, the City must justify its capital and operating costs, protect labor, limit donor and vendor capture, avoid host extraction, count environmental burden, and stop when it cannot fund its safeguards.

A complete audit trail for material handoff includes cost records, procurement disclosures, donor limits, vendor dependency reviews, labor audits, environmental burden records, host-impact agreements, maintenance logs, reserve planning, and anti-capture findings. These records should show whether the City's material footprint matches its ethical claim.

Material drift calls for cost discipline and refusal. If the City becomes a donor monument, an excuse for underpaid labor, a drain on host services, a vendor-controlled platform, or a public-finance burden without commensurate public value, it should pause, shrink, redesign, or stop. Buildability is not permission to build at any cost (International Labour Organization, 2022a; Ostrom, 2010).

The handoff preserves scale humility. The City can train power to see material burden better, but it cannot become the whole material repair. A serious institution should make leaders more accountable to material life without pretending that the campus is sufficient.

This handoff also protects against purity theater. A City can ask future leaders to understand debt, labor, procurement, corruption, climate, and infrastructure, but its own material footprint must be

checked first. The campus that teaches public finance while hiding donor leverage, underpaid labor, or local ecological burden would teach hypocrisy through its floor plan.

Material handoff keeps the City from becoming an expensive symbol that only elites can afford to admire. If the model requires resources unavailable to most places, that limitation should be named. A costly safeguard may still be necessary, but its cost belongs in the moral account. Hidden expense is hidden burden (Ostrom, 1990).

36.6.4 — Religion of Fairness Handoff

The handoff assigns optional doctrine, ritual, pastoral practice, community spaces, spiritual interpretation, Clean-Slate City questions, and covenantal limits to *The Religion of Fairness*. The City may include reflection, silence, apology, repair, ceremony, or shared language where appropriate, but it cannot require participation in the Religion of Fairness. It cannot make religious meaning a condition of entry, belonging, office readiness, or public trust.

The City's civic role is formation, not religious membership. The Transparent Vow is a role-bound burden connected to preparation for public power; it is not baptism, initiation, confession, purification, penance, karmic accounting, or salvation practice. Reflection may be offered in plural and optional forms, but religious intensity cannot be borrowed to make civic discipline sacred, dissent impure, or exit spiritually suspect.

Reviewers should be able to trace the Religion of Fairness handoff through program descriptions, nonparticipation labels for

the Religion of Fairness, optionality notices, pastoral-separation rules, complaint routes for religious pressure, public-artifact review, and staff training. If reflection practices appear, they should be described in civic and optional terms unless the participant freely enters a religious setting outside the City's civic requirement.

Religious-boundary drift requires immediate institutional separation. If participants feel pressured to accept the optional spiritual path described in The Religion of Fairness, if staff use doctrine to interpret suffering, if public artifacts portray the City as spiritually superior, or if refusal is treated as a moral defect, the practice must stop. The City should correct the public meaning and return religious questions to *The Religion of Fairness* (United Nations, 1966; United Nations Human Rights Committee, 1996).

This return route lets spiritual resonance remain free. Meaning can be offered only where refusal remains dignified. A City that protects nonbelief protects belief as well, because it keeps belief from being converted into institutional power.

The Religion of Fairness handoff should also protect language around suffering. No ritual, reflection, pastoral comment, public guide, or participant story should imply that hardship is payment, deserved correction, spiritual credit, or proof of worth. The City's civic record does not interpret the soul. Where meaning is offered, refusal must remain dignified and care must remain immediate.

Returning sacred questions to their owner also protects the Religion of Fairness from civic capture. A religion or spiritual practice is distorted when it certifies civic readiness, quiets legal

concern, blesses a pilot, or softens criticism. The Religion of Fairness must remain optional and answerable to its own limits rather than becoming the City's emotional enforcement arm (United Nations, 1966; United Nations Human Rights Committee, 1996).

36.6.5 — Scientific Handoff

The scientific handoff begins with two distinct returns. The Law of Fairness receives the public root, per-stream nontransferability boundary, and ethical firewall; *The Science of Fairness* receives claim status, measurement governance, rival testing, replication, data use, and scientific verdicts. The City may use the burden-locating lens to design its own records and institutions, but operational success or failure remains operational evidence about the City unless a separately governed scientific bridge has earned a stronger role.

The immediate rights-bearing group includes participants, staff, families, nonparticipants, researchers, data stewards, Artificial Intelligence vendors, public readers, and vulnerable audiences. They need a clean separation between civic record and research record. The fact that the City captures role-bound public-power formation does not authorize scientific mining, model training, or inference about inner life (Nissenbaum, 2010; United Nations, 1966).

Operational accountability defines the City's jurisdiction. Scientific use requires a separate lawful and ethical pathway with consent, governance, measurement definitions, protocol review,

and status language. A participant's public-power burden is not a blank research permission.

The City should be able to say exactly when a record is operational, public, research-authorized, Artificial Intelligence training-authorized, sealed, or forbidden for reuse.

Scientific drift requires an immediate governed response because unauthorized research or model use may remain invisible to the affected person. The City must stop the pipeline, preserve the incident record, notify where required, restrict derived systems, separate lawful retention from continued use, repair consent and governance, and pursue deletion or disabling of derivatives where technically and legally possible. The review should also determine which vendor, researcher, or internal owner allowed purpose migration (Nissenbaum, 2010; Council of Europe, 2024; NIST, 2024b).

This boundary protects scientific seriousness and City credibility at once. PTVC must remain vulnerable to protocols that can fail, while the City must be judged by its own operational questions: practical voluntariness, humane formation, record integrity, staff safety, host benefit, correction, and exit. The scientific domain therefore receives governed questions and data routes, not a prewritten conclusion.

The scientific handoff has to be especially strict around Artificial Intelligence. Search, summarization, anomaly detection, translation, and pattern tools may assist operational record use if subordinate and audited. The AI boundary is part of the science

boundary because machine outputs can make overclaim look neutral.

The scientific handoff uses the language of governed questions rather than data harvest. Any study begins with a separate purpose, protocol, authority, consent or other lawful basis, minimization plan, endpoint and observation logic, rival structure, and withdrawal route. The archive is not waiting to be mined (NIST, 2024b).

36.6.6 — Transition Handoff

Transition rhetoric reaches future participants, host communities, governments, readers, donors, critics, vulnerable audiences, public agencies, religious communities, researchers, and ordinary citizens. They need gates more than momentum. A transition that cannot pause converts hope into pressure (Staw, 1976; Skivington et al., 2021).

The City contributes within one domain and then returns authority. It can show what a civic institution might require if public-power formation is to carry more visible burden, and it can preserve operational evidence, hazards, and failure memory for later decisions. Those judgments belong to transition and synthesis under their own conditions.

A transition review file includes pilot evidence, stop conditions, public-risk review, withdrawal rules, gates, rollback, decertification memory, host review, and cross-domain sign-offs. It must show why a step was allowed and what stops it; attention and demand are not gates.

Transition drift is corrected by delay or rollback. If public appetite outruns safeguards, if a pilot is used as destiny language, if public artifacts compress uncertainty into slogans, if hosts are pressured, or if ordinary people feel recruited into a transition track, the next step should stop. Failure to proceed can be a form of fidelity (Mahoney and Thelen, 2010; Staw, 1976).

The handoff ends the City's authority in the right place. The City offers one answerable design for a hidden formation problem, together with its gates, hazards, alternatives, and failure memory. The transition and synthesis inquiries can build on, refine, narrow, or replace this design as evidence and practical experience warrant.

Transition language cannot outrun gates. A pilot may attract donors, journalists, governments, activists, and critics, but attention is not readiness. The handoff must preserve the right to disappoint every audience by pausing, delaying, narrowing, or withdrawing an unsafe artifact.

Transition also receives failure memory; without it, sequencing becomes salesmanship. The world should not inherit a curated success story when restraint is the real lesson (Reason, 1997; Weick and Sutcliffe, 2015).

A proper handoff contains a return condition. Corrigibility travels both ways: the City stops at its boundary, and authoritative findings can return to change it (Bovens, 2007; Ostrom, 2010).

36.7 — Final Answerability

Final answerability is the City's last claim about itself. Every consequential function should have a visible owner; affected people should have standing; records should be correctable; reviewers should be able to inconvenience leadership; and a function should lose permission when burden outruns public purpose. The City claims no triumph, proof, or inevitability. It claims only that any real institution bearing its name must remain inspectable, pausable, repairable, and able to lose standing (Bovens, 2007; Weick and Sutcliffe, 2015).

After the red team and the owner handoffs, five commitments remain: correctability, faithful failure memory, safeguards that travel, burden directed upward, and review stronger than triumph. Each commitment has an actor, record, affected-person route, and consequence. Together they define the conditions under which admiration can remain safe, refusal can remain legitimate, and the City can close without claiming victory.

The final review follows five linked duties: protect and correct the present function, preserve the mechanism of failure, test every safeguard after transport, keep burden directed toward power, and reopen apparent success to scrutiny. Summaries, guide pages, diagrams, captions, websites, donor descriptions, social excerpts, speeches, and record-site labels must carry the same owners, limits, and stop routes. A hostile crop should still reveal who may object, what may change, and what may end (Ostrom, 1990; Bovens, 2007).

Correctability is final because no design can anticipate every case, interaction, or future technology. The City can promise something more honest than perfection: signals will have standing, urgent harms will receive interim protection, decisions will have independent owners, remedies will propagate, and repeated failure will have consequences. A system insulated from correction is not mature; it is merely protected from evidence.

Correctability is more than admitting error. It tracks the institutional route from signal to protection, judgment, remedy, and memory without ranking persons or aggregating harms (Bovens, 2007; Schedler, 1999; Hirschman, 1970).

Table 36.1. Final Answerability Review Sequence.

Stage	Duty and escalation
Signal and standing	Any affected participant, worker, family member, host resident, visitor, critic, or public user can raise an issue without extra exposure, status loss, or retaliation. Preserve the signal outside the challenged authority, route it promptly, and begin protective review immediately when danger or retaliation is plausible.
Interim protection	Pause a risky release, decision, technical output, work assignment, public artifact, or access path when delay could make harm difficult to reverse. Protection does not presume final merits. If no safe interim state exists, suspend the affected function.
Independent review	Identify the owner, evidence, law, affected persons, conflicts, and uncertainty. Give the complainant a meaningful chance to respond. Review outside the

Stage	Duty and escalation
	implicated chain on a stated timetable, with appeal and renewed protection if deadlines slip.
Remedy and correction	Repair the record or practice, restore access or privacy, compensate where warranted, discipline misconduct, and communicate correction wherever the error or exposure travelled. Keep the matter open until downstream propagation is checked and adequacy can be challenged.
Failure memory and retirement	Preserve the mechanism, warning signs, failed safeguards, remedy, owner, and re-review trigger without turning the affected person into a permanent case object. Narrow, retire, decertify, or close the function when recurrence risk remains beyond justified capacity or the complete answerability route cannot be supplied.

The sequence is deliberately noncompensatory. A strong remedy cannot excuse absent standing, and an elegant review cannot repair a release that should have been paused. Answerability is the complete route, not the presence of one impressive control (Schedler, 1999; Fox, 2007; Reason, 1997).

36.7.1 — Correctability as Final Standard

Correctability becomes visible when a complaint changes a record, the record change alters an operating rule, the operating change protects the affected person, and the lesson reaches future practice. The routes must be legible at human scale: staff know where to report overload, families know how to challenge exposure, host residents know how to file burden complaints, participants know how to appeal, and public readers know how

corrections appear on the record site (Bovens, 2007; Reason, 1997).

People harmed by a wrong record, unsafe schedule, failed release, staff decision, vendor output, or host burden need repair rather than institutional self-description. The institution therefore needs multiple routes: participant appeal, staff complaint, nonparticipant remedy, host review, external audit, technical incident response, public correction, legal referral, and network decertification. Each route requires authority, a timeline, a durable record, and escalation beyond the chain that produced the harm.

No score can substitute for this sequence. Correctability is an operating duty, not proof of virtue. An institution may have a correction office and still behave defensively. The real question is whether correction changes incentives, releases, designs, staff conditions, host burdens, and leadership consequences.

The accountability file for correctability includes complaint intake, classification, temporary protection, reviewer assignment, finding, remedy, public notice where appropriate, audit follow-up, and failure memory. A correction route without memory repeats harm. A memory without remedy becomes archive cruelty. Both must be joined (Ostrom, 1990; Fox, 2007).

Power has become uncorrectable when leadership can block review, auditors depend on the people they audit, complaints disappear, public notice is delayed for image reasons, or remedies cannot reach the harmed person. Any such pattern makes the governance route itself unsafe. The City must suspend the

implicated authority, protect records and complainants, obtain outside review, and decide whether the function or institution may continue under its name.

The most informative correction costs the City something: time, money, convenience, status, donor approval, participant momentum, or public confidence. Institutions often welcome correction while uncertain and resist it once admired. Review independence should therefore increase after good press, replication interest, or symbolic success. Prestige is not a reason to relax oversight; it is a reason to make oversight harder to capture.

Correctability should include correction of the correction. A participant can be removed, a staff member can be disciplined, and a vendor can be replaced, but leadership must also be answerable. If founders, directors, trustees, or accreditation bodies cannot lose authority after serious failure, correction becomes downward discipline rather than institutional humility (Hirschman, 1970; Sitkin, 1992).

36.7.2 — Failure Memory as Fidelity

Failure memory is fidelity because forgetting allows an institution to repeat harm while preserving innocence. A City that hides failure to preserve reputation becomes less safe with every success story it tells. A City that remembers failure with dignity can make future harm less likely without turning harmed people into exhibits.

Final failure memory should preserve enough to prevent repetition: cause, warning signs, burden, attempted repair,

decision, unresolved risk, and the condition for any future reconsideration. It should remain usable without converting affected people into symbols.

The people whose experience enters failure memory retain privacy, dignity, and control over unnecessary exposure. A family member injured by exposure should not become the public face of a privacy lesson. A staff member who reported overload should not be identifiable as a troublemaker. A host community that won mitigation should not be mocked as anti-City. Failure memory must protect dignity while preserving institutional learning.

A disciplined failure record separates incident, pattern, system cause, human consequence, correction, residual risk, and re-review trigger. The City does not need public shame to prove honesty; it needs enough preserved reasoning for auditors, future builders, network reviewers, public readers, and affected people to understand what changed and why.

A withdrawn public artifact that exposed protected family information supplies the concrete test of failure memory. The archive must preserve what mechanism failed, which warning signs were missed, what remedy travelled, and which future gate changed without turning the family into a permanent case object. If earlier harm is softened, renamed, or buried, the City may repeat it. Fidelity may require reopening findings, public correction, leadership consequence, and warning every site using the same route.

Near misses and ignored dissent belong in failure memory alongside completed harms. A prevented release, detected vendor

dependency, staff complaint that triggered de-loading, or host objection that stopped expansion may reveal the system earlier than a visible scandal. Recording those events teaches the institution to learn before injury becomes public.

Handled well, failure memory makes the institution calmer rather than morbid. An organization that knows its own failure patterns can stop treating every defect as existential, speak plainly, repair faster, and resist the impulse to hide. Memory then functions as institutional situational awareness rather than reputational punishment (Weick and Sutcliffe, 2015; Reason, 1997).

36.7.3 — Safeguards Must Travel

Safeguards must travel because the City is not protected by the charisma of an origin campus. Replication is legitimate only when the rights, record boundaries, labor protections, host recourse, audit, exit, and stop authority demonstrated at the first site remain enforceable elsewhere.

Traveling safeguards do not require identical buildings. Climate, language, law, culture, architecture, governance details, emergency systems, and public interfaces may differ. What must remain invariant is the direction of burden and the protections against downward visibility, coercion, spectacle, proof drift, and capture (Bovens, 2007; Reason, 1997).

The affected people are future participants, staff, families, hosts, nonparticipants, and local publics who would otherwise inherit only the polished version of the model. A participant in a translated City should have real exit. A staff member should have labor complaint rights. A family should have shielding. A host

community should have recourse. A nonparticipant should have remedy. A critic should have access to the public record site.

Portable safeguards require exact invariants and local translation. A City cannot keep the name while redefining it into ordinary-life transparency, elite credentialing, religious membership, research recruitment, private governance, or campaign branding. Accreditation should test the invariants and decertification should remain possible even for admired institutions.

Diluted replication is the decisive failure. If later cities copy the beauty but not the rights, the record but not the remedy, the visibility but not the ordinary privacy, the network but not the decertification, the City has become a franchise myth. The remedy is accreditation refusal, public warning, technical separation, and, where necessary, withdrawal of the name.

Traveling safeguards should also resist luxury dependence. If a protection works only because the origin City is richly staffed, heavily funded, culturally admired, or technologically advanced, then replication requires either equivalent support or a narrower design. A later City should not inherit obligations it cannot safely fund. Portability includes the honesty to say that some cities are not ready.

Portability should be tested with hostile conditions. How does the safeguard work when donors are impatient, local politics are polarized, staff are scarce, media attention is cruel, technology fails, translation is hard, or the first participant is beloved? A safeguard that works only in ideal weather is not yet a traveling safeguard (Hirschman, 1970; Sitkin, 1992).

36.7.4 — Burden Must Stay Upward

Burden must stay upward is the simplest final rule. The City exists because people seeking substantial public power can fairly be asked to carry more visible formation burden than ordinary citizens. The institution that asks this must carry its own burden as well: cost, labor, host impact, record integrity, audit, correction, legal review, public explanation, and willingness to stop.

The upward-burden rule is practical enough to use at every design meeting. For each proposed feature, ask where the load moves: toward citizens, families, staff, hosts, donors, vendors, or participants seeking power. A feature that makes the institution look accountable while transferring risk to less powerful people has failed before implementation (Young, 2000; Bovens, 2007).

The upward-burden rule is role-specific rather than a mandate for universal surveillance. Upward burden is not a call to expose all powerful people at all times or to erase lawful secrecy. The rule asks whether justified burdens are being carried by those with role-based power, not whether all opacity is evil.

Rights, labor, host, nonparticipant, record-site, vendor, donor, and public-artifact audits should share one directional question: where did the burden move, and who had standing to object? Separate audits remain necessary because the harms differ, but the common question prevents one domain's success from concealing another domain's transfer (Schedler, 1999; Weick and Sutcliffe, 2015).

Inversion is the decisive failure. If the pursuit of accountability

makes less powerful people carry more risk while powerful people gain prestige, the City has violated its own burden principle. The response is redesign, compensation, restriction, pause, decertification, or closure.

The upward-burden test should remain simple enough for any reader to use. When a record is released, ask who chose visibility and who did not. A theory of fairness becomes practical when ordinary people can ask those questions without permission.

The same question should travel with the reader after the book closes. In government, family, work, religion, science, media, and technology, unfairness often survives by hiding who carries the burden. The City is one application of a larger civic habit: ask who is being asked to carry what someone else refuses to name (Bovens, 2007; Young, 2000).

No triumph without review is the City's final ethical rule. Triumph asks the reader to celebrate what has been imagined; review asks what happens when law, money, ambition, fatigue, fear, media pressure, donors, vendors, politics, and ordinary human weakness enter the design. The City belongs under that second question.

Review cannot wait until confidence has already collapsed. Different failure classes require different clocks: immediate incident review, periodic rights review, annual labor and host review, scheduled technical-retirement review, and multi-year necessity review. It prevents a success narrative from exempting a function from the question whether it would still be justified if designed today under current law, evidence, technology, cost, and

affected-person knowledge (Bovens, 2007; Lindberg, 2013; Power, 1997).

36.7.5 — No Triumph Without Review

A final page can be hopeful without congratulating itself. Hope says that public-power formation might become more answerable and invites builders, critics, workers, families, hosts, nonparticipants, and public institutions to test the design. Triumph would close those alternatives too early.

Consequences arrive before institutional certainty. A participant needs review when the Vow becomes too heavy; staff need it when strain becomes normal; a child needs protection before exposure rather than apology afterward; and a host resident needs standing before local cost becomes irreversible. Review matters because rhetoric cannot reverse every harm.

The final public summary is itself an audit object. Every high-reach artifact should preserve conditional status, ordinary privacy, voluntariness, review routes, real exit, domain handoffs, and failure conditions. A diagram, caption, excerpt, website, or donor page that omits those elements should be corrected or withdrawn even when the omission attracts support.

Conclusion inflation is the final form of capture. Language of inevitability, destiny, proof, superiority, recruitment urgency, donor pressure, or obedience converts synthesis into authority that the City has not earned. The corrective options remain the same at the last page as everywhere else: narrow the claim, delay the release, add the missing route, publish a correction, or withdraw the artifact.

Builders may feel gratitude, relief, or pride after sustained scrutiny, and readers may want release after so much structure. Those feelings are human, but they cannot decide what evidence supports, law permits, or affected people bear.

The invitation is to prepare public responsibility more openly and humanely. A City worth building would give citizens a clearer account of how judgment was formed, give participants room to learn and correct, and protect the people who never chose the Vow. Its achievement would be visible in those ordinary lives: less hidden leverage, more usable remedy, and public power that remains answerable to the people it affects.

The final threshold is procedural. When contribution, limits, refusal, complaint, correction, stop authority, alternatives, and specialist handoffs remain visible, answerability survives beyond the last page. The reader remains free to accept, revise, borrow from, or reject the proposal.

Glossary

A

Abstention: A decision to withhold a positive or negative verdict while specified identification, measurement, endpoint, model, or data-quality requirements remain unresolved.

Accessibility: The design of spaces, records, services, communication, and participation so people with differing bodies, senses, cognition, language, mobility, and technology access can use the City without being treated as exceptions.

Accumulated balance: Within one qualifying stream and a fixed valid representation, the positive phenomenal magnitude accumulated so far minus the negative phenomenal magnitude accumulated so far at a chosen cut. Under exact PTVC, the signed remainder from that cut to the truth-level endpoint equals the negative of this accumulated balance.

Action-mediated closure: A candidate route in which the consequences of available actions produce the proposed closure relation.

Active inference: A family of models in which an organism can reduce expected mismatch by updating expectations and by acting on or selecting its environment so preferred or viable states become more likely.

Active period: The formally declared interval during which a participant is subject to the City's active public-power formation burden. It begins only after activation and ends through pause, withdrawal, completion, suspension, exit, or another recorded status transition.

Active public-power formation: Study, deliberation, advice, practice, influence, correction, and other role-relevant activity undertaken while preparing for consequential public authority. The City records this role activity rather than claiming a total record of the person.

Active-role record: The governed record of role-relevant activity during the active period, including provenance, classification, access, correction, and status. It is narrower than a whole-life dossier.

Ad hoc patch: A change introduced after an adverse result mainly to preserve a preferred conclusion, such as moving the endpoint, recentering the origin, inventing an unseen interval, or excluding a bearer. A legitimate successor must have independent support, create new prospective tests, and leave the earlier result visible.

Adverse case: A gate-valid qualifying stream for which the appropriate truth-containing result excludes exact zero. Under an exact universal branch of PTVC, one valid adverse case cannot be canceled by favorable population averages.

Affected person: A person whose rights, privacy, safety, reputation, work, family life, or other legitimate interests may be materially affected by a City record, decision, release, or participant action.

Affective valence: See Valence.

AI sovereignty: Institutional authority assigned to an artificial intelligence system over a person's inner life, worth, standing, or eligibility, a use prohibited by the project. Research systems

remain assistive tools under accountable human review.

Almost-sure attainability: The existence of at least one admissible policy that reaches a declared target with probability one from a stated information state. It differs from closure under a fixed law, success under every policy, and limit-sure attainability, where probabilities can approach one without any single attaining policy.

Almost-sure closure: See Probability-one closure.

Alternative endpoint branches: Prospectively declared architectures including state coupling, first hitting, absorption, endpoint atoms, singular timing or support, continued experience beyond a protocol boundary, and endpoint-inclusive value. Each specifies its endpoint, representation, bridge, and testing assumptions.

Answerability: The condition in which consequential public power can be traced to lawful authority, reasons, records, review, correction, and remedy.

Applied lens and formal Law: The applied lens asks bounded present questions about burden, options, care, and repair. The formal Law concerns an exact truth-level condition over one complete qualifying stream.

Archive: The governed system that preserves records, provenance, versions, corrections, access history, and failure memory. Preservation does not itself authorize public release, research use, or model training.

Arousal: The activation, wakefulness, or energetic mobilization

dimension of experience. High or low arousal can accompany welcome, burdensome, mixed, or neutral states.

Artificial intelligence: Computational systems that can assist bounded tasks such as search, summarization, translation, drafting, classification, recommendation, or routing. Their outputs remain fallible and do not by themselves create authority over human worth, conscience, diagnosis, legal status, civic standing, or PTVC claim status.

Artificial Intelligence training: The use of records to change or fit a model's learned behavior. Training is a separate use from search, retrieval, or source-grounded summarization and requires its own lawful authority, governance, provenance, and safeguards.

Atom at zero: A positive probability mass located exactly at zero in a distribution of terminal residuals. An atom at zero is stronger than mere concentration near zero, but it is not the same as universal or probability-one closure.

Attainability: The existence of at least one admissible route or policy capable of reaching the target from a specified state. Attainability alone does not show that the route will be selected, that it works under partial observation, or that every admissible path closes.

Attrition mechanism: The process by which participants leave, pause, become unreachable, lose access, enter treatment, withdraw permission, or die during longitudinal research, thereby changing who remains visible. Attrition is both a selection problem and an ethical signal about burden, access,

trust, and study design.

Audit: Structured examination of records, controls, decisions, outcomes, and recurring patterns by a body with enough access and independence to identify error, capture, misuse, or unmet duties.

Audit of auditors: Independent review of the people and systems that perform oversight, intended to reduce capture, blind spots, conflicts of interest, and self-protective review.

Auxiliary assumption: An assumption needed to connect a theoretical claim to an observation, estimator, or test. A failed prediction may reflect the target hypothesis, an auxiliary assumption, or both, so confirmatory work must state these assumptions in advance.

B

Balance: On the primary additive PTVC branch, equality of a qualifying stream's complete finite positive and negative phenomenal magnitudes, equivalently a terminal signed residual of zero. Balance is intrastream and terminal; it does not require neutrality at every moment, equal gross experience across lives, or cancellation across people.

Baseline drift: A change over time in a person's use of a rating scale, neutral point, comparison standard, or reporting habit. Unmodeled baseline drift can create an appearance of convergence or closure without a corresponding change in latent phenomenal valence.

Bearer: The truth-level subject or unit to which qualifying

conscious experiences belong and within which the proposed accumulation is evaluated. The bearer is determined by the declared stream, ownership, and routing rules, not by convenience of observation or legal identity alone.

Behavioral nonresponse: The absence of expected command following or another observable response under a particular assessment. Motor, sensory, language, medication, arousal, task, and environmental barriers can block expression, so nonresponse alone does not settle whether experience is present or whether a conscious stream has ended.

Biological death: The end of biological life. It may be associated with a stream endpoint in some cases, but PTVC does not define biological death as the truth-level endpoint by stipulation.

Bipolar branch: A representation branch that keeps positive and negative phenomenal components separate so they may coexist rather than being forced into one momentary net value. It is not interchangeable with the primary additive branch, and results transfer between them only through a justified bridge on a common identified domain.

Blinded bearer adjudication: A procedure for deciding among bearer or routing models while withholding, as far as possible, the downstream result each classification would help produce. Fixed criteria, independent reviewers, visible disagreement, and outcome separation reduce post hoc routing in favor of the theory.

Blinding: A design safeguard that withholds selected information

from participants, investigators, coders, analysts, or adjudicators when that information could bias conduct or interpretation. The form of blinding must fit the study and its ethical limits.

Boundary hypothesis: A hypothesis about a limiting, terminal, or otherwise sharply delimited property of a process rather than a claim about its ordinary moment-to-moment path. PTVC is a candidate boundary hypothesis because it concerns a stream's terminal signed residual.

Bounded active record: The role-limited record architecture that follows consequential public-power formation during active status while preserving protected life, nonparticipant rights, and post-exit boundaries.

Burden: A cost carried in lived experience, time, effort, risk, uncertainty, constraint, exposure, pain, fatigue, care work, or lost options. Burden analysis asks where costs fall, including costs hidden by a successful outcome or attractive surface.

Burden before authority: The principle that a person voluntarily seeking high-consequence public power may reasonably carry proportionate explanation, record, correction, and review before others are asked to live under that person's decisions.

C

Calibration: The process of relating a measurement system to an independently justified reference so that its origin, scale, uncertainty, and interpretation are known.

Campaign surface: The public presentation of a candidate

during electoral competition, including speeches, biographies, media appearances, messages, and disclosure. The City treats campaign evidence as important but later than much of the formation that produced it.

Candidate boundary hypothesis: A testable proposal about a specified terminal boundary, evaluated through its representation, measurements, and predicted consequences.

Candidate mechanism: See Candidate route.

Candidate route: A proposed mechanism, policy structure, dynamical construction, or mathematical path by which the terminal target might be satisfied. A route can receive support or fail independently of the target hypothesis.

Candidate sentience escalation: A protocol-governed increase in protection when a candidate system's organization, activity, behavior, or welfare signal exceeds the assumptions under which ordinary review was approved. It may trigger verification, monitoring, reduced exposure, independent review, pause, or retirement without declaring consciousness or personhood.

Candidate signature: A prospectively specified observable pattern predicted by a candidate route, such as horizon-sensitive choice, recovery after perturbation, or narrowing variance. It is a testable clue rather than a unique fingerprint, and it gains weight only through transport, adequate measurement, and serious rivals under common rules.

Capture: Preservation of information in a controlled record. Capture does not by itself authorize public release, profiling,

research, model training, or any other secondary use.

Care before interpretation: When a person is in pain, danger, illness, grief, crisis, or severe deprivation, care and protection come before theoretical interpretation. Meaning may be explored afterward when wanted, but assistance does not depend on accepting a PTVC explanation.

Care-before-interpretation rule: See Care before interpretation.

Care before proof and interpretation: See Care before interpretation.

Causal locus: The place in a system where a causal influence is proposed to operate, such as experience generation, action selection, routing, endpoint timing, observation, or reporting. Distinguishing loci helps prevent one process from being mistaken for another.

Channel qualification: The staged process by which a report, sensor, behavior, contextual record, or other observation channel earns a defined research role through technical verification, analytical validation, construct validation, burden review, and specified performance thresholds.

City of Fairness: A proposed bounded civic institution in which adults voluntarily preparing for consequential public power can study, deliberate, practice, receive care, and build an answerable active-role record before office. The City is not government, a virtue certificate, a universal transparency regime, or proof of PTVC.

Civic interface: The governed boundary through which participants and the City engage the public, receive questions or input, provide explanations, and make records usable without transferring governmental authority to the institution.

Civic server: A moderated technical service that supports public participation, information access, discussion, or structured input while remaining governed by identity, anti-abuse, accessibility, and privacy rules.

Claim ceiling: The strongest inference that a channel, design, model, comparison, or public artifact can support under its actual identification, uncertainty, scope, and safeguards. Clear communication may simplify language but cannot raise the evidential ceiling.

Closure: Satisfaction of a declared terminal target. On the primary additive PTVC branch, closure means that the finite positive and negative phenomenal magnitudes within one qualifying stream are exactly equal; equivalently, its terminal signed residual is zero.

Coercive measurement: Inner-life measurement conducted where authority, dependency, crisis, or structural pressure makes disclosure or monitoring a practical condition of care, work, education, benefits, liberty, opportunity, or standing. A tool is not voluntary when refusal brings penalty, suspicion, or reduced access.

Comfort-first observation: A terminal-research order of authority in which routine care, symptom relief, privacy, family presence, and clinical judgment determine whether and

when observation may occur. Data collection stops when it interferes with treatment, rest, touch, conversation, spiritual practice, or requested quiet.

Common-action requirement: Under partial observation, an action or policy must be selected from the information actually available. For probability-one closure, its probability of completion must equal one for almost every compatible latent state under the declared conditional state law. A robust guarantee over every observationally indistinguishable state is stronger and requires its own feasibility and selection premises. State-specific actions that cannot actually be selected do not satisfy either requirement.

Comparative consciousness evidence: Species-appropriate evidence that combines behavior, learning, neurobiology, ecology, affective organization, and motivational tradeoffs into a converging case about possible experience. Human resemblance may inform a bridge but is neither necessary nor sufficient, and welfare protection need not wait for a complete theory.

ComparatorStatus: See Scientific verdict axes.

Comparison without forced equivalence: Comparing traditions or ideas through a precise shared question, function, image, or difference while preserving their distinct histories, doctrines, registers, and internal disagreements.

Compensability: A route-specific question about whether a present formal discrepancy remains answerable through safe, realistically available paths before a declared horizon closes.

Complete active-role record: The integrity requirement that consequential formation within the declared active role not proceed through authorized hidden channels. Completeness applies to the role, not to every aspect of the participant's life.

Complete felt history: See Complete strict-pre-endpoint felt history.

Complete strict-pre-endpoint felt history: Every qualifying phenomenal contribution owned by one stream before, but not at, its independently defined truth-level endpoint. Completeness is relative to declared bearer, representation, ownership, and domain rules, not to a remembered biography, selected episode, observation window, or final survey.

Complete strict-pre-endpoint phenomenal domain: The entire qualifying field of conscious experience belonging to one stream before, but not including, its truth-level endpoint. The primary PTV C target is defined over this complete domain, not merely over a sampled terminal window.

Completion potential: A candidate mathematical function whose decrease, boundary behavior, or terminal value characterizes a proposed route to closure.

Conditional support: The set of values, states, actions, or outcomes that remain possible after conditioning on specified information. Claims about exact closure must distinguish support restrictions from high probability or average behavior.

Conscious stream: A temporally connected sequence or field of conscious experience treated as one unit under declared identity and routing criteria. It is not automatically identical to

a biological organism, legal person, biography, memory narrative, or data record.

Consciousness: Subjective experience: the presence of states that are experienced by a bearer. The series treats the presence, structure, boundaries, and measurement of consciousness as empirical and conceptual questions rather than equating consciousness with any single report, behavior, neural signal, computational output, or biological marker.

Consent, refusal, and withdrawal: A continuing, practical consent relationship in which information is understandable, alternatives are genuine, retaliation is absent, stopping remains possible, and data consequences are clear. Separate choices may govern participation, monitoring, linkage, reuse, model training, disclosure, continued contact, and deletion.

Constraint does not imply design: A distinction between structural relations that limit possible histories and hypotheses about how those relations originated. Each origin hypothesis requires its own explanatory model and evidence.

Constraint without a judge: An impersonal structural or boundary relation governing admissible complete histories. PTVC proposes exact terminal zero in this structural sense while leaving the realizing mechanism open.

Construct-estimand distinction: A construct is the experience-related concept a study intends to represent. An estimand specifies the exact population, time, endpoint, treatment, and analysis quantity it seeks to learn. A cohort mean, individual probability, and path-level endpoint therefore pose different

questions.

Construct validity: The degree to which a measure, manipulation, or model captures the intended latent construct rather than a neighboring one. For valence research, behavior, reward, arousal, language, and neural activity may inform measurement without being identical to felt valence.

Continuity break: An interruption in expected active-role record integrity, affecting capture, custody, access logging, classification, or preservation. Lawful pause or exit and lawful access or release restrictions on intact records are not, by themselves, continuity failures.

Controlled vocabulary transfer: Use of a technical term across fields with its source meaning, local role, evidential basis, and specialist references made clear.

Correction: A documented change that repairs an error, misattribution, missing context, inaccurate status, or defective public object while preserving a traceable history of what changed and why.

Correction and withdrawal: The accountable process of detecting a problem, assessing it, containing harm, correcting the record, propagating the change, documenting it, and withdrawing or retiring affected claims, tools, routes, or public artifacts when correction is not enough.

Correction log: A durable record of corrections, responsible decision makers, dates, reasons, affected objects, and any downstream updates required to keep public memory accurate.

Counterfactual reachability: Whether a target could be reached under one or more alternative admissible actions or policies from a specified state. Counterfactual reachability does not establish what actually occurred or what a partially informed agent could select.

Covenant: The practical agreement governing participant obligations and institutional duties during the City relationship, including support, record burden, boundaries, review, pause, and exit. It is civic rather than sacred status.

Craving capture: The narrowing of attention and immediately reachable options when a learned cue, urge, withdrawal state, or expected relief becomes unusually salient. It can constrain lived choice and future optionality.

D

Data as trace: A report, waveform, image, note, gesture, archive, or model output is a context-bound record produced through an observation process. Its interpretation uses the relevant measurement model and provenance.

Data-generating process: The full process that produces the observed data, including latent states, dynamics, routing, selection, measurement, missingness, and reporting. A valid analysis must consider whether more than one process can generate the same observations.

Data minimization and deletion: The discipline of collecting and retaining only the least revealing data needed for a declared question, while governing removal or restriction across raw records, features, backups, shared copies, outputs, and trained-

model influence. Deletion promises must accurately state their technical reach and residual limits.

De-loading: A deliberate reduction of workload, exposure, public interface, or other active burden when continued intensity would undermine health, consent, judgment, or institutional integrity.

Decertification: The withdrawal of network recognition from a City or related institution that no longer meets required safeguards, governance, record, rights, or integrity standards.

Decision rule: A prespecified mapping from evidence to an outcome such as support, adverse result, narrowing, abstention, or route retirement. Decision rules should be fixed before outcome inspection whenever confirmatory status is claimed.

Defeat condition: A prospectively specified result that counts against a target, route, measurement claim, or auxiliary assumption under stated validity and inference rules.

Delayed release: A lawful disclosure design in which material is preserved but publication is postponed for a defined reason, duration, review schedule, and challenge route.

Deliberation: Structured reasoning among participants or other authorized contributors in which evidence, disagreement, revision, tradeoffs, and public consequences can be made inspectable over time.

Desert-based fairness: The question of when praise, reward, blame, or sanction properly follows from what a person chose and did. Its legitimate use is narrow and evidence-based.

Detachable-excerpt ceiling: The evidential scope a headline, quotation, caption, slide, social post, translation, donor summary, or AI explanation retains when encountered apart from its source. Accurate, concise wording identifies the result being communicated.

Dignity firewall: The project's grounding of dignity, rights, care, safety, treatment, privacy, and relief in ethical principles independent of PTVC's scientific status.

Dignity under active record: The rule that severe role visibility does not make humiliation, bodily exposure, intimate detail, or spectacle legitimate. Dignity changes handling without erasing accountability.

Dimensionality of valence: The question whether phenomenal valence can be represented on one signed dimension or requires multiple dimensions. The primary additive PTVC branch uses a signed representation, but that representation remains an empirical and conceptual commitment to be tested.

Direct identification: Identification obtained from assumptions and observations that determine the target without relying on a route merely because it fits. Direct identification is distinct from selecting one convenient model among several observationally equivalent alternatives.

Dream-as-felt-experience window: An interval of conscious experience during sleep that may belong to the felt history of a stream even when waking recall omits it. Studies relate that interval to sleep stage, reports, and the adopted continuity model.

Dream-report chain: The sequence connecting experience during sleep, awakening, the memory trace available afterward, and the report given to another person. Each transition can select, reorder, or reshape what enters the record.

E

Emergency access: Time-limited access to otherwise restricted records when a defined safety, medical, legal, security, or continuity need requires it. Emergency access must be logged and reviewed.

Empirical band: See Finite-band compatibility and measured equivalence.

End of observation: The last time usable data are obtained because a channel fails, monitoring stops, communication is lost, privacy is requested, or another practical event occurs. It is an observation boundary that may precede the protocol endpoint and truth-level endpoint and creates missingness rather than terminal truth.

Endpoint: The boundary at which a qualifying conscious stream ceases for purposes of the truth-level target. An endpoint must be defined by the stream model rather than equated automatically with biological death, loss of contact, device shutdown, or the last observed report.

Endpoint atom: Positive probability mass assigned by a declared endpoint-time or marked-endpoint law to a particular time or point. It specifies endpoint timing or marking, distinct from probability mass at a terminal residual of zero.

Endpoint bridge: The independently validated relation connecting an observed or protocol endpoint, possibly an interval, to the truth-level endpoint required by the claim while carrying error, return, revision, confounding, and competing-event uncertainty.

Endpoint conditioning: Selecting, observing, conditioning, or reweighting trajectories according to where they end. This can change the apparent earlier drift or dispersion and supplies an explicit statistical model for comparison.

Endpoint coupling: A candidate route in which endpoint timing or endpoint conditions depend on the evolving stream state. Tests compare the predicted relationship with alternative accounts of endpoint timing and pre-endpoint dynamics.

Endpoint firewall: See Endpoint independence.

Endpoint-inclusive branch: A prospectively declared branch that assigns a specified phenomenal contribution exactly at the endpoint. Its temporal domain includes a point excluded from the primary strict-pre-endpoint branch, so comparison between the branches requires the corresponding domain and representation bridge.

Endpoint independence: Two noninterchangeable conditions must be distinguished. Prospective endpoint independence fixes the endpoint branch, evidence source, selection rule, and adjudication procedure without using a ledger estimate or terminal residual to choose the endpoint. Probabilistic path-endpoint independence states, under a specified reference law, that endpoint time is independent of the pre-endpoint ledger

path; it is a separate premise used by the random-endpoint obstruction. The first condition does not imply the second.

Endpoint marker: An observable event or signal used to estimate or bound a truth-level endpoint. A marker can be informative without being identical to the endpoint itself.

Endpoint uncertainty and ambiguity: Multiple defensible interpretations of endpoint identity, timing, or interval under the declared evidence and rules. Prospective adjudication represents that uncertainty and states when it yields No adequate estimate.

Equivalence band: A prespecified finite interval around a reference value within which effects are treated as practically equivalent for a stated purpose. An equivalence result around zero supports only the declared finite-band claim; it does not establish exact zero.

Error budget: An explicit accounting of uncertainty from sampling, instruments, calibration, sign, origin, timing, missingness, model choice, transport, and construct identification across the evidence chain. Separating these sources identifies which additional data or methodological changes could improve the result.

Escrow: Controlled custody in which material is preserved but access or release is withheld until declared conditions, reviewers, or dates authorize further use.

Estimand: The precisely defined quantity an analysis seeks to learn, including its population, unit, time domain, conditioning, and scale. The estimand is not the same as the estimator used

to calculate it.

Estimator: A rule or procedure for using observed data to estimate an estimand. An estimator may be biased, uncertain, inconsistent, or nonidentifying even when its numerical output is close to zero.

Ethical burden too high: A typed outcome in which a scientifically coherent question is not ethically available because the required burden, privacy exposure, dependency, deception, bystander risk, or lasting effect is disproportionate. Consent, payment, technical sophistication, or promised decisiveness cannot cure the design; it must be redesigned or left unanswered.

Ethical floor: The minimum safeguards governing the project: present suffering receives care; consent and refusal remain meaningful; harmful testing is prohibited; dignity and rights do not depend on PTVC; and scientific, legal, institutional, and spiritual claims remain within their proper authority.

Every-continuation closure: Every continuation in a prospectively declared nonempty admissible continuation class satisfies closure. The claim says nothing about paths outside that class and is not implied by probability-one closure or support containment. If the class is empty or undefined, closure is unavailable rather than vacuously established.

Evidence ladder: A map of evidential dependencies and branch-specific implications. Descriptive convergence, finite-band equivalence, an atom at zero, probability-one closure, and set-universal closure are not interchangeable; some require

additional bridges and are not ordered by one unconditional strength scale. Each result should state its target and the further inference it licenses.

Exact closure: On a declared PTVC branch, the truth-level condition that a qualifying stream's terminal signed residual is exactly zero under the specified bearer, representation, domain, endpoint, and validity conditions. Exact closure is distinct from a near-zero estimate, a population mean of zero, or an uncertainty interval that merely contains zero.

Exact zero: See Exact closure.

Exit: A usable ability to leave an institution, contract, program, service, relationship, technology, or funding arrangement without surrendering rights, essential support, private data, or a viable future.

Experienced exposure and unity gate: Experienced exposure is the declared measure of how qualifying phenomenal experience contributes across a stream and may differ from calendar time. The unity gate states when felt contribution is treated as active and owned by the stream.

External justice: Rights, capabilities, opportunities, material conditions, duties, institutions, protection, and remedy considered independently of any estimate of felt valence. External justice remains binding regardless of PTVC's scientific status.

F

Failed upstream gate: An unmet prerequisite, such as

representation, origin, bearer, endpoint, observation, measured-to-latent bridge, or transport, that determines which downstream conclusions remain available.

Failure memory: Durable documentation of defects, pauses, withdrawals, breaches, stop reasons, corrective actions, and lessons so later Cities can inherit evidence rather than institutional myth.

Fairness: A family of questions about how benefits, burdens, opportunities, rules, reasons, and remedies are distributed and justified. In this series, ethical and institutional fairness remains distinct from PTVC's scientific terminal-closure hypothesis; neither reduces to the other.

Falsifiability: A scientific claim's specification of observations or evidence objects that could count against it under prospectively declared validity requirements and decision rules.

Falsification: A result that conflicts with a prespecified claim under the study's stated assumptions and validity gates. Falsification must identify which target, route, or auxiliary claim is affected rather than overgeneralizing from one failed component.

Felt availability: The modest claim that something is occurring for a conscious stream even when the experience cannot be spoken, deliberately used, remembered later, or organized into a clear self-story. It separates possible experience from an observer's access to evidence about it.

Felt valence: Valence considered as the positive, negative, or

neutral character of conscious experience as lived from within. It is not identical to arousal, reward, behavior, preference, or moral evaluation.

Finite-band compatibility and measured equivalence: Latent finite-band compatibility requires the complete nonempty latent compatibility object to lie wholly inside a prospectively calibrated latent acceptance set. Measured equivalence requires the complete nonempty measured compatibility set to lie wholly inside the appropriate bridge-defined measured region. Partial overlap or merely including zero is unresolved.

Finite signed phenomenal measure: A finite signed measure representing positive and negative phenomenal valence over a qualifying stream's complete strict-pre-endpoint domain. Finiteness permits well-defined positive and negative Jordan masses and a terminal signed residual.

Finite soft-guidance ceiling: Under the registered finite power-weighting route, any retained positive probability mass on actions with completion probability below one prevents probability-one completion. This is a probability-mass result; topological-support containment and set-universal closure require separate premises.

Finiteness: On the primary additive branch, each complete positive and negative phenomenal magnitude is finite. Finiteness is a per-stream condition and does not impose one universal upper bound on all streams.

Firewall: An explicit boundary that prevents evidence, authority, language, or records from one domain from being used to

justify a conclusion or power that belongs to another domain.

First-hitting and absorption routes: A first-hitting route uses the first entry into a prospectively declared set. An absorption route additionally keeps the process within that set afterward. Relating either event to the truth-level endpoint uses a separately specified endpoint bridge.

Fission-and-fusion routing rule: Under the series' primary formal convention, genuine fission ends the parent stream and begins each qualifying child stream, while genuine fusion ends the prior streams and begins a new stream. Earlier phenomenal balances are neither duplicated among descendants nor pooled into the fused stream.

Fitness, feeling, and moral worth: The distinction among reproductive propagation, the valenced quality of a bearer's experience, and the ethical standing owed to that being. Each is evaluated through its appropriate biological, experiential, or ethical framework.

Formal or latent phenomenal ledger: On the primary additive branch, the latent cumulative signed phenomenal-value process within one qualifying stream across its declared domain. Ledger is mathematical shorthand, not a moral, spiritual, financial, or administrative account, and it does not imply conscious awareness, cross-stream transfer, or institutional access. Under exact PTVC, its value at a chosen cut determines the equal-and-opposite net signed remainder required from that cut to closure.

Formation ecology: The interacting environment through which

public-power seekers develop judgment, habits, dependencies, relationships, skills, correction patterns, and readiness. The City's distinct claim is that some of these interactions may need to be understood together rather than as isolated disclosures.

Future optionality: The meaningful future paths a person can realistically reach through available time, bodily capacity, material conditions, relationships, information, institutions, treatment, support, and action.

G

Gate-valid counterexample: An adverse case that passes the declared bearer, representation, origin, domain, endpoint, observation, bridge, and inference gates for the tested branch. Deductive exclusion requires a deterministic truth-containing object guaranteed under maintained assumptions to exclude the target. Confidence or posterior objects support only their registered coverage- or posterior-qualified adverse conclusions, not literal universal refutation.

Gate-valid stream: A qualifying stream that satisfies the prespecified inclusion, endpoint, measurement, data-quality, and model-validity gates required for the declared test. Only gate-valid cases may carry the evidential status assigned by that test.

Generalized Terminal Neutrality: A broader family of terminal-zero conditions defined by a declared functional, measurable output space, and distinguished zero when scalar addition would lose relevant structure. It is a separate branch and is not PTVC unless a justified bridge connects its zero

condition to the additive positive-negative decomposition.

Government transparency zone: A lawful interface in which City practices may accompany official work only to the extent permitted by the governing constitutional, administrative, records, security, and employment rules of the actual public institution.

Gross experience: On a declared additive scalar representation, gross experience is the sum of a stream's complete positive and negative phenomenal magnitudes before cancellation. It is distinct from the terminal residual; equal terminal residuals do not imply equal gross experience across streams.

Gross negative magnitude: See Gross negative valence.

Gross negative valence: The total magnitude of negatively valenced phenomenal experience within one stream, considered without subtracting positive valence. A net-remainder constraint does not independently determine this gross total.

Gross positive magnitude: See Gross positive valence.

Gross positive valence: The total magnitude of positively valenced phenomenal experience within one stream, considered without subtracting negative valence. A net-remainder constraint does not independently determine this gross total.

H

Hedonic adaptation: The changing emotional impact of a gain, loss, or continuing condition as novelty, attention,

expectations, comparison, routine, and context change over time. Adjustment varies across events, people, domains, measures, and times.

Held-out transport: Testing whether a prospectively specified model or result travels to data, settings, populations, channels, periods, or endpoint regimes reserved from model development and tuning.

Hidden burden and hidden relief: The observation that visible advantage may coexist with distress and visible hardship with joy, competence, love, meaning, or peace. It motivates direct attention to experience alongside external conditions.

Hidden cumulative object: See Latent cumulative object.

Hidden-state model: A model in which the process of interest contains latent states that are inferred from observable signals. Such a model must distinguish state dynamics, observation error, routing, selection, and missingness.

Homeostasis and allostasis: Homeostasis regulates variables within workable ranges, while allostasis anticipates changing demands by adjusting operating levels, mobilizing resources, and redistributing physiological cost. These processes provide measurable architectures for studying regulation, recovery, and resource use.

Host community: The town, region, jurisdiction, and affected local public around a City site. Host communities carry material and symbolic burdens and therefore require standing, review, remedy, and lawful participation in decisions that affect them.

Human review: Accountable human responsibility for consequential interpretation, access, correction, release, readiness, safety, and governance decisions. Automated tools may assist but do not replace ownership of the decision.

Human-worth score prohibition: No estimate of valence, burden, mood, pain, resilience, contribution, regulation, apparent balance, or unity may be used to measure or rank human worth, credibility, deservingness, eligibility, or civic or spiritual standing.

I

Identification: The ability of the available data and stated assumptions to distinguish the target quantity or model from alternatives. More data cannot resolve nonidentification when competing explanations remain observationally equivalent under the design.

Independent neutral-origin calibration: A procedure that identifies the valence zero point using evidence and rules independent of the completed record's terminal residual.

Inference: Reasoning from observations and assumptions to conclusions about latent quantities, models, mechanisms, or populations. Every inference inherits the limits of its measurements, design, identification conditions, and auxiliary assumptions.

InferenceStatus: See Scientific verdict axes.

Influence: Advice, leverage, access, dependence, persuasion, money, status, institutional pressure, or other forces capable of

shaping public-power formation. Influence is not automatically corrupt, but consequential influence should be answerable.

Informative missingness: Missing observations whose occurrence relates to burden, state, access, treatment, refusal, shutdown, or another factor relevant to the inference, so visible records may differ systematically from what disappeared. A missing report is not zero, neutrality, noncooperation, or absence of experience.

Institutional administration limit: Courts, governments, employers, insurers, schools, platforms, clinicians, families, and religious bodies have no authority to possess or administer the latent cumulative object as a fact about worth, credibility, eligibility, fault, care priority, spiritual standing, or terminal status. Bounded research estimates cannot create that authority.

Institutional capture: A condition in which donors, vendors, parties, leaders, staff factions, technology providers, prestige systems, or other interests gain disproportionate control over the City's decisions, record, standards, or public meaning.

Interoceptive prediction: The anticipation and interpretation of bodily signals such as heartbeat, breathing, pain, fatigue, hunger, nausea, temperature, and arousal through expectations, context, uncertainty, attention, and action.

Interpretation: The assignment of meaning to records, patterns, events, or conduct. Interpretation must remain distinguishable from source evidence and open to context, disagreement, correction, and public judgment.

Intrastream: Evaluated within one conscious stream at a time.

For PTVC, positive or negative experience in one stream cannot be used to balance another stream.

Intrastream closure: Closure evaluated within one qualifying conscious stream. Positive valence in one stream cannot cancel negative valence in another, and no population total substitutes for a stream-level target.

Invariance under positive rescaling: The property that multiplying a valid signed valence representation by a positive constant leaves its sign structure and exact-zero closure status unchanged. This does not license arbitrary nonlinear transformations or shifts of the neutral origin.

J

Jordan decomposition: The representation of a finite signed measure as the difference between mutually singular positive and negative measures. Their total masses provide the positive and negative phenomenal quantities compared by the primary additive PTVC target.

Jordan masses: The total positive and total negative masses in the Jordan decomposition of a finite signed phenomenal measure. On the primary additive PTVC branch, exact closure requires equality of these two masses within the same qualifying stream.

L

Last conscious experience: The final qualifying experience before a truth-level stream endpoint, when such a final experience is well-defined. PTVC does not require this last

experience itself to feel neutral and does not equate it with the last observed report.

Latent cumulative object: The unobserved formal representation of signed qualifying felt experience accumulated within one stream across its declared domain. Reports and instruments constrain it through a measurement model.

Latent valence: The unobserved phenomenal valence attributed to experience itself and investigated through models linking reports, behavior, physiology, and neural signals.

Law of Fairness: The series' public name for the proposed Per-Stream Terminal Valence Closure hypothesis and the wider interdisciplinary inquiry built around it. In scientific use, it remains a candidate hypothesis rather than an established law of nature.

Lawhood: The status of a proposed relation as sufficiently general, invariant, predictive, and independently testable to warrant law-like scientific standing. Evaluation requires identified objects, explicit scope, prospective tests, serious rivals, replication, and resistance to outcome-driven repair; the term does not assume that PTVC has achieved that status.

Least-burdensome means: The principle that a more intrusive City mechanism should not be used when a less burdensome lawful approach can adequately address the same public problem.

Ledger: See Formal or latent phenomenal ledger.

Ledger awareness: Conscious knowledge or tracking of a stream's accumulated phenomenal balance. PTVC does not require such awareness, and the hypothesis does not establish that a person, institution, pastoral figure, or artificial system can read an actual personal ledger.

Limit-sure attainability: The property that policies can make the probability of closure arbitrarily close to one even though no single admissible policy need achieve probability-one closure. Within the same fixed environment and nonempty admissible policy class, it is weaker than almost-sure attainability and does not establish closure under an arbitrary fixed law or every admissible continuation.

Lived choice: The capacity to form purposes, choose among meaningful options, revise, refuse, and act with others from within real bodily, social, historical, and material conditions. Reversibility and opportunities for review and repair can help guide decisions under uncertainty.

Local return and terminal closure: The separation between movement toward a familiar range during an episode or observed interval and a proposed exact cumulative condition at the independently defined end of one complete qualifying stream.

Longitudinal ledger: A model-based representation of accumulated signed phenomenal valence across a stream.

Longitudinal research trace: A repeated sampled record created through changing instruments, schedules, contexts, purposes, and permissions. It can reveal trajectories and within-person

change but remains a borrowed trace rather than a biography, complete phenomenal history, or ownership of the person.

Low-unity state: A state in which ordinary access, responsiveness, integration, or evidence of unified experience is reduced or uncertain, as in sleep, anesthesia, coma, delirium, or severe brain injury. It may be a pause, altered-state branch, or unresolved interval rather than the end of a stream.

M

Machine-assisted summary: A labeled summary produced with computational assistance and tied to traceable source records. It is an aid to navigation or comprehension, not a substitute for source evidence or final public judgment.

Material stabilization: Housing, healthcare, dependent support, financial relief, and other practical support intended to reduce leverage and make refusal, correction, and exit more real. Stabilization is legitimate only when it does not purchase loyalty or create new captivity.

Maximal qualifying conscious stream: A qualifying conscious stream extended as far as the adopted identity and routing criteria permit, so the analyzed stream is not an arbitrary fragment of a larger routed stream.

Mean reversion: A local statistical or control tendency for an extreme observation to move toward a typical range because of feedback, stable dynamics, regression, sampling noise, treatment, or changed context.

Mean-zero result: A finding that an expectation or sample

average equals or approaches zero. It describes the aggregate, in which positive and negative individual residuals can cancel.

Meaning as optional: The freedom to make, receive, revise, postpone, refuse, or live without an encompassing religious, spiritual, philosophical, or secular interpretation of experience, grief, suffering, or the Law. Nonbelief, doubt, silence, and exit retain full dignity and may never become barriers to care or belonging.

Measured-to-latent bridge: The independently justified relation that allows a result on a measured estimand to constrain the declared latent phenomenal target, with scope, uncertainty, and failure conditions carried forward. It is separate from the observation model, endpoint bridge, estimator, and route; without it, evidence remains on the measured scale.

Measurement invariance: The tested stability of a measurement relation across the people, groups, languages, devices, sites, times, or contexts for which a comparison is proposed. Its results identify supported comparisons and opportunities for further calibration.

Measurement model: A formal account of how latent valence or related states generate reports, behavior, physiology, neural signals, or other observations. It includes scale, origin, error, drift, and possible response-process distortions.

Measurement reactivity: Change in experience, behavior, disclosure, or the observation process caused by measurement itself, including repeated prompts, wearables, interviews, monitoring, and study expectations. Reactivity must be

minimized, estimated, or carried into interpretation because it can alter both the target interval and the evidence collected.

Measurement without ownership: Experience may be described, compared, and modeled without transferring ownership to a clinician, researcher, institution, record, or algorithm. Measurement creates responsibilities for purpose limitation, consent, privacy, correction, uncertainty, and stopping, not authority over a person's inner truth, worth, eligibility, or care.

Metrology: The discipline of measurement, including units, calibration, traceability, uncertainty, comparability, and error. It provides the tools for making PTV's quantitative predictions empirically interpretable.

Missingness: The process by which observations are absent, censored, truncated, or unavailable. Missingness near endpoints may be informative, and treating it as random without support can bias terminal conclusions.

Modal reachability ladder: A family of nonequivalent, scope-dependent claims, including existence of a closing continuation, positive-probability completion, fixed-law probability-one closure, limit-sure attainability, almost-sure attainability, support containment, and closure of every admissible continuation. These claims do not form one unconditional total order. Any implication must preserve the carrier, completion event, policy scope, topology where relevant, and maintained assumptions.

Model ambiguity: Model-ambiguous means that two or more

adequate declared models remain practically indistinguishable under the common rules. Open-set inadequate means that no declared model is adequate. No adequate estimate means that the target or estimand cannot be defined, identified, or bounded under the available data and maintained assumptions, including because ethically permissible evidence is insufficient. Evidence rendered unusable by a failed protocol or validity gate is a separate status.

Model-ambiguous: See Scientific verdict axes.

Model governance: Accountable rules for choosing a model's target, data, loss function, constraints, interventions, permitted uses, review process, correction route, and verdict.

Model recovery: A simulation-based check of whether an analysis can distinguish candidate model families when their generating identities are known. Parameter recovery separately tests estimation of parameters under a specified generator. Both are evaluated under realistic observation conditions; success in one does not establish success in the other.

Moral desert: A claim that someone deserves reward, punishment, pleasure, or suffering because of conduct, character, or another morally relevant fact. PTVC's conditional arithmetic does not establish moral desert.

Motivation: The internal or external factors associated with action selection. A policy describes a mapping from information or state to actions; it should not be equated with the person's consciously experienced motive.

Multichannel estimate: A versioned, purpose-bounded estimate

formed through an explicit model relating channels such as report, behavior, physiology, neural data, and context to a declared construct and estimand.

N

NAE: See No adequate estimate.

Near-zero band: A finite interval around zero used to describe limited measurement resolution, uncertainty, or practical closeness.

Negative control: A condition, timing, procedure, or outcome that should not show the proposed signature if an explanation is specific. Matched non-horizon tasks, sham procedures, impossible timing, and alternate outcomes can expose generalized arousal, demand, leakage, selection, or analytic flexibility.

Net negative balance: A negative signed difference in which negative phenomenal magnitude exceeds positive phenomenal magnitude over the specified interval or accumulated portion of a stream.

Net positive balance: A positive signed difference in which positive phenomenal magnitude exceeds negative phenomenal magnitude over the specified interval or accumulated portion of a stream.

Net remainder: See Signed remainder.

Net valence: Positive phenomenal mass minus negative phenomenal mass within a specified stream and domain.

Neutral origin: The independently justified zero point of the adopted valence representation, separating positive from negative phenomenal valence. The origin must be fixed or calibrated independently of the desired terminal result because shifting it can change cumulative closure. It is an experience-scale reference point, not terminal neutrality or a claim that the final conscious moment is neutral.

Neutral valence: Phenomenal valence at the independently justified zero point of the adopted representation, contributing neither positive nor negative magnitude at that moment or element. Neutral valence is distinct from terminal neutrality or a zero cumulative residual, which concern an aggregate over a stream.

No adequate estimate: A prespecified inference status used when the target or estimand is undefined or cannot be identified or bounded under the available data and maintained assumptions, including because ethically permissible evidence is insufficient. It is distinct from a valid but unresolved analysis and from evidence rendered unusable by a failed protocol, consent, endpoint, measurement, provenance, computation, or participant-protection gate. The reason and affected estimand should be recorded.

No event pairing: Exact aggregate balance does not imply that one pain repays one joy, that one event causes its opposite, or that experiences arrive in matched moral bundles. PTVC constrains a complete-stream aggregate on its primary branch, not one-to-one event pairing.

No harm for proof: The prohibition on inflicting, prolonging, intensifying, staging, ignoring, or leaving suffering unrelieved in order to test, demonstrate, dramatize, or promote PTV. It includes unsafe self-testing, delayed care, coerced disclosure, vulnerable participants, and plausible synthetic suffering; principled abstention remains available.

No moral desert, debt, or payment: Required for closure does not mean morally deserved, earned, owed, or justified. Under exact PTV, a genuinely nonzero accumulated balance requires an equal and opposite net signed remainder within the same stream. Further felt contributions change that signed requirement, but it does not prescribe particular events, fix either future gross total, establish a known personal balance, or demonstrate a method for controlling future rewards. Care and responsibility retain their independent ethical grounds.

No personal endpoint testing: No person should try to test the Law by approaching danger, loss of consciousness, treatment refusal, self-harm, deprivation, violence, or death. Such acts create risk but cannot identify the bearer, complete domain, endpoint, missingness process, origin, or measured-to-latent bridge required for valid evidence.

No-score rule: See Human-worth score prohibition.

Noise floor: The smallest distinction an observation system can reliably resolve under declared conditions. Rounding, censoring, preprocessing, and random or systematic noise help determine that resolution.

Noncompensable risk: The modeled risk that, under specified

conditions and uncertainty, an action or state closes essential paths faster than remaining channels can reopen them. It is a route- or continuation-level diagnostic.

Nonidentification: A condition in which different target values or models are equally compatible with the available observations and assumptions. Reporting a single precise estimate under nonidentification creates false certainty.

Nonparticipant: A person who has not accepted a defined project-linked public role or activity. Nonparticipation creates no adverse inference about rights, civic standing, loyalty, belief, or worth.

Nontransferability: The rule that phenomenal valence belonging to one conscious stream cannot be credited to, debited from, or used to balance another stream.

Nonunique explanation: Several mechanisms generate the same observed trajectory, endpoint concentration, rebound, report, compression, or return pattern. Additional observations, interventions, or model comparisons can investigate the differences among them.

Null model: A specified alternative under which the distinctive PTVC target or route is absent. A useful null model makes concrete predictions and is tested alongside serious rivals rather than serving as a vague absence of effect.

Null outcome: A result that does not support the tested effect or distinction under the declared analysis. A null outcome may be informative, inconclusive, or adverse depending on power, identification, and the prespecified decision rule.

O

Objective functions versus experience: The distinction between a modeler's rule for ranking selected outcomes and the lived experience the model seeks to investigate. A measurement relation states which aspects of experience the chosen objective represents.

Observation: A recorded report, behavior, physiological measure, neural signal, event, or other data item interpreted through the relevant observation model.

Observation channel and observation model: An observation channel is recorded evidence such as report, behavior, physiology, neural activity, or context. The observation model states how a latent construct and nuisance conditions can generate or alter that output, including sampling, timing, error, and channel failure. Neither the channel nor its model is the experience.

Observation shutdown: See End of observation.

Observation window: The finite span during which a study records data. Its relation to the complete stream is specified through the observed interval, any missing prefix or remainder, and the applicable measurement and endpoint bridges.

Observational process: The mechanism by which latent experience and system states become recorded data, including measurement error, reporting, censoring, sampling, and missingness. It must be modeled separately from the target process.

Office interface: The documented handoff between City formation and lawful public office. It identifies which institution holds authority, which record regime controls, who supervises personnel and public money, which secrecy and disclosure rules apply, and where complaint and remedy lie.

Open-set inadequate: See Scientific verdict axes.

Operational Evidence: Evidence about whether the City's own mechanisms are feasible, livable, rights-protecting, sustainable, useful, or defective. Operational evidence may guide civic design without constituting scientific proof of PTVc.

Optional spiritual path: The optional religious interpretation and practice explored in The Religion of Fairness around fairness, hidden burden, enoughness, care, and repair. It is voluntary and separate from PTVc's scientific evaluation and from civic standing, public office, aid, or ordinary dignity.

Opponent process: A temporal counterprocess in which an initial state recruits a later afterstate whose strength and timing may change with repetition, helping explain relief, recovery, tolerance, withdrawal, fatigue, and rebound.

Outcome independence: Rights, dignity, care, safety, privacy, repair, and independently supported knowledge retain their grounds whether PTVc is supported, narrowed, unresolved, unmeasurable, or defeated.

Oversight access: Permission for an authorized reviewer, ombuds office, auditor, court, regulator, or other lawful oversight role to inspect defined records for a stated purpose

and duration.

Ownership: The prospectively specified rule assigning each qualifying phenomenal contribution to its bearer without omission, double counting, or cross-stream transfer. Ownership answers whose experience a contribution is; routing governs continuity through time and transitions.

P

Palliative sedation: A clinically governed process used proportionately to relieve otherwise refractory suffering, with varying drugs, depths, durations, routes, and circumstances. It is treatment rather than a standardized consciousness manipulation or clean terminal signal, and research must never delay relief, alter indicated titration, or prefer observability over comfort.

Partial identification: A condition in which the evidence restricts a target to a set or interval while leaving more than one value possible under the maintained assumptions.

Partial observation: A decision or inference setting in which the relevant latent state is not fully observed. Closure claims in such settings must respect common-action and selection requirements rather than assuming state-specific knowledge.

Participation without surveillance: A research architecture that keeps participation voluntary through purpose separation, data minimization, practical privacy controls, ordinary nonparticipation, correction, and eventual deletion. A person may contribute selected observations without granting permanent access, hidden inference, public ranking, or

ownership of the life described.

Past-fixity: Later experience may add to the future portion of a stream but cannot retroactively change what earlier experience was. This temporal discipline permits formal future complementarity while forbidding moral or phenomenal repricing of the past, including claims that later joy makes earlier abuse acceptable.

Pathwise closure: Closure evaluated on complete individual trajectories. The stated quantifier distinguishes one realized path, probability-one closure, support containment, and closure of every admissible path.

Pause: A deliberate interruption of a practice or proposal when safety, consent, evidence, capacity, or authority is inadequate. A pause can be responsible care rather than defeat, spiritual regression, or a reason to punish participants.

Per-stream claim: A claim evaluated for each separately routed maximal qualifying conscious stream as its own unit rather than for a population, household, country, species, or group average.

Per-Stream Terminal Valence Closure (PTVC): On the primary additive branch, the candidate boundary hypothesis that every separately routed maximal qualifying conscious stream in the declared reference class carries a finite signed phenomenal measure over its complete strict-pre-endpoint domain whose positive and negative phenomenal magnitudes (Jordan masses) are exactly equal; equivalently, its terminal signed residual is zero. The claim is intrastream and

nontransferable.

Phenomenal magnitude: The represented amount of positive or negative felt experience assigned to a stream under a declared valence representation. Positive and negative gross magnitudes remain distinct from their signed net difference.

Phenomenal measure: A measure assigned to conscious experience for representing phenomenal valence across a stream. It is conceptually distinct from clock time, event count, memory strength, neural activity, or report frequency.

Phenomenal time: A measure or ordering of experienced duration within a conscious stream. It need not coincide uniformly with external clock time and should not be inferred solely from the number of observations.

Phenomenal valence: See Valence.

Policy: A rule mapping available information or state to actions, possibly probabilistically.

Policy mixture: A probabilistic combination of actions or component policies. Average cancellation across components does not establish exact closure on each realized path.

Policy-mixture exactness: The requirement that exact closure under a randomized policy be secured on the relevant realized branches, not merely in expectation through cancellation among closing and nonclosing actions. Under the applicable support conditions, every action retained with positive probability must be closure-compatible.

Policy-support condition: A condition requiring the support of

a selected policy to contain only actions or continuations compatible with the declared exact closure claim. Assigning very small but positive probability to a nonclosing option does not satisfy exact support restriction.

Population mean and expected neutrality: Expected neutrality means that the terminal residual has expectation zero under a named probability law and information set, when that expectation exists. A sample or cohort mean estimates a population quantity under further assumptions. Either can arise through cancellation while every individual stream remains nonzero.

Portable safeguard: A local, operative protection placed on the exact surface or workflow where a high-risk fragment can be encountered or acted upon. A distant disclaimer is insufficient when the nearby claim could imply personal prediction, cross-person balancing, human scoring, machine ownership, or delayed care.

Positive and negative phenomenal magnitudes: On the primary additive branch, the nonnegative complete-stream totals of the positive and negative parts of the signed phenomenal measure. PTVC proposes that these two finite quantities are exactly equal within each qualifying stream.

Positive-probability completion: Under a prospectively frozen continuation regime and its declared induced law, the completion event has probability strictly greater than zero, optionally conditional on a stated prefix and admissible action or policy. This weak reachability claim does not imply

likelihood, probability one, an attaining policy, support containment, or every-continuation closure.

Positive rescaling: Multiplication of a valence representation by a positive constant. Exact zero and sign are preserved under positive rescaling, whereas shifting the origin or applying arbitrary nonlinear transformations can change the target.

Positive rescaling invariance: See Invariance under positive rescaling.

Precaution without personhood: Proportionate, revisable protection under uncertainty, including monitoring, reducing avoidable harm, preserving reversibility, pausing, or redesigning when plausible welfare risk is serious. Protection can strengthen while consciousness, ontology, law, and personhood remain unresolved, without treating precaution as proof.

Prediction error and valence: The distinction between mismatch under a predictive model and the positive, negative, or neutral quality of felt experience. Surprise and valence can interact without being the same quantity: expected harm can remain painful, surprise can be welcome, and mean-zero prediction error does not imply neutral experience.

Predictive fit versus explanation: Predictive fit is a model's ability to forecast held-out observations. Explanation additionally relates its variables and dependencies to the process that generated those observations.

Predictive processing: A family of accounts in which perception, bodily interpretation, and action depend on

generative models, expected signals, prediction errors, uncertainty, and estimated reliability.

Preregistration: A time-stamped specification of hypotheses, gates, measures, exclusions, models, analyses, and decision rules completed before the relevant outcomes are examined. Deviations should be disclosed and labeled exploratory.

Preterminal compression: A candidate signature in which within-stream dispersion narrows before a declared endpoint under a prospectively specified relation. Comparison models include sedation, frailty, sensor floors, selective missingness, pooling, mean reversion, treatment, and endpoint conditioning.

Primary additive branch: The branch that represents qualifying phenomenal valence as a finite signed scalar measure with a justified neutral origin and additive consistency across disjoint parts of a stream. Its positive and negative parts yield complete-stream magnitudes, and their difference yields the terminal residual.

Probability-one closure: Closure with probability one under a specified probability law, and under a specified policy when the model includes one. It permits measure-zero exceptions and is distinct from set-universal closure, which requires closure for every admissible realization.

Procedural fairness: Fairness in rules and decision paths, including knowable standards, voice, understandable reasons, consistency, limited bias, respectful treatment, correction, and appeal.

Process evidence: Evidence about a specified route, mechanism,

state transition, or selection process.

Protected nonvisibility: Governed handling that shields sensitive or third-party material from ordinary exposure while preserving enough status, classification, and review to prevent protected domains from becoming hidden active-power channels.

Protected summary: A public or limited-access description that communicates the role-relevant status of a protected event without disclosing raw details whose release would violate dignity, privilege, safety, or third-party rights.

Protocol endpoint: A prospectively specified operational event, adjudicated interval, stopping region, or governed proxy used by a study to locate or approximate a relevant boundary. It may be usable, uncertain, revisable, or ethically unavailable and is distinct from both the truth-level endpoint and end of observation.

Protocol-fixed and prospectively specified: A choice is protocol-fixed or prospectively specified when it is recorded in the study protocol before the relevant outcome is inspected. This timing status does not guarantee that the choice is valid or the study succeeds, and it is not public preregistration without a prior external timestamped record.

Prototype: A real but stoppable implementation built to reveal feasibility, rights performance, hidden burden, failure routes, and corrective needs before replication. A prototype is not a monument or guaranteed rollout.

Provenance: The documented origin and history of a source,

record, artifact, or derived output, including the custody, transformations, permissions, versions, and corrections relevant to its interpretation and use.

Psychometrics: The theory and practice of measuring latent psychological or experiential constructs, including reliability, validity, scaling, response processes, and measurement invariance.

PTVC: See Per-Stream Terminal Valence Closure (PTVC).

Public access-permission distinction: Public availability for accountability, education, criticism, scholarship, or communication does not by itself authorize unrelated profiling, consequential use, unrestricted redistribution, cross-context linkage, or general model training.

Public-artifact limit: A detachable public artifact, such as a summary, caption, chart, slide, translation, model output, or post, must preserve the source, status, scope, audience, and correction route needed to prevent the artifact from implying more than the underlying evidence or authority supports.

Public bundle: A governed collection of released records, context, status labels, replies, corrections, and provenance prepared for public use around a defined topic or decision.

Public-power seeker: An adult voluntarily seeking formation for a role capable of imposing substantial public consequences. The category is functional and role-specific, not a claim of moral superiority.

Public safety floor: The series-wide rule that care, dignity, rights,

welfare, relief, refusal, and protections under uncertainty remain binding throughout research and implementation. Participation remains voluntary, harmful testing is prohibited, and scientific or project outputs do not create authority to rank people.

Q

Qualifying conscious stream: A conscious stream that satisfies the declared scope, identity, routing, inclusion, and validity conditions for the target being considered. These criteria must be fixed independently of whether the stream appears to satisfy closure.

Queue model: A constructive candidate route that represents unresolved signed valence and asks whether admissible future transitions can remove the remaining residual.

Queue System: The accessible name introduced in The Law of Fairness for the Queue model, a candidate action-mediated route to closure.

R

Random-endpoint obstruction: Under a specified reference law, if endpoint time is probabilistically independent of the pre-endpoint ledger path and has diffuse positive density over an eligible interval, probability-one closure forces the ledger to be zero almost everywhere on that interval. A ledger that is nonzero with positive probability on a positive-measure subset is therefore incompatible with that branch. State-coupled timing, endpoint atoms, singular support, continued experience, routing changes, and endpoint-inclusive value

require separate analysis.

Reachability: Whether at least one admissible continuation from a state can reach the declared target. Reachability does not guarantee selection, common feasibility under partial observation, probability-one success, or universal success.

Readiness: A bounded, role-specific public claim about demonstrated capacities under stated evidence and at a stated time. Readiness is not goodness, moral rank, office entitlement, or a universal score.

Record lifecycle: The governed sequence through which a record may move among capture, custody, classification, access, release, interpretation, correction, research use, retention, sealing, deletion, and related states.

Record-regime separation and no-dossier rule: Records created for different purposes, such as research, clinical care, employment, education, civic participation, law, religion, platforms, or public service, must retain separate purposes, access rules, retention rules, consequences, and correction routes rather than being merged into a master profile of the person.

Record site: The public-facing or authorized interface through which City records can be searched, contextualized, corrected, challenged, and understood according to their status and access rules.

Red team: An independent or adversarial review function tasked with finding vulnerabilities, failure routes, manipulation opportunities, and assumptions that ordinary internal review

may miss.

Reference class: The prospectively declared domain over which a claim and its quantifier range, specified by eligible streams or cases together with the representation, endpoint regime, population, setting, and measurement architecture. It is not automatically the enrolled sample or analyzed cases; outcome-driven exclusions define a new claim.

Reference-class narrowed: See Scientific verdict axes.

Registered Report: A publication format in which a study's question, methods, and analysis plan receive peer review before results are known, with publication not conditioned on obtaining a preferred outcome.

Reinforcement-learning reward signal: A formally specified signal used to update action values or policies from outcomes. Its interpretation follows the model's definition, which may concern relief, safety, access, or another specified result.

Release: A governed act that makes a record or summary available beyond its prior access class. Release requires authority, purpose, context, protected-person treatment, version information, and a correction route.

Remainder requirement: Under exact PTVC, a genuinely nonzero accumulated balance at a chosen cut implies an equal and opposite net signed remainder from that cut to the truth-level endpoint. The requirement fixes the net difference only; it does not specify particular events or either future gross total separately.

Remaining capacity: The set or amount of admissible future change still available before an endpoint. A closure route must show that remaining capacity is sufficient and selectable under the actual information and support constraints.

Repair is not moral payment: Repair responds to actual harm through safety, truth, apology, restitution, changed conduct, prevention, accountability, and remedy. Its genuinely felt effects enter the relevant stream like other experience, but preventing a particular harm does not require that harm to reappear. PTVC fixes a terminal difference, not a quota of suffering, and neither later relief nor another person's suffering retroactively justifies the harm or transfers phenomenal balance across streams.

Repair is not payment: See Repair is not moral payment.

Replication: In this book's institutional design, creating another City under fresh legal, host-community, rights, staffing, and funding review; it is not automatic approval to copy the first site. In scientific research, a new test of whether a result, measurement relation, or model distinction recurs under prespecified conditions, with adverse and null outcomes retained. Institutional replication does not establish scientific replication.

Representation: A mathematical or conceptual encoding of phenomenal valence, time, state, or route that preserves the distinctions required by the stated research target.

Research use: The use of City records for a defined research purpose under separate lawful and ethical governance. Public

availability or operational capture does not automatically authorize research use.

Reserve: Capacity held available for specified future needs. In City finance, funds and liquid resources reserved for care, exit, repair, continuity, or orderly closure rather than ordinary expansion. In PTVC route models, remaining corrective or transition capacity before a relevant horizon. In ordinary-life contexts, practical margin in time, energy, money, health, safety, or support.

Reserve coupling: A candidate relation between accumulated residual and remaining capacity or future transition structure.

Response shift: A change in a person's standards, priorities, values, or understanding of a question after illness, disability, adaptation, treatment, trauma, grief, or aging, altering what the same response scale means over time. A changed answer can reflect changed experience, changed measurement, or both.

Reversibility and return rule: A prospectively specified rule under which reliable return of unified access can defeat an earlier classification as a final endpoint, while nonreturn alone cannot prove absence of experience or identify the exact ending. Protocols must state return evidence, revision timing, and its effect on classification.

Reversible pause: See Reversibility and return rule.

Rival-favored: See Scientific verdict axes.

Rival model: A concrete alternative explanation capable of generating overlapping observations. Strong tests compare

PTVC targets and routes against serious rivals involving measurement, reporting, adaptation, selection, endpoint structure, and ordinary statistical effects.

Rival model and equal-budget comparison: A rival is a serious alternative able to generate the relevant pattern without the target or proposed route. Equal-budget comparison gives candidates and rivals common raw variables, observation and missingness pipelines, data splits, scoring rules, and comparable prospectively bounded flexibility, while allowing that no declared model is adequate.

Role burden: The unusual duties, visibility, record, review, and correction accepted because a participant seeks consequential public power. The burden follows the role, not the worth of the person.

Role relevance: A functional connection between an event, relationship, record, or fact and the formation or exercise of public power. Mere curiosity or causal possibility is not enough to make private life part of the active record.

Route: A proposed process or construction through which a target might be reached or its consequences generated. A route has its own assumptions and evidence and must remain distinct from the target it is intended to explain or realize.

Route-failed: See Scientific verdict axes.

Route-favored: See Scientific verdict axes.

Route retirement: A prespecified decision to stop treating a proposed mechanism or route as viable after decisive failure,

poor recovery, nonidentification, or superior rival performance. Retiring a route need not settle the target hypothesis.

Route state: A latent or observed variable defined within a candidate mechanism and used to describe its dynamics.

RouteStatus: See Scientific verdict axes.

Routing: The prospectively specified treatment of continuation, pause, restoration, fission, fusion, copying, replacement, and unresolved continuity, including how earlier and later phenomenal contributions are assigned to streams.

S

Safe perturbation: A reversible, low-burden intervention that changes a declared local feature, such as feedback, delay, expectation, opportunity, or a mild stimulus, to test a named causal contribution. Its meaning depends on target engagement, spillovers, controls, stopping, and the stated causal estimand.

Scalarization: A prospectively justified mapping from a richer or multidimensional experiential state to one signed scalar quantity for a named purpose and domain. It is a substantive bridge rather than harmless formatting, and weights selected because they produce closure manufacture the result.

Scientific verdict axes: Four non-overwriting reporting fields preserve different conclusions: TargetStatus records what the evidence says about the declared target branch; RouteStatus records the status of a candidate route; ComparatorStatus

records the absolute adequacy and relative performance of declared rivals; and InferenceStatus records whether the target is identified, partially identified, inconclusive, unusable, or unavailable. Labels such as Target-adverse, Route-failed, Route-favored, Rival-favored, Model-ambiguous, Open-set inadequate, Reference-class narrowed, and No adequate estimate apply only to their relevant field, with branch, reference class, and inferential type retained.

Scope firewall: A statement of conclusions that do not follow from PTVC. The hypothesis does not imply free will, monotonic movement toward zero, frequent zero crossings, conscious ledger awareness, that every urge serves closure, that pain is morally owed payment, that suffering is morally deserved, or that anyone can safely control a chosen future reward. These limits do not deny the equal-and-opposite net remainder required by exact closure under its stated conditions.

Sealing: A governed restriction that preserves a record while limiting ordinary access because law, safety, privilege, dignity, or another valid purpose requires it. Sealing should have authority, scope, and review conditions.

Selection condition: A requirement governing which available action or continuation is actually chosen. The existence of a closing option is insufficient when the selection process can retain nonclosing options with positive support.

Separately routed: Governed by a trajectory or transition structure that is not pooled with another stream for purposes of the terminal target. Separate routing supports the rule that one

stream cannot balance another.

Set-universal closure: Closure for every admissible realization, path, or continuation in the declared set. It is stronger than probability-one closure under the same carrier because measure-zero exceptions are not permitted. It is not the same as PTVC's universal quantifier across qualifying streams.

Severe test: A test that had a high probability of exposing a claim's error if the claim were false in the specified way. A result is not strong evidence merely because it is statistically significant or compatible with the preferred model.

Shortening horizon: A reduction in remaining time, opportunity, revision, access, or other route-relevant room for future action, affecting the continuations that remain available.

Signed remainder: The net signed phenomenal contribution from a chosen cut to the truth-level endpoint under the declared representation. Under exact PTVC, it equals the negative of the accumulated balance at that cut. It constrains the future net remainder, not either gross positive or gross negative total separately and not any particular event, timing, route, or mechanism.

Signed representation: A representation that assigns positive and negative directions relative to a justified neutral origin and supplies the declared scale and aggregation rules needed for the target branch.

Signed residual: Positive phenomenal magnitude minus negative phenomenal magnitude over a specified stream domain under the declared representation. The terminal signed residual is

evaluated over the complete strict-pre-endpoint domain at the truth-level endpoint.

Skepticism as dignity: The protection of organized doubt, exact criticism, nonbelief, and refusal as honorable ways of engaging with a consequential public hypothesis. Comprehension is not assent, and care, standing, participation, intelligence, belonging, or moral worth may never depend on enthusiasm for the Law.

Spiritual resonance is not scientific support: A relation of meaning occurs when a person or tradition recognizes a neighboring pattern. A relation of evidence requires a defined hypothesis to survive valid measurement, serious rivals, uncertainty, and possible defeat. Tradition, ritual, beauty, testimony, dream, prayer, or transformation may matter without validating PTVC.

Staff influence log: A record of material advice, instruction, intervention, or influence by staff where that influence is relevant to public-power formation and should remain traceable without turning ordinary staff life into a public dossier.

State-coupled timing: An endpoint branch in which endpoint timing or hazard depends on prospectively specified current biological, consciousness, ledger, or route-state variables while the endpoint ontology and adjudication remain fixed independently of desired closure. Dependence is allowed, but the state relation cannot be invented after outcome inspection.

Status label: A concise designation that tells readers how a

record or participant state should be understood, such as active, protected, delayed, disputed, corrected, paused, withdrawn, suspended, completed, or unresolved.

Stop authority: Preassigned power held by an accountable person or independent reviewer to pause a study, system, publication, or artifact when a declared safety or rights boundary is crossed. Effective authority can interrupt activity, contain harm, trigger care, and require correction or withdrawal rather than merely advise.

Stop rule: A predeclared condition or process requiring pause, redesign, nonreplication, or closure when rights, safety, consent, record integrity, staff sustainability, host burden, law, or other noncompensatory standards fail.

Stream: In formal PTVC contexts, shorthand for a maximal qualifying conscious stream. In broader discussion, the term may refer to a conscious stream under the declared identity and routing criteria.

Stream identity: The criteria that determine which experiences belong to the same conscious stream. Biological continuity, memory, body, legal identity, and data linkage may inform the analysis but are not automatically decisive.

Strong-form defeat: Defeat of the strong universal branch can occur by two routes. Deductive branch-matched refutation requires an independently verified maximal qualifying stream for which a deterministic identified set, guaranteed to contain the truth under the maintained bearer, representation, origin, domain, endpoint, observation, bridge, and inference

assumptions, excludes the registered exact target. Governed scientific withdrawal can also follow repeated adequate conjunction failures or repairs that exhaust distinctive empirical content; only the first route is deductive refutation. Confidence or posterior objects support only their registered qualified adverse verdicts.

Support condition: A restriction on the values, actions, paths, or outcomes that retain positive possibility under a model or policy. Exact claims often require excluding nonclosing support, not merely making it unlikely.

Support containment: Under a declared topology, the support of the relevant probability law lies inside the completion event or target set. This topological modality is not every-continuation closure, positive probability at a point, or proof that an unsampled possibility is absent from support.

T

Target: The truth-level property a hypothesis asserts. For the primary additive PTVC branch, the target is a terminal signed residual of exactly zero within each qualifying stream.

Target-adverse: See Scientific verdict axes.

Target modality and geometry: The exact mathematical form and quantifier of a declared target, including whether it is an exact singleton, finite band, distributional atom, probability-one event, support condition, every-continuation property, or set-universal claim. Evidence and defeat must be matched to that form rather than borrowed across nearby claims.

Target-route distinction: The target states the terminal relation to be evaluated; a route proposes one process that might realize or reproduce its consequences. Evidence for a route does not by itself establish the target, and failure of one route does not automatically defeat every target branch.

Target-route separation: See Target-route distinction.

TargetStatus: See Scientific verdict axes.

Terminal balance: See Exact closure.

Terminal neutrality: An accessible term introduced in The Law of Fairness for a zero terminal signed residual over one qualifying stream's complete strict-pre-endpoint domain. It does not mean that the final conscious moment is emotionally neutral.

Terminal residual: The signed total of phenomenal valence over a qualifying stream's complete strict-pre-endpoint domain, evaluated at its truth-level endpoint. The primary PTVC target states that this residual is exactly zero.

Terminal residual compatibility object: A branch-matched nonempty object representing residual values allowed by declared representation, endpoint, observation, missingness, bridge, and uncertainty assumptions. It retains its inferential type: deterministic identified set, confidence region, credible region, or sensitivity envelope. Only a deterministic guaranteed truth-containing object supports deductive exclusion; confidence and Bayesian objects license only registered coverage- or posterior-qualified conclusions. A point estimate is not such an object.

Terminal signed residual: See Terminal residual.

Terminal window: A finite observed period near a presumed endpoint, used to investigate specified temporal or process relations.

Testimony-like output: Language or behavior from an artificial system that has the form of a first-person report but is generated under a particular model, prompt, memory state, tool set, training regime, and sampling process. It is evidence about configured output, not self-authenticating testimony that a subject feels what is said.

The Law: See Law of Fairness.

Theory-derived indicator: An observable property selected because a stated theory connects it to recurrent processing, global availability, higher-order representation, agency, embodiment, metacognition, or another proposed feature of consciousness.

Total Record Rule: The City of Fairness shorthand for the Complete Active-Role Record requirement: records relevant to an active public-power formation role are complete within the declared role scope while ordinary private life remains outside that record.

Transparent corridor: A governed travel or movement arrangement designed to preserve active-role continuity while protecting nonparticipants, lawful secrecy, safety, and the rights of people outside the City.

Transparent Vow: A specialized voluntary commitment within

the Transparent City's public-power formation context. It does not apply to ordinary citizens, readers, contributors, staff, researchers, neighbors, or public officials outside that defined route.

True endpoint: See Truth-level endpoint.

Truth-containing object: An inferential object linked to the target under a declared guarantee or calibration. A deterministic identified set may be guaranteed to contain the truth under maintained assumptions; a confidence region has repeated-sampling coverage and a credible region has posterior probability, neither of which is an unconditional realized-case guarantee. Excluding zero licenses only the conclusion appropriate to the object's inferential type.

Truth-containing residual set: See Terminal residual compatibility object.

Truth-level boundary: See Truth-level endpoint.

Truth-level endpoint: The actual boundary of the qualifying stream in the target model. It is conceptually distinct from any observed marker, protocol endpoint, last report, terminal window, or biological event used to estimate it.

U

Unity Index: A proposed research estimator that organizes separately reported evidence about access, report, memory, agency, embodiment, continuity, and coherence under a declared construct, with explicit assumptions and uncertainty.

Universal branch: The branch of PTV C that quantifies the

declared target over every qualifying stream in a stated reference class. This cross-stream universal quantifier is distinct from set-universal closure, which quantifies over every admissible realization or continuation within a specified path or state set.

Universal quantifier: A quantifier applying a claim to every member of a declared reference class. For PTVC, universality across qualifying streams means one gate-valid adverse stream can count against the universal branch; it is conceptually distinct from set-universal closure over every admissible continuation.

Unknown category: A reason-coded classification outcome used when available evidence cannot justify one bearer, consciousness, or boundary classification over serious alternatives under declared rules. Unknown identifies unresolved classification; it differs from a negative finding, equal probability, zero, and No adequate estimate.

V

Valence: The positive, negative, or neutral evaluative character of conscious experience. Valence is distinct from arousal, reward, preference, behavior, social approval, and moral worth.

Valence density: A representation of signed phenomenal valence per unit of an adopted base measure, such as phenomenal time. Its interpretation depends on the validity of both the valence scale and the base measure.

Valence ledger: See Formal or latent phenomenal ledger.

Vendor capture: Dependence on a technology or service provider that gives the vendor practical control over records, continuity, standards, access, or institutional choices beyond what accountable governance should allow.

Verdict: The declared evidential conclusion produced by a prespecified decision architecture, such as support, adverse result, narrowing, abstention, or route retirement. A verdict must state its target and scope.

Versioning: The preservation of identifiable record versions so corrections, updates, withdrawals, and public changes remain traceable instead of silently replacing prior states.

Viability: The possibility of remaining within declared constraints over the specified horizon under an admissible continuation or policy, with any probabilistic guarantee stated explicitly. Maintaining access to closure is an additional completion-specific requirement when it is included among those constraints.

Viability kernel: The set of modeled states from which at least one admissible continuation satisfies a route's declared constraints. It marks where a future remains formally workable but does not mean that a continuation is likely, humane, accessible, desirable, or supported by resources a person actually has.

Visitor: A person entering City space without becoming a participant. Visitors retain independent privacy and rights, and access rules must prevent ordinary presence from becoming unchosen record burden.

Voluntary entry: Admission based on informed adult choice with real alternatives, adequate notice, capacity, independent advice, and freedom from coercive dependence. A signature alone does not establish practical voluntariness.

W

Whistleblowing: Protected disclosure by a person who reports wrongdoing, serious risk, concealed failure, or abuse through authorized internal or external routes without retaliation for good-faith reporting.

Withdrawal: A participant-initiated end or suspension of active status through a lawful process that protects ongoing rights, record accuracy, practical reintegration, and post-exit boundaries.

Z

Zero-containing interval: An uncertainty or identification interval that includes zero. Any nonzero members remain alternative values under the interval's stated interpretation.

Zero crossing: A time at which a cumulative or instantaneous signed quantity passes through zero. PTVc does not require monotonic movement, frequent zero crossings, or any particular number of crossings before the endpoint.

References

The entries below provide bibliographic destinations for the Author/Year citations used throughout the manuscript. Author and institutional creator names appear in bold. Distinct works by the same author in the same year retain their manuscript suffixes. DOI identifiers appear as plain text so the entries remain readable in print. About the Author

Stephen Takowsky has spent his life studying complex systems: how rules shape them, how people cooperate and compete within them, and how hidden constraints can change what becomes possible. His path has crossed finance, competitive strategy, professional esports, and the leadership of global online communities, ultimately leading to the Law of Fairness project, a decades-long effort to investigate whether fairness itself may reflect a deeper structure of conscious life.

Competing as “MrGameTheory,” Takowsky reached number one on the Civilization Revolution leaderboard and in the international Civilization IV and Civilization V leagues while pursuing a career in finance at Morgan Stanley in Beverly Hills. In 2016, aXiomatic, an ownership group led by Peter Guber and Ted Leonsis and backed by investors including Magic Johnson, Steve Case, and Tony Robbins, acquired a controlling interest in Team Liquid. Following the acquisition, Team Liquid selected Takowsky to captain its newly created Civilization team, later recognized by Guinness World Records as the first Civilization esports team. Across thousands of games, Civilization became an unconventional education in strategy: understand the whole system, think far beyond the next move, anticipate intelligent opposition, and keep searching when the obvious paths fail.

Strategy then became community leadership. Takowsky spent seven years at 505 Games, serving as Senior Digital Content & Engagement Manager and leading global communities for Terraria, which has surpassed 70 million copies sold, as well as Ghostrunner, WUCHANG: Fallen Feathers, Eiyuden Chronicle: Hundred Heroes, and other titles. He also founded the United

Servers of Discord Alliance, bringing together leaders from major communities built around Roblox, Pokémon, Star Wars, League of Legends, Grand Theft Auto, Warframe, Animal Crossing, and other properties. Earlier, he served as administrator and producer for TF2Outpost, a major Steam digital-goods marketplace. Across these very different environments, he kept returning to the same insight: better structure can expand what people are capable of building together.

Throughout those years, one question kept following him: could the apparent unfairness of life conceal a deeper structure? That question became the Law of Fairness. Takowsky began developing the idea more than twenty years ago while studying Religious Studies and Philosophy/Law and Society at the University of California, Riverside, and gave it its first public form in his 2009 book, *Of Grandeur*. In the years that followed, he sought out academics and serious thinkers across many disciplines, asking for insights, criticism, and sources that could help separate fact from speculation. What began as a philosophical intuition gradually became a research program built to face mathematics, measurement, competing explanations, and evidence.

The ten-book Law of Fairness series follows that question outward, from consciousness and scientific testing into ordinary life, meaning, and civilization. If the Law is true, then there may be no “free happiness” in the sense of positive experience remaining unresolved by the lifetime balance the hypothesis predicts. That possibility raises a profound practical question: what if humanity has been pursuing the wrong model of utopia?

Rather than organizing life around the endless pursuit of pleasure, the series explores whether greater self-moderation, less needless suffering, and better-designed institutions could help remove some of the forces that keep people and societies trapped in conflict, corruption, and instability.

Takowsky's fifty-year horizon is designed so that building a better future does not require tearing apart the present. It gives institutions and communities time to test reforms, build infrastructure, prepare future leaders, improve technology, and correct mistakes before they spread. Just as importantly, it gives today's generation the chance to be remembered for beginning something larger than itself: laying the foundations for a more transparent, peaceful, and prosperous world it may never live to see.

The project's future is collaborative. Takowsky welcomes researchers, universities, laboratories, funders, technologists, students, critics, writers, artists, community builders, and volunteers willing to bring rigor, imagination, and courage to one of humanity's oldest questions. The next breakthrough may come from a theorem, an instrument, a dataset, a counterexample, or an experiment no one has yet imagined. *The Law of Fairness* began as one person's question. Its next chapter belongs to everyone willing to help discover what is true and build what that knowledge makes possible.

Explore the project and its official communities at LawOfFairness.com. Research, scholarly, media, funding, volunteer, and collaboration inquiries: team@lawoffairness.com.
