Table of Contents

<i>Table of Contents</i>	<i>i</i>
<i>Series Map</i>	<i>x</i>
<i>How to Read This Book</i>	<i>xv</i>
<i>Part I — City Type, Vow, and Power</i>	<i>1</i>
Chapter 1 — A City for Public Responsibility	8
1.1 — The Hidden Pipeline of Power	15
1.2 — Why Campaigns Arrive Too Late.....	29
1.3 — Schools, Parties, and Platforms	39
1.4 — Why Visible Formation Changes the Democratic Timeline	51
1.5 — City as Power Formation, Not Ordinary Citizenship.....	64
1.6 — The Governing Question: Where Does the Burden Go?.....	76
Chapter 2 — The Transparent Vow and Bounded Active Record	90
2.1 — The Transparent Vow as Civic Burden	96
2.2 — Complete Active-Role Record	106
2.3 — Capture Is Not Public Release.....	117
2.4 — Protected Nonvisibility Without Off-Record Formation.....	133
2.5 — Continuity Breaks, Technical Failure, and Repair	146
2.6 — Exit Instead of Secret Exception	158
Chapter 3 — The City’s Boundaries	168
3.1 — Not a Prison	176
3.2 — Not a Cult.....	187
3.3 — Not a Spectacle Park or Reality Show	197
3.4 — Not Government Itself	208
3.5 — Not a Virtue Certificate.....	219
3.6 — Not Proof of the Law	228
Chapter 4 — Prototype, Operational Evidence, and Ethics	239
4.1 — Why One Real City Matters	245
4.2 — Prototype Versus Monument.....	258
4.3 — What the First City Must Demonstrate	269
4.4 — Failure Thresholds and the Ethics of Stopping.....	283
4.5 — Operational Evidence, Not Formal Proof.....	299
4.6 — Why Replication Must Wait for Safeguards	312

<i>Part II — Ground, Form, and Spatial Charter</i>	323
Chapter 5 — Site, Host, and Shared Responsibility	328
5.1 — Why Campus Scale May Be the Minimum Prototype	335
5.2 — Host Jurisdiction and Legal Envelope	346
5.3 — Host-Community Burden and Local Legitimacy	360
5.4 — Proximity Without Overexposure	374
5.5 — Climate, Utilities, and Physical Resilience	387
5.6 — Cost Discipline, Expandability, and Replicability	402
Chapter 6 — The City’s Spatial Order	414
6.1 — Architecture as Constitutional Meaning	420
6.2 — Visibility Gradients and Access Bands	435
6.3 — Thresholds, Corridors, and Anti-Shadow Circulation	454
6.4 — Wayfinding, Legibility, and Civic Clarity	471
6.5 — Light, Sound, Materials, and Sensory Burden	486
6.6 — Seriousness Without Fear	501
Chapter 7 — Zones, Commons, and Service Ecology	516
7.1 — Residential Quarters and Household Edges	522
7.2 — Educational and Study Precincts	535
7.3 — Deliberative Halls and Drafting Rooms	548
7.4 — Commons, Dining, Libraries, and Walking Grounds	561
7.5 — Recovery, Health, Quiet, and Reflection Zones	574
7.6 — Archive, Public Record Site, and Logistics	585
7.7 — Landscape, Water, and the Restorative Exterior	596
Chapter 8 — Infrastructure and Resilience	607
8.1 — Capture Infrastructure and Continuity Systems	612
8.2 — Service Routes and Maintenance Labor	629
8.3 — Accessibility, Disability, and Sensory Inclusion	645
8.4 — Construction and Materials	659
8.5 — Emergency Systems and Continuity of Care	673
8.6 — Maintenance as Institutional Honesty	689
<i>Part III — Rights, Records, and Openness</i>	704
Chapter 9 — Rights, Privacy, and Protected Life	709
9.1 — Participant Rights Under Visible Burden	715
9.2 — Protected Nonvisibility Categories	733
9.3 — Children, Dependents, and Families	750

9.4 — Third-Party Rights and Incidental Contact	767
9.5 — Professional Interfaces	782
9.6 — Care Before Evidence, Complaint, Appeal, and Remedy	798
Chapter 10 — Archive and Public Record Site	814
10.1 — Archive as Lawful Public Memory	822
10.2 — Participant Record Site as Public Interface	839
10.3 — Provenance, Chain of Custody, and Tamper Resistance	855
10.4 — Public Bundles, Status Labels, and Versioning	872
10.5 — Correction, Right of Reply, and Context Integrity	887
10.6 — Record Site, Newsroom, and Machine-Assisted Summary	905
Chapter 11 — Record Lifecycle and Access	923
11.1 — Capture, Access, Release, Interpretation, and Research	929
11.2 — Delayed Release, Escrow, and Lawful Shielding	950
11.3 — Redaction, Protected Summaries, and Category Review	964
11.4 — Public, Affected-Person, and Oversight Access	978
11.5 — Retention, Deletion, Sealing, and Time Review	992
11.6 — Research Use and Model Training	1007
11.7 — No Cross-Architecture Dossier	1022
Chapter 12 — Perimeter, Visitors, and Media	1038
12.1 — Why the Perimeter Exists	1045
12.2 — Security Without Carcerality	1060
12.3 — Access Classes, Gates, and Screening	1075
12.4 — Experts, Critics, and Temporary Contributors	1090
12.5 — Protest, Dissent, and Adversarial Presence	1105
12.6 — Media, Documentation, and Narrative Pressure	1121
12.7 — Openness Without Boundary Collapse	1137
<i>Part IV — Entry, Vow, and Anti-Capture</i>	<i>1151</i>
Chapter 13 — Who Applies and Why	1156
13.1 — Ambition Under Visibility	1162
13.2 — Service, Wound, Calling, Prestige, Escape, and Fear	1175
13.3 — Desired Traits, Dangerous Traits, and Mixed Motives	1189
13.4 — Why Perfect Motives Are Not Required	1203
13.5 — Voluntary Entry as Civic Threshold	1214
13.6 — Applicant Privacy Before Acceptance	1225
Chapter 14 — Application, Support, and Role Pathways	1236

14.1 — Identity Verification and Eligibility	1243
14.2 — Capacity, Psychosocial Support, and Load Review	1255
14.3 — Role Pathways and Office-Track Matching	1271
14.4 — Security, Manipulation, and Capture Risk.....	1284
14.5 — Global Discovery and Local Legitimacy.....	1296
14.6 — Public Input as a Bounded Open Decision.....	1310
14.7 — Acceptance, Delay, Redirection, or Refusal.....	1321
Chapter 15 — Covenant and Stabilization.....	1331
15.1 — The Transparency Covenant in Place	1337
15.2 — Debt Relief and Financial Stabilization	1351
15.3 — Housing, Healthcare, and Dependent Support.....	1364
15.4 — Gifts, Sponsorship, and Anti-Leverage Rules.....	1377
15.5 — Reviewable Support, Not Ownership	1391
15.6 — Material Stability as Anti-Corruption Infrastructure.....	1404
Chapter 16 — Review, Pause, and Return	1417
16.1 — Pre-Activation Review and Informed Consent	1424
16.2 — Lawful Pause and De-Loading Before Activation.....	1440
16.3 — Reversible Participation and Real Refusal	1451
16.4 — Household, Dependent, and Professional Consultation.....	1462
16.5 — Capacity Reassessment and Changed Circumstances	1475
16.6 — Activation as Public-Power Threshold	1487
<i>Part V — Living Under the Vow</i>	<i>1496</i>
Chapter 17 — The Architecture of a Day.....	1502
17.1 — Morning: Reentry Into Public Time.....	1509
17.2 — Work Blocks: Study, Deliberation, and Visible Labor.....	1524
17.3 — Meals, Movement, and Human Interval	1539
17.4 — Public Interface Windows	1554
17.5 — Evening: Decompression and Reassembly	1567
17.6 — Routine as Public-Power Evidence.....	1580
17.7 — Anti-Performance Drift.....	1594
Chapter 18 — Health, Recovery, and Care Load.....	1610
18.1 — The Biophysical Cost of Visible Life	1616
18.2 — Sleep Protection and Sensory Safeguards	1635
18.3 — AI, Mentor, and Clinician Boundaries.....	1653
18.4 — Load Limits and Weekly Rhythms	1677

18.5 — Reflection and Ritual	1696
18.6 — Breakdown, De-Loading, and Humane Failure	1715
Chapter 19 — Family, Children, and Dependents.....	1733
19.1 — Partners, Spouses, and Household Forms.....	1739
19.2 — Children and Absolute Protection Boundaries	1758
19.3 — Dependents, Elders, Disability, and Care Burden.....	1773
19.4 — Pregnancy, Custody, and Reproductive Health	1791
19.5 — Conflict, Mediation, Apology, and Household Repair.....	1806
19.6 — Return to Ordinary Humanity After Visible Service	1822
Chapter 20 — Intimacy and Bodily Dignity.....	1837
20.1 — Relationship Records Under the Vow	1845
20.2 — Intimacy, Modesty, and Non-Spectacle.....	1860
20.3 — Consent, Bystander Partners, and Collateral Persons	1870
20.4 — Sexual Health, Reproductive Health, and Pregnancy	1883
20.5 — Delay, Shielding, Summary, and Restricted Access.....	1893
20.6 — Public Appetite Is Not Public Interest.....	1908
20.7 — Expert Review and Legal Boundary.....	1919
Chapter 21 — Staff and Hidden Labor.....	1931
21.1 — Staff Are Not Background.....	1937
21.2 — Staff Role Records Versus Full-Life Records.....	1953
21.3 — Educators, Clinicians, Mentors, and Security	1970
21.4 — Staff Complaint, Appeal, and Anti-Retaliation	1989
21.5 — Staff Influence, Advice Logs, and Source Integrity.....	2008
21.6 — Staffing Ratios, Workload, Burnout, and Hidden Cost	2024
<i>Part VI — Formation and Public Readiness.....</i>	<i>2043</i>
Chapter 22 — Education for Office	2050
22.1 — Why Office Requires Formation Beyond Credentialism	2059
22.2 — Law, Constitution, and Public Reason.....	2074
22.3 — Economics, Administration, and Material Order	2088
22.4 — Diplomacy, Conflict, and Peace Architecture	2103
22.5 — Systems Design, Ethics, and Institutional Craft	2118
22.6 — Media, Data, AI, and Public Interpretation Literacy.....	2132
Chapter 23 — Deliberation Across Record Boundaries.....	2149
23.1 — Why Reasoning Must Become Visible	2156
23.2 — Seminar, Debate, and Working-Group Forms	2173

23.3 — Drafting, Notes, Traceability, and Revision History.....	2188
23.4 — Error, Apology, and Public Learning.....	2203
23.5 — Advisors, Influence, and Intellectual Dependency	2217
23.6 — Deliberation as Operational Evidence, Not Validation	2234
Chapter 24 — Opposition, Simulation, and Stress	2245
24.1 — Why Opposition Is Educational	2252
24.2 — Cross-Ideological Formation and Mutual Legibility	2269
24.3 — Crisis Labs and Scenario Simulation	2284
24.4 — Fear, Ambiguity, and Decision Under Pressure.....	2301
24.5 — Trauma-Safe Limits and Clinician Review	2316
24.6 — After-Action Review and Visible Correction.....	2331
Chapter 25 — Readiness and Campaigns	2348
25.1 — The Archive as Democratic Object.....	2354
25.2 — Building a Record Instead of a Persona.....	2367
25.3 — Readiness Varies by Office and Jurisdiction.....	2378
25.4 — The Virtue of Not Yet	2390
25.5 — Readiness Bundles and Record-Site Releases.....	2400
25.6 — Public, Institutional, and Party Release.....	2411
25.7 — Campaign as Continuation, Not Reinvention.....	2422
25.8 — Ready Is a Public Claim, Not an Institutional Halo	2433
<i>Part VII — Office and Public Interface</i>	<i>2442</i>
Chapter 26 — Public Office and the City Interface.....	2448
26.1 — Election Deepens Rather Than Ends the Covenant	2455
26.2 — The Office Suite as Constitutional Environment	2466
26.3 — Staff as Part of the Visible Governing Process	2479
26.4 — Public Explanation and Record Continuity	2490
26.5 — Crisis Governance and Return to Record	2501
26.6 — How Governing From the City Changes Power	2512
26.7 — Government and Constitutional Boundary.....	2523
Chapter 27 — Public Interaction and Volunteers	2538
27.1 — From Spectators to Contributors	2544
27.2 — The Civic Interface as a Constitutional Boundary	2559
27.3 — Volunteer Networks Without Fan Culture	2573
27.4 — Expert Input and Distributed Intelligence.....	2587
27.5 — Civic Servers, Moderation, and Platform Integrity	2601

27.6 — Public Voting and Approval as Bounded Input	2614
27.7 — Anti-Mob, Anti-Bot, and Anti-Doxxing.....	2627
Chapter 28 — Diplomacy, Travel, and Government Settings.....	2639
28.1 — Diplomacy in a Partly Opaque World	2645
28.2 — Travel as a Continuity Problem.....	2659
28.3 — Transparent Corridors and Secure Movement	2673
28.4 — Emergency Mobility and Logged Secrecy Exceptions	2686
28.5 — Sister Cities and Reciprocal Hosting	2700
28.6 — Government Transparency Zone Boundaries	2712
28.7 — The City as a Node, Not a Fortress	2725
<i>Part VIII — Governance, Failure, and Exit.....</i>	<i>2737</i>
Chapter 29 — City Governance and Audit.....	2743
29.1 — Who Governs the City	2751
29.2 — Separation of Educator, Operator, and Auditor.....	2767
29.3 — Participant Voice, Ombuds, Complaint, and Appeal.....	2780
29.4 — External Inspection and Red Teams	2792
29.5 — Audit of Auditors	2808
29.6 — Authority Without Moral Totalism.....	2821
Chapter 30 — Archive, Records, and Artificial Intelligence	2833
30.1 — The Technical Stack in Place	2840
30.2 — Artificial Intelligence Pattern Analysis and Search	2857
30.3 — Cybersecurity, Deepfakes, and Sabotage	2872
30.4 — Vendor Capture and Infrastructure Continuity.....	2884
30.5 — Search, Retrieval, and Query Classes	2895
30.6 — The City as an Anti-Forgetting Institution.....	2906
Chapter 31 — Failure, Exit, and Reintegration	2917
31.1 — Misfit, Misconduct, Exhaustion, and Drift.....	2924
31.2 — Probation, Recall, Removal, and Suspension.....	2936
31.3 — Record Breach, Bystander Harm, and Data Injury	2949
31.4 — Remedy, Appeal, Correction, and Public Notice.....	2962
31.5 — Continuity Breaks and Failure Memory	2974
31.6 — Exit, Retirement, and Reintegration.....	2988
31.7 — Posthumous Records and Long-Term Dignity	2999
<i>Part IX — Buildability and Network Discipline</i>	<i>3008</i>
Chapter 32 — City Costs and Anti-Capture.....	3017

32.1 — How the City's Cost Must Be Justified	3022
32.2 — Capital Costs, Operating Costs, and Reserve Design	3036
32.3 — Public, Philanthropic, and Mixed Finance.....	3052
32.4 — Anti-Capture Funding and Donor Limits	3065
32.5 — Local Labor, Regional Spillovers, and Civic Benefit	3078
32.6 — The Cost of Leaving Leader Formation Private.....	3092
Chapter 33 — Construction, Host Review, and Pilot.....	3105
33.1 — Design Thresholds and Go/No-Go Criteria.....	3112
33.2 — Construction and Labor Dignity.....	3130
33.3 — Staff Recruitment, Training, and Dry Runs.....	3144
33.4 — Phased Admissions and Early Cohort Growth.....	3159
33.5 — Post-Occupancy Evaluation and Rights Audit.....	3171
33.6 — What the Pilot Must Demonstrate Before Replication	3184
33.7 — Stopping Early as Moral Success.....	3197
Chapter 34 — Accreditation and Replication.....	3209
34.1 — Why One City Is Not Enough	3215
34.2 — Accreditation and Nonnegotiable Standards	3228
34.3 — Local Translation Without Constitutional Drift	3247
34.4 — Corridor, Archive, and Record-Site	3261
34.5 — Decertification and Suspension	3275
34.6 — A Conditional Network of Cities, Not a Shrine	3288
<i>Part X — Objections and Final Synthesis.....</i>	<i>3301</i>
Chapter 35 — Objections and the Tests They Create.....	3306
35.1 — "This Is Authoritarian Surveillance"	3311
35.2 — "This Becomes a Prison, Cult, or Reality Show"	3324
35.3 — "No Human Can Survive the Record"	3336
35.4 — "The City Becomes Government or an Elite Gate"	3348
35.5 — "Archives and AI Become New Sovereigns"	3360
35.6 — "Sex, Children, and Families Make This Impossible"	3373
35.7 — Donors, Vendors, and Staff	3386
35.8 — "The First City Will Drift Before It Replicates"	3398
Chapter 36 — Answerability, Not Triumph	3409
36.1 — The City in One View	3414
36.2 — What the City Changes About Public Power	3427
36.3 — What the City Does Not Change.....	3440

36.4 — Duties to Staff, Families, and Hosts.....	3452
36.5 — What the City Must Never Become.....	3463
36.6 — Handoff to Government and the Wider Project Domains.....	3475
36.7 — Final Answerability.....	3488

THE LAW OF FAIRNESS

A new way of seeing every life.

We judge fairness by the visible shape of a life: health and hardship, love and loss, opportunity and misfortune. Yet life is not lived from the outside. It is lived within consciousness, through joy and sorrow, pleasure and pain, peace and fear.

Could life be fair where it is actually lived, even when it appears profoundly unfair from the outside? The Law of Fairness proposes that every felt experience carries weight according to its intensity and duration. Across the completed conscious life, total positive and negative feeling exactly balance.

Picture a scale open for a lifetime. Joy and relief add weight to one side; pain and grief to the other. It may tip heavily for years, but when the conscious life is complete, the two sides balance. Each life carries its own scale. No life balances another.

Lives may differ enormously in length, choices, pleasures, wounds, and circumstances. The scale weighs neither wealth nor virtue, status nor faith. It weighs felt experience alone. Circumstances tell the visible story of a life, but feeling is how that story is lived. The Law asks us not to mistake the visible story for the whole.

WHAT IF THE LAW IS REAL?

A new meaning of utopia.

If the Law of Fairness is real, utopia cannot mean endless pleasure. More comfort, luxury, or consumption does not make a society ideal. If conscious lives end with no lasting surplus of positive feeling, utopia must mean something deeper and steadier than limitless happiness.

“There is no free happiness” does not mean joy is wrong, pain is payment, or suffering is holy. Pleasure alone cannot define a good life, nor appearances a good society. The goal is joy without excess. A fairer world would reduce needless suffering, poverty, disease, cruelty, corruption, and abuse while protecting love, beauty, rest, play, choice, and joy. Moderation restrains excess, work builds worthy goals, and stewardship preserves the world so future generations inherit something worth protecting.

If the Law is real, its deepest equality lies beneath wealth, status, power, culture, and belief. Lives may differ while reaching the same final balance of felt experience. These ten books follow that question from science into life, spirituality, government, cities, law, transition, and peace, exploring how humanity might build a lasting utopia.

THE TEN BOOKS OF FAIRNESS

A complete path from truth to practice.

THE LAW OF FAIRNESS

Explores the core question, defines key terms, and sets the ethical bounds of the series.

THE SCIENCE OF FAIRNESS

Evaluates the Law through evidence, measurement, rival models, protocols, and falsification.

THE UTOPIA OF FAIRNESS

Brings the series into a mature view of what a peaceful world could become.

THE TRANSITION OF FAIRNESS

Asks how a move toward utopia could unfold with care, step by step, under real limits.

THE LIFE OF FAIRNESS

Brings the Law into daily life and asks what it means for how we live.

THE RELIGION OF FAIRNESS

Explores faith, world religions, and the optional path of Fairness.

THE GOVERNMENT OF FAIRNESS

Examines civic structure and the public institutions that give it form in practice.

THE CITY OF FAIRNESS

Builds a civic space for learning, service, and peace with privacy kept safe.

THE CONSTITUTION OF FAIRNESS

Sets out the rights, rules, paths, and checks a lasting utopia would need.

THE PEACE OF FAIRNESS

Builds the base for lasting peace and a fairer future for all humanity.

The series moves from the deepest question about reality to the structures that make a more peaceful world.

THE WORK AHEAD

A shared mission to build a better world.

Read the books, share them, and bring the Law of Fairness into classrooms, research groups, reading circles, and community conversations. Important ideas grow stronger when people examine them together, challenge assumptions, compare perspectives, and turn understanding into shared effort.

Scientists, researchers, clinicians, philosophers, and other experts can help test the Law, refine its measurements, improve its methods, and compare it with strong rivals. Serious criticism is essential. It exposes weaknesses, sharpens the questions, and helps reveal what should endure, what needs revision, and what should be rejected.

Beyond the hypothesis lies a practical challenge: building a world with less corruption and needless suffering, and more room for dignity, freedom, meaning, beauty, and opportunity. If this project speaks to you, bring your knowledge, experience, curiosity, and determination. Progress begins when people from different paths meet, share what they know, and build what survives scrutiny.

Help us make this generation
the one that brought peace to our world.

How to Read This Book

Public leaders are usually judged after power has already formed them. The City of Fairness asks whether preparation could begin earlier, inside a bounded civic environment where adults who voluntarily seek public responsibility live, study, deliberate, and practice under an active public record. The proposal is ambitious because it moves accountability upstream, before office, while attempting to protect private life beyond the City's declared boundary.

The City is neither government nor a virtue certificate. It does not guarantee office, prove the Law, rank human worth, or create a superior class. Its purpose is narrower: to test whether public-power formation can become visible, reviewable, humane, and difficult to capture. Entry must be voluntary, refusal dignified, exit real, and nonparticipants protected from spillover, coercion, or involuntary exposure.

Read Part I sequentially, then use the remaining Parts as a layered reference unless you are conducting a full cover-to-cover study. Parts II through V develop place, rights, entry, and daily life; Parts VI through VIII develop formation, office interface, governance, failure, and exit; Part IX tests buildability and replication; and Part X gives the strongest objections and final synthesis. Readers with a specific professional role can move directly from Part I to the relevant Part and return to cross-referenced safeguards as needed.

Read every design choice from the edge. If a record is captured, ask who may access it, what remains shielded, who can object, and what remedy follows misuse. If a participant receives support, ask whether help becomes leverage. If visitors arrive, ask

what happens to their privacy. If a system fails, ask whether the City can pause, repair, compensate, or close without trapping the people who trusted it.

The Series Map is the visual threshold. Let it make the City imaginable, then let the chapters test whether the beauty survives law, psychology, labor, security, cost, dissent, technical failure, and ordinary human fatigue. Architects, educators, public servants, clinicians, lawyers, technologists, organizers, critics, and potential participants will see different risks. The book needs all of those perspectives.

The City is not trying to manufacture perfect people. It asks whether the path to public authority can become more answerable than the power it hopes to improve. Its credibility rests not on grandeur, but on boundaries: no secret exception, no involuntary citizen surveillance, no permanent ownership of the participant, no expansion without evidence, and no beauty exempt from review. Read it as a prototype to challenge, strengthen, and, only if it earns trust, someday build.

Part I — City Type, Vow, and Power

Public responsibility can be designed before it is exercised. Architecture matters, but the institution's type matters first, because beauty should express answerability rather than conceal an undefined burden.

The Transparent City is a bounded civic institution for adults who voluntarily seek substantial public power and accept a heavier role burden than ordinary citizens should carry. Its affirmative work is to join education, deliberation, record, correction, care, public interface, and lawful exit inside one inspectable formation ecology. It is designed to make the route toward public authority more answerable before authority is granted.

That proposal matters because public power enters ordinary life through consequences. Housing rules alter a household's horizon. Policing orders alter the body's sense of safety. Budget delays alter medicine, care, work, school, and sleep. A decision that appears administrative at the top can become intimate at the bottom.

The Law of Fairness enters this Part as a formally specified, falsifiable candidate boundary hypothesis and as a disciplined lens for tracing consequence. The City makes a civic contribution rather than a scientific verdict: it receives one practical question from the project. Where is burden carried, hidden, shifted, reduced, repaired, recorded, consented to, or made reviewable when people are formed for substantial public power? Governed research retains the work of testing Per-Stream Terminal Valence Closure (PTVC): the hypothesis that the total positive and negative felt experience within each qualifying conscious stream

balances at its true endpoint. That endpoint is not assumed to be biological death.

Modern democracies already possess institutions for judging, restraining, and improving power. Elections, campaign disclosure, public financing, ethics and lobbying rules, party reform, professional civil services, investigative journalism, citizens' assemblies, open deliberation, public records, courts, audits, protests, and oversight bodies all matter. Their existence is not an obstacle to the City's argument; it is the comparison that gives the argument integrity.

The central concern of this Part is excessive public guesswork at the entrance to power. Citizens are often asked to infer independence, judgment, and governing character from campaign surfaces, donor reports, résumé fragments, curated disclosure, scandal cycles, partisan branding, social media performance, and managed biography. In some jurisdictions, existing or improved reforms may make that evidence sufficiently rich, and a City would then be unnecessary.

A City becomes relevant only where the remaining problem is ecological. Formation may be distributed across money, education, party selection, advisers, media, family advantage, professional networks, recovery patterns, staff relations, public reasoning, and private compromise. No single disclosure rule can show how those forces interact across time, and no single institution should be blamed for failing to carry a burden it was never designed to carry.

The positive case for a built institution is therefore integration rather than total knowledge. A whole civic ecology can place study beside practice, dissent beside decision, record beside correction, public interface beside protected recovery, and ambition beside the ordinary labor that supports it. The achievement sought is answerable formation, not access to a person's soul or a guarantee of virtue.

Part I defines the City before it describes the City. It establishes the institution's type, the role burden it assigns, the democratic authority it does not possess, and the boundaries that prevent visibility from spreading downward. The City burdens chosen adult public-power formation. It does not pull ordinary citizens into record life by proximity, curiosity, admiration, accusation, or civic fashion.

The Transparent Vow and the Total Record Rule appear early because every later design depends on their meaning. A partial Vow would permit managed image to return through hidden active channels. An unlimited Vow would collapse role burden into whole-person exposure. The City's first craft is to hold a severe middle in which active public-power formation becomes answerable while dignity, protected nonvisibility, professional privilege, family life, and third-party rights remain real.

The institution must also make ordinary daily life possible within its exceptional role burden. Residence, study, meals, work, recovery, care, dissent, visitors, staff relations, public explanation, and exit cannot be treated as decorative surroundings. They are the places where a design either becomes

humane or begins shifting its cost onto people least able to contest it.

Several false forms must be blocked before architecture makes them attractive. The City is not a prison, cult, spectacle park, prototype government, virtue certificate, or scientific proof event. Each false form imposes a concrete design obligation: voluntary entry, real exit, bounded authority, plural conscience, protected nonvisibility, complaint, appeal, pause, and an honest capacity to stop. Each boundary must therefore survive ordinary operation, not merely appear in the charter. Its credibility depends on whether the people carrying the institution can invoke the safeguard before a crisis exposes that it was only rhetorical.

A first implementation must be understood as a prototype rather than a monument. A monument protects its image, while a prototype exposes its weaknesses; a monument asks to be admired, while a prototype asks to be inspected. A fair prototype is strengthened, not humiliated, when it can be corrected, narrowed, paused, or stopped. That posture keeps early evidence provisional: the first City earns the right to continue learning from the design, not the right to treat the design as settled. A correction made before prestige hardens around the institution is evidence that the prototype is functioning as intended.

The City also creates burdens that belong inside its own case for existence. Self-selection may narrow who enters. Credential inflation may turn participation into prestige. Continuous observation may produce performance, chilling effects, conformity, or strategic compliance. Construction, records, care, security, and maintenance may impose financial, labor, host-

community, and environmental costs that rival reforms would avoid. Those burdens belong in the case for the City itself, not in an implementation footnote, because an institution can solve one opacity problem while creating another through selection, observation, or cost. A fair comparison asks whether the City reduces more hidden burden than it creates and whether its added burden can be carried without coercion or hidden subsidy. That comparison should include who absorbs recurring costs after the excitement of construction and launch has passed. Long-term staffing, maintenance, care, and host-community obligations belong in the same judgment as the City's most visible public benefits.

Democratic pluralism remains the decisive outer boundary. Participation cannot create office entitlement, trust, rank, or presumed fitness. Voters, parties, legislatures, courts, appointment systems, and other lawful institutions retain authority, while people formed elsewhere retain equal civic standing and legitimate routes to public service. The City therefore succeeds only if its evidence can matter without becoming a gate that lawful public service must pass through. A model that improves public judgment while preserving genuine alternatives strengthens pluralism; one that converts participation into automatic advantage would recreate the hidden pipeline it was designed to expose. The institution should therefore track whether participation begins functioning as an informal credential even when no formal preference exists. Evidence of such drift should trigger changes in messaging, partnerships, admissions

practices, or public interfaces before reputation hardens into a new gatekeeping system.

Part I begins with a demanding promise and an honest test. Public power should carry more knowability before ordinary people are asked to trust it, while any institution built for that purpose must carry its own burdens openly. The chapters ahead define the City's positive architecture, the alternatives it must outperform, and the conditions under which refusal, redesign, or closure would be the fair result. That standard gives Part I its role in the book: before the City is allowed to become beautiful, complex, or scalable, its type and limits must be clear enough that later design cannot quietly change what the institution is. Everything that follows should make these opening boundaries more concrete rather than weaken them through detail. A useful test is whether each later mechanism can identify its burden bearer, lawful authority, review route, and exit condition without expanding the City's mandate. When those answers remain visible, greater institutional complexity becomes evidence of disciplined design rather than an opportunity for mission drift.

Chapter 1 — A City for Public Responsibility

Democratic judgment becomes stronger when it can see how public power was formed before it must decide who should carry that power. The relevant story begins earlier than an oath, election night, confirmation, campaign launch, or first closed-door meeting. It begins in the rooms, obligations, credentials, habits, and loyalties that shape a future official before those influences become policy. The City of Fairness enters at this earlier point by asking whether formative routes can become reviewable without making ordinary private life public property.

The democratic claim of this chapter is positive: voters deserve an adequate object of judgment. Elections remain authoritative, but judgment cannot become more informed than the evidence available to it. A ballot can choose among candidates; it cannot retrospectively reveal every dependency, compromise, habit, or gatekeeping process that shaped the available field before the campaign began.

The hidden pipeline of power is an ordinary accumulation of formative influences. Money, prestige, education, family advantage, parties, media, consultants, professional networks, crisis, and compromise can shape a future public figure before the public encounters a candidate. Most people inside these systems are not villains, and many of the institutions involved serve indispensable democratic purposes.

Ordinary privacy, association, mentorship, friendship, family life, political experimentation, and professional socialization should not be treated as suspect. Democratic life would become thinner and more coercive if every relationship involving a future candidate were converted into public evidence. The relevant

threshold is crossed when private influence becomes materially consequential for public power while remaining insulated from proportionate review.

That threshold matters because hidden formation creates routes of burden. Donor dependence can narrow an agenda before legislation exists. Prestige systems can determine who appears credible before voters hear a case. Party and consultant networks can decide viability, language, and access. Family advantage can create opportunity without moral blame while still shaping whose ambition is resourced and whose is never seen.

Campaigns reveal real abilities. They expose candidates to questioning, opposition, scheduling pressure, coalition demands, public scrutiny, and legal disclosure. Yet campaign time is compressed, strategic, and performance-heavy, so it often reveals an already-formed person through a managed surface rather than showing how judgment, dependency, correction, and public reasoning developed across time.

Comparative necessity is the chapter's discipline. The City earns consideration only after a less intrusive bundle of reforms has been specified, resourced, and judged against the same failure the City claims to address. The comparison is not the City versus nothing. It is the City versus the strongest plausible combination of disclosure, education, party reform, professional formation, journalism, deliberation, ethics rules, and oversight.

The proportional test is therefore part of the chapter's intellectual architecture. A City is not justified because it is more vivid, more dramatic, more comprehensive, or more beautiful than reform. It

is justified only if the remaining burden is not merely a missing rule but a missing formation ecology, and only if the burdens created by the City do not exceed the burden it reduces. Necessity here means conditional institutional fit, not inevitability.

A City becomes relevant only if the unresolved problem is ecological. Residence, study, deliberation, staff relations, public interface, recovery, dissent, record, correction, and protected nonvisibility may need to be observed as an interacting system rather than as disconnected disclosures. The case is not that a campus knows more because it sees more. The case is that a bounded ecology may make routes of influence and correction more inspectable across time.

The City's positive theory of action can be stated plainly: answerability before authority. It seeks longitudinal evidence of how a person studies, reasons, changes position, treats staff, handles criticism, acknowledges conflict, repairs error, resists leverage, and carries public consequence. That evidence remains contextual and contestable, but it gives democratic judgment more than a campaign fragment.

Moving evidence earlier changes the democratic timeline. Formation can become visible before a campaign hardens every signal into advantage or defeat. Journalists and critics can examine patterns before scandal becomes the only discovery mechanism. Voters can encounter a record of correction and conflict before office turns hidden formation into official consequence.

Earlier visibility also creates new distortions. Participants may perform for the archive, avoid unpopular thought, imitate institutional norms, or learn to satisfy observers rather than exercise judgment. Long records can produce false confidence, context collapse, selective interpretation, and the illusion that inspectable conduct reveals the whole person. The City must be designed as an answerability institution, not a perfect-observation machine.

Selection creates another burden. People able or willing to live under an exceptional record may not represent the full range of capable public servants. The City could privilege people with financial stability, fewer dependents, greater comfort under observation, elite verbal fluency, or unusually strong institutional support. A design that ignores these filters may reproduce the same narrowness it claims to repair.

Ordinary citizenship therefore remains outside the City's burden. Private people do not owe a record of their lives to possess dignity, voice, safety, care, citizenship, or belonging. Public-minded people may decline the City, form elsewhere, and seek office through other lawful routes without being treated as less serious, less fair, or less trustworthy.

The institution's output is evidence, not entitlement. A formation record may inform voters, parties, journalists, appointment bodies, courts, and other lawful decision makers, but it cannot create a presumption of fitness, a protected route to nomination, or an automatic civic advantage over people formed elsewhere. Voters and lawful institutions remain free to find particular

evidence persuasive; City membership itself confers no preference.

That discipline matters because the City's design will become severe. A severe institution can be defended only if it is aimed precisely. The first chapter therefore refuses two shortcuts: the complacent shortcut that says ordinary campaign democracy already reveals enough, and the grand shortcut that says only a City can make public power intelligible. The better path is narrower and stronger: identify the hidden burden, compare available reforms, then ask whether a bounded City can carry what remains without becoming a new burden machine.

Formation is more than instruction. It is how a person behaves when information is incomplete, incentives conflict, time is short, status is at stake, and someone with less power may carry the consequences. The City deserves consideration only if it can make those patterns more inspectable without pretending to read inner character.

This is why curriculum alone cannot carry the design. Law, economics, history, data, ethics, and public reason matter, but the institution also needs observed practice in drafting, revision, disagreement, staff relations, handling error, and respecting protected boundaries. Democratic competence frameworks treat knowledge, skills, values, and attitudes as interdependent; a City would add role-bound continuity and public accountability, not replace those educational foundations (Council of Europe, 2018a).

The comparative question remains open throughout. If campaign finance reform, stronger parties, professional public-service education, investigative journalism, citizens' assemblies, public records, or a combination can address the hidden burden with less intrusion, they should be preferred. The City is not the default answer; it is a candidate institution whose added severity must earn added public value.

The chapter therefore develops a testable civic proposition: earlier, longitudinal, context-rich formation evidence may improve public judgment when ordinary privacy remains protected, candidates formed elsewhere retain equal legitimacy, and records can be corrected and contested. It also identifies the mechanisms that could defeat the design, including performance, self-selection, chilling effects, prestige, and information overload. A serious City earns attention by making both its contribution and its failure routes inspectable. Operational success may support the institution, but it cannot validate the formal Law or create entitlement to office.

1.1 — The Hidden Pipeline of Power

The mechanism here is formation before visibility. A person who may later govern is shaped by rooms, favors, credentials, narratives, dependencies, and silences whose public effect is not yet public. The affected persons are future citizens, staff, competitors, communities, and institutions that will later carry decisions made by someone formed through channels they could not review (Norris and Lovenduski, 1995; Lawless and Fox, 2005; Hazan and Rahat, 2010; Carnes and Lupu, 2023).

The record stage is deliberately limited. Before voluntary City entry, ordinary life remains ordinary life. After entry, the City records active public-power formation and continuing dependencies without treating the whole past as public property. The review route is a public-consequence test: does a hidden relationship still shape role judgment, leverage, access, agenda, silence, or public burden?

Secrecy in the formation pipeline does not require malicious actors. It persists because societies normalize influence before asking when private dependence becomes public consequence. Money, prestige, family, media, parties, consultants, institutions, and compromise can shape a future officeholder long before a campaign begins. The task is not to expose all private formation, but to locate the point at which unreviewable dependence begins to travel outward through power.

Public power is carried by persons, but persons are formed by environments. A candidate does not arrive as a political surface from nowhere. The apparent individual may already be the

product of financial backing, elite fluency, family inheritance, party gatekeeping, media preparation, consultant discipline, and private obligations that the public is asked to discover late or never. The City exists because these formative channels eventually become public burden.

Consider Mara, a composite role seeker created from recurring features of political recruitment rather than from one identifiable person. At twenty-four, she enters a policy fellowship after an excellent academic record and a mentor's recommendation. The fellowship leads to a donor-supported conference, a party research post, a consulting assignment, selective press access, and eventually a campaign role. No single step is necessarily corrupt, and several give her valuable skill.

Across those steps, however, Mara learns which questions are rewarded, which forms of dissent remain employable, whose calls receive an immediate answer, and which public problems become visible only after they interest a gatekeeper. She also learns good things: how to read a budget, how to negotiate, how to revise a proposal, and how to work inside a coalition. Formation is powerful precisely because dependence, knowledge, generosity, compromise, and ambition can coexist.

When Mara later announces a candidacy, the public receives a résumé, a donor report, prepared biography, policy positions, and a few difficult interviews. Those materials may be accurate and still leave the formative sequence largely invisible. Voters are asked to judge the person produced by the pipeline without seeing enough of how influence was accepted, resisted, repaid, corrected, or carried forward.

A City-specific formation record would not publish Mara's private friendships, family history, or every conversation. It would make role-relevant pathways legible while they are active: who funded the work, who shaped the task, what advice changed a public position, what conflicts were declared, what correction followed challenge, and where lawful office authority would begin and City authority would end. That narrower object responds to the timing problem without turning biography into a dossier (Norris and Lovenduski, 1995; Lawless and Fox, 2005; International IDEA, 2014; OECD, 2024b).

1.1.1 — Donor and Patronage Formation

Donors, parties, families, schools, advisers, professional networks, and private associations are not suspicious by default. Democratic freedom depends on relationships that remain outside public ownership. The narrower question is whether a formative relationship creates leverage, privileged access, agenda control, silence, or dependency that later affects people who never consented to it. The City may address that public consequence; ordinary privacy remains beyond its reach.

Ordinary privacy protects the formation of conscience, friendship, association, family life, professional identity, dissent, and political experimentation. A democratic order would become poorer if every mentor, donor, teacher, colleague, or friend had to act as though future public scrutiny were already present. The City therefore needs a public-consequence threshold. It should record role-relevant leverage and dependency after voluntary entry, not reconstruct an applicant's entire past as though private life were presumptively suspect.

Money is never only money in the formation of public power. It buys time, introductions, staffing, message discipline, private reassurance, legal advice, strategic patience, and a sense of who must be pleased before public trust is requested. A donor may never issue an explicit command and still become formative. The burden arrives through dependency before it arrives through bribery.

International IDEA's political-finance work distinguishes private and public funding, spending, reporting, oversight, and sanctions because money in politics is not one problem with one remedy. The OECD Anti-Corruption and Integrity Outlook 2026 likewise separates the existence of political-finance rules from their implementation in practice (International IDEA, 2014; Wolfs, 2025; OECD, 2026c). Timely disclosure, effective oversight, enforceable sanctions, and public financing can reduce some dependencies without requiring residential formation under record. Where such reforms are enforceable and sufficient, they are less burdensome than a City and should be preferred.

Campaigns may disclose contributions, but disclosure after formation is not the same as seeing how dependence shaped habits, access, confidence, and silence. The City is designed to show not merely who gave money, but how financial formation changes a person's public judgment over time.

Financial formation is best treated as a record of dependency and independence, not as a simple accusation. Support, mentorship, introduction, policy education, and lawful fundraising can enlarge public capacity. Patronage can narrow independence without an explicit command. The public question is whether a later record

can distinguish those paths and show when private obligation entered public judgment.

The operational distinction the City must draw is between support that enlarges public capacity and support that narrows public independence. A future participant may have had many legitimate helpers before entry, including teachers, neighbors, donors, lawyers, campaign volunteers, community elders, and professional mentors. The City does not retroactively make those relationships suspicious. It asks whether, after voluntary entry, ongoing financial influence, access dependency, or gratitude pressure becomes part of active public-power formation and therefore part of the role-bound record.

A mature record of financial formation would not reduce a person to a contribution list. It would connect money to time, access, advice, staffing, travel, research, housing security, legal preparation, messaging support, and agenda exposure. The public question is not only who gave, but what the participant could no longer afford to ignore after receiving support. That is why the City's archive must distinguish source, channel, purpose, condition, refusal capacity, and later policy relevance rather than presenting financial influence as a crude accusation.

The remedy for donor dependency is not theatrical confession. It is reviewable independence architecture. A participant should be able to disclose relevant financial formation, receive material stabilization that weakens private leverage, decline improper access, document attempted pressure, answer affected-person objections, and show how judgment changed under scrutiny. If the City cannot make that chain visible without exposing ordinary

supporters or converting donations into moral dirt, it has failed the burden question at the first gate.

1.1.2 — Prestige and Credential Channels

Prestige does not need to command in order to shape public power. Elite institutions can supply valuable knowledge, discipline, and opportunity while also teaching which voices sound serious and whose approval matters. Political recruitment research makes these social pathways relevant to the formation of public power (Norris and Lovenduski, 1995; Carnes and Lupu, 2023).

The City should test what a credential enables a participant to do. Can the participant explain expert knowledge clearly, recognize its limits, and revise after challenge from people outside the institutions that trained them? Staff observations, local testimony, policy exercises, and responses to disagreement can supply evidence of that conduct.

Expertise deserves respect; it does not establish readiness by itself. Prestige becomes useful when it is made answerable to people outside the room that produced it. The same rule applies to the City's own reputation: participation must never become a shortcut to credibility.

1.1.3 — Party, Consultant, and Media Shaping

A future public figure may learn the party before learning the public. They may learn how to avoid a bad clip before learning how to explain a hard tradeoff. They may learn how to speak in phrases that survive television before they learn how to build

institutions that survive time. Formation through apparatus is not automatically corrupt, but it is rarely neutral.

The burden of this shaping later falls on citizens as flattened language, strategic ambiguity, controlled emotion, rehearsed sincerity, and policy that has already passed through the machinery of electability. People may think they are judging the person, when they are partly judging the apparatus that trained the person to appear before them.

Citizens should not encounter the party, consultant, lobbying, and media apparatus only through its polished final product. The OECD Recommendation on Transparency and Integrity in Lobbying and Influence, revised in 2024, recognizes influence as a legitimate part of public decision making while requiring safeguards against opaque access, conflicts of interest, and revolving-door capture. The OECD Anti-Corruption and Integrity Outlook 2026 also reports that lobbying safeguards remain among the weaker elements of many integrity systems (OECD, 2024b; OECD, 2026c). The City's contribution, if needed, is earlier evidence of how advice was received, resisted, revised, or internalized, not a presumption that influence itself is corrupt.

Parties, consultants, and media remain legitimate democratic actors. Democratic life needs organization, communication, and public scrutiny. The problem begins when those systems shape a person while hiding their formative pressure. A party may help someone understand governance. A consultant may clarify language. A newsroom may reveal truth. None should become an invisible author of public judgment.

The party, consultant, and media environment creates a discipline of appearing. A person learns which sentences travel, which truths can be delayed, which emotion is safe, and which ambiguity protects the coalition. This discipline can produce public clarity when it is honest. It can also create a person who knows how to survive the public without becoming more answerable to it.

Political apparatus forms a candidate by teaching the cost of unscripted judgment. Party officers, consultants, pollsters, fundraisers, opposition researchers, endorsers, media coaches, platform managers, and campaign lawyers may all perform legitimate democratic functions. They also create habits of timing, tone, omission, audience segmentation, and message discipline before the voter arrives. The City's concern is not the existence of political skill. It is the hidden transfer of judgment from future officeholder to apparatus.

A serious City record would separate advice from command, training from dependence, message discipline from evasion, and coalition respect from capture. It would show when a participant changed language because a public reason improved, and when language changed because a sensitive patron, faction, consultant, or media constituency could not be offended. That difference cannot be inferred from the final slogan. It appears across drafts, meeting notes, disagreement, correction, and the participant's willingness to make tradeoffs visible when stakes rise.

Recent candidate-emergence research reinforces the timing problem without proving that one formation path is universally superior. Experience inside a state legislature can materially

change the probability of seeking higher office because institutions confer skills, networks, reputational signals, and practical knowledge. That finding supports a general proposition: political ambition is not merely an inner trait waiting to be revealed. Institutions help produce the confidence, opportunity, and credibility through which ambition becomes candidacy (McCrain and O’Connell, 2023).

Party gatekeeping is also capable of correction rather than only exclusion. A large conjoint study of party elites in Austria, Germany, and Switzerland found that information about women’s underrepresentation changed selectors’ preferences in patterned ways. The lesson for the City is not that parties fail. It is that selection environments respond to rules, cues, representation, ideology, and the composition of gatekeepers. A fair comparison must therefore treat party reform as a serious alternative and the City as one possible additional route (Gatto and Radojevic, 2025).

Digital political finance widens the formation map. Advertising purchases, data-driven outreach, third-party spending, influencers, platform services, and campaign technologies can route money and influence through channels that conventional reports miss. International IDEA's 2025 comparative work shows why disclosure must follow the real architecture of political spending as categories evolve. The City therefore treats campaign-stage disclosure as one interface in a longer accountability record, while finance regulation and enforcement remain with their lawful owners (Wolfs, 2025).

1.1.4 — Family Advantage and Social Inheritance

The design therefore needs to examine social inheritance without turning family life into spectacle. It should not expose relatives as public material. It should not build a shame record around childhood. It should ask how advantage shaped the participant's public imagination, tolerance for uncertainty, relation to staff, understanding of ordinary life, and ability to see burdens that were carried elsewhere.

Fairness requires a public-power seeker to understand what formed them without making the public own their family story. Social inheritance matters because it often decides who feels entitled to speak, who feels watched, who feels afraid, and who feels the world is already theirs. The City's task is to bring that formation into role-relevant understanding while protecting the private dignity of those who did not choose the Vow.

Family inheritance should be handled without cruelty because no one chooses the household into which they are born. Advantage may give language, safety, introductions, money, confidence, and the ability to take unpaid risks. Disadvantage may give urgency, knowledge of burden, improvisation, and suspicion of institutions. Neither inheritance is a moral verdict. Both are formative facts.

Inheritance should appear as context rather than accusation. The question is not whether a participant came from advantage or hardship. It is whether the person understands what that background made visible, what it concealed, which burdens remain easy to miss, and whether public judgment can reach

beyond the social world that formed them (Carnes and Lupu, 2023).

Family advantage is one of the hardest burdens to describe fairly because it is often innocent at the level of love and powerful at the level of consequence. A parent's education, neighborhood, citizenship, language, safety, network, wealth, reputation, and emotional steadiness can open public pathways without corrupt intent. Gratitude to family should not become shame. Neither should inherited access disappear from analysis merely because it arrived through affection rather than patronage (Carnes and Lupu, 2023).

The role boundary matters here. The City may examine how inherited advantage shapes public-power formation after voluntary entry, but it may not make families into public exhibits. The record should focus on what advantage enables, what blind spots it leaves, what dependencies remain active, and what corrective encounters the participant undergoes. It should not demand that private relatives surrender their lives to make a participant's formation legible. Family does not inherit the participant's vow by proximity.

The positive test is whether a participant can carry inheritance without disguising it as pure merit. Can the participant identify doors opened by birth, name forms of burden not personally known, hear resentment without defensiveness, and design public action that does not mistake inherited ease for universal possibility? If not, the public later pays for a private story of deserved ascent. If yes, family advantage becomes a disclosed formation fact rather than a hidden public filter.

1.1.5 — Private Compromise Before Public Trust

The City is not designed to create impossible purity. Every person has compromised in some way because every person has lived in systems of dependence, fear, need, ambition, care, and belonging. The City's question is whether private compromise can be brought under awareness, correction, disclosure where role-relevant, and future refusal capacity before authority is granted.

A fair record of public-power formation should distinguish ordinary human complexity from compromising leverage. Not every private mistake matters to the public. Not every embarrassment reveals public danger. But patterns of dependency, silence, obligation, and concealed influence do matter when they later shape public decisions. The City must handle this distinction with precision.

The City approaches private compromise through sustained formation rather than a one-time questionnaire. People often cannot identify their own formative compromises quickly or safely. They need time, record, mentors, opposition, material stabilization, and public-role pressure to reveal the shape of their dependencies. The City does not ask for instant confession. It asks for formation strong enough that hidden compromise can become visible before it governs others.

Compromise before public trust is often quiet because it begins as survival. A person may owe someone a chance, a defense, a silence, a public posture, or a private loyalty before they have even admitted their own ambition. By the time office becomes

possible, the compromise may feel like friendship, gratitude, realism, or prudence rather than pressure.

A fair City would also protect context. Not every private mistake belongs in the public record, and not every compromised relation has civic consequence. The relevant question is narrower: does a dependency, secrecy, loyalty, fear, or material tie alter the person's ability to carry public power openly? When it does, the burden must move toward the participant and the institution, not toward citizens who discover it too late.

The City's record should therefore be categorical rather than voyeuristic. It should distinguish donor influence, prestige formation, party shaping, media coaching, family inheritance, private compromise, staff treatment, and public reasoning instead of mixing them into one impression of character. Category protects the participant from crude moral judgment and protects the public from polished ambiguity.

Private compromise can form public power more deeply than public scandal because it changes the person before it changes the record. A favor accepted, a silence kept, a weak bargain normalized, a dependent relationship concealed, or a professional debt carried forward can train the future officeholder to protect a private equilibrium. The public may see only the later caution, evasiveness, or selective courage. The formative event has already become habit.

The City's record should not attempt to excavate every past mistake. That would convert formation into retrospective surveillance and would punish ordinary human incompleteness.

The relevant question is whether a compromise remains active within public-power formation. Does it create present leverage? Does it silence the participant on a live issue? Does it endanger staff, families, citizens, counterparties, or institutions? Does the participant have a path to repair that does not merely protect reputation?

A fair mechanism would include confidential legal and ethical review, affected-person standing where appropriate, protected disclosure routes, correction logs, recusal rules, staff escalation, and public explanation when public consequence requires it. The chapter's burden question becomes exact: who carries the cost of a hidden compromise if the participant is later entrusted with public authority? The City is justified only if it can move that cost into lawful review without turning every private wound into a spectacle. The hidden pipeline reveals that public authority is often shaped long before voters receive a candidate to judge. Donors, prestige systems, parties, inherited opportunity, and private compromise do not tell one story, but each can move public burden upstream.

1.2 — Why Campaigns Arrive Too Late

Campaigns perform vital democratic work, yet they enter after much of the formative story has already been written. By the time a campaign begins, a candidate may know which rooms matter, which donors reassure, which phrases survive consultants, which parts of the self are marketable, and which compromises must remain beneath the surface. Campaign pressure can reveal real capacities, but it rarely reconstructs the earlier process that made performance possible (International IDEA, 2014; OECD, 2024b; OECD, 2026c).

The City's local remedy is earlier record with later democratic freedom. It does not end campaigns, substitute for voters, or remove the need for journalism and public argument. It changes the sequence so the public does not have to rely only on managed surfaces, scandal, and compressed disclosure after viability has already been constructed.

The problem is not that campaigns reveal nothing. Campaigns can reveal stamina, communication, pressure response, coalition skill, evasiveness, cruelty, courage, and public imagination. They can expose flaws and generate useful scrutiny. The problem is timing. Campaigns often reveal managed surfaces after deeper patterns have already formed and after the person has learned how to appear before the public.

1.2.1 — Persona After Formation

Late exposure cannot by itself reconstruct hidden formation. Campaigns remain central democratic institutions, and the OSCE Office for Democratic Institutions and Human Rights emphasizes

plural competition, fundamental freedoms, equal conditions, and voters' capacity to make an informed choice in its campaign observation handbook (OSCE/ODIHR, 2021). The issue is timing and scope: a campaign can reveal public performance under contest, but it cannot recover every dependency, habit, and formative pattern that preceded it.

A campaign persona is usually built after a person has already become someone in relation to power. By the time slogans, colors, speeches, debate posture, biography, and public rhythm appear, the person has already learned habits of dependence, ambition, conflict, avoidance, and self-presentation. The campaign may reveal those habits indirectly, but it rarely shows their formation.

When persona replaces formation, citizens must infer character from speeches, images, biography fragments, debate style, endorsements, and media frames. Staff manage the distance between public presentation and private pattern. Opponents search for contradictions. Journalists compress complexity. The evidentiary burden moves downward because the public is asked to judge a surface without an adequate account of how that surface was made.

Persona after formation becomes dangerous when voters are asked to treat it as evidence enough. The City is not hostile to inspiration, rhetoric, or public identity. It is hostile to the unfairness of asking ordinary people to live under power formed earlier than they could see and polished later than they could challenge. A public person should be allowed to speak

beautifully. They should not be allowed to substitute beauty for formation.

The difference between persona and formation is temporal. Persona answers, who is this candidate now, under public contest? Formation asks, how did this candidate learn to carry money, dissent, staff, ambition, family, failure, expertise, apology, and public burden before the contest began? A campaign can show composure under pressure, but it rarely shows the long history of correction that produced composure or the dependencies that made some answers safer than others.

The remedy is not to abolish campaign persona. Public life needs narrative because voters need a coherent object of attention. The remedy is to place persona against an earlier record so narrative can be checked by pattern. A person may still tell a story about service, courage, faith, competence, or reform. The City's contribution is to let the public ask whether that story is supported by visible formation rather than by campaign discipline alone.

1.2.2 — Managed Disclosure and Narrative Control

Narrative control can protect legitimate privacy, but it can also hide formative burden. A campaign may disclose financial information while concealing financial dependence. It may disclose biography while concealing private obligations. It may disclose professional experience while concealing who shaped judgment. It may disclose mistakes while controlling their meaning so tightly that public correction becomes performance.

Managed disclosure transfers verification labor to the public. Citizens must decide whether the offered narrative is sufficient,

whether missing context matters, and whether an opponent, whistleblower, journalist, investigation, or accident will reveal what strategy omitted. This burden is unequal. People with time, access, education, institutional knowledge, and media literacy can investigate more deeply than people who encounter only the curated surface.

The City does not require total exposure as an answer. Total exposure would be another injustice. Instead, it creates structured formation records before campaign strategy begins. Managed disclosure remains possible in a campaign, but it must now stand beside role-specific public evidence accumulated under conditions the campaign did not fully control.

Managed disclosure becomes less dangerous when it is not the public's first encounter with the person. A campaign can still summarize, argue, explain, and persuade. But it no longer has the same monopoly over meaning if citizens can examine earlier records, correction histories, staff treatment, opposition behavior, and public explanation patterns. The City weakens the campaign's power to decide what the public is allowed to know.

Managed disclosure is not inherently dishonest. Every public system must decide what to release, when to release it, and how to provide context. The problem arises when the disclosure process is controlled primarily by the candidate's strategic need rather than by the public's burden of judgment. At that point, disclosure can become a shield that appears transparent while keeping formative dependencies outside the frame.

The City answers the release problem by governing distinct record stages. Capture creates a preserved source; access assigns lawful viewers; release creates a public bundle; research requires separate consent and authority; contextualization explains without excusing. This staged architecture keeps campaign strategy from becoming the only timing rule. It supports a record that can later be reviewed, labeled, corrected, challenged, and understood without exposing everything at once.

A failure condition should be named early: if the City's own record site becomes a new campaign instrument, it has reproduced managed disclosure under institutional branding. The participant must not be able to select only flattering bundles, and the City must not be able to hide institutional failure behind polished summaries. Public trust requires release architecture that is independent enough to resist the candidate, contextual enough to avoid distortion, and bounded enough to protect third parties.

1.2.3 — Scandal as Late Evidence

Scandal forces democratic judgment into emergency time. It can reveal donor dependence, staff cruelty, private compromise, evasive reasoning, or other conduct that institutions failed to surface earlier, but it often arrives under maximum heat and limited context. The public then chooses between denial, outrage, and compressed interpretation when a slower formation record might have allowed correction before crisis.

The City does not eliminate the need for investigation. Misconduct can still occur. Hidden behavior can still require exposure. Journalism remains essential. Legal processes remain

essential. But the City reduces dependence on scandal by producing earlier structured evidence of formation. The aim is not to make scandal impossible. It is to make scandal less necessary as the first discovery mechanism.

Scandal also creates incentives for concealment. If the only public discovery of deeper character is catastrophic, candidates and institutions will hide more. They will fear partial disclosure, honest ambiguity, and early correction because every exposed flaw may become a public event. The City attempts to create a space where error and correction can appear before they harden into scandal.

A City record does not ask citizens to ignore scandal. It asks them to interpret scandal alongside formation. Did the event reflect a pattern? Was correction already present? Were staff concerns ignored? Did advisors warn? Did the person learn? Was the institution responsible? These questions are fairer than the simple spectacle of exposure. Scandal may still matter, but it should not be the public's first real window into power.

Investigative journalism remains indispensable because no institution can safely investigate itself alone. UNESCO's fully updated second edition of *Story-Based Inquiry* presents investigation as a disciplined, hypothesis-led process of evidence, verification, and publication rather than rumor or public appetite (Hunter, 2026). A City should make such work easier through provenance and access, while preserving newsroom independence and the possibility that journalists will find failures the City's own systems missed.

Earlier channels for pattern, correction, complaint, and review can reduce dependence on scandal. When a staff member has no safe route to name a hidden burden until a crisis erupts, the institution transfers risk to the most vulnerable witness. When the public learns only through emergency, judgment occurs under emotional compression rather than sustained evidence.

An upstream record gives scandal a different civic role. When a serious allegation appears after City formation, the public can compare it with prior patterns, correction logs, influence records, staff protections, release labels, and independent review. Investigation remains essential, but it no longer begins in a vacuum or carries the entire burden of discovery. The City succeeds when scandal becomes one tested input in a structured system of answerability rather than the only flashlight in a dark room.

1.2.4 — Voter Guesswork as Civic Burden

When citizens lack formation evidence, they carry guesswork as civic labor. They must infer courage from speeches, kindness from anecdotes, competence from credentials, independence from donor lists, and judgment from debate posture. Some will do this carefully. Others will rely on identity, party, style, fear, fatigue, or trust in intermediaries. The problem is not voter failure. The problem is an evidentiary burden placed on voters too late.

Late-stage inference magnifies inequality in political judgment. Citizens with time, education, media literacy, social networks, investigative reporting, and institutional knowledge can test

campaign claims differently from citizens making decisions under exhaustion, isolation, language barriers, disability, care burdens, or misinformation (Lupia, 1994; Lau and Redlawsk, 2001; Todorov et al., 2005).

The City does not remove the responsibility of judgment. It respects that voters remain voters. But it asks that the public be given deeper, structured, contextual evidence before being asked to decide. Democratic dignity is not weakened by better evidence. It is strengthened when citizens are not forced to choose in fog manufactured by late disclosure.

Voter guesswork also affects public trust after the election. If citizens later learn that the person they trusted was formed by hidden dependencies, they may conclude not only that one leader failed, but that the entire system is theater. Repeated late discovery corrodes trust beyond the individual case. It teaches cynicism as a rational defense.

The City offers a different civic burden distribution. Public-power seekers carry more knowability before trust. Institutions carry more record responsibility. Staff influence is counted. Formation becomes earlier. Voters still interpret, disagree, and decide, but they do so with more than fragments. The public should carry judgment, not needless blindness.

The City's ambition should therefore be modest and serious: reduce unnecessary guesswork, not end political disagreement. A deeper record can improve the public's object of judgment while still leaving voters free to weigh values, policy, party, coalition, character, and trust differently. The goal is not consensus. It is a

fairer burden of inference, with more of the evidentiary work carried by the person seeking power and by the institution that forms them.

1.2.5 — Why Late Exposure Cannot Undo Earlier Harm

Late exposure can reveal misconduct and prompt genuine reform, but it cannot undo decisions already made or restore every opportunity already lost. The timing advantage claimed for the City is therefore preventive: relevant dependencies might be identified and corrected before a participant exercises public authority.

Less intrusive reforms deserve the first comparison. Timely donor disclosure, public financing, conflict and lobbying rules, ethics enforcement, party reform, public records, and independent journalism can all move scrutiny earlier. A City merits testing only where a substantial formation gap remains after these alternatives have been tried or fairly assessed.

Campaigns and later investigations retain their own evidentiary value. A campaign tests prior formation under open political contest; an earlier record may help journalists and citizens interpret a later allegation or reversal. The two sources complement one another. Review should distinguish a warning that was reasonably available earlier from information that genuinely emerged later.

Inside the City, an identified dependency can lead to recusal, financial stabilization, adviser separation, further education, public explanation where warranted, delayed readiness, or exit. The intervention succeeds only if follow-up shows that the

dependency weakened or conduct changed under comparable pressure. Completing a process, apologizing, or producing a larger record is insufficient. Repeated failure after support should narrow readiness claims rather than disappear into a narrative of growth. Before intervention, reviewers should record the observable change they expect and the evidence that would count against improvement, so later success cannot be defined retrospectively.

1.3 — Schools, Parties, and Platforms

Existing democratic institutions provide the baseline any City proposal must surpass. Schools, parties, platforms, leadership programs, journalism, and civic associations each contribute something the City should respect and may never need to replace. The City becomes plausible only where their combined strengths still leave a formation burden that no less intrusive arrangement can carry adequately.

The affected persons in this section include not only voters and candidates, but also teachers, party workers, online audiences, donors, staff, volunteers, and people excluded by existing pathways. The review route is comparative: what can be repaired through less intrusive reform, and what requires a bounded ecology of residence, record, recovery, opposition, staff relations, and public interface?

If campaigns arrive too late, the next question is whether existing institutions before campaigns can solve the problem. Schools, parties, platforms, professional networks, and leadership programs already shape public-power seekers. They teach, filter, expose, credential, message, and sometimes discipline. But each institution carries only part of the burden, and each has incentives that prevent it from becoming the whole answer.

A fair comparison begins by asking what each institution can carry, not by arranging a procession of failures. Schools can educate and widen judgment. Parties can recruit, aggregate, contest, and govern. Platforms can open access and expose conduct. Leadership programs can train. Civil-service institutions

can develop administrative competence. Journalism can investigate. Deliberative bodies can test public reasons. The City has a case only if the unresolved burden lies in the interaction among these functions rather than in a single missing reform.

1.3.1 — Schools Educate Without Whole Public-Power Formation

Instruction, selection, amplification, and training each contribute to public leadership, yet none alone creates integrated public-power formation. Universities, parties, debates, media exposure, online accountability, fellowships, and ethics courses may already carry much of the need. The City's distinct claim arises only where residence, record, recovery, opposition, staff ecology, archive integrity, public interface, and lawful exit must operate together in one bounded institution.

But schooling is not full public-power formation. A student can pass exams without showing how they carry public burden. A person can master theory while treating staff poorly. A person can write about justice while hiding dependence. A person can debate rights while lacking the steadiness to respect them when constrained by time, pressure, and power.

Schools cannot ordinarily carry residence, role-bound longitudinal record, public interface, staff influence mapping, protected nonvisibility, exit rules, readiness evidence, and public-power simulation within one civic burden, nor should most schools be redesigned to do so. Their legitimate mission is education. The question is not whether schools are inadequate in general, but whether educational achievement is being mistaken

for evidence that a person can carry public authority humanely under pressure.

Education can enter the City without allowing credentialism to take command. Curricula, experts, research literacy, seminars, and disciplinary knowledge are necessary, but diplomas cannot stand in for visible formation. The relevant test is not only what a participant knows, but how knowledge becomes judgment under public consequence (Council of Europe, 2018a).

A City can draw from schools without imitating their status economy. It needs law, history, administration, economics, ethics, science literacy, media literacy, negotiation, and constitutional reasoning. It also needs habits that are harder to grade: how a participant treats a frustrated staff member, hears an affected person, revises a policy after embarrassment, resists an implied threat, or carries fatigue without cruelty. These are not anti-intellectual concerns. They are where knowledge becomes public conduct (Council of Europe, 2018a).

The review route is therefore not an exam score. It is a formation record that connects learning to judgment, dissent, workload, correction, public explanation, and humility before affected people. If the City merely becomes a prestigious school with cameras, it has failed. If it places education inside a role-bound ecology where learning must survive consequence, it may add something schools should not be asked to carry alone.

1.3.2 — Parties Select Without Role-Bound Record

When party selection substitutes for public knowability, citizens may be asked to trust vetting they cannot inspect. Internal

factions, donors, staff knowledge, electoral calculations, and coalition needs can shape who becomes viable. The OSCE Office for Democratic Institutions and Human Rights and the Venice Commission (OSCE/ODIHR and Venice Commission, 2020) protect party freedom and recognize parties as essential democratic associations in the Guidelines on Political Party Regulation, Second Edition. That protection is a reason to preserve party autonomy, not a reason to treat party selection as complete evidence of public-power formation.

Parties also have incentives to hide flaws until they must manage them. They may protect a candidate because the alternative is worse for the party. They may frame concerns as attacks. They may delay disclosure, discipline whistleblowers, or select for message compliance. Even when a party acts responsibly, the public still receives a partial process through a strategic filter.

Parties remain free to interpret, support, refuse, and challenge City evidence without becoming subordinate to the City; the City likewise cannot make party selection its own authority.

Parties select without full record because they are built for political competition. The City forms under record because public-power burden requires a different standard. The two may interact, but they must not collapse. If they collapse, the City becomes a partisan instrument. If they remain distinct, democratic politics receives a stronger object for judgment without losing its own processes.

This distinction also protects pluralism. Different parties may value different temperaments and policies. No institution should

erase ideological difference by certifying one preferred kind of candidate. It should make formative burden more visible so political disagreement occurs with better evidence and fewer hidden obligations.

Parties remain indispensable because they recruit, aggregate, coordinate, bargain, discipline coalitions, and connect office seekers to governing programs. The narrower problem is that candidate selection often determines which choices voters will see before the public receives a role-bound formation record. The choice before the choice remains one of political life's least visible burdens (Hazan and Rahat, 2010; OSCE/ODIHR and Venice Commission, 2020).

Party insiders may judge electability, loyalty, fundraising capacity, coalition compatibility, message discipline, ideological fit, and personal reliability. Some of those judgments are legitimate. Some hide factional protection, donor preference, social reproduction, risk avoidance, or discomfort with candidates outside familiar pathways. Without a role-bound record, the public may never know whether party selection rewarded public capacity or simply filtered ambition through private comfort.

What changes is the object available to parties and voters. A party may still endorse, oppose, recruit, and organize, but its reasons can be compared with a participant's visible record of study, debate, staff treatment, public explanation, conflict response, and readiness. Selection remains partisan and lawful; it is no longer carried entirely behind the party door.

1.3.3 — Platforms Amplify Without Stewardship

Platforms convert attention into political consequence without carrying full responsibility for formation. They can reveal ignored voices, expose hypocrisy, distribute evidence, and mobilize public care. They can also reward speed, fury, simplification, persona, harassment, manipulation, and the kind of certainty that survives a screen better than a deliberative room.

Platform visibility reveals how quickly attention systems compress a person into clips, metrics, shares, sentiment, search results, and viral moments. The City needs a different institutional model: slow enough for context, governed enough for correction, and humane enough to resist exposure designed mainly for engagement. Formation becomes legible through provenance, role relevance, review, and care rather than through intensified attention capture (Marwick and boyd, 2011; UNESCO, 2018).

The burden question is who pays when amplification substitutes for stewardship. Citizens pay through confusion and exhaustion. Participants pay through performance drift. Staff and families may pay through harassment or misrecognition. The City must build slower evidence structures because public power should not be formed primarily by the rhythms of visibility markets.

Digital public life reveals what the City must resist. A participant under record should not be trained to satisfy spectators, trend cycles, factional audiences, or machine summaries. Public interfaces should make evidence usable rather than addictive by preserving status labels, correction, context, delayed release, bystander shielding, and review routes. Without those controls,

the City would become a platform with buildings and the same burden would return under more dignified materials (Marwick and boyd, 2011; UNESCO, 2018).

The operational question is who stewards the record after visibility begins. Platforms often distribute fragments faster than institutions can contextualize them. The City must reverse that logic. It should make public information slower where slowness protects accuracy, faster where delay hides public risk, and always contestable where interpretation may harm someone. Amplification can reveal. Stewardship must carry.

1.3.4 — Leadership Programs Lack Civic Consequence

Training separated from visible consequence can improve skill while leaving dependency, staff conduct, household burden, and correction habits largely untouched. An OECD study of senior civil-service leadership identifies values-based leadership, open inclusion, organizational stewardship, and networked collaboration as core capabilities (Gerson, 2020). Candidate academies and civil-service schools can develop such capacities at far lower burden than a City and should be preferred where the actual gap is training or professional standards.

Leadership programs can deepen skill, confidence, networks, and public aspiration. Their structural limit is consequence: short programs rarely show how a person carries disagreement, fatigue, dependency, staff authority, correction, family shielding, public interface, and exit over time.

Formation becomes performative when people learn the language of service while remaining insulated from those who bear public

decisions. The City's additional test is observed conduct under burden, where service language must survive disagreement, correction, staff dependence, and affected-person scrutiny.

Candidate academies may also offer a narrower response. They can provide constitutional literacy, budgeting, evidence use, media discipline, conflict management, public speaking, and ethical decision practice. Their weakness is not that they are schools, but that short programs can be captured by prestige, party pipelines, donor networks, or credential inflation. Transparent selection, diverse faculty, open curricula, independent evaluation, and no entitlement to office can make them a proportionate alternative in many settings.

A program can award certificates without later public consequence. It can teach ethics without seeing how a person handles leverage. It can celebrate service without recording staff burden, bystander impact, family strain, donor pressure, correction, or failure under role conditions. It may improve a participant and still leave citizens guessing when the person later seeks authority. That is not hypocrisy. It is a mismatch between educational form and public-power consequence.

The City's burden is heavier because its formation must be contestable. A participant should not merely complete modules. The participant should encounter opposition, produce public reasoning, revise under critique, disclose role-relevant dependencies, protect nonparticipants, respect staff, handle fatigue, and accept delay or exit when readiness fails. That is the difference between leadership training and public-power

formation. One develops capacity. The other makes capacity answerable.

1.3.5 — The City as Integrated Ecology

An ecology is a system of relations. The Transparent City is an integrated ecology because public-power formation is not one activity. It requires place, record, routine, care, education, disagreement, public interface, staff labor, family shielding, archive integrity, legal boundary, host review, exit, and the possibility of failure. Remove too many of these, and the City becomes something else.

An integrated institution is justified only if the burden truly crosses institutional seams. A classroom may miss staff burden; a platform may miss care; a party may subordinate disclosure to victory; a leadership program may lack public consequence; an archive may lack embodied context. Integration is not automatically better. It is better only where these interactions are central to the problem and cannot be made answerable through coordination among existing institutions.

The City as integrated ecology is therefore a conditional answer to partial formation. Schools, parties, platforms, programs, journalism, public records, ethics systems, civil-service institutions, and deliberative forums may collectively carry enough of the burden in some places. Where consequential gaps persist across them, the City may be tested as one additional institution under law, rights, cost discipline, and stop authority.

Relying on these institutions separately leaves a coordination limit because each is governed by a narrower purpose than the

City. Leadership programs organize selection, inspiration, training, and network formation. Public-power formation may require those functions to meet inside one higher burden structure, but only where coordination among existing institutions cannot do the work with less intrusion.

Campaign disclosure and public financing address money and electoral competition. They do not necessarily reveal how financial dependence shaped judgment before reporting began, but they can materially reduce that risk. Their adequacy depends on timing, enforcement, coverage of third parties and digital spending, and whether ordinary donors remain protected from unnecessary exposure.

Ethics, lobbying, conflict-of-interest, beneficial-ownership, and revolving-door rules address influence around public decision making. They can be highly effective when independent bodies possess investigative power, records are usable, sanctions are credible, and exemptions are narrow. They may make a City unnecessary for roles whose main risk is transactional influence rather than deeper formation.

Professional civil-service formation addresses administrative competence, stewardship, and public-service values. It is often the better institution for officials whose authority arises from expertise and lawful administration rather than electoral leadership. A City should complement, not duplicate, professional schools of government and merit systems (OECD, 2020b).

Investigative journalism and strong public records address concealment through independent inquiry and usable evidence. These routes are less intrusive because they investigate matters of public interest rather than placing a whole participant under continuous institutional record. Their limits include access, resources, source protection, legal environment, record quality, and the fact that investigation often begins only after a concern becomes visible (UNESCO, 2025).

Citizens' assemblies and other representative deliberative processes improve public judgment on bounded questions. Learning, expert input, facilitation, minority views, evaluation, and public reporting can support considered recommendations. These bodies do not form office seekers, but they can reduce the demand for heroic leaders by strengthening the institutions around decision making (OECD, 2020a; OECD, 2025a; International IDEA, 2025).

The City's higher burden structure is not a claim of moral superiority. Staff ecology reveals how power treats the people who make its day possible. Lawful exit prevents the institution from owning the participant.

Integration also protects the public from substitution. Without integration, a candidate can answer questions about donor dependence with credentials, answer questions about staff conduct with charisma, answer questions about knowledge with party loyalty, or answer questions about public reason with platform popularity. The City keeps burdens from being traded across categories as if one excellence cancelled another hidden cost.

A manifesto can name the problem; a built prototype can test how time, place, body, staff, opposition, record, public interface, and exit interact. The comparison with coordinated existing institutions must determine whether a City adds enough value to justify building it. For example, a revised seminar schedule may alter recovery time, staff coverage, and public access together; an integrated pilot makes those interactions available for assessment.

Integration is not total exposure. Study, deliberation, recovery, staff treatment, advice, correction, and exit must be understood together while retaining their boundaries. The craft is relation without possession. A shared decision can be traced across those functions without copying every underlying record into a single file.

A campus can become a prestige ecology when fluency is mistaken for readiness. Critics, hosts, affected people, auditors, journalists, opposing traditions, and lawful institutions must retain standing to contest it. A candidate institution remains open to correction. A published account of what changed after an outside challenge gives that standing practical effect and makes the institution's learning visible.

1.4 — Why Visible Formation Changes the Democratic Timeline

Earlier, contextual evidence can enlarge democratic choice. When knowledge arrives before authority, citizens, journalists, parties, and lawful decision makers can investigate, compare, challenge, and refuse with a fuller object before official consequences are imposed. The City's timing claim is therefore practical: moving answerability upstream can change the moral structure of public trust without replacing the institutions that authorize office (McAllister, 2007; Thompson, 2000; Jamieson, 1996).

Earlier visibility must be built with restraint. A long record can clarify, but it can also chill thought, reward performance, and overwhelm interpretation. The City's record should therefore deepen context without converting formation into destiny. Its purpose is to improve democratic choice, not to close it.

Democracy is not only a method of decision. It is also a timing structure. Citizens are asked to judge candidates at specific moments, often after parties, donors, consultants, schools, media systems, and personal histories have already formed the person who seeks power. The City changes that timing by making formation visible before authority is granted.

Voters remain sovereign over electoral judgment. The City gives voters and institutions deeper context before they decide; it does not replace democratic choice. The public remains free to disagree, refuse, support, investigate, criticize, and decide. What

changes is the evidentiary moment: public-power seekers carry more burden before the public is asked to carry trust.

1.4.1 — Formation Before Election

Timing is a burden issue, but earlier visibility is not automatically fairer. Information that arrives too late can leave citizens with uncertainty and after-the-fact harm. Information demanded too early or too broadly can chill association, narrow experimentation, reward conformity, and turn formation into performance. The City's temporal claim therefore depends on a protected interval in which role-relevant conduct is recorded and reviewable without treating every private thought or relationship as public material.

Formation before election means that public trust is not first requested during the campaign. A person seeking public power has already lived through a visible role-bound process before asking for electoral or institutional authority. This changes the civic sequence. Public evidence begins before public persuasion.

Elections are crucial, but they often ask voters to judge a person at a late point in the person's development. By the time an election begins, the candidate may already have learned how to manage donors, party expectations, consultants, public narrative, media pressure, and private compromise. The public is then asked to judge the result without seeing enough of the formation.

Moving formation earlier shifts part of the risk of late discovery toward the person seeking power. They must show more before asking for authority, but they must also retain rights, protected nonvisibility, and the ability to leave. The public gains context; it

does not acquire ownership of the person. Earlier evidence is legitimate only when the burden is proportionate to the role and narrower alternatives cannot provide enough of it.

For people considering the City pathway, ambition creates a voluntary choice about whether to accept its visible formation process. The prospect may discourage some hidden leverage or opportunism, but it may also select for people comfortable with observation and public performance. The pilot must test both effects. People who choose other lawful routes to office retain equal legitimacy.

Formation before election is valuable because it changes the public's question. Instead of asking only who this person says they are, citizens can ask how this person has carried burden over time. That shift does not guarantee good judgment. It makes better judgment possible.

Moving formation before election does not mean moving authority before election. This is the most important democratic boundary in the chapter. The City may help create a richer object of public judgment, but it cannot decide who deserves office. Voters, parties, appointment systems, courts, legislatures, and lawful institutions retain their roles. The City's timing intervention is evidentiary and formative, not sovereign.

The remedy for poor upstream evidence is not automatic disqualification. It is a public readiness consequence appropriate to the role: delayed release, narrowed pathway, further formation, public reply, correction, independent review, or exit from the City track. The City should never make itself the electoral gate. It

should make formation knowable enough that lawful democratic gates can judge with less forced blindness.

1.4.2 — Public Burden Before Public Authority

Public authority should not arrive before public burden. This is one of the chapter's central claims. A person who seeks power over the lives of others should carry a heavier burden of knowability before that power is granted. The City gives institutional form to that principle.

Public burden before public authority means that the candidate's comfort is not the first concern. The first concern is the burden that future authority may place on others. If a public role can shape housing, health, safety, law, education, environment, labor, war, policing, benefits, taxation, or dignity, then the person seeking that role should not be formed entirely outside public view.

The relevant entry cost is answerability, not money, humiliation, sacrifice, or pain. A person who seeks high-consequence authority may fairly be asked to carry role-specific record, explanation, correction, and review before others live under their decisions. That burden is not payment for trust and cannot purchase office. It creates evidence that voters and lawful institutions remain free to reject.

Public burden before public authority must still be lawful and bounded. The City cannot demand unlimited exposure. It cannot burden families, children, staff, or ordinary citizens in the name of candidate knowability. The burden belongs to the role seeker

and the institution that receives them. It does not spread downward.

Self-selection complicates the temporal claim. People comfortable with observation, public performance, institutional life, or delayed privacy may enter at higher rates, while people with caregiving duties, disability, trauma histories, minority affiliations, financial constraints, or culturally different relations to privacy may stay away. Earlier evidence cannot be called democratically richer if the route systematically narrows who can afford to produce it.

The same principle protects ordinary citizens. They should not be asked to compensate for hidden power by becoming more transparent themselves. Public burden belongs upward, toward the role that seeks authority. Any design that moves it downward has reversed the City's first law of direction.

The governing question is whether the burden of being known is carried before or after power harms others. In ordinary politics, much of that burden is postponed. Citizens must discover dependencies after the candidate is viable, journalists must investigate under crisis, and institutions must respond after public trust has already been requested. The City reverses the sequence for those who voluntarily seek substantial public authority.

This reversal is not punitive. It is proportional. A person asking for power over budgets, police, courts, procurement, war, health systems, infrastructure, migration, education, or emergency authority is asking others to live with consequences they cannot easily escape. The public-power seeker should therefore carry

more of the burden of explanation, record, and correction than ordinary people carry. The burden follows potential consequence, not moral superiority.

A City mechanism that embodies this principle must state when the active burden begins, what it covers, who reviews it, how affected persons can contest it, and what happens when the burden becomes excessive. Burden before authority is not a slogan. It is a sequencing rule. If the City cannot define the sequence cleanly, it risks either underburdening power or overburdening people.

1.4.3 — Longitudinal Evidence Over Campaign Fragments

Longitudinal evidence matters because hidden burden often appears in recurrence. One generous speech can coexist with repeated staff exploitation; one apology can coexist with resistance to correction; one promise to serve ordinary people can coexist with habitual distance from them. Yet recurrence must be interpreted carefully. A long record can magnify surveillance, produce false patterns, and reward those best able to perform consistency under observation.

Longitudinal evidence also protects against overreaction. One failure may be serious, but its meaning depends on pattern, response, context, and remedy. One success may be meaningful, but it does not certify readiness. A record across time allows more humane interpretation than fragment culture. It makes both condemnation and worship harder.

This is one reason the City requires an embodied institutional ecology rather than merely a digital archive. Longitudinal

evidence requires continuity of life, not only stored statements. It requires daily rhythm, staff ecology, study, opposition, public interface, recovery, and record. The institutional form may be campus-based, embedded, distributed, leased, phased, or multi-site; the test is whether these functions remain coherent and reviewable without turning every moment into public release.

Campaign fragments will still exist. They will still influence public life. But the City adds a deeper layer beneath them. Citizens can compare campaign statements with formation records, correction history, and conduct under burden. This weakens the power of the fragment to define the person alone.

Longitudinal evidence is not more truthful merely because it is longer. It is more useful when it is structured around categories that matter: correction, staff treatment, dependency, public reason, learning, care load, opposition, fatigue, and repeated choices under pressure. Without structure, a long record can become a larger swamp.

A fragment can be true and still be unfair as a basis for judgment. One video, one debate line, one staff account, one donation, one apology, one accusation, or one photograph may matter, but fragments invite overinterpretation. Longitudinal evidence changes the question from what happened in this moment to what pattern appears across pressure, correction, role change, and time. That is why a City record must be structured around sequences rather than highlights.

1.4.4 — Readiness Before Persona

Readiness before persona means that evidence of role-specific formation should precede the public story built around a candidate. Persona is easy to produce. Readiness is harder to demonstrate. The City asks that public-power seekers develop a record before they develop a campaign mythology.

Persona without adequate formation evidence places risk on the public. Citizens may later discover that the story was too simple, that staff carried hidden burden, that advisers controlled judgment, that courage was selective, or that correction could not be tolerated. The answer is not to abolish persona, which is inevitable in public life, but to prevent persona from becoming the only coherent account available.

Readiness is not a universal score. It is role-specific, contextual, and contestable. A person may show readiness for one kind of office and not another. They may show promise but require delay. They may show integrity but lack administrative competence. They may show technical skill but lack public explanation. The City's record should make these distinctions visible.

This change helps democracy because it makes persuasion less sovereign. A candidate can still persuade, but citizens can ask whether the persuasion matches the record. Readiness before persona does not guarantee truth. It makes public myth more difficult to sustain without evidence.

Persona prefers simplicity because simplicity travels. Readiness prefers accuracy because accuracy protects people. A fair City should resist turning readiness into a halo and should instead

present public claims with scope, evidence type, uncertainty, limits, and the right of public disagreement.

Readiness is narrower than goodness and more demanding than charisma. A person may be admirable and not ready for a particular office. A person may be eloquent and unable to carry administrative burden. A person may be morally serious and unable to withstand public exposure without harming family, staff, or self. Persona tends to compress these distinctions. The City must expand them.

Role-specific readiness asks what the office or pathway requires: legal literacy, financial judgment, executive discipline, diplomatic restraint, conflict tolerance, administrative humility, media resistance, staff respect, emergency decision capacity, and willingness to be corrected. The record should show not whether the participant is a better human being, but whether the participant has developed specific capacities under visible burden. Readiness is a public claim, not an institutional halo.

Credentialed destiny begins when City completion sounds like readiness for everything and turns a bounded formation record into an elite gate. The right remedy is bounded language: readiness for a stated role, at a stated time, under stated evidence, subject to public judgment and lawful institutional authority. Persona asks the public to trust a figure. Readiness asks the public to examine a pattern.

Citizens properly carry judgment, disagreement, forgiveness, and responsibility. They should not be forced to carry avoidable blindness manufactured by hidden formation. Deeper context can

improve democratic choice while leaving the final decision where it belongs. The record must remain evidence, not verdict; context, not command; and a resource for plural judgment, not a civic score.

1.4.5 — Democratic Choice With Deeper Context

Democratic choice with deeper context is the City's strongest political promise. It does not promise better leaders by magic. It promises that people asked to choose, trust, oppose, report, investigate, or refuse will have more than the late surface of power. Fairness does not decide for the public. It gives the public a less hidden object.

Deeper context does not guarantee better choices. Citizens may still disagree, ignore evidence, distrust the City, prefer other values, or reject a participant's politics. That freedom matters. The City is not designed to force consensus; it is designed to reduce hiddenness before disagreement begins.

The danger of any formation institution is paternalism. If the City acts as if it knows better than the public who should govern, it has become an elite gate. If it offers record, context, correction, and boundaries while preserving voter judgment, it becomes a public object rather than a sovereign filter.

A democratic timeline is not only a schedule of elections. It is a schedule of when knowledge becomes available, when accountability can begin, when correction can occur, and when the public is asked to trust. Hidden formation compresses these moments into the campaign and then into office. The City spreads them out so public burden appears before public authority.

The City's contribution ends at formation evidence within its own scope. *The Constitution of Fairness* owns lawful eligibility, authority, rights, and review; *The Government of Fairness* owns the operation of public office and administration. The City can prepare, document, and explain, but it cannot confer office or command government. Clear return routes let its evidence matter without turning civic formation into a rival sovereignty.

The timeline change also has a humane purpose. A person should not be interpreted only by crisis fragments, and citizens should not be forced to learn only through rupture. Longitudinal formation gives more room for correction before collapse, more context for failure, and more evidence of whether learning actually changed conduct. It can reduce both reckless condemnation and reckless trust.

The strongest democratic objection is that the City could make itself a pre-electoral authority. That objection should be accepted as a design constraint. City records may inform voters, parties, appointment bodies, journalists, and institutions, but they cannot bind them, and non-City candidates cannot be treated as deficient by default. Earlier evidence improves the democratic timeline only when political choice remains genuinely open after the evidence appears.

Deeper context should make democratic choice richer, not narrower. It should not tell citizens what they must value or which candidate they must prefer. Voters may legitimately weigh ideology, party, policy, competence, representation, character, coalition, history, accountability, and local need differently. The City's role is to reduce unnecessary ignorance about formation,

not to replace political disagreement with institutional certification.

A fair public record therefore ends in public freedom. It gives citizens more to consider, but it does not bind their judgment. It gives journalists more to investigate, but it does not make them stenographers for the City. It gives parties more to weigh, but it does not remove their responsibility. Deeper context is democratic only if it leaves judgment alive.

Election integrity frameworks already treat the campaign environment, media conditions, finance, candidate rights, and dispute resolution as connected parts of democratic judgment. The City carries that systems insight upstream only within voluntary formation; it neither replaces elections nor rewrites the lawful regulation of parties. Its contribution is a contestable pre-campaign record whose provenance, corrections, and limits are visible before political compression takes over (OSCE/ODIHR, 2021; OSCE/ODIHR and Venice Commission, 2020).

A fairer timeline has four linked properties: evidence arrives before authority, context travels with evidence, citizens retain interpretive freedom, and the institution remains corrigible. Research on citizen participation similarly emphasizes coordination, accountability, and respect for the public's time and contribution rather than participation as theater. The same discipline should govern how the City asks citizens to use the record it creates (OECD, 2025a). That sequence keeps the City in an evidentiary role while leaving political choice with lawful democratic institutions.

Timing changes the value of disclosure. If material appears only after nomination windows, primary ballots, coalition commitments, appointment shortlists, or other lawful decision points have closed, the public may learn what happened without recovering the choice that was lost. The City should therefore record not only what became public, but whether it became public early enough to alter a real decision; transparency delivered after the last available remedy is often historical explanation rather than democratic agency (OSCE/ODIHR, 2021). A release calendar should therefore be tested against the actual decision windows in which the public can still act.

The City's comparative claim is easiest to test when each formative channel is given credit for what it already contributes and a precise boundary for what remains. Education, parties, finance, media, family networks, and City formation each retain their own functions; the residual City question begins only where those institutions leave a role-bound formation burden that still needs an answer.

This comparison is not a ranking. Less intrusive channels remain preferred. The City is justified only where a role-bound formation question remains; lawful office begins elsewhere. That comparison should be reopened whenever a narrower institution becomes capable of carrying the same burden adequately.

1.5 — City as Power Formation, Not Ordinary Citizenship

The City protects ordinary citizenship by limiting its exceptional burden to chosen public-power formation. Democratic competence and civic-participation frameworks properly address citizens broadly, while the City addresses a narrower role threshold for adults seeking consequential public power. Activists, volunteers, students, journalists, neighbors, donors, and private associations retain ordinary civic privacy and equal standing (Council of Europe, 2018a; Kahne and Bowyer, 2017).

The affected persons are everyone who might otherwise be pulled into the participant's burden by admiration, proximity, criticism, curiosity, or institutional fashion. The remedy is role-bound language, separate record categories, nonparticipant shielding, equal dignity for outside paths, and the refusal to turn City status into eligibility, rank, moral elevation, or public trust score.

A City that begins as a burden on public-power seekers can become dangerous if people start treating it as a model for ordinary citizenship. That drift must be blocked early. The Transparent City is not an ideal lifestyle, a higher civic class, a more serious form of humanity, or a future expectation for everyone. It is a role-bound institution for a narrow category of public-power formation.

Ordinary life remains complete outside the City. A private person does not owe the public a record in order to possess dignity. A citizen does not become lesser because they refuse the City. A parent, worker, neighbor, voter, artist, caregiver, dissenter,

believer, skeptic, or private individual does not need to become visible to become fair. The City burdens chosen public-power roles because those roles impose unusual consequences on others.

1.5.1 — Public-Power Seekers as the Target

The direction of burden makes the narrowing essential. If visibility moves downward, the City becomes surveillance culture. If it moves upward toward voluntary seekers of substantial public power, it may protect ordinary privacy. Even then, the burden must remain role-bound and non-exclusive. Candidates formed elsewhere retain full civic legitimacy, and no lawful institution should treat City participation as an automatic advantage.

The target of the Transparent City is the person who voluntarily seeks formation for substantial public-power roles. This includes roles that may later affect law, budgets, administration, public office, public trust, public explanation, crisis response, staff direction, or institutional decision. The target is role-specific. It is not humanity in general.

The target must remain narrow because the City's tools are severe. Full active-period record, public interface, archive, and readiness release cannot be generalized without becoming oppressive. What may be justified for a voluntary adult role seeker would be unjust if applied to ordinary life. Narrowness is not weakness. It is the condition of legitimacy.

Public-power seekers are not morally inferior because they are burdened. Nor are they morally superior because they accept the burden. They are people entering a role that carries public

consequence. The burden follows the role, not the essence of the person.

Public-power seeker is therefore a functional category, not a personality type. It should depend on the authority sought, the consequence of the office, the jurisdictional route, and the voluntary acceptance of role burden. Ambition alone is not enough. Influence alone may not be enough. The City must define its target through public consequence rather than through fascination with talented people.

Plural pathways are essential. A union organizer, mayor, teacher, entrepreneur, judge, scientist, community advocate, civil servant, military officer, caregiver, journalist, or independent candidate may arrive at public service through different legitimate formations. These histories cannot be flattened into one preferred civic biography. The City offers a route with a defined burden; it does not define the only route by which public competence can be formed.

This category also protects against institutional expansion. A City that begins by forming high-consequence public-power seekers must not drift into forming celebrities, activists, philanthropists, academics, spiritual leaders, or ordinary professionals unless a separate lawful framework and domain ownership justify it. The first burden is to stay narrow.

The target of the City is not the ambitious person as such. Ambition may serve vanity, but it may also serve courage, responsibility, vocation, outrage at injustice, or love of a community. The target is chosen substantial public power,

meaning roles whose decisions can impose burdens on people who did not choose the decision maker. The stronger the public consequence, the stronger the case for role-bound formation burden before trust is requested.

The review route should therefore begin with role definition. What power is being sought? Over whom? Through what lawful path? What burdens would the role impose? What evidence of formation is relevant? Which private domains remain outside scope? When does the active record begin and end? Those questions keep the City from swallowing civic life. Public-power seekers are the target because public power is the source of the burden.

1.5.2 — Ordinary Citizens Remain Private

Ordinary citizens remain private because ordinary life is not a public application. A person does not owe exposure in order to vote, complain, receive services, speak, refuse, worship, parent, work, rest, dissent, or live quietly. Privacy is not a weakness to be overcome by civic seriousness. It is part of ordinary dignity.

The City's existence may create cultural pressure unless this boundary remains publicly legible. People may begin to think that visible life is nobler, that hidden life is suspicious, or that serious citizens should want a record. That would be a profound misuse of the City. Privacy is not a lower stage of development.

Ordinary privacy is not a concession the City grants to people outside itself. It is one of the reasons the City exists. A society that cannot distinguish public-power burden from ordinary human life will eventually ask the vulnerable to expose

themselves in the name of fairness. The City must make the opposite movement: concentrate visible burden where high-consequence authority is being formed so private life elsewhere does not become the default evidence of civic worth.

This principle protects nonparticipants, voters, critics, host residents, visitors, relatives, staff families, romantic partners, children, professionals, and ordinary activists. They do not become record subjects because they interact with a participant. Incidental contact must be governed by minimization, shielding, category review, consent where appropriate, complaint, redaction, delay, and remedy. Proximity is not inheritance of burden.

Cultural imitation is the risk: even a legally role-bound City can teach schools, employers, movements, parties, donors, and online audiences to treat visibility as seriousness and pressure ordinary people to prove themselves through exposure. The City must resist that drift in its own language. It should repeat not as boilerplate but as a lived premise: ordinary citizens remain private, and their privacy is not less fair.

1.5.3 — Formation Is Not Government

If formation became government, the City could become a shadow state, credential gate, private sovereign, or second capital. Citizens would then carry an institution that claims public legitimacy without the lawful routes, duties, and remedies of government. The City must therefore remain a formation institution whose records can inform public judgment but cannot

confer office, issue commands, or displace constitutional authority.

This refusal protects both the City and government. Government remains responsible for law, administration, public services, coercive authority, elections, courts, and jurisdiction-specific duties. The City remains responsible for public-power formation under the Vow. When those roles are separated, interface is possible. When they collapse, public trust fails.

The City's archive must also respect this distinction. A record may inform voters or lawful institutions, but it does not command them. A readiness bundle may offer evidence, but it is not an appointment. A public interface may collect questions, but it is not government procedure by itself. Formation evidence remains evidence.

The City forms; it does not rule. That sentence must remain hard. If the City begins issuing public authority from within its own record, it has crossed into the domains of law and government. The fact that a person has lived under visible burden does not make the City a legislature, court, executive, agency, or election administrator.

A formation institution must therefore know the difference between evidence and authority. A participant may produce drafts, explanations, policy analyses, and public reasoning. Those materials may help voters or lawful institutions evaluate judgment. They do not enact policy. Even when an officeholder works from inside a City environment, the lawful office, public

duties, legal records, and government authority remain governed by the constitutional and administrative order outside the City.

Boundary drift is prevented through office-interface humility from the beginning. City record must remain distinct from government record, participant role record from official act, public explanation from legal command, and readiness evidence from electoral mandate. Formation can change the meaning of power only if it refuses to impersonate power before law grants it.

An office-interface boundary should therefore be written as a five-question handoff before any City record, staff support, or facility crosses into official work. Which institution possesses lawful authority? Which record regime controls? Who supervises personnel and public money? Which secrecy, disclosure, and professional-duty rules apply? Where do complaint, review, and remedy lie? If any answer is simply “the City because the City prepared the officeholder,” the interface has failed. Formation may accompany an officeholder only through a documented transfer that preserves the independence of elections, Government, and constitutional review (Mashaw, 2006; Barak, 2012; Weber, 1978).

1.5.4 — Participation Is Not Moral Elevation

Participation is evidence of willingness to carry a defined public-power formation burden under specific conditions. It is not evidence of virtue by itself. A participant may carry the burden well or badly. They may be ready or not ready. They may grow

or manipulate. They may serve or perform. The record must be interpreted, not worshiped.

A complete institution must also protect participants from the burden of moral elevation. Being treated as an example can become another form of captivity. Participants may feel pressure to symbolize courage, humility, transparency, or future civilization. That symbolic pressure can distort behavior and damage the person.

Participation can be mixed in motive. Some will seek service. Some will seek prestige. Some will seek repair. Some will seek power with partial self-knowledge. The City's task is not to declare pure motive. It is to create conditions where mixed motive becomes more answerable before public consequence arrives.

The City's severity may tempt participants and admirers to treat entry as a moral badge. That temptation must be broken early. Accepting a heavy role burden may be admirable in some cases, but it does not make the participant more human, more truthful, more trustworthy, more sacred, more deserving, or more fit than someone outside the City. It is a specialized burden for a specialized role, not a ladder of worth.

Moral elevation would create several hidden burdens. It would pressure ambitious people to enter for prestige rather than public reason. It would make refusal look cowardly. It would let City graduates convert institutional endurance into social authority. It would encourage donors, media, parties, and voters to treat the City as a purification machine. It would also wound ordinary

citizens by implying that private life is a lower form of civic seriousness.

The remedy is status discipline. City labels should describe stage, role, record, readiness claim, pause, exit, correction, or decertification. They should not describe virtue. Public bundles should explain evidence, not rank persons. Institutional language should honor participants without praising them into caste. The City is morally serious only when it refuses to make its own participants morally superior.

1.5.5 — City Life Is Role Burden

Role burden means the City's practices are justified by public consequence. Full active-period record, structured daily rhythm, public interface, staff influence logs, readiness bundles, and archive governance make sense only because the participant seeks public-power formation. Remove the role, and the burden loses its justification.

Role burden also protects against resentment. Participants should not imagine that ordinary people live less seriously because they remain private. Ordinary citizens carry different burdens. The participant's burden is not the burden of humanity. It is the burden of seeking a public role that may affect others.

Role burden distinguishes every adjacent person. Participants accept an active civic burden; staff carry professional duties under separate labor and privacy rules; families and visitors remain third parties whose rights do not transfer; officeholders remain governed by law. This map keeps proximity, employment, relationship, and later public authority from collapsing into one

status, and it gives every later chapter a stable boundary for design.

The principle that City life is role burden gives the institution its moral shape. It explains why the burden can be severe and why it must remain narrow. The City becomes fair only if it keeps asking whether each burden belongs to the role and whether anyone outside the role is being made to carry it.

This distinction should guide every later image of the City. A dining room, library, garden, archive, deliberative hall, clinic, residence, public interface, or office suite should not be photographed or described as the better way to live. It should be described as the environment needed to carry a severe public-power burden humanely.

Role burden also means the City owes care to the people it burdens. The institution cannot say that because participation is voluntary, every harm is self-chosen. Voluntary burden still requires rights, exit, complaint, support, staffing, audit, protected nonvisibility, and honest failure memory.

Public power can shape millions of lives. Adults who voluntarily prepare for such roles may reasonably accept a proportionate burden of explanation, record, and correction that ordinary citizens should not be asked to carry. The ethical strength of the City is not that it makes life visible. It is that it refuses to make ordinary life visible while making public-power formation harder to hide.

Seeing the City as role burden clarifies what each support system accomplishes. Housing reduces leverage and gives participants a

stable place to recover. Health care protects the body under visible civic strain. Archive systems make formation contestable. Staff support reveals and sustains the labor that carries the institution. Public interfaces let citizens examine power before trust is granted. Each provision earns its place by making the burden more humane, answerable, and bounded.

Romance weakens the boundary when readers, participants, donors, or designers imagine the City as a superior community for enlightened people and the ordinary-privacy firewall begins to look like a concession. The City's beauty should be functional beauty, born from care, clarity, restraint, and answerability. Its life should be livable because burden must remain humane, not because the City is a better way to be alive. Design review should therefore ask whether each attractive feature serves a role need or merely manufactures institutional prestige. Procurement and design reviews can document the role purpose served by each amenity, making prestige drift easier to detect before it becomes culture. Functional beauty should also be judged by the labor required to sustain it. If an amenity makes the City appear humane while shifting disproportionate maintenance, security, or service burden onto others, the design has contradicted the role-burden principle it was meant to serve.

Exit should end the active burden in practice as well as in theory. Former participants may retain role-relevant public records where lawful and necessary, but ordinary life must become ordinary again. Reintegration support, correction routes, protected private spaces, and a clear end to institutional claims over the person are essential evidence that the Vow was a role condition rather than a

permanent identity. Post-exit audits should test whether monitoring, access expectations, and informal institutional claims actually contract as promised. A scheduled sunset review can verify that temporary permissions and support arrangements close on time rather than becoming quiet extensions of the Vow. A role-bound institution proves its own narrowness by relinquishing authority when the role ends rather than allowing institutional familiarity to become a continuing claim over the person.

The no-advantage rule requires an annual independent audit. Participation must not create privileged ballot access, preferred appointment status, service priority, donor access, institutional immunity, or presumed credibility. The audit should examine informal credentialing, record migration, post-exit monitoring, and public claims that imply a superior civic class. Comparisons with similarly situated non-City candidates should distinguish judgments based on disclosed evidence from shortcuts based on membership. When status itself produces preferential treatment, the responsible institution must correct the practice and publish the remedy.

1.6 — The Governing Question: Where Does the Burden Go?

Transparency and participation can move burden rather than reduce it when they are unusable, uncorrectable, inaccessible, or imposed on the wrong people. The chapter therefore turns the analysis back onto the City and asks what its own record, participation, and review demands cost participants, staff, families, host communities, and the public (Heald, 2006; Fung et al., 2007; Fox, 2007; Tyler, 2006).

The review route is comparative and reversible. If a less burdensome reform can solve the problem, prefer it. If the City creates greater burden than it reduces, narrow it, delay it, redesign it, or stop it. If safeguards cannot travel, do not replicate. The City begins in answerability because every later chapter will inherit that standard.

The chapter's final question is where the burden goes, including the burden created by the proposed remedy. Calling the City transparent, democratic, civic, humane, or ambitious is not enough, because those descriptions can conceal surveillance, cost, institutional prestige, unequal access, self-selection, staff exhaustion, political dependency, and a narrowing of legitimate routes to power. Burden may fall on public-power seekers, staff, families, children, host communities, citizens, critics, records, technical systems, future Cities, and future readers. Some burdens are justified, some are not, some must move upward toward power, some must be shielded from those who did not consent, and some must stop the project. Every mechanism must disclose

who carries what and who has authority to refuse, repair, narrow, or end it.

Burden tracing is the method that carries through the institution. The Vow, campus, rights, records, entry, daily life, education, office interface, governance, cost, replication, objections, and final synthesis all return to the same test: who carries the consequence, who can contest it, and what remedy follows? If burden is hidden, misplaced, or denied, the design is not yet fair.

1.6.1 — Burden on Power

A comparative proportionality test keeps the burden inquiry from becoming a slogan. First, the City must pursue a legitimate and sufficiently serious aim: reducing hidden formation burden associated with substantial public power. General distrust of politics is not enough; the problem must be specified by role, jurisdiction, and evidence. Second, the design must be suitable. Its mechanisms must plausibly address identified routes of influence, dependency, conduct, and correction. A campus, archive, Vow, or record is not suitable merely because it is visible; the proposal must explain how each mechanism changes the causal path that creates public burden.

Burden on power does not mean punishment. It means public consequence requires public answerability. The person seeking power accepts a role-bound burden: record, correction, public interface, staff influence visibility, opposition, readiness limits, and the possibility of not yet. These are not humiliations. They are costs attached to the request for authority.

Proportionality begins with role consequence. A local technical office, national executive, legislature, court, regulator, diplomatic role, or emergency authority may require different preparation, and many roles may be adequately served by existing professional and democratic institutions. A uniform City burden would be both analytically lazy and ethically dangerous. The institution has a case only where its added burden fits the specific public risk.

Burden on power also means no victory exception. If the participant later receives public office, the need for answerability deepens rather than ends. The City's later office interface and record continuity are built from this principle. Authority increases consequence, so it should not reduce memory.

Burden on power should be described in operational terms. It includes record, explanation, study, opposition, correction, staff accountability, donor visibility, role-specific preparation, public interface, and willingness to be known in ways ordinary citizens should not be known. It does not include humiliation, spectacle, compelled ideology, forced religion, or suffering as admission price.

Earlier burden does not eliminate uncertainty; it changes who must do the preparatory work. Instead of citizens reconstructing a path after scandal or office, the participant and institution must create a contestable record before trust is requested. Public authority should not receive confidence at the cheapest point in its own formation.

The primary burden must remain on power because power is the role that exports consequence. A participant seeking authority

asks strangers to live with decisions about money, safety, law, care, infrastructure, rights, war, climate, schools, borders, punishment, and institutional memory. The City's first fairness move is therefore vertical: more explanation, record, correction, and review should travel upward toward the person who seeks to shape those burdens.

Role burden never makes the participant public property. Health, dignity, counsel, protected nonvisibility, family boundaries, exit, appeal, and legal limits remain active. The participant is not a sacrifice offered to transparency but an adult volunteer for a public-power formation role whose severity must be justified by the role's potential consequence. Burden on power is proportional, not total.

The remedy when burden on power becomes excessive is not denial. It is redesign. A City must be able to narrow record scope, improve support, delay activation, allow pause, protect health, revise release rules, separate roles, or stop a pathway when public value no longer justifies human cost. If the City cannot correct its own burden on participants, it becomes another institution exporting cost downward while speaking of fairness upward.

1.6.2 — Burden on Staff

Staff burden includes physical labor, emotional labor, technical labor, interpretive labor, care labor, exposure to conflict, moderation strain, and the pressure of working in an institution with public symbolic weight. The City must count these burdens before calling itself humane. A participant's visible formation should not rest on exhausted workers.

Staff dignity protects the City from hypocrisy. An institution built to reveal public-power burden cannot treat its own workers as background. Their labor is part of the moral architecture. Their complaints are early warnings. Their exhaustion is evidence about the system.

Burden on staff must be counted in every later chapter. Architecture, daily routine, archive governance, public interface, Artificial Intelligence systems, cost, pilot evaluation, and replication all depend on staff. If staff burden is hidden, the City has not solved the problem. It has relocated it.

Staff burden appears early because staff often see public power before the public does. They see entitlement, fatigue, generosity, contempt, learning, avoidance, dependence, manipulation, apology, and correction in ordinary operating life. If staff have no protected way to record or contest what they see, the institution turns them into hidden witnesses.

The City's answer to hidden leader formation must also reveal and protect staff labor. Educators, mentors, cleaners, clinicians, archivists, cooks, security workers, technicians, reception staff, moderators, and administrators carry the daily institution. Their workload, authority, privacy, complaint routes, and influence on formation belong inside the design. A public record that exposes participants while leaving workers invisible would repeat the burden shift the City claims to repair.

The staff charter begins before any public record is released. Educators teach without ideological control; clinicians retain independent care; security workers use the least restrictive lawful

means; archivists preserve provenance instead of reputation; moderators receive protection from public hostility; maintenance workers receive visible credit, fair conditions, and routes to report failure. The City's formation record must show how the institution treats the people who make formation possible, because hidden labor is part of the public burden it claims to reveal.

Staff are not the only people who can inherit a participant's chosen burden. The same transfer can reach the household through schedules, security, care, exposure, and dependence. The next subsection therefore tests whether role burden can be kept from crossing into family life, especially where children and dependents cannot choose it.

1.6.3 — Burden on Families and Children

Family burden is therefore one of the City's highest design risks. Public-power formation can change schedules, finances, public attention, security, household privacy, emotional load, and future relationships. Counting those effects early makes family consultation, protected records, support, and exit part of the design. Ignoring them would push civic burden into private life.

Collateral persons require more than a general promise of privacy. The institution must distinguish consent, notice, shielding, complaint, correction, and remedy, and it must recognize that a participant cannot waive another person's rights. Family life remains private, but the City must account for the schedules, attention, security, financial, and emotional burdens it creates. Children receive the strongest boundary because they cannot be made evidence of an adult's public seriousness.

Children require absolute protection. No child should become evidence of the City, proof of the future, a participant by proximity, a public image, a readiness signal, or emotional legitimacy for an adult's public role. Family scenes may reveal relevant conduct, but they contain independent rights, histories, and vulnerabilities; public appetite for the household is not public interest. The City's claim collapses if children or family intimacy become symbolic material.

Burden on families and children is a test of the City's restraint. The City is strongest when it refuses to take what it does not need. It may need to count household effects. It does not need to consume the household. It may need to protect public power from hidden leverage. It does not need to make children public.

Chosen public-power burden does not inherit downward into family life. Children, dependents, partners, and other household members retain ordinary privacy, independent rights, and refusal even when a participant accepts severe visibility. Every related design decision must begin from that noninheritance rule rather than treating family protection as an exception.

A partner may consent to some shared arrangements, but that consent cannot erase dignity, privacy, professional counsel, health needs, or later refusal. A dependent may be affected by City life without becoming a public actor.

The remedy for family burden includes before activation consultation, dependent impact review, child shielding, legal and clinical advice, housing alternatives, refusal without retaliation, complaint rights, emergency exits, and post-exit privacy

protection. If the City cannot protect the people closest to participants, it has no standing to claim it protects the public. Fairness begins by refusing to pass a chosen burden through household love.

1.6.4 — Burden on Host Communities

Host-community burden also includes symbolic burden. A town, region, or jurisdiction may become associated with the City in ways residents did not request. Supporters may celebrate the place. Critics may target it. Local politics may be altered. The City must not treat these effects as externalities outside its moral concern.

Host legitimacy does not require unanimous support. Serious public institutions often generate disagreement. But disagreement must have routes. Host complaint, review, reporting, mitigation, benefit sharing, and recourse should be part of the City's structure. Local criticism can reveal burdens the project has missed.

Burden on host communities becomes especially important when replication begins. A City that hides local burden in one place may reproduce that harm elsewhere. The host community is therefore not just a neighbor. It is a moral witness to whether the City can stand in the world without making others pay for its meaning.

Local legitimacy should precede architectural desire. Host review, compensation, labor dignity, environmental burden, emergency coordination, exit planning, and public explanation belong to buildability, but the moral premise begins earlier. A fair

City makes public-power formation visible while keeping local cost visible too.

Host communities also possess a refusal interest. National enthusiasm, donor capital, or political prestige cannot substitute for lawful local process and material review. A host should be able to challenge cost estimates, land use, security arrangements, infrastructure claims, and public-benefit narratives. The City is not proportionate if its public mission depends on local acquiescence that would not be accepted from participants.

A City is never built on abstract land. It occupies water, roads, utilities, labor markets, housing pressure, emergency services, schools, clinics, ecosystems, cultural memory, neighbors, and jurisdictional trust. Host communities should not become the uncredited infrastructure of a public-power experiment. A City that names hidden burden must count the burden of its own arrival.

Host burden includes traffic, security pressure, media attention, property effects, displacement risk, environmental load, policing relationships, labor competition, symbolic conflict, and the possibility that local people become unwilling scenery for a global project. Some burdens may be offset by jobs, infrastructure, public amenities, education, and civic benefit. But offset is not consent, and benefit is not silence. Host legitimacy requires standing, review, remedy, and the power to object before expansion hardens.

1.6.5 — Burden on Public Confusion

Ambiguity can serve supporters, critics, media, donors, and institutions in different ways. Vague inspiration attracts hope; caricature attracts attention; prestige ambiguity attracts money; flexible language postpones accountability. Ordinary citizens carry the cost when they cannot tell whether the City is a school, campaign gate, surveillance institution, private government, public archive, or civic rank. Clarity is therefore a distributive safeguard, not a branding preference.

Confusion also burdens participants and staff. If the public does not understand the Vow, participants may be treated as moral superiors, prisoners, reality-show subjects, or public property. Staff may be harassed or misunderstood. Families may be exposed to suspicion. Public clarity protects actual people.

Public confusion carries its own civic cost, which is why the City's language must be exact. Inspiration is not enough. Every definition should survive hostile reading, simplified summary, public-artifact travel, and skeptical interpretation. Clarity is part of fairness because ambiguous hope can become institutional harm.

Public artifacts carry the heaviest compression risk. A campus rendering can resemble a compound, a record-site mockup can resemble a dossier, and a readiness label can resemble civic rank. Every public object must therefore show where burden goes, what status it has, and who remains protected.

If citizens misunderstand the City as surveillance for all, proof of the Law, a moral ranking system, a new government, a

requirement to adopt the optional spiritual path explored in The Religion of Fairness, a campaign shortcut, or a prestige gate, then the institution's public meaning has shifted burden onto the public. People will fear, imitate, attack, worship, or use the City in ways the design did not authorize.

Disciplined public language is the remedy, not public-relations gloss. Each public surface should state status, scope, boundary, nonparticipant protection, record-stage separation, no-proof meaning, and correction route where the local risk requires it. Foreseeable confusion can be designed against even though it cannot be eliminated. Fine print that appears only after a dangerous image or slogan has already travelled simply hides burden in presentation.

1.6.6 — Burden on Future Replication

Every design choice carries future replication burden. If the first City creates a confusing standard, later Cities may copy the confusion. If the first City hides staff burden, later Cities may normalize hidden labor. If the first City overuses technology, later Cities may become more automated and less humane. If the first City lets donors shape prestige, later Cities may become civic trophies.

Replication burden also includes failure memory. If the first City fails in a way that is hidden, future Cities may repeat the same harm. If it names failure honestly, future builders inherit wisdom instead of myth. The City must preserve not only its successes, but also its corrections, pauses, redesigns, and shutdown conditions.

Accreditation and decertification exist because future copies can become dangerous. A bad copy may expose ordinary people, weaken child protection, overuse Artificial Intelligence, neglect staff, sell archive access, or turn public records into spectacle. The first City must establish standards strong enough that later misuse can be named and stopped.

Future builders inherit more than a design: they inherit its standards, omissions, habits, and explanation of failure. The first City should therefore make safeguards portable, correction memory durable, and burden routes visible before replication begins. A practice earns the right to travel only when later sites can reproduce its protections and recognize the conditions that require pause, redesign, or closure. Describing the prototype as destiny, shrine, or proof would instead pressure later builders to copy symbols and hide failure.

Replication discipline begins with the first design. A future network should not copy aesthetics before copying rights, staff protection, record lifecycle, protected nonvisibility, host review, cyber resilience, complaint routes, failure thresholds, decertification, and exit dignity. The transferable object is the burden discipline, not the image.

The burden question is a discipline against enthusiasm. It slows the reader before admiration and before rejection. A design may look transparent and still shift burden to staff. A rule may look protective and still hide power. A record may look complete and still injure a child, family member, professional helper, or bystander. A beautiful campus may hide cost in land, labor, local patience, and future maintenance.

The question must therefore be asked at several scales at once. It asks about the participant, but also about staff, families, host communities, public interpretation, records, technology, law, material cost, and future replication. The City is not fair because burden is named once. It is fair only if burden remains traceable as the institution becomes more complex.

The chapter's burden map also prepares the reader for later safeguards. Staff rights will matter because staff carry hidden labor. Family shielding will matter because private people can be collateralized. Host review will matter because the City has a local body. Record lifecycle will matter because memory can become harm. Governance will matter because the City itself will seek to evade embarrassment. Buildability will matter because an idea that hides its cost is already unfair.

The final threshold can be stated without a score. The City merits consideration only when the hidden formation problem is substantial, the public aim is lawful and precise, less intrusive alternatives remain inadequate after serious comparison, and the proposed mechanisms fit the problem. Ordinary privacy and plural candidacy must remain protected; staff, family, host, and financial burdens must be bearable; evidence must remain contextual rather than dispositive; and pause, correction, and shutdown must be real. The aim is earlier answerability before authority, not perfect observation or institutional prestige. Failure on any noncompensatory condition is a reason to narrow the proposal or choose another reform (Barak, 2012; Wertheimer, 1987). That discipline gives later chapters a stable test: every

added mechanism must show what burden it reduces and what new burden it creates.

Portability is evaluated as a complete protection package. Local law and institutional capacity must be able to safeguard children, staff, nonparticipants, host communities, record stages, exit, protest, and authority boundaries before the City name travels. Replication multiplies both promise and exposure, so scale raises the required proof of protection. Where the package cannot travel intact, the responsible result is delay, redesign, or refusal. Portability therefore requires evidence that protections survive ordinary staffing changes, funding pressure, and local translation, not merely a faithful copy of the first site's language.

Failure memory must travel with the institution through defect logs, withdrawn artifacts, version histories, stop reasons, decertification records, and independent inspection. A network becomes safer only when later sites can see precisely what the first site got wrong and are allowed to refuse the model. A refusal to replicate can itself be evidence that the network learned from failure rather than converting expansion into an obligation.

Chapter 2 — The Transparent Vow and Bounded Active Record

A public-power record becomes worthy of trust only when its burden and limits are defined together. In the City, an adult who voluntarily enters the active formation role accepts a severe, role-bound record designed to make public-power development answerable. The same charter separates capture from access and release, protects nonparticipants and sensitive domains, preserves correction and appeal, and makes exit more honest than secret exception. This book uses complete active-role record as the plain-language description of that bounded obligation; “Total Record” is retained only as a defined shorthand for completeness within the active role. Neither term means whole-person surveillance or public ownership of private life.

The inquiry follows where burden has been hidden, shifted, consented to, repaired, or made reviewable. In ordinary political life, the burden of discovering formative dependency often falls late on voters, journalists, whistleblowers, courts, staff, rivals, and harmed communities. The Transparent Vow reverses that direction for a narrow class of adults who voluntarily enter a public-power formation role. It says that a person who asks to be prepared for power may not keep an authorized active formation channel hidden from the public system that will later be asked to trust them.

That reversal is not a license to expose everything. The City’s severity is lawful only if its scope is exact. It belongs to an active public-power role, not to the whole person, not to a soul, not to every bodily fact, not to family members, not to children, not to staff, not to visitors, not to ordinary citizens, and not to future life after exit. The sentence has to carry that boundary because the

language of totality will otherwise be misread by both admirers and enemies.

The Transparent Vow is therefore not sacred membership, religious belonging, party initiation, personal devotion, or moral elevation. It is a civic threshold. It can be legitimate only if the person entering understands the burden, has capacity to consent, has access to counsel and support, can refuse without disgrace, can contest implementation, and can leave by a lawful route rather than being forced to invent a secret exception.

No single camera, public feed, or permanent file can define the Total Record Rule. The candidate rule is narrower: the active public-power formation period may not contain authorized off-record channels for consequential role formation. Record integrity is one question; public release, research use, Artificial Intelligence training, machine summary, retention, deletion, sealing, and later interpretation are separate decisions with separate gates.

A fair City separates record stages as carefully as a court separates evidence from verdict. Capture creates or preserves the record; custody protects it; access permits inspection for a defined purpose; release makes it available beyond the holder; and interpretation assigns meaning that may be wrong. Research, model training, retention, and deletion require their own authority because none follows automatically from an earlier stage.

The chapter also refuses the old blanket-protection mistake. Protected nonvisibility does not mean an active participant can keep a hidden formation life. It means that dignity, health,

counsel, family, children, bodily modesty, safety, whistleblowing, and other protected categories require different handling from public role evidence. A clinical visit may justify a minimal protected status entry about a necessary role consequence, such as an adjusted workload; its clinical content does not become City evidence by default. Any separate consequential political business remains subject to the active-role rules.

This distinction is where the City either becomes humane or fails. A system with no protected nonvisibility would produce humiliation, trauma, coercion, and spectacle. A system that calls every hard case protected would reproduce the private channels the City was built to make answerable. The chapter therefore treats protection and review as paired duties, not as competing slogans.

The affected persons are broader than the participant. A partner, child, dependent, lawyer, doctor, spiritual advisor, journalist, protester, staff member, security worker, host resident, visitor, or accidental bystander may appear near the active role without ever accepting its burden. The City's record regime must keep proximity from becoming inheritance. No one should be made transparent because they love, advise, treat, oppose, serve, or happen to encounter a participant.

Record continuity is also a fairness issue. A break in capture can protect a human emergency, reveal technical weakness, or hide misconduct. The City cannot treat every gap as scandal, but it also cannot treat gaps as private repairs. It needs labels, logs, classification, appeal, correction, public notice where

appropriate, and a route for distinguishing accident from evasion without letting rumor govern the missing time.

Exit is the final test of the Vow's integrity. If the only way to survive the institution is to create a secret exception, the institution has already failed. Lawful pause, de-loading, withdrawal review, and post-exit privacy are not loopholes. They are the safety valves that keep severe role burden from becoming captivity or shame.

The governing grammar is narrower than final implementation. Legal wording, capture architecture, release cadence, retention, research use, model training, and protected-category handling require separate legal, technical, clinical, archival, privacy, disability, family-rights, and public-administration review. What can be fixed here is the relationship among role-bound record, stage-specific authority, protected nonvisibility, correction, and exit. Implementation should therefore preserve a visible record of which authority owns each stage, so later reviewers can distinguish design choice from lawful constraint.

The grammar is simple enough to remember and difficult enough to build. While active, a participant's public-power formation role carries a full record burden that is role-bound, stage-bound, purpose-bound, reviewable, correctable, and exitable. Protected nonvisibility handles dignity without authorizing hidden active power. No record becomes proof of worth or truth, evidence of the Law, research consent, Artificial Intelligence training permission, public entertainment, or office entitlement. A usable charter should let participants, staff, and reviewers identify the boundary without reconstructing it from scattered exceptions.

The City's promise is severe because public power is severe. It is limited because human dignity is not a price to be paid for trust. The chapter asks whether a community can design a threshold where a future wielder of power carries more knowability before ordinary people are asked to carry more risk. That question belongs at the front of the book because every later chapter depends on it. If that threshold cannot be explained plainly before entry, the institution has not made its burden understandable enough to request consent.

2.1 — The Transparent Vow as Civic Burden

The Transparent Vow is the City's threshold, not its decoration. It turns an abstract preference for answerable power into a role commitment that can be explained, reviewed, and refused. A person does not drift into the Vow by enthusiasm, donor invitation, public attention, family expectation, or institutional admiration. The entry point must be visible because the burden that follows is too serious to rest on atmosphere (Beauchamp and Childress, 2019; O'Neill, 2002a; Faden and Beauchamp, 1986).

The Vow should be understood as a civic act. It concerns a chosen public-power formation role and the public consequences that may follow from that role. It does not consecrate a person, cleanse a biography, rank motives, or make the participant more worthy than citizens who never enter. The City's first act of fairness is to keep the person and the role distinct.

A role commitment creates duties for the participant and duties for the institution. The participant agrees that active public-power formation will not proceed through authorized hidden channels. The institution agrees that the burden will be explained, bounded, supported, and contestable. If either side fails, the Vow loses legitimacy as a civic instrument.

At the threshold, the fairness question becomes concrete. The Vow moves a portion of the burden of public trust upstream, but it also creates new burdens: comprehension burden, record burden, staff burden, family burden, and exit burden. A fair Vow must count those costs at the doorway rather than discovering them after the participant is already inside.

2.1.1 — Adult Role Commitment

The Transparent Vow begins with adulthood because the burden is not appropriate for children or dependent youth. An active public-power formation role requires legal capacity, developmental maturity, practical understanding, and the ability to refuse social pressure. A minor may be affected by a participant's choice, but a minor cannot inherit the participant's Vow. The City's first line of protection is that the threshold belongs only to adults who can be held to a civic decision without being treated as property of an institution.

Adult status alone is not enough. The commitment must be tied to a role that seeks substantial public authority, not to curiosity, fame, general civic interest, spiritual longing, or ordinary community service. The record burden is justified only because the participant is asking to be formed for a role that may later move law, budgets, security, diplomacy, administration, or public trust. Without that role connection, the same practice would become exposure for exposure's sake.

Active burden should begin only after a declared public-power pathway exists. The declaration need not promise a particular candidacy because readiness may change and jurisdictions differ. It should identify the kind of authority sought, the likely public consequences, and the reason ordinary preparation is insufficient. That declaration anchors the record to a public role rather than to personal identity, and it gives informed consent a defined object (Faden and Beauchamp, 1986; Beauchamp and Childress, 2019).

The adult role commitment should be witnessed by independent offices rather than by the same educators, donors, recruiters, or charismatic leaders who benefit from admission. A serious threshold needs counsel, capacity review, disability accommodations, language access, cooling-off time, family and dependent consultation where appropriate, and a record of questions asked before acceptance. The Vow is not voluntary merely because a person signs it. It is voluntary when refusal and understanding are real.

The institutional test is whether a serious critic could reconstruct why this adult, this role, and this moment justified activation. If the answer is only ambition, charisma, talent, or public enthusiasm, the threshold has failed. The record should show role pathway, burden explanation, capacity review, support design, refusal route, and a start condition that the applicant could understand before the institution gained authority over the active record.

2.1.2 — Civic, Not Spiritual, Status

The Transparent Vow is civic. It does not require participation in the Religion of Fairness, religious belief, reverence for the Law of Fairness, loyalty to a founder, or acceptance of any spiritual interpretation of human experience. A participant may have religious reasons, secular reasons, mixed reasons, or no religious reasons for entering. The institution may not turn those reasons into a membership test.

This boundary matters because severe visibility can become sacred theater if the institution is careless. People may be tempted

to treat the Vow as confession, purification, initiation, sacrifice, or proof of a higher life. Those readings are not harmless metaphors inside a public-power formation system. They can make exit feel like betrayal, criticism feel like blasphemy, and ordinary privacy look morally inferior.

The City's civic language should therefore remain plain. A participant accepts a public-power burden because the public consequences of power justify earlier answerability. That is enough. The Vow does not cleanse motives, redeem harm, reveal the soul, or make the participant spiritually safer than a private citizen. It creates a recordable role condition under law and institutional review.

The record itself must carry the same boundary. Public bundles, status labels, archive descriptions, and ceremonies of entry should not use language of purity, election, holiness, spiritual rank, chosen persons, or sacred transparency. Even beautiful language can become coercive when attached to visibility. The City should honor courage without turning courage into sanctity.

A failure here would be easy to quote and hard to repair. If the public sees the Transparent Vow as a spiritual superior class, the City will be read as cultic before its actual safeguards are understood. The remedy is not to drain the Vow of gravity. It is to make gravity civic: power can injure many people, so the people who seek it may accept proportionate, bounded, reviewable burden.

A useful safeguard is translation. If the Vow can be translated into secular legal-administrative language without loss of authority, it

is civic. If the Vow requires reverence to make sense, it has crossed into another domain. The City should be able to explain every duty through role, consequence, record, rights, and remedy. Any optional spiritual interpretation belongs outside the civic obligation.

2.1.3 — Burden Before Trust

The Vow reverses a familiar civic sequence. In ordinary politics, the public often grants attention, votes, appointments, donations, trust, or institutional proximity before it can see much of the formative route that produced the candidate. The City asks whether some of that burden should be carried earlier by the person seeking power. It does not demand trust in advance. It demands burden before trust.

Burden before trust means the participant accepts that public-power formation has public consequences before formal authority arrives. The person's study habits, influence channels, pressure responses, financial dependencies, correction behavior, staff relations, and use of advice may later matter because these patterns can shape decisions affecting others. The Vow makes those patterns more reviewable during the period when they are forming rather than waiting for scandal after authority is already exercised.

The participant's burden is not merely being watched. It is being answerable to a structure that records context, preserves correction, separates influence from advice, allows reply, protects dignity, and keeps evidence from becoming a halo. A camera without rights would not be burden before trust. It would be

exposure before judgment. The Vow's legitimacy depends on the whole system that surrounds the record.

The public's burden also changes. Citizens should not be forced to become detectives of hidden patronage, family leverage, consultant grooming, private compromise, or institutional capture after the fact. They may still disagree, interpret, forgive, reject, or ignore the City record. The Vow gives them better material, not a command to trust.

Carrying the Vow creates evidence, not entitlement. Visibility is not merit, and trust remains a public judgment; the record's civic value lies in the inspectable patterns it makes available before authority is granted.

A role burden is defensible only when it is connected to a public consequence the participant is voluntarily preparing to carry. The relevant comparison is not between perfect privacy and perfect visibility. It is between alternative distributions of uncertainty. Without an active formation record, more uncertainty remains with voters, journalists, future staff, affected communities, and institutions that must evaluate the candidate later. With an overbroad record, uncertainty is reduced by shifting excessive exposure onto the participant and nearby people. The Vow is justified only in the narrower middle.

That middle requires a least-burdensome-means inquiry. Before a category is captured, designers should ask whether disclosure law, conflict rules, independent ethics review, confidential counseling, delayed release, aggregate reporting, or another less intrusive mechanism can address the same public risk. It wins

only where the active formation purpose is clear, the category is necessary, and the burden cannot be placed more fairly elsewhere.

2.1.4 — Notice Before Acceptance

Good notice should be layered. The applicant needs a plain-language explanation, a detailed technical explanation, an independent rights consultation, a scenario review, and access to examples that show what the Vow means in daily life. A person who understands only the noble version has not yet understood the Vow.

Notice protects the choice that was actually explained. Nonwaivable dignity, third-party rights, future research consent, model-training authority, and later review under changed circumstances remain separately governed. The City records notice as an accountability safeguard, with renewal and challenge routes, rather than as permanent armor against future claims.

Acceptance should fail when notice fails. If an applicant cannot describe the active burden, the protected categories, the exit route, the difference between capture and release, and the limits on research and Artificial Intelligence training, the fair answer is more review, not entry. The City would rather delay a promising person than build public trust on misunderstood consent.

Notice should include the burdens carried by other people. Staff will support the participant, but staff are not servants of the participant's ambition. A person who accepts the Vow should understand that the institution counts collateral burden rather than hiding it behind their courage.

The notice record should be useful later. If a dispute arises, reviewers should be able to see what explanations were given, what questions were asked, which accommodations were offered, what uncertainties were disclosed, and whether the applicant had time to reconsider. It is not a trap; it is an account of understanding.

2.1.5 — Reviewability of Commitment

The Transparent Vow must remain operationally contestable. A commitment this severe cannot be treated as a frozen sentence spoken once at the beginning and then used against the participant forever. It gives the Vow the institutional humility required to remain fair under changed conditions, mistakes, illness, family burden, legal development, technology failure, or newly discovered risk.

Review should begin before activation and continue after activation. After activation, it asks whether the burden remains within scope, whether protected nonvisibility is functioning, whether nonparticipants are shielded, whether staff can support the system, whether the participant is being pushed into performance, and whether pause or exit should be considered. The Vow is an active governance relation, not a ceremonial artifact.

The reviewing offices should be separated from the offices that benefit from keeping the participant active. Educators may want continuity, public-interface teams may want attention, donors may want visible success, and the City may want its first participants to appear durable. Ombuds, counsel, medical or

clinical review, privacy review, archival review, and external audit should have protected routes into the decision.

Reviewability protects the public as well as the participant. When a challenge produces delay, restricted access, or protected handling, a proportionate status label can preserve public understanding without exposing the underlying protected material. This design blocks both strategic disappearance and rumor-producing silence while keeping dignity boundaries intact.

The Vow fails if it becomes captivity or theater. It must remain serious, role-bound, reviewable, and exitable under documented conditions protecting participants, nonparticipants, and the public status of active power formation. A reviewable Vow is therefore a continuing agreement, not a one-time surrender.

Review must be scheduled as well as complaint-driven. Ordinary intervals let participants raise burden, families report collateral strain, staff identify hidden labor, privacy officers find scope creep, and auditors test whether the Vow remains role-bound. Correction becomes ordinary rather than dramatic. Scheduled review also makes quiet scope expansion easier to detect before it becomes custom.

Review must test comprehension, not merely renew a signature. Periodic review revisits categories, technologies, public uses, family effects, care needs, and continuing capacity to consent. Reaffirmation matters only when it can alter scope, pause participation, or trigger independent advice. The Vow is a role-specific civic threshold, not a claim of superior character. It places burden before trust under independent advice, review, and real

refusal. Complete public-power formation is recorded without granting unlimited access to the whole person. The active-role record must therefore be complete enough to expose consequential formation while remaining bounded enough to protect the person beyond the role. The review record should show what changed and why continued commitment remains voluntary.

2.2 — Complete Active-Role Record

A complete active-role record is useful only when its scope is exact. In this book, Total Record is a defined term for the complete active-period record of the chosen public-power formation role, governed by purpose, access class, protection, correction, and exit. It never means a total record of the person or raw public access. Its severity answers a specific problem: hidden role formation can later become public burden.

A record rule without role boundaries becomes surveillance. A record rule without continuity becomes theater. A record rule without dignity becomes humiliation. A record rule without nonparticipant separation becomes collateral punishment. The City must therefore state the active rule in one hand and the limiting conditions in the other.

The active-period public-power record is not defined by the participant's feelings, popularity, public ambition, or moral seriousness. It begins when the institution declares active status under a defined pathway and ends when pause, exit, suspension, completion, or transition out of active status is formally recorded. The public may care about many things in a participant's life, but public care is not the measure of the record.

Totality is an integrity condition for the active role. Consequential public-power formation cannot move through authorized hidden channels outside review. The existence of a record, however, does not decide who may inspect it, when it may be released, how it is summarized, what must be masked, whether it may be researched, or how long it persists. Separate gates govern each later use.

2.2.1 — Active-Period Scope

Active-period scope defines when the full active-period public-power record applies. It should not begin at birth, first interest in politics, application inquiry, campus visit, informal conversation, or public rumor. It begins only when an adult applicant becomes an active participant under a declared public-power formation pathway after notice, review, and acceptance. The start date must be recorded because the boundary protects both public memory and future ordinary privacy.

Scope is not only temporal. It is functional. The record follows the active public-power formation role: study, deliberation, influence mapping, public interface, readiness preparation, relevant staff interaction, role-related travel, role-related correspondence, and consequential decision practice. It does not automatically claim unrelated inner life, family privacy, children's experience, medical detail, intimacy, spiritual care, or every incidental human moment. When a mixed-purpose situation arises, classification must be explicit rather than opportunistic.

Active-period scope must also account for geography. The rule cannot end at the campus edge if the participant travels for role formation, public interface, lawful office activity, or transparent corridor work. But off-site continuity does not allow the City to turn every location into a surveillance zone. Travel protocols, host agreements, portable capture rules, emergency exception labels, and nonparticipant masking must define how the active record follows the role without colonizing the surrounding world.

Scope fog is not a minor drafting defect; it gives the institution interpretive power over where burden begins and ends. If no one can tell whether a moment was active, protected, paused, applicant-stage, post-exit, or ordinary private life, then the City has not built a record regime. It has built interpretive power for itself. Scope clarity is the first mercy of a severe rule because it tells every person where burden begins and where it stops.

Scope should be teachable through examples before it is enforced. The City should be able to show applicants what happens to a policy seminar, a medical appointment with incidental role discussion, a family meal, a donor contact, a journalist visit, a legal consultation, a crisis evacuation, and a post-exit public speech. Examples prevent the rule from becoming a mystery that only administrators can interpret.

Scope should also travel through handoffs. When a participant moves from residence to classroom, from campus to transparent corridor, from active formation to office interface, or from pause back to activation, the record should carry a status transition. Handoffs are where hidden burden often enters systems. A clear transition log protects everyone from later claims that the rule was obvious when it was not.

2.2.2 — No Authorized Off-Record Role Formation

The central active rule is plain: consequential public-power formation may not move through an authorized off-record channel. The institution cannot announce transparency while preserving private rooms, private channels, private handlers, unlogged advice, donor corridors, consultant arrangements, or

hidden influence routes where consequential formation occurs. If such channels exist by design, the City has recreated the hidden pipeline it was built to answer.

This rule is not a demand that a participant have no interior life. Thoughts, feelings, doubts, prayer, fear, grief, love, and private meaning do not become public property because a person accepts a civic role. The rule concerns active public-power formation conduct, influence, dependency, role learning, and institutional shaping. A person remains a person. The role remains answerable.

Off-record active life can appear in subtle forms. A mentor may give decisive advice in a protected setting without classification. A donor may communicate through a family member. A consultant may shape public persona through informal calls. A staff member may become a private handler. A platform may feed privileged information outside official channels. The City must treat these side routes as record-integrity problems, not as merely awkward social events.

When a truly protected channel is necessary, the rule requires classification, not denial. Legal counsel, clinical care, crisis support, whistleblowing, family safety, and emergency response may need restricted handling. They should be logged by category, purpose, authority, time, and review route where lawful and safe. The public need not receive raw content, but the active record should not pretend the channel did not exist.

Off-record active life is not only a participant problem. Institutions hide influence through channels that feel too ordinary to count, including hallway instruction, private calls, social

dinners, encrypted side chats, foundation meetings, donor introductions, and staff coaching outside official structures. The City must also preserve role-relevant institutional memory of admissions decisions, staff influence, security classifications, protected-nonvisibility rulings, record edits, release delays, and continuity breaks. A City that hides itself while recording participants is not transparent power; it is asymmetry with better architecture.

2.2.3 — Role-Burden Limitation

Role-burden limitation keeps the Total Record Rule from becoming whole-person exposure. The burden arises because a participant seeks formation for substantial public authority, not because their humanity is less private than anyone else's. The rule should therefore be interpreted through role purpose. It asks what the public must be able to know about power formation, influence, judgment, correction, and dependency. It does not ask what the public might be curious to see.

Role-bounded capture works through declared channels. Official formation meetings, assigned projects, role-related financial relations, supervised simulations, institutional communications, and approved external interfaces can carry clear provenance and review. Private devices, family conversations, bedrooms, intimate communications, and unrelated ordinary life remain outside that architecture. The quality of the channel design, not expanding suspicion, proves whether the active role has truly been separated from the whole person.

Scope must travel with every later use of the phrase. Public bundles, interfaces, staff instructions, contracts, retention schedules, and automated summaries should identify the record as role-bound and active-period rather than letting Total Record appear alone. Precision here is operational metadata, not rhetorical hedging (Nissenbaum, 2010; Solove, 2008).

Role-burden limitation also protects against self-expansion by the institution. A City may be tempted to treat everything as role-relevant because anything can indirectly shape power. Sleep, love, grief, illness, childhood memory, friendship, faith, and family can all affect judgment, but that does not mean all must be exposed. The correct test is not causal possibility. It is public-power relevance under a defined purpose, with protected handling for sensitive domains and nonparticipants.

Every classification should apply one role-relevance test: identify the concrete public-power pathway; ask whether less intrusive evidence can answer the question; route sensitive substance to the appropriate protected reviewer; give affected people standing; state whether even a minimal status summary is necessary; attach expiry and appeal; and provide remedy for overclassification. Causal possibility alone is insufficient.

Role-burden limitation requires good-faith classification by both the institution and the participant. A donor dinner that creates a material policy dependency, a consultant call shaping an active public statement, or a mentor's strategic direction may belong in the role record. The reviewer must identify the concrete public-power decision, duty, or dependency affected and the least intrusive evidence needed to make it answerable. Merely

influencing a person's outlook is insufficient. Clear criteria and appeal prevent both overcapture and convenient relabeling.

2.2.4 — Dignity Under Active Record

Dignity under active record means that a participant can carry severe role visibility without being reduced to material for humiliation. The active-period record may be full for the public-power role, but fullness is not nakedness. It requires context, proportionality, category handling, delay where needed, restricted access where justified, protected summaries where raw exposure would harm, and a refusal to let degradation become civic interest.

Dignity begins with the body. Health, sleep, disability, reproductive care, sexual health, intimate modesty, crisis care, and bodily vulnerability can intersect with role formation without becoming public spectacle. The record may need to show that an event occurred, that a protected category was invoked, that influence did not hide inside the protection, and that review occurred. It does not follow that raw footage, detailed notes, or intimate description should become public material.

Dignity also protects the mind without claiming mind-reading authority. The City may record deliberation, stated reasoning, public explanation, revision, advice, and observable conduct. It should not pretend to possess inner truth. A participant's private fear, shame, grief, longing, or doubt may be humanly relevant, but the City must not build a doctrine of inward exposure. Public power needs accountable conduct and contextual evidence, not institutional possession of consciousness.

Dignity also belongs to accountability. A participant who has harmed staff, hidden influence, misused protected categories, or attempted off-record activity cannot invoke dignity as a shield against review. Dignity changes handling, not truth. The City may protect raw details while still disclosing the status, consequence, correction, sanction, or unresolved question required for public understanding.

The remedy for dignity failure must include more than regret. Exposure of protected material, a mistaken classification, public humiliation, unnecessary raw release, or a fragment presented as the whole story should trigger correction of the public interface and notice to affected persons. Further access may need restriction, staff action may require review, and remedy must follow. A dignified record does not hide public power; it refuses needless human injury while making power answerable.

Dignity should also be protected in public disagreement. Critics may challenge a participant's conduct, interpretation, readiness, or institutional support. They should not be given raw material that invites mockery of body, disability, trauma, intimacy, family, or illness. The City can preserve a strong record for public judgment while designing the public record site so that critique is directed toward public-power burden rather than human vulnerability.

2.2.5 — Nonparticipant Separation

Nonparticipant separation is a core condition of the Vow. Spouses, children, partners, parents, friends, dependents, neighbors, visitors, clinicians, lawyers, journalists, protesters,

host residents, staff members, and accidental bystanders keep their own privacy and standing. The participant's chosen burden does not cross by proximity, relationship, affection, employment, or chance contact. Consent and lawful purpose must be established for every additional person and every additional use.

The record system must therefore identify third-party presence early. A conversation may include a participant and a nonparticipant. A household event may include role-relevant conduct and protected family material. A public corridor may include visitors. A clinical or legal encounter may include professionals bound by other duties. Capture design must recognize these people as rights-holders, not as background noise in the participant's record.

Nonparticipant separation has technical, legal, and narrative dimensions. Technical systems may need masking, segmentation, access controls, metadata boundaries, deletion review, and audit logs. Legal review must consider consent, privilege, child protection, labor rights, professional duties, and jurisdictional obligations. Narrative release must avoid making unnamed people legible through context, geography, timing, voice, or relational clues. Redaction that leaves a person identifiable by implication has not protected them.

Nonparticipant protection can create evidentiary tension. The public may need to know that a role-relevant event happened, that a participant received advice, that a conflict occurred, or that a protected category was invoked. The answer is not raw exposure. It is status-labeled summaries, affected-person review, independent oversight, delayed release, or restricted access where

needed. The City should make public burden legible without transferring the participant's burden to another person.

The most difficult nonparticipant cases will involve dual roles. A spouse may also be an advisor. A staff member may also be a political expert. A clinician may notice role-relevant risk. A journalist may become an affected person. Relationship labels alone are insufficient. It should classify the role played in the specific event and then protect the person according to both their public relevance and their independent rights.

Nonparticipant separation should be measurable by consequences, not merely by promises. Can a child attend family life without becoming a public character? Can a partner object? Can a staff member report harm without being swallowed into the participant's narrative? Can a visitor pass through the City without being indexed? If the answer is uncertain, the record design has not yet placed burden correctly.

2.2.6 — Post-Exit Distinction

Post-exit distinction prevents the active-period record from becoming a permanent claim on a person's future. When a participant exits, completes, withdraws, is suspended, or otherwise leaves active status, future ordinary privacy should be restored except where lawful duties, active-period public memory, remedy, litigation, safety, or office-related obligations require continuing handling. The City must not let the word total follow someone for life.

The active-period record does not vanish at exit. Public trust may have relied on it, harmed persons may need remedy, staff may

need protection, voters may need context, and the institution may need failure memory. But the record that remains should be the record of the active public-power role, not an open license to monitor the person after exit. Future life deserves a boundary.

Status labels should mark the boundary among active, paused, withdrawn, suspended, completed, office-interface, and post-exit conditions. The public record site must not present them as one continuous surveillance story. Readers should be able to see when role burden ended and which later material falls outside the City's active-record authority.

2.3 — Capture Is Not Public Release

Accountable record systems gain legitimacy by separating lifecycle stages. Capture creates or preserves a record under institutional authority; public release is a later governed act that moves material into public view or structured access. Custody, classification, access, review, interpretation, correction, research consent, Artificial Intelligence training permission, retention, sealing, deletion, and appeal each require their own authority (ISO, 2016a; ISO, 2017; International Council on Archives, 2012; W3C, 2013).

Consider a hypothetical scheduling meeting outside the clinical consultation. A participant and an authorized coordinator discuss a change to an active-role work session. Only the necessary administrative facts enter the role record under declared notice and purpose; no clinical conversation, diagnosis, or family narrative is recorded. Capture of that bounded scheduling record does not authorize public release.

Suppose an automated transcript of the scheduling meeting attributes one sentence to the wrong speaker. The record enters restricted review rather than the public site. The coordinator receives notice and standing to inspect the affected segment, the participant can contest the attribution, and an accountable human reviewer checks the authorized source record, corrects the attribution, and preserves an audit trail. No model-training permission arises from capture.

Only after purpose, attribution, protected-person review, context, and release authority are satisfied can a public summary be

considered. The public may learn that an active-role schedule changed and why that mattered without receiving clinical or family information. If attribution remains unresolved, the object is labeled accordingly or remains unreleased. This journey shows why a humane record is a sequence of governed decisions rather than a camera pointed at a person (ISO, 2016a; ISO, 2017; NIST, 2020b).

The record-stage firewall preserves full active-period integrity without pretending that every captured item belongs in a public interface. It also blocks the opposite error, treating nonpublic material as though it were never captured or reviewable. Capture, access, release, interpretation, research, and model training therefore remain distinct governed states.

Records management, privacy risk practice, archival ethics, public-records law, and responsible Artificial Intelligence governance converge on one operational rule: purpose binds use. Accountability records, public summaries, research datasets, legal-retention copies, and machine-search aids have different authorities and different risks. A record moves between those states only through an explicit lawful bridge, documented review, and the protections attached to the new purpose. This keeps preservation from becoming unlimited reuse.

Each record stage carries a different burden. Capture burdens the participant and staff. Custody burdens the archive. Access burdens reviewers and affected persons. Release burdens the public interface and the people exposed by it. Interpretation burdens readers, journalists, machines, and critics. Research and

model training create new burdens that the original Vow does not silently authorize.

2.3.1 — Capture Defined

Capture is the creation, preservation, or intake of record material within the City’s active public-power formation system. It may include documents, attendance, deliberation traces, influence contacts, work products, status labels, audit entries, security events, protected-category logs, technical continuity records, and other role-relevant evidence. Capture does not mean public visibility. It means the institution has accepted custody or created memory under a defined purpose.

Capture can occur through several channels. Some material is produced by the participant’s role work. Some is produced by staff, sensors, facilities systems, institutional logs, public-interface interactions, official correspondence, or external submissions. Some arrives from affected persons, whistleblowers, journalists, auditors, or host-community processes. Each channel needs provenance so later readers know where the record came from and what it can and cannot show.

Sensitive private life is not captured merely because it could affect public judgment. Clinical care, legal consultation, intimacy, and ordinary family contact begin from noncapture within the City role-record system. Where a separate lawful purpose requires a record, the responsible professional or authorized custodian records only what that purpose needs. A minimal role-status entry, such as an approved workload adjustment, is used only when necessary and safe; protected

content does not enter the civic archive by default. Classification governs justified collection as well as later access and release.

Invisible accumulation is the archival form of mission creep. If the City captures everything because storage is cheap, because later use is imaginable, or because uncertainty feels safer than judgment, it will create a hidden archive of burden. If it fails to capture active formation because the material is inconvenient, it will hollow out the Vow. Capture must be purposeful, role-bound, classified, logged, and open to correction.

The capture definition should also prohibit speculative capture. Inferred motives, imagined inner states, psychological guesses, and machine-generated personality profiles must never be recorded as source evidence. It may capture observed conduct, stated explanations, declared influences, work products, review findings, and contextual labels. Inference belongs in interpretation with a status label, not in the source layer where it can harden into false fact.

A stage-specific active-record charter should answer seven questions before any category is captured. What event or object enters the record? Who is responsible for capture? Which purpose authorizes it? What metadata establishes provenance? Which protected people or subjects appear within it? What is the default access class? What review or appeal can change its treatment? If one of these questions has no answer, the system has produced data without governance (NIST, 2020b).

Capture should also be event-sensitive. A policy seminar, a private medical consultation, a donor meeting, a conflict-of-

interest disclosure, an emergency drill, and a household conversation are not variations of one record type. They carry different purposes, participants, risks, and lawful constraints. Treating them as interchangeable because each can be digitized would erase the very context that makes responsible visibility possible.

2.3.2 — Access Defined

Access is permission to inspect, handle, query, or use a record for a defined purpose. It is narrower than capture and often narrower than public release. A record may exist inside the archive while being available only to a participant, affected person, ombuds, auditor, legal reviewer, clinician, security reviewer, archive staff, or other authorized role. Access is a governance decision, not a natural consequence of existence.

Access classes must be defined before activation. Public, participant, affected-person, oversight, staff-operational, legal, emergency, research, and Artificial Intelligence development access are not interchangeable. Each class needs a stated purpose, duration, logging rule, confidentiality condition, reviewer, and withdrawal route. A vague all-access culture would turn record integrity into internal surveillance (ISO, 2016a; ISO, 2017; NIST, 2020b).

Affected-person access deserves special care. A staff member harmed by a participant, a nonparticipant misidentified in a record, a family member exposed by context, or a visitor whose image was captured may need access to correct, complain, or seek remedy. Yet granting access to one affected person may expose

another. The City must treat affected-person access as a rights problem with review, not as a customer-service request.

Emergency access must be narrow and logged. Safety, medical crisis, imminent harm, legal duty, cybersecurity event, or continuity failure may require faster access than ordinary review. But emergency access should not become the back door through which curiosity, institutional embarrassment, or political pressure enters the archive. Every emergency access event should record who entered, why, what was viewed, what was done, when review occurred, and what notice or correction followed.

Access creep can destroy privacy and dignity long before public release as more people inspect more records for more reasons. A fair City treats access as a burden allocation: every access grant moves risk onto someone, so every access grant needs purpose, authority, logging, minimization, and remedy if abused.

The access system should also make misuse visible. If an authorized user inspects material for an unauthorized reason, exports material, shares fragments, trains a tool, or pressures another person through knowledge gained from records, the violation should be treated as record injury. The harmed party may be the participant, a staff member, a nonparticipant, or the public. Access abuse should have complaint, audit, sanction, and correction routes.

Access must be role-based, time-bounded, logged, and reviewable. The person who maintains storage need not have authority to interpret content. The person who reviews a protected category need not have permission to export it. The person who

investigates a complaint should see what is necessary for the complaint, not the participant's entire active history. Separation of access powers reduces the chance that a single operator becomes the hidden sovereign of the record.

2.3.3 — Release Defined

A release decision should answer several questions before material leaves custody. What public burden does this release address? Which role-relevant fact is being made knowable? What protected categories are implicated? Which nonparticipants appear directly or by inference? What context is required to prevent misreading? What reply, correction, or appeal is available? What harms would raw release create that summary, delay, or restricted access could avoid?

Contextual bundles should be preferred to fragments. A single clip, line, image, or emotional moment can mislead even when authentic. Release design should preserve chronology, provenance, status, counterevidence, correction, and uncertainty so that public memory remains interpretable rather than merely abundant (International Council on Archives, 2012; W3C, 2013).

The final public-release cadence must be set through jurisdiction-specific legal and expert review before activation. It must be timely enough to preserve a real opportunity for public judgment and restrained enough to protect dignity, safety, correction capacity, nonparticipants, and context. Where those aims conflict, the release decision needs a documented reason, accountable owner, review date, and route for challenge.

Release can also be partial. Protected summaries may reveal that a review occurred, that no unrecorded active influence was found, that a conflict was resolved, that a correction was made, or that a protected category prevented raw disclosure. Restricted release may allow affected persons or oversight bodies to inspect more than the public sees. Nonrelease may be justified where public value is low and harm is high, but nonrelease should not erase the fact that a governed decision occurred when public understanding requires a status label.

Release fails at either extreme: spectacle or secrecy. If release maximizes attention, outrage, monetization, or humiliation, the City becomes a reality show. If release is so constrained that citizens cannot understand active formation, the City becomes an archive without public consequence. The fair release regime makes enough role-burden visible to support judgment while refusing the public's appetite for raw private detail.

Monetized release should also be rejected. Release decisions cannot be driven by clicks, subscriptions, donor interest, campaign spectacle, or personality fandom. Public record access may require infrastructure funding, but the record itself should not become entertainment inventory. The public interest is understanding public-power formation, not consuming the lives of those carrying the Vow.

Release is a public act, not an automatic technical state. It should identify the releasing authority, source bundle, applicable status label, protected omissions, date, version, correction route, and intended public meaning. A raw file placed online without those elements may be publicly reachable while remaining

institutionally irresponsible. The release decision is where archival integrity becomes public explanation.

2.3.4 — Interpretation Defined

The design must label each interpretive layer. Source records preserve what was captured; official status records a governed process; review findings state an accountable conclusion; participant replies and affected-person statements preserve contest and context; journalism offers independent interpretation; public opinion remains public judgment. Readiness bundles, correction notes, protected summaries, and machine-generated summaries must identify which layer they represent. The labels keep evidence useful without allowing any single representation to masquerade as the whole person or the final verdict.

Artificial Intelligence adds a new interpretive risk. Search tools, clustering systems, summary models, translation systems, and pattern detectors may help users navigate a large record, but they can also create false coherence, hidden ranking, hallucinated meaning, or unfair prominence. The City should treat machine interpretation as a labeled aid subject to audit, appeal, provenance limits, and human responsibility. It must not let a model become the reader's sovereign.

Verdict drift begins when labels, summaries, readiness bundles, or machine outputs are received as final truth about the participant; at that point, the record has become a score. Interpretation should help the public understand role formation, not close democratic judgment. Meaning remains contested, contextual, and answerable to correction.

Interpretation should include disagreement by design. A strong record site can show underlying source record, official status, participant reply, affected-person reply, auditor finding, unresolved question, and later correction without forcing one smooth story. Public power often becomes dangerous when institutions smooth conflict to preserve authority. The City should let disagreement remain visible where it helps public judgment.

Another obligation is to teach readers how not to overread. A pattern may suggest risk without proving motive. A correction may show learning without proving virtue. A protected label may show dignity handling without implying hidden misconduct. Interpretation guidance should not tell the public what to think. It should tell the public what kind of evidence they are seeing, which burden it can support, and which verdicts it cannot bear.

Interpretation requires contestability because facts do not arrange their own significance. A record may accurately show a statement while omitting the question that prompted it, the evidence available at the time, a later correction, or a disagreement about classification. Public bundles should therefore preserve context, contrary readings, affected-person response, and the distinction between what the record shows and what an observer infers.

2.3.5 — Research Use Defined

This boundary is especially important because The City of Fairness is part of a larger project that also contains formal and scientific domains. The City does not validate the Law of Fairness, does not calculate scientific ledger estimators, does not provide PTVc evidence, and does not turn civic records into

scientific proof. Operational evidence about whether the City works as an institution remains distinct from scientific validation of the formal Law.

A lawful research pathway would need separate governance. It would need purpose, protocol, ethics review, consent where required, privacy protections, data minimization, risk assessment, withdrawal and nonretaliation rules, publication controls, access limits, deidentification limits, and safeguards for nonparticipants. It would also need to explain how operational records will be transformed or not transformed into research material. The existence of a rich archive is not permission to mine it.

Every record receives an explicit research-use status. Operational accountability, public release, dignity restriction, legal retention, separately approved research, and model training are distinct states with separate decision owners and safeguards. A public record becomes research material only through a lawful, ethically reviewed bridge, and research approval does not automatically authorize general model training (Nissenbaum, 2010; Solove, 2008).

Scientific appropriation begins when the existence of a record is mistaken for consent to research. If researchers, City staff, funders, or public advocates use the archive as if it were automatically available for studies, the City will have moved burden from public-power seekers onto persons whose data are being repurposed. A fair institution can invite research only by building a separate lawful route. It cannot let the promise of knowledge override the promise of the Vow.

Secondary research use should begin with a new purpose test rather than inherit permission from public availability. A record released for civic accountability may still be inappropriate for behavioral profiling, emotion inference, personality prediction, commercial product development, or generalized social science. Research governance should specify the question, data minimization, legal basis, consent or waiver route, privacy risk, security plan, publication limits, community review, and destruction or return obligations.

2.3.6 — Artificial Intelligence Training Defined

Artificial Intelligence training is a distinct and high-risk use of record material. It is not implied by capture, access, public release, research approval, archive storage, machine summary, search indexing, or operational analytics. Training a model on City records could preserve patterns, generate inferences, reproduce sensitive details, amplify bias, expose nonparticipants, and make later deletion or correction difficult. The City must treat training permission as its own gate.

The rule should be blunt: no City record becomes model-training material by default. A participant's role-bound active-record burden does not authorize the institution, vendors, researchers, donors, public users, or future network partners to train models on the material. Public visibility is not the same as machine ingestion. A thing that can be read by citizens may still be forbidden for training.

Operational Artificial Intelligence tools may be useful for search, translation, accessibility, anomaly detection, provenance support,

deepfake detection, and record navigation. Those uses still require governance, but they differ from training a general model on the records themselves. The City should distinguish retrieval over controlled material, summarization with source grounding, audited pattern analysis, and model training that changes the model's future behavior. Confusing those functions would hide a major burden shift.

Artificial Intelligence outputs should also be non-sovereign. A model may assist by finding records, proposing summaries, flagging inconsistencies, or identifying possible continuity breaks. It may not determine truth, worth, readiness, trust, spiritual status, public rank, office entitlement, or proof of the Law. Human review, appeal, provenance, and public labeling must remain visible wherever machine assistance appears.

Indexing and model learning require separate rules. A controlled search index may help users locate records without altering a model's general capacities; training or fine-tuning may encode patterns that cannot be cleanly removed. Retrieval, classification, summarization, and training therefore need separate technical, legal, and human-approval paths. The public should be told not merely that Artificial Intelligence is used, but exactly how it is used (NIST, 2024b).

Before any training use, the City would need an authorized purpose, lawful basis, dataset provenance, model owner, retention rule, evaluation plan, bias and privacy assessment, human approver, opt-out or exclusion logic where applicable, and a credible route for correcting downstream outputs (NIST, 2023a; NIST, 2024b; UNESCO, 2021b).

Even authorized systems should be limited to functions that do not claim access to inner truth. Search, transcription, translation, retrieval, duplicate detection, accessibility support, and provenance checking are different from inferring sincerity, loyalty, moral character, psychological fitness, hidden motive, or future trustworthiness. The latter uses convert records into purported personhood instruments and would violate the City’s no-score boundary even when the software is technically impressive. An accessibility tool, for example, can make an approved record easier to use while leaving the task of judging its significance with the reader. Procurement review should reject systems whose vendor documentation cannot separate these functions in practice.

The active record becomes governable when each stage has a separate purpose, authority, visibility rule, and correction route. The charter below is a minimum operating object, not a substitute for jurisdiction-specific law or the fuller lifecycle developed in Part III. A release request should therefore identify the specific stage being advanced, so its reviewer can see which permission is sought and which remains unchanged. Stage transitions should also carry an explicit effective date so later reviewers can reconstruct which authority governed a disputed use.

Table 2.1. Stage-Specific Active-Record Charter.

Record stage	Core rule and response
Capture	Create role-relevant records with stated purpose and provenance. Restrict pending classification; allow challenges to relevance, attribution, protected-person inclusion, or authority.

Record stage	Core rule and response
Custody	Protect integrity, versions, access logs, and chain of responsibility. Custody does not confer interpretive authority. Breach or misuse triggers evidence preservation and independent review.
Access	Permit only a named class to inspect a record for a stated task and duration. Revoke misuse, correct permissions, notify affected people, and log the event.
Public release	Release only a governed object with provenance, context, status, and protected-person treatment. Preserve reply, correction, retraction, appeal, contextual supplement, and lawful removal routes.
Interpretation	Explain a source without replacing it or hiding uncertainty. Keep source and status reachable; preserve dissent, disclose machine assistance, and correct error.
Research use	Require a separate approved purpose, minimization, and lawful basis or consent in a restricted environment. Control publication and delete or return material when required.
AI training	Require separate explicit authority and risk controls. Training is prohibited by default; refusal, withdrawal where applicable, derivative removal where required, and audit remain available.
Retention	Keep records only for declared reasons and periods. Use time review, affected-person petition, legal-hold review, deletion verification, and appeal.
Correction and appeal	Repair attribution, classification, access, interpretation, or release through independent review, audit trail, remedy, and public notice when meaning changes.

Record stage	Core rule and response
Post-exit	End active capture at exit. Prior records follow the continuing-record rules; no new active-role record is created. Post-exit correction, sealing review, and reintegration protection remain available.

A complete charter also exposes unready stages: any stage without an accountable owner, affected-person route, access rule, or remedy leaves the City with data but not governance. Later Parts add legal, archival, and technical detail without changing this separation. The missing capability can then become a concrete development task with a responsible team and a completion test, rather than an unresolved demand passed to the next operator. Closing the gap should require evidence that the control works under an ordinary operating scenario, not only that a policy was written.

2.4 — Protected Nonvisibility Without Off-Record Formation

Protected nonvisibility lets the City combine answerability with dignity. It rejects indiscriminate exposure while also preventing sensitive categories from becoming undeclared channels of active public-power formation. The governing task is to define protection, delayed release, restricted access, affected-person standing, and review precisely enough that privacy remains real without reopening an off-record active zone (Lyon, 2007; Penney, 2025; NIST, 2020b).

Protected nonvisibility includes noncapture where the City has no justified basis to record private life. When a record is lawfully necessary, classification, restricted access, masking, delay, protected summary, or sealing can protect its sensitive content. A minimal status entry is used only where needed and safe. Protection remains reviewable without making the protected person or encounter a public exhibit.

Protected nonvisibility replaces the unsafe idea of a private active zone. No category may become a blanket authorization for unrecorded influence, donor shaping, consultant coaching, party discipline, staff manipulation, or strategic planning during active public-power formation. Protection governs whether collection is justified and, where it is, how access and release are handled. It does not authorize consequential role business to evade the active-record rules.

Dignity handling becomes practical only when burden is properly allocated. The burden of dignity-sensitive material should not fall

on the participant as humiliation, on family as collateral exposure, on staff as hidden witnesses, on the public as rumor, or on the institution as unreviewed discretion. The burden should be carried by classification, review, shielding, summary, correction, and remedy.

2.4.1 — Dignity Handling

Dignity handling protects domains where raw exposure would injure the person without improving public understanding. Health, clinical care, disability support, reproductive care, sexual health, modesty, grief, fear, spiritual care, family distress, and emergency vulnerability can all intersect with public-power formation. The City must be able to acknowledge the intersection without displaying the vulnerable material as if it were civic content.

Dignity handling should begin with category recognition. A record should identify whether the material involves health, counsel, intimacy, family, safety, child protection, professional privilege, or another protected domain. The classification should trigger rules for capture, custody, access, release, interpretation, retention, correction, and review. Protection cannot depend on staff improvising in the moment after sensitive material has already been exposed.

Dignity does not erase accountability. If a participant uses a protected setting to receive hidden strategic advice, pressure a staff member, conceal a donor channel, or prepare public action outside the active record, the protected category should not shield the misconduct. The response may protect raw details while still

disclosing the status of the violation, the remedy, the review finding, and any effect on readiness or active status. Handling changes; public-power burden remains.

Dignity handling must be designed into architecture and workflow. Rooms, corridors, devices, signage, staff training, incident classification, private counsel windows, clinical spaces, and emergency protocols should make clear how protected domains are handled. A system that relies on discretion after embarrassment occurs will produce inconsistent outcomes and public distrust. Dignity needs design before crisis.

Dignity handling should include staff discretion bounded by rules. A clinician, security worker, educator, or archivist may see that raw procedure would cause harm in a live moment. They need authority to prevent immediate injury, but that authority should trigger later classification rather than private memory. Humane discretion becomes fair when it is reviewed after the fact and not used as a hidden exception to the Vow.

Institutional practice should protect against dignity inflation. Not every discomfort is a protected category. Public-power formation will involve criticism, disagreement, correction, embarrassment, and difficulty. Dignity handling protects vulnerability and rights, not reputation management. If every hard public fact becomes dignity-sensitive, the institution will hide the very burden it promised to reveal.

Dignity handling must account for chilling effects as an institutional outcome, not an individual weakness. People can begin to narrow lawful speech, experimentation, friendship,

humor, dissent, and intellectual risk when observation is uncertain or socially punitive. The City should therefore measure where participants become performative, where staff avoid escalation, where protected people withdraw, and where public interpretation rewards conformity. Visibility that produces compliant silence can defeat formation while appearing orderly (Penney, 2025).

2.4.2 — Role-Record Delayed Release

Delay must be governed as a status. Every delayed record needs a classification, reason code, responsible office, review date, conditions for earlier release, conditions for extension, and a public-facing status label where silence would mislead. Content may remain unavailable, but the existence and governance of the delay should be intelligible.

Delay can protect participants from performance pressure. If every difficult moment is released immediately, participants may start living as if each hour is campaign media. That would undermine the purpose of formation. The City needs enough time for reflection, correction, reply, and context before public interpretation hardens around fragments. Delayed release can support truth when speed would create theater.

Delay can also protect nonparticipants and affected persons. A family member may need time to consent or object. A staff member may need protection from retaliation. A child may require absolute shielding. A legal process may require confidentiality. A security event may need containment. The public's interest in role formation is important, but it does not automatically defeat every competing duty.

Delayed release requires an independent purpose test. The reviewer asks whether immediate disclosure is necessary for public-power accountability, whether delay protects dignity or evidentiary integrity, how long the restriction lasts, and what public status should remain visible. Favored participants, donors, staff, and the institution itself receive no special convenience. A dated decision, renewal burden, and appeal route keep lawful delay from becoming reputation management.

The remedy for improper delay should include public correction where appropriate. If the City delayed material for an improper reason, extended delay without review, or used delay to shape public judgment unfairly, the record should disclose the delay history and the corrective action. Delay can be honorable. Unlabeled delay is hidden power.

Delayed release should also include anti-surprise planning. Participants and affected persons should know when delayed material may become public, what review happens first, and how they can challenge classification or context. Surprise releases can replicate the cruelty of exposure even when technically lawful. A fair delay regime uses time to prepare truth, not to ambush people with it.

2.4.3 — Restricted Access

Restricted access is a narrower alternative to public release. It allows particular reviewers to inspect material under defined conditions while preventing broader exposure. This tool is necessary when public understanding requires confidence that review occurred, but raw public release would violate dignity,

legal duty, safety, child protection, privilege, or nonparticipant rights. Restricted access is neither concealment nor publicity. It is accountable containment.

The restricted-access class should be defined by role and purpose. Ombuds, external auditors, affected-person advocates, legal reviewers, clinicians, privacy officers, cybersecurity responders, child-protection reviewers, or designated public-interest panels may each need different access. No elite room should give powerful insiders unrestricted access to everything. That would reproduce hidden authority under the name of protection.

Restricted access must be logged. Who inspected the material, under what authority, for what purpose, for how long, with what restrictions, and with what outcome should be recorded. Logs may themselves require protection, but the existence of access should be auditable. Without logs, restricted access becomes a second archive invisible to the people it burdens.

Restricted access should include public explanation where public trust would otherwise collapse. The public may be told that an independent review occurred, that raw material remains restricted, that the review found no hidden active formation or found a violation, that remedy is underway, or that a further review date exists. Such labels prevent rumor from filling the silence while preserving dignity.

Restricted access becomes a protected oligarchy when a small inner circle holds unreviewed power over hidden material; that arrangement privatizes the archive rather than protecting people. The remedy is role separation, external inspection, logs, appeals,

public status labels, and limits on who may interpret restricted material for the public.

Restricted access should come with interpretive humility. A reviewer who sees raw material may understand why public release would harm, but they may also overvalue their privileged perspective. The public-facing account should not ask citizens to trust a secret elite entirely. It should state the reviewer role, the status of the finding, the available challenge route, and the reason raw material remains restricted.

The next requirement is to define conflicts of interest. A reviewer with political ties, donor ties, family ties, professional dependence, vendor incentives, or institutional loyalty may not be appropriate for restricted material. Access to sensitive records is a form of power. It needs conflict review as much as it needs credentials.

Protected summaries allow public knowledge without raw exposure. They state the relevant role fact, status, review result, or boundary condition while omitting details that would violate dignity or third-party rights. A good summary is not a euphemism. It is a carefully governed public interface between the public's right to understand public-power formation and the human rights of those caught inside sensitive material.

2.4.4 — Protected Summaries Before Release

A protected summary should answer the public question that justifies disclosure. Did a role-relevant event occur? Was a protected category invoked? Was there hidden active influence? Was an allegation reviewed? Was a record gap accidental,

emergency-based, or misconduct? Was a remedy issued? The summary should not invite speculation about irrelevant private details. It should carry enough specificity to be meaningful and enough restraint to be humane.

The summary should state its own limits. It may say that raw material is restricted, that nonparticipants are masked, that a clinical or legal category is involved, that independent review occurred, that a participant or affected person disputes the interpretation, or that further review remains open. The public should not confuse a summary with the entire record. Status labels protect interpretation.

Protected summaries should be reviewable and correctable. Participants may challenge incompleteness, affected persons may challenge distortion, auditors may challenge institutional self-protection, and public reviewers may challenge vagueness. Correction should not require exposing raw material. It may require amended status, stronger context, additional independent review, or a clearer statement of uncertainty.

A protected summary becomes manipulation when it launders serious facts through vague language, manages reputation, punishes opponents, shields favored participants, or feeds public drama without accountability. Compression can conceal as effectively as redaction when uncertainty, dissent, burden, or institutional responsibility is flattened away. A fair summary tells the public enough to understand public-power burden, makes its omissions and limits explicit, and preserves a route back to the fuller governed record.

Protected summaries should be written in a stable house language that avoids insinuation. Words such as incident, concern, protected review, resolved, unresolved, corrected, disputed, delayed, and restricted need definitions. Without definitions, summary language can become a way to imply guilt, minimize harm, or protect status. A glossary of summary terms may be more protective than dramatic prose.

A summary should also identify what decision it supports. Some summaries support public context, some support readiness review, some support affected-person remedy, and some support institutional audit. A summary that tries to serve every audience may reveal too much to some and too little to others. Purpose-specific summaries can preserve fairness if their differences are explained and traceable.

Nonparticipant masking prevents collateral record inheritance. It includes blurring, redaction, pseudonymization, voice alteration, location generalization, timing suppression, relationship masking, metadata removal, contextual shielding, and protected summaries where needed. The point is not merely to hide names. Many people can be identified by pattern, role, geography, sequence, voice, family relation, workplace, or event timing. Masking must protect against real identifiability, not just visible labels.

2.4.5 — Nonparticipant Masking in Active Records

Masking should happen before public release whenever feasible, not after harm. The City should design capture and archive systems that separate participant role evidence from third-party

material at intake. If masking is treated as an after-publication cleanup task, the first public release will already have moved burden onto people who never accepted it. Prevention is better than apology.

Nonparticipant masking should include an objection route. A person may argue that they are identifiable, mischaracterized, exposed by context, or unfairly hidden where they need recognition for remedy. The City should allow affected-person review when safe, provide support, and update public materials when masking fails. A public record regime that cannot hear from the people it exposes will reproduce the unfairness it was designed to reduce.

Collateral exposure reverses the City's stated burden direction when ordinary people become searchable characters in a public-power archive merely because they lived near, worked with, loved, treated, opposed, or encountered a participant. Nonparticipant masking keeps severity where it belongs: on the chosen active role and the institution that governs it.

Masking is a continuing risk-management duty rather than a one-time edit. A person who is unidentifiable today may become identifiable after later public events, leaked fragments, social-media speculation, or archive expansion. High-risk records therefore receive scheduled and event-triggered review, with stronger masking or access controls when context changes. Public memory remains useful only while the institution continues to protect people who never chose the role.

Where reidentification risk remains high after masking, use a protected summary or nonrelease rather than treating redaction as sufficient.

Masking must be tested against re-identification, not judged by removal of a name alone. Voice, location, date, relationship, rare events, distinctive phrases, linked releases, and background details can identify a person even when direct identifiers disappear. The protection review should consider the full public environment, including search engines, social media, commercial datasets, and machine inference. A masked record that predictably exposes a child, clinician, partner, critic, or bystander is not protected.

2.4.6 — Protected Domains Cannot Hide Role Formation

The old danger is easy to understand. A system might announce total record, then carve out a broad protected active zone for anything sensitive. Inside that zone, donors could advise, parties could discipline, consultants could craft persona, family pressure could shape public commitments, staff could manipulate, or the participant could prepare policy through hidden channels. The City would then have preserved its most important private pipeline under humane language.

The better rule is classified visibility. The existence of a protected event can be recorded. The role-relevant edge can be reviewed. The raw details can be restricted. Nonparticipants can be masked. Public summaries can be issued. Emergency exceptions can be logged. What cannot happen is unrecorded active formation

justified by the sensitivity of the setting. The Vow follows the role even when raw public access does not.

Professional interfaces need role-specific charters. Legal counsel protects due process and privilege-sensitive material while role-related political strategy remains traceable. Clinical care protects treatment and professional independence without becoming hidden formation coaching. Spiritual care protects conscience without institutional command. Family consultation protects private relationships while public influence remains reviewable. The charter identifies purpose, confidentiality, escalation, record handling, and the point at which another role must take custody.

Hard classification cases require independent review. If the participant, staff, or institution alone decides whether a sensitive event is also role-relevant, incentives will distort the result. Privacy, legal, clinical, archival, and public-interest reviewers may need distinct roles, even when the public receives only a status label.

Care becomes a mask for private power when protection is used to hide influence. When protection hides influence, the burden returns to citizens, journalists, staff, and future harmed persons. The City's promise is not that active life will be publicly naked. Its promise is that active public-power formation will not be allowed to disappear.

This rule should be visible to professionals before they enter the City. Lawyers, clinicians, spiritual advisors, educators, and security staff need to know that their protected roles are respected but not available for hidden public-power formation. The City

should train them in how to preserve their professional duties while logging role-relevant status safely. Professional independence and public record integrity must be designed together.

The rule also protects the professions themselves. If political instruction hides inside therapy, therapy becomes suspect. If strategic evasion hides inside legal counsel, counsel becomes a route of public distrust. If donor leverage hides inside family consultation, family care becomes instrumentalized. This rule preserves the dignity of protected domains by refusing to use them as tunnels for power.

2.5 — Continuity Breaks, Technical Failure, and Repair

Repairable continuity is more credible than a promise of perfect capture. Devices fail, power goes out, networks break, staff misclassify, emergencies unfold, protected domains require delay, people make mistakes, and adversaries attempt sabotage. The City therefore needs declared gap classes, visible notices, independent review, correction routes, and consequences proportionate to what is known rather than automatic suspicion or automatic excuse (NIST, 2024a; NIST, 2025b; ISO/IEC, 2022; ISO, 2019).

Continuity is a burden because missingness changes interpretation. A gap can make public trust harder, can burden the participant with suspicion, can burden staff with blame, can burden nonparticipants with rumor, and can burden the institution with credibility loss. The fair response is classification and repair, not panic or silence.

Record interruption needs a shared grammar: continuity break, technical failure, emergency exception, gap notice, remedy, correction, and public status label. Interruption cannot be eliminated without creating new danger. It can be classified, repaired, reviewed, and explained well enough that the record remains trustworthy without becoming cruel.

The City's failure memory begins here. A gap properly classified can teach the institution where its systems are fragile. A gap hidden, minimized, or sensationalized becomes a new hidden burden. The record must remember not only active formation, but

the conditions under which active formation could not be recorded cleanly.

2.5.1 — Continuity Break Defined

A continuity break is an interruption in active record integrity during a period or event that falls within the role-bound active public-power record. It does not automatically mean misconduct. It means the expected chain of capture, custody, access logging, classification, or preservation was interrupted. Naming the break prevents the City from treating absence as either nothing or scandal by default.

Continuity breaks may result from device failure, misrouting, emergency interruption, cyberattack, or the absence of authorized capture infrastructure. Classification should identify which expected capture, custody, access-log, or preservation function actually failed. An intact record whose access or release is lawfully restricted or delayed is not, for that reason alone, a continuity break. Its access or release status should be labeled separately. Where an emergency both interrupts capture and restricts disclosure, record both conditions and assign each its own review and remedy.

A continuity break is not the same as lawful pause or exit. If the participant is formally paused or has left active status, the record obligation changes. If the participant remains active and the record fails, the continuity break belongs inside the active record. This distinction prevents the institution from retroactively reclassifying active gaps as private time after embarrassment occurs.

Continuity breaks should be expected in design. Backup systems, redundant storage, manual logs, witness protocols, emergency review, audit trails, and protected-category workflows reduce the damage of failure. A City that treats continuity as a technology guarantee will be brittle. A City that treats continuity as a governance problem can recover honestly.

Continuity breaks should be categorized by effect as well as cause. A short recording failure during an assigned workshop differs from a missing record during a donor contact, staff conflict, emergency, or readiness decision. The public significance of a gap depends on the question the missing evidence could answer. A period in which capture was neither required nor authorized is not a continuity break. Classification should identify the expected record, the function that failed, and the public-power question affected.

Partial evidence can be preserved, but only as labeled reconstruction. A gap may leave surrounding logs, witness statements, access records, backup fragments, status entries, or participant explanations. Those materials may support a limited account, yet the public must be able to distinguish original continuity from an account assembled after interruption.

2.5.2 — Technical Failure Classification

Technical failure classification assigns the right remedy to the right cause. Accident, system weakness, negligent design, vendor breach, user error, cybersecurity event, sabotage, and intentional evasion produce different responsibilities and public meanings. A battery failure calls for resilience and maintenance; chronic

underinvestment calls for governance correction; a vendor exploit calls for security and contractual remedies; deliberate concealment calls for investigation and due process. Evidence, not institutional convenience, determines the category.

Technical failures require both engineering and governance review. Engineers may identify how a system failed, while archivists see custody implications, privacy reviewers see exposure, security reviewers see adversarial patterns, and ombuds see the burden on participants or affected persons. Classification should join technical diagnosis to rights, remedy, and public-risk analysis (ISO, 2019; ISO/IEC, 2022; NIST, 2024a; NIST, 2025b).

A technical failure should preserve chain-of-custody evidence where possible. Logs, hashes, timestamps, backup status, access attempts, system alerts, manual notes, staff reports, and vendor communications may help distinguish loss from tampering. The City should avoid overpromising technical certainty. It should state confidence levels, unresolved questions, and what cannot be reconstructed.

Vendor failures deserve special treatment. If core record systems depend on external vendors, the City has moved burden into contract architecture. Vendor telemetry, access, model tools, cloud storage, transcription systems, cybersecurity tools, and maintenance processes can become hidden power. Technical failure classification should therefore ask whether the vendor caused, worsened, concealed, or profited from the failure.

Technical fog appears when every failure is called a glitch or every gap is treated as evasion. If all failures are called glitches,

misconduct hides. If all failures are called evasion, people are harmed by suspicion. A fair classification system lets the City repair the system, assign responsibility, compensate or correct where needed, and preserve public trust through precision rather than drama.

Classification should also consider cybersecurity deception. Deepfakes, altered logs, spoofed identities, malicious access, ransomware, insider threats, and adversarial deletion can make record failure appear like participant evasion or staff incompetence. The City should avoid immediate public conclusions until forensic review has enough basis. Precision protects both accountability and the innocent.

Emergency exception logging preserves later review when ordinary record procedure must bend. Fire, medical crisis, physical threat, cyberattack, evacuation, security incident, family emergency, legal compulsion, or sudden infrastructure failure may make ordinary capture, release, access, or classification temporarily impossible or unsafe. Emergency handling can be humane. Unlogged emergency handling becomes hidden power.

Failure classification should distinguish at least availability failure, capture failure, provenance failure, integrity failure, confidentiality failure, classification error, wrongful access, wrongful release, interpretation failure, correction failure, and model-generated distortion. Each type creates a different public meaning and requires a different response. A system that labels every incident technical difficulty hides the difference between a broken camera, an altered file, a privacy breach, and a false public summary.

2.5.3 — Emergency Exception Logging

An emergency exception should record the triggering condition, the active status of the participant, the nature of the deviation, who authorized it, who was notified, what material may have been lost or restricted, what protective steps were taken, and when ordinary review resumed. Some details may remain restricted for safety or dignity, but the existence of the exception should not disappear where public-power formation is implicated.

Emergency exceptions can be abused. A participant or institution may learn that invoking emergency language buys secrecy, delay, or narrative control. The City should therefore require independent after-action review, pattern monitoring, and escalation when emergency exceptions become frequent or poorly explained. A repeated emergency may reveal a design failure or a strategy of evasion.

Emergency logging must also protect nonparticipants. A crisis may involve children, family, visitors, host residents, staff, or vulnerable people. Public status labels should not identify them unnecessarily. The City should provide enough information to preserve integrity without turning someone else's worst day into proof of transparency.

Heroic exception turns emergency improvisation into a mythology of benevolent secrecy when the City celebrates it without later review. A fair emergency regime honors immediate protection and then returns to record, explanation, correction, and remedy. The exception is legitimate only because it is later answerable.

Emergency exception logs should be protected from public exploitation. A public label may say that an emergency exception occurred without revealing tactical security details, medical information, child location, or vulnerability that could invite harm. The City must avoid the idea that emergency accountability requires operational exposure. Safety and later review can coexist.

Emergency preparedness also requires rehearsal. Dry runs, tabletop exercises, staff drills, manual fallback forms, alternate power, protected transport, and communication protocols reduce the chance that crisis destroys record integrity. A fair emergency system is not improvised morality. It is preparation that treats crisis as foreseeable enough to deserve design.

2.5.4 — Record Gap Notice

Record gap notice makes missing or impaired evidence visible without sensationalizing it. It identifies an expected active-role record that is incomplete, of uncertain integrity, under reconstruction, or unrecoverable. An intact record that is protected, restricted, or awaiting release receives an access or release notice instead. When both conditions apply, the notice states them separately. Neither an unexplained gap nor a lawful restriction should be presented as proof of misconduct.

A gap notice should identify the expected record that is missing, incomplete, or of uncertain integrity. It should state what is known, what remains unknown, who is reviewing the failure, whether reconstruction is underway, and when the status will be updated. Protected nonvisibility, restricted access, delayed

classification, and pending masking receive separate status labels. They appear beside a gap notice only when an actual loss or impairment of expected evidence also occurred. No label should imply misconduct before a finding supports it.

Gap notices need precision rather than euphemism. Record unavailable without explanation invites suspicion and protects the institution; serious hidden breach before review can injure participants and staff. A fair notice states what is known, what remains unknown, who is reviewing the event, and when the status will change.

Gap notice is especially important for public timing. If an event occurs near a readiness bundle, campaign transition, office interface, public controversy, staff complaint, or allegation of influence, missing record material can shape public judgment. The notice should prevent the gap from being exploited by supporters, opponents, media, or the institution itself. The gap is a fact with a status, not a blank screen for narrative war.

Participants and affected persons should have a route to challenge a gap notice. The participant may argue that the notice implies suspicion unfairly. An affected person may argue that the notice understates harm or hides a protected category. Staff may argue that institutional management caused the gap. Correcting a notice should be part of record correction rather than a public-relations choice.

Rumor governs when an unexplained absence enters a public record and people fill it with fear, loyalty, hostility, or

imagination. A fair gap notice does not resolve every uncertainty. It prevents uncertainty from becoming unaccountable power.

The notice should also be designed for hostile interpretation. Supporters may use a gap to claim persecution. Opponents may use it to claim corruption. The City cannot control misuse, but it can reduce fuel by writing labels that are exact, calm, and tied to review. The tone of a gap notice is part of its fairness.

2.5.5 — Remedy and Correction

Remedy and correction turn record failure from embarrassment into answerability. A continuity break, misclassification, improper release, hidden access, technical failure, false summary, inadequate masking, or delayed notice should not end with an internal acknowledgment. The City must ask who was burdened, what public understanding was distorted, what record must change, what harm requires repair, and what system must be altered to prevent recurrence.

Correction has several layers. Affected persons may need notification, apology, support, privacy repair, or legal remedy. Staff may need protection if they reported the problem.

Remedy should not depend on proof of bad intent. A public record can mislead without malice. Intent matters for discipline, but harm and correction matter for fairness.

A complete system must also repair institutional incentives. If staff were pressured to classify broadly, if vendors made audit difficult, if release deadlines encouraged shortcuts, if public attention rewarded sensational fragments, or if leadership

suppressed bad news, individual correction is not enough. Otherwise the next record will carry the same hidden burden.

Correction standing belongs to every person or public user burdened by the record. Staff, nonparticipants, visitors, host residents, journalists, critics, affected persons, and participants can raise error, context, access, or exposure claims through routes that do not require loyalty or insider status. An answerable public memory repairs harm beyond its own membership.

Cosmetic correction cannot repair a public distortion that has already spread; a small edit buried in the archive is not enough. The City may need prominent correction, notification, machine-summary update, public-bundle versioning, search-result correction, and external audit. The record's integrity depends on the institution's willingness to make correction visible enough to matter.

Remedy should also include learning duties. A corrected error should feed training, design revision, vendor review, policy change, and audit memory. Failure memory is how the institution carries its own burden instead of moving it onto the next participant or affected person.

2.5.6 — Public Status Labels

Public status labels are the vocabulary by which the City tells the public what kind of record condition it is seeing. A label may identify active, paused, delayed, restricted, protected, under review, corrected, disputed, sealed, deleted under schedule, or unrecoverable status. It is public burden management.

A label should be precise without exposing what it protects. “Release delayed pending nonparticipant masking” may be safer than immediate public access. The label should carry enough information to locate the burden while refusing unnecessary exposure.

Public labels separate process status from moral meaning. Under review marks an unresolved process; restricted marks controlled access; protected marks a dignity boundary; corrected marks a change to the record; disputed marks an active challenge; sealed marks a lawful access condition. By displaying status, owner, date, and review path, the record slows the rush from procedural state to moral judgment.

The label system should be standardized before public use. Standard definitions, examples, update rules, appeal routes, and expiration or review dates should be public enough to be understood. Internal labels may be more detailed, but public labels should map to stable categories rather than institutional mood.

Artificial Intelligence and search systems must preserve the same status architecture visible to human readers. Machine summaries and search results should display restriction, dispute, version, correction history, provenance, and uncertainty where relevant. A label has done its work only when it survives retrieval, synthesis, export, and public reuse.

Public labels need plain-language definitions near the record. Readers should understand delayed, restricted, protected, disputed, corrected, sealed, and under review without legal

training. Status language must be navigable without becoming falsely certain.

Labels should remain conceptually stable across jurisdictions and translations. Protected cannot mean hidden in one place and restricted raw access with public summary in another. Safeguards that cannot travel with language will not survive replication.

Status labels must travel with excerpts and change interpretation. Complete, partial, delayed, protected, disputed, corrected, superseded, under investigation, provenance uncertain, access breached, and withdrawn each need an effective date. A detached record without its label is not protected. Continuity failure now triggers classification, protection, repair, and an accurate public status. Pause and exit must preserve both accountability and a future beyond the City. The review must ask what happens when interruption reflects consent, health, family burden, capacity, role fit, or a decision to leave.

2.6 — Exit Instead of Secret Exception

A severe civic Vow becomes fair only if the participant can leave by a lawful route. Exit is not the enemy of transparency. It is the alternative to secret exception, hidden active life, coerced endurance, and institutional self-protection. A City that cannot let people leave will eventually teach them to hide (Hirschman, 1970; Wertheimer, 1987; United Nations, 1966).

Exit also protects the public. If a participant remains active only in name while living through unrecorded exceptions, the public receives a false continuity story. A pause or exit label may be disappointing, but it is honest. Public trust is better served by a visible status change than by an active record that survives only through concealment.

Exit, pause, withdrawal review, no-shame departure, and post-exit boundaries are parts of the record regime. They are structural safeguards, not merely welfare policies. Together they keep the Vow from becoming captivity, keep protection from becoming evasion, and make active status credible by giving it a real and lawful end.

The relevant question is where the cost of continuing would land. Sometimes it lands on the participant's health, family, staff, protected persons, host community, public understanding, or institutional integrity. In those cases, exit or pause may carry less hidden burden than forced continuity. The City should be brave enough to say so.

2.6.1 — Exit as Integrity Tool

Exit is an integrity tool because it keeps the active record honest. When a participant can no longer carry the role-bound active-period public-power record, the institution should prefer an explicit status change to informal exception. The public record can then say what happened at the level appropriate to the case: voluntary withdrawal, health-related exit, family-burden exit, misconduct removal, role mismatch, completion, or institutional failure. The label may be painful, but it is cleaner than hidden continuation.

The institution also needs authority to release participants when its own conditions fail. Misused records, inadequate third-party protection, unsustainable staff systems, legal limits, technical breakdown, or spectacle pressure may make continued active burden unjustifiable. Independent review can order de-loading, pause, protected exit, or closure, with care and record repair following the person. This power proves that the Vow serves a bounded civic purpose rather than institutional self-preservation.

Exit should preserve active-period accountability where justified. Departure does not erase the public-power record created while active, does not cancel remedies owed to affected persons, does not hide misconduct, and does not remove the City's failure memory. The participant exits future burden; the record of active burden remains governed. The distinction lets exit protect future privacy without rewriting the past.

Secret survival begins when unofficial exceptions preserve participation because public exit would embarrass the City; at that

point, the Vow has become false. An honest exit may reduce institutional prestige in the short term, but it protects the City's deeper claim: public-power burden should be reviewable even when review reveals limits.

Exit planning should begin at entry. The applicant should know how to request withdrawal, what happens to active-period records, what support continues temporarily, how family and dependents are handled, and what public status may appear. Exit explained only at collapse becomes coercive because the participant must decide under fear and exhaustion. A fair Vow names the door before the room becomes hard.

Pause is different from active participation. A paused participant is not secretly active. The person may de-load, receive care, consult family, handle legal or health matters, or reassess capacity without continuing role formation through hidden channels. A pause label tells the public that active burden has changed, while the pause process protects dignity and avoids premature exit where recovery or review may be possible.

2.6.2 — Pause Versus Active Participation

Pause rules must specify which City-sponsored duties stop and which support continues. Basic support, care, necessary administration, and review may remain available. The City must not continue strategic coaching, donor access, policy assignments, public-interface preparation, or office-readiness work covertly while describing the participant as paused. This restriction governs the City's active-role program; it does not authorize surveillance of private thought, ordinary relationships,

or lawful political activity outside that program. Any proposed return to active status requires a declared transition and review of role-relevant conflicts, not a claim over all conduct during the pause.

Pause should have entry criteria. Health overload, family emergency, technical failure, legal review, protected-category complexity, security threat, capacity concern, staff conflict, or participant request may justify it. The criteria should be broad enough to protect real life and narrow enough to prevent evasion. A pause granted for every inconvenience would dissolve the Vow. A pause denied until collapse would make the Vow cruel.

Pause should also have review dates and transition options. The outcome may be return to active participation, modified support, extended pause, withdrawal, suspension, removal, or institutional correction. The status should not drift indefinitely. Drift burdens the participant, staff, and public because no one knows whether active formation is continuing, suspended, or quietly abandoned.

A shadow pause is off-record active life under a gentler name if role formation continues privately; refusing pause to avoid public disappointment turns active participation toward captivity. A fair pause regime protects truth by letting active burden stop visibly before hidden exception begins.

Pause should be visible to internal systems as well as public materials. Staff schedules, access permissions, public-interface calendars, role assignments, record capture rules, education requirements, advisor contacts, and support services should all reflect paused status. Otherwise the label will say pause while

daily operations continue activation by habit. Status must change workflow, not merely narrative.

Withdrawal review protects consent under changed circumstances. The fact that a participant understood the Vow at entry does not mean every later burden remains fair. Illness, disability, family change, legal development, harassment, public threat, staff failure, technological change, record breach, or discovered misunderstanding can alter the moral status of continued participation. Withdrawal review lets the institution ask whether the original commitment still rests on fair conditions.

A pause needs a defined legal and operational state. The institution must decide whether new capture stops, prior access continues, and a public label appears. It must also specify whether stipend, housing, care, and dependent support remain; what contact is permitted; who reviews return; and when a new decision becomes mandatory. Ambiguity would turn pause into either secret participation or disguised expulsion.

2.6.3 — Withdrawal Review

The review should begin from respect for the participant's stated reason without surrendering public accountability automatically. A person may need to leave for deeply private reasons. Withdrawal cannot require public confession. It should identify what level of public status is necessary to explain the active record, preserve remedies, and protect affected persons, while withholding raw protected material where dignity requires it.

Withdrawal review should also identify institutional obligations. Has the City provided promised support? Did notice accurately

describe the burden? Were protected nonvisibility processes functioning? Did public release create unexpected harm? Did staff or donors exert pressure? Did technical systems expand beyond understood scope? If the institution changed the burden, it should not treat withdrawal as participant failure.

Withdrawal review records and implements the participant's decision to leave; it does not make voluntary departure conditional on institutional approval. The review may offer a pause, arrange support, modify conditions at the participant's request, open a complaint, initiate institutional correction, preserve the governed active-period record, or refer alleged misconduct to a separate process. Accountability and remedy can continue after departure, but they must not be used to require continued participation. These outcomes remain distinct because withdrawal is a change of status, not a single moral category.

Affected persons may need a voice in withdrawal review when their rights or remedies are at stake. A participant should not be able to leave in a way that erases an unresolved staff complaint, family exposure, nonparticipant harm, record breach, or public misrepresentation. At the same time, affected-person participation should not become retaliation or forced exposure. The review route must balance dignity, remedy, and public memory.

Withdrawal review should include the possibility of participant success. Sometimes leaving is the right civic decision because the participant recognizes misfit, competing duty, or changed ambition before harm occurs. The City should be able to say that

withdrawal preserved fairness. Not every ending is failure, and not every continuation is courage.

The review should also protect against strategic withdrawal. A participant should not be able to exit just before a serious complaint, continuity review, or influence investigation and thereby erase public relevance. The City may need to preserve active-period record status, continue remedy processes, or state unresolved questions while still ending future burden. Exit changes status; it does not cancel accountability.

2.6.4 — No Shame in Leaving

No shame in leaving is not sentimental kindness. It is a structural necessity. If leaving marks a person as cowardly, impure, disloyal, failed, weak, or unworthy, the City will coerce continued participation through reputation. A Vow that can be continued only by shame is not voluntary. It is social captivity with beautiful language.

Departure needs a civic vocabulary rather than a moral hierarchy. Not yet, no longer active, withdrawn, completed, redirected, suspended, removed, and reintegrating describe institutional status, not human worth. Even removal for misconduct should identify conduct and consequence without converting the person's entire life into an object of contempt.

No-shame departure protects ordinary citizens as well. The City must not teach the public that people outside its record are less brave, less trustworthy, less fair, or less suited to human dignity. A person who never enters and a person who leaves remain fully

complete. The City is a role-burden institution, not a ladder of worth. Its language around exit should make that unmistakable.

No shame does not mean no consequence. Misconduct may require remedy, correction, or public notice. The City must be able to be serious without being cruel.

Public artifacts should follow the same rule. Exit pages, summary entries, captions, archive labels, interviews, donor materials, and social excerpts should not use departure as a cautionary tale, loyalty test, or inspirational sacrifice story. The institution should not harvest leaving as content.

Shame becomes leverage when leaving threatens identity, family standing, professional future, or public dignity; at that point, the City has built a trap. A fair City lets a person leave with truth, consequence, privacy, and dignity held together.

No-shame language should appear in how other participants speak as well as in official labels. If the culture of the City treats leavers as weak even while the policy says exit is honorable, the real rule will be shame. Staff, mentors, educators, public-interface workers, and participants should be trained to speak of exit as a legitimate status change, not a moral fall.

This safeguard also protects those who remain. The active record is a role burden, not a tournament of pain. No shame in leaving helps prevent those who stay from converting endurance into rank.

2.6.5 — Post-Exit Boundary

The post-exit boundary restores future ordinary privacy while preserving the active-period record that public trust may need. A participant's active record may remain for accountability, correction, remedy, lawful retention, public memory, or institutional learning. But the City's authority to create new active records ends when active status ends, except for defined administrative, legal, safety, or correction-related purposes.

The boundary should be visible in the public record. Public materials should distinguish active-period evidence, post-exit updates about the old record, later public office records handled by government, ordinary public speech, private life, and unrelated future conduct. Without this distinction, the City's archive becomes a permanent identity system.

Post-exit communication should be limited by purpose. The City may need to notify the public of withdrawal, preserve an active-period bundle, provide correction, handle appeals, support reintegration, or comply with law. Curiosity after exit is not public-power formation.

Post-exit boundary also limits research and Artificial Intelligence use. Any later use must pass the separate gates described earlier: lawful authority, consent where required, nonparticipant protection, purpose limitation, correction, and human review. Exit does not turn dignity into archival raw material.

The boundary needs long-term review because records outlive the active role. Retention, sealing, deletion, bundle updates,

correction, appeal, and posthumous dignity require clocks. A record kept forever without purpose becomes hidden cost.

Permanent transparency would turn a role burden into a lifelong mark. The design instead preserves justified active-period records, restores future privacy after the role ends, and makes the boundary legible to the public, the participant, staff, and later systems.

Post-exit rules also govern narrative ownership. The City may preserve an accurate role record without continually using a former participant as warning, success story, or brand asset. Later work, family life, belief, health, and ordinary change remain private unless a new public role creates a separate lawful basis.

Chapter 3 — The City's Boundaries

The City's boundaries are part of its affirmative design. A bounded civic institution can prepare adults for substantial public responsibility only when practical exit, plural conscience, anti-spectacle controls, authority separation, no credential of worth, and scientific claim discipline are observable in operation. These are not reassurance labels. They are tests by which participants, families, staff, hosts, critics, and the public can determine whether the institution remains what it says it is.

The first work of this chapter is therefore negative, but not merely defensive. Negation becomes architecture when it identifies a failure mode and then assigns a design obligation. To say the City is not a prison means entry, exit, rights, perimeter, and care must be built in non-carceral form. To say it is not a cult means dissent, plural conscience, founder limits, spiritual optionality, and exit without betrayal must be operational facts, not sentimental claims.

Public misunderstanding is not an accidental problem outside the institution. Misdescription can become a hidden designer. A campus called total openness will tempt designers to reduce privacy. A record site described as absolute truth will tempt viewers to treat records as souls. A formation program praised as proof will tempt supporters to use civic function as scientific validation. Bad description shifts burden onto the people who later have to live inside the misunderstanding.

Every false form in this chapter misplaces burden. A prison places coercive burden on the confined person. A cult places belonging burden on conscience and loyalty. A spectacle park places entertainment burden on the exposed person. A shadow

government places authority burden outside law. A virtue certificate places worth burden on those who are not certified. A proof shrine places scientific burden on civic success and makes human beings carry a theory's public hunger.

The City is severe because public power is severe. It is not severe because privacy is inferior, because ordinary citizens owe their lives to spectators, because technology can discover virtue, because a founder can certify meaning, because an archive can read inner life, or because a successful pilot can validate the Law of Fairness. Its severity has one narrow justification: adults who seek consequential public power may fairly carry extra role-bound burden before asking ordinary people to trust them.

Vividness can seduce before structure has earned trust. Land, architecture, infrastructure, dashboards, ceremony, and public imagery can make the City feel legitimate while its type remains wrong. The design must therefore reject the prison, cult, spectacle, shadow-government, virtue-certificate, and proof-shrine pathways before any of those surfaces are allowed to become attractive.

Skepticism deserves mechanisms rather than reassurance. A journalist, privacy lawyer, prison abolitionist, cult-studies scholar, constitutional theorist, scientist, or ordinary reader should be able to trace each refusal into entry rules, exit rights, record boundaries, authority labels, complaint routes, and stop conditions. The proper institutional voice is calm enough to build and severe enough to stop.

Three operational tests organize the chapter's boundary work. The carceral test asks whether movement, exit, and review remain genuinely available. The cult test asks whether conscience, criticism, outside relationships, and leadership correction remain free from loyalty control. The spectacle test asks whether records serve civic judgment instead of entertainment, humiliation, monetized exposure, or contextless clipping. These tests translate broad refusals into observable institutional behavior.

The fourth refusal is governmental. The City may form and support people who seek public authority, but government remains government. Elections, appointments, offices, courts, agencies, constitutional validity, public administration, and lawful coercive power remain outside the City's ownership. The fifth refusal is moral ranking. Participation does not make a person worth more than a private citizen, and nonparticipation does not make a life lesser. The sixth refusal is scientific overclaim. City success can show operational feasibility; it cannot validate PTVC.

The tests must appear throughout the institution: doors, visitor flows, record labels, public bundles, staff training, grievance procedures, release policies, donor materials, tours, diagrams, machine summaries, excerpts, and captions. Each surface should reveal the relevant purpose, right, decision owner, review path, and remedy. Language begins the design review, but operation completes it.

The chapter protects the people who bear the highest cost when civic enthusiasm outruns boundaries. Ordinary citizens retain complete standing in private life. Children and dependents remain

outside adult public-power burden. Staff receive their own labor, privacy, and complaint protections. Critics retain adversarial independence, and former participants recover ordinary life without permanent institutional marking. These protections define the City's legitimacy more clearly than any claim of moral distinction.

The City will be credible only if it can answer hostile description without asking for charitable reading. Imagine a skeptical headline calling the City a high-design prison, leadership cult, civic reality show, shadow state, virtue machine, or pseudo-scientific shrine. The answer cannot be a press statement. The answer must be mechanisms: lawful entry, real exit, protected dissent, anti-spectacle release, authority labels, role-specific evidence, scientific deference, human appeal, and stoppability.

The governing question is where the burden goes. This chapter applies that question before the City receives detail. If a denial simply protects the City's reputation, it is not enough. A denial must show who is protected, who can object, what record stage is involved, what remedy exists, what authority remains outside the City, and what failure condition would force correction, pause, or closure.

Practical voluntariness is the chapter's first cross-cutting test because formal consent can coexist with conditions that make refusal unreal. The inquiry must follow the applicant's alternatives, material dependence, time to decide, access to independent advice, consequences of saying no, and ability to revise consent after entry. It must also ask whether housing, health care, debt relief, immigration status, professional

opportunity, or public reputation have become leverage. Consent is strongest when support remains available without ownership and when the institution can demonstrate that a person had a credible route away from it (O'Neill, 2002a; Wertheimer, 1987; ILO, 2025).

That test cannot be administered only by the people who designed the City. Participants, former participants, staff, families, host-community representatives, independent counsel, disability advocates, privacy specialists, and external inspectors will see different forms of pressure. A boundary is credible when those perspectives can trigger review, pause, remedy, or redesign without first accepting the institution's vocabulary. The City should therefore treat an outsider's classification problem as operational evidence: what does the arrangement look like when the mission statement is removed and only the powers, dependencies, records, exits, and remedies remain?

The six refusals in this chapter can be examined through that stripped-description test. If the remaining facts resemble confinement, a high-control group, a humiliation market, parallel government, a status caste, or proof theater, the name Transparent City does not cure the defect. The burden lies with the institution to alter the mechanism until the ordinary description changes. This converts public skepticism from a public-relations obstacle into a design instrument and gives later auditors a disciplined way to distinguish aspiration from institutional type.

A city that knows only its aspiration will eventually excuse itself. A city that knows its dangers can be designed. The City must be able to look at its admirers and say no, at its critics and say you

may be right to worry, and at itself and say stop if this boundary fails. That posture is not self-doubt. It is the institutional beginning of fairness.

Boundaries also carry a burden of proof. When the City describes a mechanism as voluntary, noncarceral, noncultic, or non-ranking, the institution should show how that mechanism works for the person with the least leverage. The relevant perspective may belong to an applicant who cannot afford to lose housing, a staff member whose complaint threatens a career, a family member who never chose visibility, a critic who enters under hostile conditions, or a former participant who wants an ordinary future. A boundary becomes credible when those people can use it without first displaying gratitude, loyalty, eloquence, or insider knowledge. The burden of proof should rise with the institution's practical leverage: the more it controls access to housing, support, records, reputation, or continued participation, the less silence or compliance can count as evidence that the boundary is working. Dependence therefore changes what counts as evidence; endurance by someone who cannot safely refuse is weaker evidence of legitimacy than a challenge the institution permits without retaliation.

The boundary tests must work under pressure. During crisis, donor influence, security fear, charismatic leadership, hostile media attention, institutional fatigue, or technical failure, rights, exit, protected nonvisibility, independent audit, and stop authority remain available through precommitted procedures. Each exception carries a purpose, owner, duration, review date, appeal, and an appropriate status record. Durability is demonstrated when

the safeguards operate precisely when the institution has the strongest incentive to suspend them. The same test continues after the pressure passes: temporary access, authority, and exceptional practices should contract on schedule rather than survive as convenient precedent. Review should therefore ask not only whether the City handled the exceptional moment lawfully, but whether it actually returned to its ordinary boundaries afterward.

Each refusal also needs an honest comparator. Noncarcerality should be examined against custody, confinement, parole-like dependency, and the practical consequences of leaving. Noncultural design should be compared with high-control groups, founder-centered loyalty systems, and environments where dissent threatens belonging. Nonspectacle design should be tested against entertainment production, monetized exposure, and attention markets. The government boundary should be compared with the powers of actual public agencies, the virtue boundary with credentialing systems that can turn participation into status, and the proof boundary with scientific projects vulnerable to evidentiary overclaim. Comparison prevents the City from inventing a private definition of safety that only its designers can pass. The comparison should also include the nearest legitimate alternative, not only the dangerous extreme. Otherwise the City can appear safely distinct simply because it was compared with an abusive form rather than with the ordinary institution most similar to it in purpose, power, dependency, or operation.

3.1 — Not a Prison

Practical voluntariness is the City's first legitimacy test. A place with a perimeter, routines, record systems, security gates, role obligations, and structured exit remains civic only when entry is informed, continued participation is genuinely revisable, and leaving is materially possible. Good intent cannot supply those conditions; observable differences from custody must (United Nations, 1966; United Nations, 2015; Goffman, 1961; Foucault, 1977; ILO, 2025).

The City cannot invoke its mission to make constraint harmless. Constraint always places burden somewhere. If a participant is not genuinely free to enter, not practically free to leave, not protected by rights, not cared for under load, or made to live under a perimeter that feels like ownership, then the City has shifted civic reform into carceral form.

The non-prison boundary is therefore a compound boundary. Voluntary entry, real exit, rights under constraint, a non-carceral perimeter, and care before control must all point in the same direction. If one element points toward captivity, the other elements cannot redeem it. A fair City must be able to be inspected by people who do not already believe in it.

Voluntary entry is the first wall between the City and custody. A person who enters the Transparent City must be an adult who understands the Transparent Vow, the active-period record, the limits on off-record public-power formation, the rights that remain, the exit routes, and the possible public consequences of

participation. Consent cannot be treated as a signature collected after persuasion has already done its work.

3.1.1 — Voluntary Entry

Accordingly, the institution should separate application, orientation, independent advice, commitment, and activation. Application may begin in aspiration; activation must begin in informed capacity. A candidate should have time to read the Vow, speak with counsel or an independent advocate, consult family or dependents where relevant, understand record stages, review health and load obligations, and decline without penalty. A compressed or theatrical entry process would place institutional momentum on the applicant's shoulders.

Voluntary entry is also role-specific. A person enters because they seek a public-power formation role, not because they are morally higher, spiritually chosen, scientifically interesting, or personally transparent by nature. The burden attaches to the chosen active role. The applicant's private worth, family dignity, childhood history, faith, sexuality, medical life, and future ordinary life are not surrendered as metaphysical collateral.

Entry is not genuinely voluntary when institutional threats, exploitation of vulnerability, or dependence make refusal impracticable. Shame, emergency, donor pressure, career anxiety, family need, religious belonging, and public acclaim therefore require careful review rather than a presumption that a signature settles consent. The applicant must retain a credible alternative, independent advice, time to decide, and basic support free from

retaliatory withdrawal. A voluntary threshold is a process that can withstand a person's no.

The entry mechanism should also include an anti-recruitment safeguard. The City may publish eligibility, answer questions, and accept applications, but it should not hunt for vulnerable people at moments of crisis, scandal, debt, public shame, or grief. Public-power seekers may be invited to consider burden, but they should not be emotionally cornered into it. Recruitment that depends on weakness would make the institution look voluntary while shifting pressure onto the applicant's most exposed moment.

A strong entry file should document what was not used: no undisclosed inducement, threat of lost support, donor pressure, family coercion, spiritual claim of destiny, hidden promise of office, or punishment for refusal. Such negative evidence may attract little public attention, but it is early evidence that entry remained voluntary and that the threshold was not custody in another language.

Practical voluntariness should be tested as a continuing condition rather than presumed from an application. The first question is whether the person had a real alternative before entry. The second is whether the material consequences of refusal were disclosed. The third is whether debt, immigration status, housing, medical need, employment, family dependence, or reputational pressure made refusal nominal. The fourth is whether independent advice was available before commitment (ILO, 2025).

The test continues after entry. Can the participant raise a complaint without retaliation? Can they decline a specific activity without being recast as disloyal? Can they pause without losing care or basic stability? Can they exit without forfeiting earned compensation, essential records, legal support, or the dignity of a public explanation? A voluntary institution is defined less by the ease of joining than by the reality of saying no after belonging has become costly.

Indicators developed in forced-labour prevention should not be transplanted as accusations, but they offer a useful adversarial checklist: abuse of vulnerability, deception, restriction of movement, isolation, intimidation, retention of identity documents, withholding of wages, debt bondage, abusive conditions, and excessive overtime. A City that begins to resemble these conditions cannot defend itself by pointing to an old consent form. It must treat the pattern as evidence that voluntariness has failed.

3.1.2 — Real Exit

Exit must have more than one path. There should be ordinary exit after reflection, urgent exit for safety or incapacity, pause or de-loading when the participant needs temporary relief, removal where misconduct or load failure requires it, and administrative exit when role eligibility changes. Each path should have status labels, care obligations, record handling, appeal where appropriate, and post-exit boundaries. Secret exception is more dangerous than declared exit because it hides active burden while preserving the image of continuity.

Public record after exit must remain limited by purpose. The active-period record may remain reviewable where public-power accountability requires it, but the former participant does not become a permanent public object. Post-exit life should not be monitored through location tracking, social-media enrichment, purchased data, informal staff updates, alumni surveillance, donor invitations, or public curiosity. Renewed public relevance must have its own authority.

The final test of real exit is ordinary return. A former participant should be able to become boring again. They may remain accountable for active-period conduct, but they should not be followed as a permanent symbol. If the culture treats leaving as disgrace, betrayal, weakness, contamination, or evidence of low worth, the City has smuggled custody into identity.

Exit also needs independent witnesses. If the same office that benefits from a participant's continued presence controls the exit determination, the process will not be trusted. A fair design gives the participant access to an ombuds, counsel or independent advocate, medical review where relevant, and a public status label that says only what public-power accountability requires. The story of departure cannot belong to the institution alone.

Aggregate exit data can test practical voluntariness without turning departures into spectacle. The public should be able to see patterns of pause, withdrawal, redirection, health-related exit, family burden, record challenge, and reintegration support while individual privacy remains protected. No one should owe a private confession as the price of proving that departure exists (Hirschman, 1970; Wertheimer, 1987).

Real exit requires both a door and a landing place. The participant needs time, transport, housing continuity, access to personal property, independent counsel, health and mental-health support, dependent protection, transfer of earned funds, and a record explaining the status change without stigma. An exit route that leaves a person materially stranded is an architectural permission with little practical value.

Exit also needs an information boundary. The City may explain that participation ended and preserve the historical record, but it should not speculate publicly about motive, diagnosis, loyalty, weakness, or moral failure. The former participant should have a right of reply and a route to challenge inaccurate summaries. The public can be told what happened institutionally without being invited to consume the person's private crisis.

3.1.3 — Rights Under Constraint

The rights floor should be written before the first participant arrives. It must state what may be recorded, what may not be released, who may access restricted material, and how complaints and emergency actions are reviewed. It must also shield nonparticipants, protect medical and legal boundaries, log staff influence, and provide a route for challenging interpretation. Rights invented after crisis become public relations.

Rights also belong to people near the participant. Partners, children, dependents, professional helpers, visitors, staff, and incidental contacts do not lose their own boundaries because an adult sought public power. Their nonvisibility, correction, notice, complaint, and remedy routes are part of the non-prison

boundary. A noncarceral institution must reverse the logic that treats surrounding persons as extensions of the managed body.

Rights under constraint should be readable in ordinary language. A participant should not need a specialist to understand which rights survive the Vow, how to complain, how to appeal, how to request shielding, how to challenge a release, and how to contact outside help. If rights are written only in internal legal form, the burden of comprehension has been shifted to the person under pressure. A fair rights floor must be understandable before it is needed.

The rights architecture should also include pattern review. A single complaint may be handled correctly while a pattern reveals intimidation, delay, access barriers, staff bias, or hidden retaliation. Periodic public summaries should show categories and reforms without exposing protected persons. Pattern review must begin before catastrophe reveals whether the rights system works in practice.

A mature rights floor should include emergency rights. The moment of crisis is when rights are easiest to treat as inconvenient. A participant in panic, illness, conflict, security alarm, or public controversy still needs status notice, de-escalation, care access, record logging, after-action review, and an appeal route where consequences follow. The City is most unlike prison when the pressure to control is highest and it still remembers the person.

Every constraint should be decomposed into purpose, duration, decision owner, review, appeal, and remedy. A secure-area access

limit, an emergency safety separation, and a delayed-release rule serve different functions and therefore require different authorities. The record identifies what triggered the constraint, who approved it, how the affected person can challenge it, and when it expires. This architecture keeps temporary protection from silently becoming general control.

3.1.4 — Non-Carceral Perimeter

A non-carceral perimeter starts with purpose-labeled gates. Some gates protect record systems. Some protect residential edges. Some manage visitor flows. Some preserve recovery zones. Some separate public interface from household life. Each gate should explain what burden it prevents from moving onto the wrong person. A gate without a clear purpose begins to look like power for its own sake.

The test is whether a participant can describe the perimeter without using the language of captivity. If the boundary exists to protect the right people from the wrong visibility, it belongs to the City. If it exists to keep participants available for the institution's narrative, it has become carceral. The difference will be felt in doors, routes, staff tone, signage, and exit practice.

Perimeter rules should separate entry control from exit control. A secure gate that carefully screens visitors is not the same as a gate that delays a participant's lawful departure. The City can protect residents from intrusion while making exit administratively simple and physically legible. A participant should know where to go, whom to notify, what happens to the record, and how to

leave without negotiating with security as if seeking permission from custody.

The perimeter should also protect the host community. A non-carceral boundary is not only about participants inside. It should prevent crowds, media, activists, vendors, fans, or hostile observers from spilling burden into surrounding neighborhoods. If the City protects its image while the host community absorbs traffic, surveillance, policing tension, or spectacle, the perimeter has failed the burden question from the other side.

The perimeter should communicate safety and relationship to children and dependents as clearly as it communicates access rules to experts. Family routes, visitor explanations, household edges, and contact procedures should show that the participant remains reachable and that institutional access does not depend on favor. Design language, staff practice, and physical form must make the boundary feel like governed civic infrastructure rather than custody or display.

A non-carceral perimeter is designed to protect boundaries, not to make departure difficult. Gates may distinguish participants, staff, visitors, media, protesters, delivery personnel, and emergency responders, but they should not create a psychology of custody. Wayfinding should show exits. Security staff should be trained in de-escalation and rights. Visitor rules should be published. Searches, restraints, detention, and exclusion should remain governed by law and external authority, not by the City's self-image.

3.1.5 — Care Before Control

Care should not be cosmetic softness around hard domination. It should have authority. Clinicians, mentors, disability specialists, participant advocates, and ombuds must be able to trigger review when record burden, schedule, public interface, security practice, or staff influence becomes unsafe. Care professionals should not be reduced to keeping participants functional for institutional output.

Care before control also protects staff. Security workers, clinicians, mentors, archivists, and educators should not be asked to carry impossible contradictions in private. If staff are told to keep the City safe while hiding overload, suppressing complaint, or treating participants as content, the hidden burden has simply moved backstage. Staff need training, role clarity, reporting routes, and protection from retaliation when they say the institution is drifting.

The public should see care as evidence of seriousness, not weakness. A pause, de-loading event, medical restriction, accessibility adjustment, or exit can be a sign that the City understands burden. Humane failure should not be concealed to preserve an image of heroic transparency. Public-power formation is not a theater of toughness. It is preparation for roles where unchecked toughness often becomes harm.

Care before control should have budget priority. It is easy to fund cameras, locks, incident systems, and security posts while treating sleep protection, trauma support, disability accommodations, family consultation, de-loading, and clinical independence as soft

costs. The budget tells the truth. If control receives durable funding and care depends on goodwill, the institution has already chosen the wrong moral sequence.

Care before control should include a burden-transfer review after every new restriction. If the City adds a gate, camera, escort rule, curfew-like limit, or public-interface constraint, it should ask whose burden has increased: participant, staff, family, visitor, host, or public. Security may be justified, but fairness requires the institution to count the cost of its own protective reflexes rather than naming them neutral.

Care before control changes the first institutional response to distress. When a participant misses obligations, withdraws, becomes disorganized, or appears overwhelmed, the initial question is what support, illness, conflict, exhaustion, or harm may be present. Security or disciplinary escalation may sometimes be necessary, but it should not become the default language through which vulnerability is translated into threat. Care teams need independence from performance evaluation so seeking help does not become self-incrimination.

3.2 — Not a Cult

Plural conscience and freely exercisable dissent are civic assets, not obstacles to formation. Coercive belonging can grow around politics, therapy, technology, philanthropy, education, leadership, science, nationalism, or reform, so a secular label offers no protection by itself. The operational test is whether interpretation, criticism, outside relationships, and exit remain free when the institution becomes admired (Lifton, 1961; Lalich, 2004; Tourish, 2013; Hirschman, 1970).

A City organized around visible public-power formation will be especially vulnerable to group intensity. Participants may live together, study together, face criticism together, recover together, and become symbols together. The public may project hope onto them. Donors may praise them. Critics may attack them. Shared pressure can create loyalty rituals even when no one writes a doctrine. The City must design against that social chemistry.

The belonging test asks who carries the burden of membership. In a cultic system, the individual carries the burden of protecting the group's image, the dissenter carries the burden of being treated as betrayal, and the outsider carries the burden of being morally lesser. In a fair City, the institution carries the burden of protecting plural conscience, dissent, refusal, and the right to leave without spiritual or civic disgrace.

No sacred membership requirement means the City cannot require participation in the Religion of Fairness, theological assent, spiritual practice, ritual belonging, metaphysical language, or reverence for the Law of Fairness as a condition of

entry, participation, office support, public trust, or exit dignity. A participant may be religious, secular, skeptical, agnostic, atheist, a participant in the Religion of Fairness, or otherwise. The City forms public-power roles. It does not govern conscience.

3.2.1 — No Sacred Membership Requirement

This boundary must be visible in admissions. The application may ask whether a person understands the City's civic burden, record rules, rights, and limits. It should not ask whether the person believes the formal Law is true, finds the optional spiritual path explored in *The Religion of Fairness* meaningful, accepts a founder's interpretation, or treats transparency as sacred. Public-power formation requires public accountability, not spiritual conformity.

Daily life must also preserve plural conscience. Reflection spaces should not become mandatory religious spaces. Optional rituals should not become unofficial tests. Language about burden, repair, apology, grief, ambition, and service should be accessible to people who do not share the same metaphysical frame. A civic institution can make room for meaning without turning meaning into membership.

Public materials should reinforce the distinction. A guide page, tour script, website, caption, or donor description should describe the City as a civic public-power formation institution. It may note that *The Religion of Fairness* explores optional religious meaning elsewhere, but it must not suggest that the City is a religious house, spiritual order, sacred training ground, or required path of salvation.

Devotional substitution begins when civic participation feels like membership in a sacred community rather than a role-bound burden; at that point, the City has moved toward cultic form. The remedy is not hostility to religion. The remedy is role clarity, optionality, plural conscience, and the refusal to make belief pay rent for public power.

Civic vocabulary needs safeguards against sacred substitution. Covenant, vow, burden, service, witness, and repair can express seriousness, but they can also accumulate religious aura or discourage dissent. Each term should be defined through lawful civic obligations, review, and exit so that understanding a rule never requires accepting a hidden theology (Lifton, 1961; Lalich, 2004; Tourish, 2013).

Admissions and public records should never mark belief status as readiness evidence. A participant may mention faith, doubt, or participation in the Religion of Fairness voluntarily where relevant to public-power formation, but the City should not collect belief as a performance metric. The moment belief becomes data for advancement, conscience begins to carry burden that belongs only to the public role.

The City may use ceremony to mark responsibility, but ceremony cannot define a sacred in-group. No creed, metaphysical affirmation, reverence for the founder, belief in PTV, participation in the Religion of Fairness, or emotional display should be required for entry, continuation, trust, or office preparation. Shared civic practice can be solemn without becoming a test of ultimate meaning. The institution should be

able to welcome the religious, nonreligious, uncertain, critical, and indifferent without translating difference into deficiency.

3.2.2 — No Founder Sovereignty

This boundary should be written into governance. Board authority, audit authority, ombuds authority, scientific deference, legal review, accreditation, public artifact review, and complaint systems should not depend on founder approval. A founder should be able to be criticized in the record, investigated by oversight, corrected by experts, and overruled by governance where the institution's safeguards require it.

No founder sovereignty also applies to language. Phrases such as founder vision, loyalty to the origin, true interpretation, inner circle, betrayal of the project, or enemies of the Law can create an atmosphere where personal identity and institutional truth merge. The City should prefer public reasons, written criteria, reviewable decisions, and distributed authority. A phrase that makes disagreement feel like disloyalty should be treated as design damage.

Origin history belongs in the record as context, not as a source of continuing sovereignty. The public archive can document founders, early choices, funding, conflicts, corrections, and dissent while organizing the institution around its lawful mission, rights architecture, participants, staff, host community, critics, and independent review. This treatment turns biography into accountable history and prevents reverence from becoming governance.

Founder limits protect the founder as well as the institution. A project that depends on one person's authority becomes fragile, defensive, and vulnerable to personal scandal or emotional overreach. If the City is right to build, it should be able to survive the absence, error, defeat, correction, or criticism of its founder. If it cannot, it is not a City. It is a court.

No founder sovereignty also requires succession discipline. Even if a founder is wise, charismatic, or unusually careful, the City must not be organized around the founder's continuing presence. A lawful institution needs roles that can be refilled, standards that can be audited, archives that can preserve disagreement, and governance that can correct origin language. Mortality, scandal, illness, conflict, and change should not endanger the City's basic safeguards.

Founder influence should be treated as a temporary governance risk from the beginning. Charisma, authorship, fundraising, public recognition, and historical knowledge can create informal authority even when formal rules appear distributed. The practical safeguards are term limits, independent appointment routes, conflict disclosure, external audit, staff and participant complaint standing, succession plans, access to records, and the power to remove leaders. A founder who cannot be overruled has become a constitutional fact no charter can disguise.

3.2.3 — Dissent Is Legitimate

Dissent should have formal pathways. Participants should be able to criticize curriculum, record handling, staff influence, release decisions, accessibility, screening, public summaries, security,

governance, and the Vow itself. Staff should be able to report overload, retaliation, manipulation, safety concerns, record misuse, or leadership pressure. Host communities should be able to object to burden, traffic, land use, policing, cost, or symbolic capture. Public critics should be able to challenge the City without being framed as enemies of fairness.

Dissent requires a protected record path. A participant who criticizes the City, a staff member who reports a problem, or an external critic who challenges the project should receive context integrity, anti-retaliation, and complaint protections. Public bundles preserve the claim, relevant evidence, response, and review status without absorbing the critic into a dossier or spectacle. Visible disagreement becomes evidence that the institution can learn under pressure.

Dissent also improves the City intellectually. A civil-liberties advocate sees captivity risk. A religious critic sees coercive belonging. A journalist sees spectacle. A scientist sees proof drift. A constitutional lawyer sees shadow authority. A disability expert sees load and access. A labor scholar sees hidden staff burden. If the City cannot learn from these critics, it will mistake admiration for safety.

Dissent routes should include protected internal dissent and public dissent. Internal dissent lets a participant or staff member raise concerns before harm spreads. Public dissent lets critics warn society when internal routes fail or when the concern belongs to citizens beyond the City. The two routes should not compete. A person should not lose protection because they went

public after reasonable internal paths proved unsafe or ineffective.

The institution's response to dissent should itself be logged and reviewed. Did the response change a rule, create a review, disclose a failure, or explain a refusal? A dissent log that records complaints without institutional movement becomes another archive of unheard burden.

Dissent must be capable of changing more than the tone of a meeting. Participants and staff need protected channels to challenge doctrine, training, record categories, leadership, donors, public claims, security practices, and the City's continued existence. The institution should preserve criticism that later proves correct rather than erase it as disloyalty.

3.2.4 — Exit Without Betrayal

The exit narrative should be plain. A pause, voluntary withdrawal, or redirection should not automatically be described as moral failure. The public status label should tell what needs to be known for public-power accountability without turning a human decision into a scarlet mark.

Exit without betrayal protects those who stay. A culture that shames exit also pressures active participants to hide distress, doubt, injury, disagreement, or changed circumstances. A participant who leaves in time may be preserving the institution's integrity rather than failing it.

The culture should also reject betrayal language from supporters. Public-interface moderation, record summaries, alumni policies, and staff scripts should all preserve the participant's dignity. The

burden of public disappointment belongs to the City, not to the departing person.

Exit language should be standardized before public emotion rises. The safest language is often boring: paused, withdrew, exited, redirected, removed after review, or entered post-exit status. Boring language protects dignity because it denies the audience a myth.

A further discipline is to prevent post-exit dependency through honors. Awards, alumni circles, donor dinners, public testimonials, and former-participant panels can keep a person symbolically attached even after formal exit. Exit without betrayal also means exit without permanent ceremonial usefulness.

The language surrounding exit is diagnostic. Terms such as deserter, apostate, failure, traitor, unready, unsafe, or ungrateful can create a social penalty more powerful than a locked gate. Alumni relations should be voluntary, and former participants should retain ordinary rights to criticize the institution publicly.

3.2.5 — Religion of Fairness and Civic Membership Boundary

This boundary protects religious freedom and religious seriousness at the same time. Civic institutions become less fair when spiritual identity becomes a condition of participation. It should state the burden directly and let optional spiritual resonance remain optional.

The boundary should be explicit in programming. If participants may attend voluntary religious services, reflection gatherings,

pastoral conversations, or Religion of Fairness events, those activities must be clearly optional, non-evaluative, non-recorded in a way that affects readiness, and separated from admissions or office-track status. Declining them must have no penalty, visible mark, or whispered interpretation.

The boundary also applies to public artifacts. A cover image, guide page, diagram, donor pitch, room name, ceremony, or social excerpt should not make the City look like a sacred campus, pilgrimage site, temple of transparency, or holy training ground. The City can be beautiful, quiet, and morally charged while remaining civic in status.

Boundary language around the Religion of Fairness should not become contempt for believers. Participants who find religious meaning in their burden should be protected too, provided they do not impose that meaning on others or convert civic record into spiritual rank. The City should permit conscience in many directions: belief, nonbelief, doubt, syncretism, rejection, silence, and change.

Spiritual leverage crosses the boundary when participation in the Religion of Fairness, founder meaning, religious language, or spiritual community becomes an informal condition of acceptance, status, trust, donor favor, public affection, or exit dignity. The repair is separation, disclosure, optionality, review, and the courage to disappoint those who wanted the City to be sacred.

The optional spiritual path explored in The Religion of Fairness belongs to optional spiritual and religious life, not City status.

Prayer, ritual, reflection, secular contemplation, chaplaincy, and comparative study may exist under plural rules, but spiritual interpretation cannot explain records, assess sincerity, guide selection, assign belonging, or settle civic disagreement. Separation protects both faith and institution.

Pastoral and spiritual conversations remain outside the active civic record unless a participant requests a lawful, purpose-defined disclosure. Clergy, chaplains, advisers, and peer facilitators are not investigators or readiness assessors. Confidentiality and reporting limits must be clear before care begins.

The boundary also needs ordinary mechanics. Scheduling, facilities, staff authority, funding, honors, housing, support, and advancement may not favor the Religion of Fairness over another path. Participation, refusal, conversion, doubt, and departure carry no civic consequence.

3.3 — Not a Spectacle Park or Reality Show

A public record serves democracy when context defeats spectacle. Visibility can help citizens judge power, yet the same material can be clipped, monetized, aestheticized, or turned into an appetite for private exposure. The City’s public interface must therefore make civic purpose, provenance, affected-person protection, correction, and contextual access stronger than humiliation, voyeurism, fame, or entertainment (Andrejevic, 2004; Debord, 1994; Marwick and boyd, 2011; UNESCO, 2018).

Imagine a journalist receives a cropped sentence from the record site: “the participant accepted a total active record.” Detached from its surrounding rules, the phrase can be made to sound carceral, devotional, or televisual. A hostile-crop review treats that misreading as a design test rather than as proof of bad faith.

The local public object should therefore carry the scope needed to survive separation. It identifies the chosen adult role, active period, purpose, protected nonvisibility, access class, correction route, and exit boundary in the same view. The interface also preserves a stable link to provenance and makes clear what was not released. Context is not a public-relations supplement; it is part of the record’s integrity.

The test is passed only when a critic can quote the visible object without being forced to invent the missing boundary. The critic remains free to reject the institution, but the disagreement concerns an accurately described civic design rather than an accidental invitation to voyeurism. That discipline protects journalists and readers as much as participants because it reduces

the burden of reconstructing truth from fragments (UNESCO, 2018).

This risk is sharper because the City will be visually interesting. A bounded campus, visible routines, deliberation rooms, archives, public bundles, visitor routes, and participants under unusual burden could be clipped into images that look like a reality show or moral zoo. The chapter must give future guide pages, diagrams, tours, media rules, and record-site interfaces the conceptual discipline to avoid that fate.

Public knowledge has a price, and the design must identify who pays it. If the participant pays by becoming content, if nonparticipants pay through collateral exposure, if staff pay by becoming background performers, or if the public pays by learning to confuse appetite with judgment, the record regime has failed. Public review is legitimate only when the City carries the burden of context, limitation, correction, and anti-exploitation.

3.3.1 — Records Are Not Entertainment

Records are not entertainment because the purpose of the City record is civic accountability. It exists to make public-power formation more knowable, not to provide drama, intimacy, humiliation, gossip, or moral consumption. A viewer should approach the record site as a citizen reviewing evidence about a role, not as an audience following a character.

The distinction must be visible in interface design. Record bundles should be organized around public-power relevance, status labels, context, role period, decision points, correction, and reply. They should not be organized around sensational moments,

emotional peaks, conflict clips, intimate scenes, or algorithmic popularity. The design should slow appetite when appetite would distort meaning.

Entertainment logic often hides as engagement. A platform may say it is making records accessible while ranking clips by outrage, intimacy, humiliation, or partisan utility. Views, shares, spectacle, and fan behavior are not measures of civic usefulness. Public usability matters, but usability is not virality. An accessible record is one that improves judgment, not one that captures attention longest.

The public needs education in record use. The record site should explain the difference between raw capture, restricted material, public release, protected summary, unresolved dispute, interpretation, and institutional conclusion. A citizen who sees only a dramatic fragment has not been given civic knowledge. They have been given a weapon or a thrill.

The public record site should not have entertainment affordances. It should avoid autoplay feeds, reaction badges, popularity charts, character pages, dramatic thumbnails, countdowns, teaser language, and algorithmic recommendations based on emotional intensity. These design choices may look harmless in commercial platforms, but in the City they would turn civic evidence into attention architecture.

A practical test is whether the record remains useful when stripped of drama. A release should help citizens understand role formation, influence, decision process, correction, or readiness limits even when presented plainly. If it matters only because it

shocks, humiliates, or fascinates, it probably does not belong in that form. A record site designed for judgment will often be slower, plainer, and more contextual than a site designed for excitement.

Anti-humiliation design protects the dignity of people under visible burden. The City may need to reveal errors, conflicts, influence patterns, decision processes, apologies, corrected judgments, or failures of readiness. It does not need to degrade people. Humiliation is not accountability. Humiliation often shifts burden from power to vulnerability and trains the public to enjoy exposure.

An anti-entertainment rule should govern selection, interface, and institutional economics. Records should not be promoted according to emotional intensity, embarrassment, conflict, celebrity, or predicted engagement. Public importance, affected-person standing, statutory duty, and explanatory value are different criteria from audience appetite. The archive should be designed for inquiry rather than endless viewing, with friction where friction protects context.

3.3.2 — Anti-Humiliation Design

The record regime should distinguish role-relevant accountability from bodily, relational, clinical, sexual, familial, spiritual, or grief-based exposure. Separation of capture from release becomes decisive here. A record may exist because active-period continuity requires it, while public release must pass a different gate. Dignity handling can include delay, redaction, protected summary, restricted access, nonparticipant masking, or

nonrelease where public-power accountability does not justify exposure.

Anti-humiliation design must protect staff and nonparticipants too. A staff member involved in complaint, care, security, teaching, or record handling should not become a public side character unless role accountability requires it. Children, dependents, partners, visitors, and professional helpers require stronger protection. The adult participant's chosen burden cannot make surrounding people available for public judgment.

Anti-humiliation design should include a pre-release dignity review. Reviewers should ask whether a release degrades the person beyond the role need, exposes nonparticipants, magnifies bodily vulnerability, punishes a private relationship, or turns medical or psychological burden into public drama. A release can be truthful and still unfair if its form asks the public to enjoy another person's exposed weakness.

Anti-humiliation design strengthens accountability by keeping attention on conduct, consequence, repair, and public relevance. A fair record can be stern and, when the facts require it, devastating. Its force comes from accuracy, context, due process, and remedy rather than degradation added for memorability. The public learns more when the institution names what happened, who was burdened, what changed, and what remains contested.

Anti-clipping discipline recognizes that fragments govern modern interpretation. A sentence, face, chart, floor plan, visitor video, machine summary, or public record preview can travel farther than the chapter that explains it. The City should assume

that any public artifact may be isolated from context. The response is not secrecy. The response is design that makes fragments harder to misuse and easier to correct.

Humiliation can occur without insults. Camera angle, replay, thumbnail, headline, excerpt length, notification timing, audience reaction, searchable tagging, and juxtaposition can turn an accurate record into a degrading object. Anti-humiliation review should therefore examine presentation as well as content. The standard is not whether the participant feels comfortable. It is whether the institution is using exposure to reduce a person's status rather than to explain a public-role fact.

3.3.3 — Anti-Clipping Discipline

A public record fragment should carry status. Is it raw capture, verified record, contested material, protected summary, delayed release, right-of-reply bundle, machine-generated summary, editorial interpretation, or public-facing guide? A fragment without status invites the viewer to supply authority from mood. Status labels shift the burden of interpretation back onto the record system where it belongs.

Visual discipline carries civic meaning before a reader reaches the explanatory text. Perimeter diagrams should communicate access and rights rather than confinement; record interfaces should foreground provenance and context rather than surveillance theater; archive imagery should present public memory rather than institutional worship. Intimate, medical, child, and household material remains outside public illustration. Strong

visual design is vivid, humane, and difficult to crop into the opposite of its purpose.

Correction routes must exist before fragments are misused publicly. When material spreads with false status or missing context, the institution should be able to publish a corrective bundle, mark the relevant limits, protect affected persons, and avoid fueling further spectacle. Private people should not be forced to explain themselves because the City chose the record regime (Andrejevic, 2004; Marwick and boyd, 2011).

Anti-clipping discipline should shape sentence design as well as interface design. Captions, status labels, and summaries should be written so that a separated line still carries its limit. If a sentence says the archive shows a participant's failure, nearby language should state the role scope, dispute status, and remedy route. Public writing should assume it will be cut and still try not to lie when cut.

Anti-clipping discipline should be tested before release. The City can conduct hostile-crop review by asking how a screenshot, headline, short video, or isolated sentence would look if used by a critic who hates the project. This review should not suppress truth. It should improve labels, framing, status, and context so that truth does not travel disguised as the very false form this chapter refuses.

Clipping risk should be addressed at source. Each detachable excerpt should carry identity, date, status, context, correction state, and a stable route to the fuller record. If a passage cannot survive detachment without material distortion, the interface

should flag it and avoid packaging it for sharing. The City cannot prevent hostile editing, but it can refuse to facilitate it.

3.3.4 — No Monetized Exposure

The funding boundary matters because money changes interpretation. A record system that profits from engagement will eventually prefer engagement. A tour that depends on spectacle will eventually stage spectacle. A donor page that uses participant vulnerability to raise funds will eventually pressure vulnerability. The City should fund civic memory as infrastructure, not as content business.

Access design should avoid premium visibility. No donor, subscriber, journalist, influencer, academic, volunteer, or political actor should receive rawer exposure because they pay, praise, or amplify. Access classes may exist for oversight, affected-person rights, research review, legal process, professional duties, or public bundles, but access should follow authority and purpose. It should not follow money or status.

The design must also refuse merchandising of suffering or virtue. Participant stories, exit stories, apology arcs, health struggles, family sacrifices, dramatic conflicts, or visible endurance should not become fundraising assets without strict purpose, consent where valid, protected-person review, and limits on reuse. Even then, the safest default is to fund the institution without trading in personal exposure.

Financial appetite becomes dangerous when the institution needs visibility because visibility pays and begins redefining public

interest until it matches revenue. A City that makes money from exposure will struggle to protect people from exposure.

The no-monetization rule should extend to indirect benefits. The City may not sell records directly, but it could still benefit from increased donations, prestige, volunteer growth, political access, or media partnerships after a dramatic release. Those indirect incentives should be reviewed. A release that predictably helps the institution by exposing a person deserves heightened scrutiny.

A public interface with context is the constructive alternative to spectacle. Citizens need evidence about public-power formation, but evidence becomes fair only when the interface helps them understand what they are seeing. The interface should not simply display more. It should structure attention toward role relevance, burden, uncertainty, correction, and lawful limits.

The financing model is part of the boundary. Advertising, sponsored placement, subscription tiers for privileged record access, engagement bonuses, influencer partnerships, donor-branded releases, or sale of behavioral data would create structural pressure toward exposure. The public interface should be funded as accountable civic infrastructure, with disclosed budgets and procurement, so its survival does not depend on turning participants into content.

3.3.5 — Public Interface With Context

The public interface should include layered access. A general public bundle might show role history, major formation work, public deliberation patterns, declared conflicts, correction history, readiness claims, and status labels. A deeper oversight bundle

might be available to authorized reviewers. Affected persons may have specific access and complaint rights. Restricted material may remain under shield, escrow, or protected summary. The interface should make these layers intelligible without implying that hidden material is secret active life.

Interpretation should remain contestable. Public summaries should distinguish institutional conclusions from participant replies, third-party disputes, external review, unresolved facts, and machine-generated assistance. A public reader should be able to see not only what the City says, but where the City's interpretation was challenged. Context integrity includes the right to know that meaning is not always settled.

Context should be built into navigation, not added as a separate warning page. A user should encounter role scope, release status, dispute markers, correction routes, and protected-omission notes while reading the record itself. If limits appear only at the bottom of a policy page, the interface has asked the reader to do the City's interpretive labor.

The interface must also prevent public overreach. Citizens may ask questions, submit evidence, contribute expertise, or review permitted bundles, but crowds cannot demand greater exposure. Curiosity creates no entitlement to intimacy; participation remains bounded by role relevance and dignity.

Civic review sometimes requires time to read context, see replies, check status, separate role evidence from noise, and notice absences. Designs that reward instant judgment convert review

into reaction; the City should make careful interpretation easier than outrage.

Accessibility is part of context preservation. Captions, transcripts, audio description, multilingual access, keyboard navigation, readable typography, cognitive-access versions, and plain-language summaries should carry the same provenance, status labels, and correction history as the primary record. An inaccessible archive forces some readers to rely on secondary clips and summaries, which are often the forms most vulnerable to distortion.

Deliberate friction is warranted when virality would outrun judgment. Delayed reposting for sensitive material, visible correction overlays, limits on automated excerpt generation, and public-interest review for high-risk releases can slow the conversion of civic evidence into entertainment. The purpose is not to control criticism, but to keep evidence attached to the conditions that make it intelligible (Andrejevic, 2004; Marwick and boyd, 2011).

Exposed or mischaracterized family members, staff, visitors, critics, or bystanders need a usable route to request context, correction, shielding, or removal without becoming public performers. Curiosity cannot defeat a specific dignity interest.

Context belongs in the interface, not in a disclaimer added after circulation. Each excerpt should preserve source, date, role, release status, corrections, and a route to the fuller record. A clip unable to carry fair context should not be optimized for reach.

3.4 — Not Government Itself

The City is politically serious, but it is not government. It may form people who seek public authority, support those who lawfully hold office, preserve role-bound records, and create better evidence for democratic judgment. None of that gives it sovereign power. A civic institution becomes dangerous when it begins to confuse preparation for authority with authority itself (Weber, 1978; Mashaw, 2006; Barak, 2012; United Nations, 1966).

This boundary must be clear because the City's ambitions are adjacent to law. It touches public trust, office readiness, staff process, public explanation, crisis behavior, record continuity, and government environments. Without status discipline, the City could appear to be a shadow administration, unelected gate, constitutional workaround, or elite substitute for ordinary politics.

Legitimacy has an owner. In government, legitimacy must travel through lawful authority: elections, appointments, statutes, constitutions, courts, agencies, procedures, and public rights. The City cannot carry that burden by aspiration. Its task is to make formation more answerable before lawful authority arrives, not to become the authority that arrives.

Government remains government because lawful public authority has sources the City does not own. The City may influence who becomes more visible, prepared, answerable, and reviewable before office, but it cannot enact law, command agencies, collect taxes, police citizens, adjudicate rights, issue binding public

orders, or substitute its internal review for public constitutional process.

3.4.1 — Government Remains Government

This distinction protects citizens. Ordinary people should not wake up governed by a private or quasi-private institution because its participants appear more prepared or transparent. The burden of public authority belongs to the legal order. The City can improve the evidence available to that order, but it cannot become the source of the order's power.

City formation ends at a public interface rather than an accession ceremony. Readiness records may inform voters, parties, appointing authorities, journalists, civil society, and lawful institutions, but authority still arrives through the relevant legal process. Preparation, candidacy, appointment, election, and office remain distinct states. This separation lets formation evidence matter while preserving democratic and constitutional judgment.

Every output needs an authority label. A readiness bundle is a public evidentiary claim, not a government credential. A participant's explanation is not law. A City audit is institutional oversight, not judicial decision. A lawful office suite is a workspace under external authority, not a separate branch of government (Mashaw, 2006; Barak, 2012).

Government boundary should be evident in institutional documents. City charters, participant materials, office-interface agreements, public diagrams, and press descriptions should use status words carefully: candidate, participant, officeholder, official, advisor, staff, auditor, public reviewer, and citizen.

Sloppy labels create hidden authority. A person who is being formed for power should not be linguistically installed into power.

Institutional practice should maintain a refusal procedure when public bodies ask too much of it. A government office may want the City to vet candidates, pre-clear appointments, manage public explanations, supply staff judgments, or absorb political accountability. The City should have authority to say no. A boundary that only restrains the City but not those who would use it remains incomplete.

This boundary is especially important for emergency admiration. A City participant who appears unusually calm, informed, or transparent during crisis may inspire public demands for command. Admiration cannot be allowed to blur law. Competence under record can recommend a person to citizens; it cannot grant power. The authority to govern still arrives through the ordinary lawful route.

City formation is pre-authority. It occurs before public office is granted, and in some lawful situations it may continue alongside office as support and record continuity. But its primary logic is formation: education, deliberation, opposition, correction, daily discipline, influence visibility, and role-specific evidence. It prepares and reveals; it does not rule.

The distinction should be visible in every consequential object. City exercises are simulations, not orders. City committees are educational or internal governance bodies, not public agencies. City budgets are institutional budgets, not public appropriations.

City records are formation records, not automatically official records. City security is campus security, not police power. Naming the distinction in documents, uniforms, rooms, interfaces, and public statements prevents symbolism from hardening into shadow authority.

3.4.2 — City Formation Is Pre-Authority

Pre-authority formation matters because many burdens are set before voters or appointing authorities can see them. Donor dependence, prestige sorting, family advantage, consultant framing, hidden compromise, and untested decision habits may shape public power upstream. The City is a candidate institution for moving evidence earlier. That is enough of a claim. It does not need to claim governmental status to justify its inquiry.

The pre-authority label should shape record design. The record should show formation under burden, not official command. It should distinguish study from policy, simulation from decision, advisor influence from agency instruction, readiness bundles from legal credentials, and public interface from constituency service. Blurring these categories would place the burden of confusion on citizens.

Pre-authority formation also means the City can be refused by the political system. Voters may ignore City records. Parties may reject City participants. Jurisdictions may decide the City model is unsuitable. Courts may limit office interface. Legislatures may decline recognition. Those refusals do not necessarily disprove the City. They mark the boundary between civic formation and legal authority.

Pre-authority inflation turns a candidate institution into an elite gate when formation is described as the true democracy, the true government, or the necessary path to legitimate office. A fair City remains a proposal under law, not a replacement for democratic permission.

Formation evidence must remain distinct from campaign advantage. A formation record may later become useful in a campaign, but the City cannot run campaign strategy, message discipline, polling, voter targeting, opposition research, or partisan branding. Once formation becomes campaign machinery, the institution has moved from public-power preparation into electoral apparatus.

Pre-authority formation should clarify fit rather than inflate ambition. An admitted participant may prepare for a qualifying public-administration, local-board, or advisory role where the declared authority and consequences justify the City's exceptional burden. Journalism, advocacy, union activity, or general public influence alone do not establish that threshold. A participant who discovers a better fit in those ordinary civic pathways may be redirected or leave without stigma. The City offers a bounded route into substantial public-power formation, not a general institution for all influential people.

Pre-authority means that every exercise remains reversible and nonbinding beyond the institution. Participants may draft policy, conduct hearings, negotiate, manage projects, or rehearse crisis decisions, but affected outsiders do not owe compliance and public institutions do not inherit the result. Realism is educational only while status remains unmistakable. A simulation that can be

mistaken for an official act has crossed the boundary it was meant to teach.

3.4.3 — Officeholding Requires Lawful Pathway

This rule prevents readiness from becoming entitlement. The City may help the public see whether a person is ready for a certain office, but public trust remains a judgment made through lawful institutions and citizens. A readiness bundle is not a crown. It is an object for evaluation. The voter, appointing authority, party, court, agency, or legal process retains its own authority.

No City process can bypass external eligibility rules. Age, citizenship, residency, conflict rules, financial disclosures, professional qualifications, constitutional limits, term limits, confirmation standards, and statutory requirements do not disappear because a participant accepted a heavier record burden. Legal humility means external law controls wherever external law has authority.

Lawful pathway also matters during office. If an active participant becomes an officeholder and law permits some City interface, that interface must remain subordinate to official duties, public law, confidentiality requirements, security obligations, records law, and constitutional boundaries. The City cannot make its own transparency rule override legal obligations by force of moral enthusiasm.

Lawful pathway language should be repeated at moments of public excitement. A participant's impressive record, viral deliberation, public praise, or crisis performance may create calls for immediate authority. The City should resist acclamation.

Democratic and legal pathways exist partly to slow charisma. The City should make better objects of judgment, not faster coronations.

This rule also protects jurisdictions that choose not to recognize City evidence. A local community may prefer candidates formed through local service, indigenous governance, union leadership, professional experience, neighborhood trust, or ordinary political apprenticeship. Declining City formation cannot be treated as backwardness. Public legitimacy is contextual, and lawful communities retain the right to evaluate evidence in their own political language.

The lawful-pathway rule should be taught to the public before any famous participant appears. Once a charismatic figure emerges, boundary language may sound like retreat. The City should establish from the start that no record, no burden, no ordeal, and no public admiration bypasses law. That expectation protects later officeholders from being treated as the City's chosen instruments.

No completion certificate should operate as a shortcut to candidacy, appointment, security clearance, civil-service entry, licensing, or office. Lawful pathways retain their own qualifications, elections, examinations, confirmation procedures, ethical rules, and review. The City can provide evidence of work completed inside the institution, but receiving that evidence and deciding its relevance belong to the independent office pathway.

3.4.4 — Government Boundary

This boundary prevents domain theft. The City can say what happens when a City-formed person seeks or holds office from

within a lawful interface. It can say how the City preserves its own records, staff boundaries, and participant obligations. It cannot silently write the operating constitution of government. That work belongs elsewhere and requires separate legal, administrative, democratic, and field-specific review.

Government boundary protects public servants too. Civil servants, agency staff, security officials, judges, clerks, regulators, contractors, and local administrators do not become City staff because a City participant holds office. Their rights, duties, confidentiality, records, and labor protections remain under the relevant law and institution. Surrounding government workers remain outside the City's visibility logic unless a separate lawful rule applies.

Boundary discipline also helps credibility. Serious public-administration readers will reject a City that treats government as an aesthetic extension of the campus. They will expect law, budgets, unions, procurement, jurisdiction, secrecy, classified information, emergency authority, administrative burden, and public-service ethics to remain complex. Those domains cannot be flattened merely to protect the City's image.

Shadow administration begins when City staff, archives, advisers, or public interfaces direct governmental action outside lawful channels; the City has then crossed into Government without authority. The appropriate response is correction, disclosure, role separation, legal review, and, if necessary, termination of the interface.

The office-interface boundary should include conflict logs. When a City participant holds office, there may be pressure from City educators, mentors, auditors, archive staff, volunteers, or donors. Those influences must not become hidden governmental advice. The City should log its own side of influence so the public can see when formation support risks becoming unofficial command.

The boundary should also separate City criticism from government criticism. A citizen may criticize an officeholder's government decision, the City's support role, or the legal interface that allowed both. Each target has a different remedy. Blurring them hides burden. The City should help the public know whether a problem belongs to the office, the City, the law, the participant, or the interface between them.

The boundary continues after a participant enters office. After office begins, the City cannot retain command, privileged confidential access, donor leverage, automatic custody of official records, or a private advisory channel that bypasses public accountability. Any continuing education or alumni relationship should be disclosed and subordinate to the rules of the office. The City forms; lawful institutions govern.

3.4.5 — Constitutional Authority Boundary

This humility matters because the City touches rights. A role-bound active record, protected nonvisibility, public bundles, exit, office interface, screening, and public approval can all raise legal questions. Those questions cannot be resolved by saying participants consented or public power is important. Consent has limits. Rights have structure. Law varies by jurisdiction. The City

must treat legal validity as an Open Decision governed by expert review and lawful adoption, not by manuscript confidence.

The practical consequence is to write in candidate-institution language. It can define safeguards that any lawful version would need: adult consent, role specificity, nonparticipant shielding, due process, lawful authority, appeal, remedy, privacy boundaries, labor protections, child protection, and public-purpose limits. It should not say these safeguards are sufficient under all constitutional systems.

Constitutional boundary also prevents coercive prestige. If the City is described as constitutionally inevitable or morally necessary, jurisdictions may feel pressured to conform before law has done its work. That would move burden onto courts, local communities, political minorities, staff, and ordinary citizens. A fair institution does not evade legal contest by appearing too noble to question.

Lawful aura without lawful authority is a direct form of overclaim. If the City's language causes people to treat internal rules as enacted law, model rights as enforceable rights, or moral clarity as constitutional settlement, the City has overclaimed. The remedy is status labeling, deference, expert review, and the willingness to leave legal questions unresolved until law can answer them.

The next requirement is to avoid constitutional cosplay. Mock courts, ceremonial oaths, symbolic chambers, official-looking seals, and grand legal language may make the campus feel more legitimate while confusing the public about authority. Serious

civic formation does not need to imitate the state. It needs lawful humility that remains visible even in architecture and ritual.

Constitutional humility should not make the City vague. The City can state its desired rights floor with precision while acknowledging that enforceability depends on law. This balance is crucial. If the prose is too vague, experts will see evasion. If it is too certain, experts will see overclaim. The right posture is concrete design under legal review.

Private agreements cannot manufacture public authority. A host contract, accreditation, land lease, philanthropic condition, participant covenant, or memorandum of understanding may define cooperation, but it cannot displace constitutional rights, courts, regulators, election bodies, public records law, or emergency authority. The City should publish an authority-and-custody map showing which institution owns each decision and record at every interface.

3.5 — Not a Virtue Certificate

Rich evidence can inform role-specific judgment without becoming a certificate of human worth. A participant's visible record may reveal relevant conduct under public-power burden, but it cannot establish honesty in every setting, civic superiority, moral rank, or greater human value than an ordinary private person. The City preserves that distinction through status labels, nonpreferential pathways, appeal, and a ban on using participation as a generalized trust score (Espeland and Stevens, 1998; O'Neil, 2016; Eubanks, 2018).

The archive can support role-specific public judgments without claiming total knowledge of a person. It records conduct, context, correction, influence, and readiness evidence under declared conditions. Human depth, ultimate motive, conscience, spiritual standing, and the complete interior life remain beyond its jurisdiction. Ethical architecture begins by matching every claim to the kind of record that can actually support it.

Moral certification always sends a bill somewhere. Nonparticipants would pay by appearing lesser. Private citizens would pay by feeling that ordinary privacy is civic inferiority. Participants would pay by performing virtue rather than learning under burden. The public would pay by outsourcing judgment to institutional aura. A fair City must keep evidence from becoming caste.

Participation carries no rank in human worth. A person who enters the City, refuses it, never applies, protects family privacy, follows another vocation, or remains an ordinary private citizen

keeps equal dignity and civic standing. The Vow marks a chosen role burden, not a superior kind of life. This sentence must remain plain enough to survive quotation because the institution's legitimacy depends on it.

3.5.1 — Participation Is Not Worth

The City's burden is role-based. It asks more from adults seeking substantial public power because their future decisions may carry burden for others. That proportionality does not imply a general hierarchy of lives. A nurse, teacher, parent, artist, mechanic, farmer, neighbor, caregiver, disabled person, private citizen, critic, or anonymous voter is not less complete because they did not enter a Transparent City.

Participation can also hide privilege. People with fewer dependents, more psychological resilience, safer legal status, stronger health, better education, fewer disability barriers, or more cultural trust may find entry easier. Treating participation as worth would punish people for constraints the City itself must recognize. The fair question is not who entered. It is what burden the institution placed, reduced, repaired, or misplaced.

Refusal, delay, or redirection must carry its own applicant protection. The decision may reflect load, role fit, legal status, timing, family burden, safety, or a better pathway. It should not become a public mark of lesser worth. Screening must never become a moral sorting machine disguised as care.

Participation is not worth also protects political opposition. A critic may oppose a City participant's policies, values, ideology, or temperament without being cast as anti-fairness. If City

supporters treat opposition to a participant as opposition to human improvement, the City has created a moral shield around power. The public must remain free to disagree with the visible.

Children who observe participants require special care. They should never be taught that public visibility makes a person better than private people. Family programming, school materials, tours, and guide images should communicate that ordinary lives are complete. The participant carries extra burden because of chosen public-power ambition, not because visible life is morally superior.

Record scope is practical and role-bound. The City may preserve conduct, context, role work, decisions, influence, correction, and patterns that bear on public-power formation. Memory, love, grief, fear, meaning, ultimate motive, and spiritual standing remain outside its claim. Even an extensive archive is a civic instrument, not metaphysical access.

No public artifact should sort people into participants and lesser citizens. The City should prohibit rankings, badges, honorific status, preferred service access, donor recognition tied to participant selection, and claims that nonparticipants avoided a burden they should have accepted. Participation is one chosen route into public-role formation. It says nothing about the value, courage, wisdom, or civic contribution of people who serve through other paths or never seek office.

3.5.2 — Record Is Not Soul

Interpretive restraint protects participants from total judgment. A recorded action can be relevant without becoming the person's

whole identity; a mistake can require remedy without becoming a permanent name; a pattern can support concern while leaving room for response, change, and context. The record should state the proposition it supports, the conditions under which it was observed, and the limits of the inference.

Record is not soul also protects nonparticipants. A partner, child, dependent, staff member, visitor, or professional helper may appear in or near records because life is relational. Their incidental appearance does not make them available for public interpretation. Nonparticipant masking, protected summaries, and access limits are not exceptions to transparency. They are how the City refuses to turn records into metaphysical claims about surrounding lives.

The City and those acting on its behalf must not present inferred sincerity, purity, courage, corruption, humility, or hidden loyalty as directly observed inner facts or as civic scores. Mentors, evaluators, volunteers, donors, and Artificial Intelligence tools must distinguish recorded conduct from contestable interpretation. Independent journalists and public readers remain free to draw and challenge inferences; the City does not govern their conclusions. Its own record should identify evidence, uncertainty, and reply rather than claim a window into the soul (O'Neil, 2016; Eubanks, 2018).

Record is not soul should govern archive search. Users should not be invited to search for truth of character, real motive, moral purity, or hidden balance. Search classes should be role-relevant: influence, decision, correction, conflict, readiness, public explanation, staff involvement, and release status. The categories

themselves teach the public what kind of knowledge the City claims and what kind it refuses.

The same restraint governs apology. A public apology can supply evidence of acknowledgment, responsibility, proposed repair, and later conduct. It cannot reveal an inner purification that the archive has no means to observe. Public judgment therefore follows words, actions, restitution, recurrence, and correction over time, while conscience remains with the person.

A record is a produced object shaped by categories, technology, access, omissions, context, and institutional judgment. It cannot exhaust motive, memory, consciousness, identity, or moral character. This matters especially when the record is coherent and searchable, because coherence can create the illusion of completeness. The archive should preserve gaps, disputes, uncertainty, and the right to say that some features of a person are neither captured nor capturable by the institution.

3.5.3 — Readiness Is Role-Specific

Readiness bundles should identify the role, jurisdiction, burden type, evidence base, time period, limits, and dispute status they address. A role-specific bundle may speak to budgeting, constitutional reasoning, conflict handling, media literacy, staff management, record integrity, or public explanation. It remains a scoped democratic object rather than a general score of political worth.

Role-specific readiness protects both public judgment and the participant. The City should state which capacities were observed, which were simulated or externally reviewed, which remain

unknown, and which deficits are role-critical. It should also make clear that strength in one domain is not universal competence and that “not yet” is a legitimate result rather than disgrace.

Readiness must also be allowed to expire. Evidence becomes stale as law, health, family obligations, public context, and the person change. A bundle without time review becomes a frozen halo. Renewal, update, correction, and retirement are therefore part of an honest readiness claim.

Role-specific readiness should include the right to narrow ambition. A participant may discover that a smaller office, advisory role, administrative path, or non-office service better fits their capacities and burdens. The City should treat such narrowing as serious learning. A system that rewards only upward ambition will recreate the prestige pipeline it was meant to correct.

Public trust is not automatic because citizens remain judges, not recipients of institutional verdicts. The City may make formation more visible and evidence more usable. It may demonstrate patterns under burden. It may show correction, failure, readiness, and limits. But public trust must still be given, withheld, divided, revised, or refused by citizens and lawful institutions.

Readiness should be attached to a declared task, time, and evidence base. A person may be prepared for one kind of legislative work and not another, capable in deliberation but not crisis command, effective in local administration but not national diplomacy, or ready now and unready after circumstances change. Role-specific readiness resists the prestige certificate because it expires, narrows, and invites reassessment.

3.5.4 — Public Trust Is Not Automatic

Automatic trust would invert the City. The purpose is to reduce voter guesswork, not to replace voter judgment. A record that says believe this person has become another authority if citizens are expected to obey it. A fair record says here is what can be known, here is what remains disputed, here is the scope, here are the limits, here are alternative interpretations, and here is the pathway by which lawful authority is granted.

Automatic trust would also create strategic behavior. Participants would learn to satisfy the City rather than the public role. The archive would become a performance target. Public life would become a transcript audition. The antidote is to keep records contestable, evidence role-specific, and voters free to interpret.

Halo transfer occurs when the public trusts a person because the City trusts them, without examining the record, role, limits, and rival evidence; the City has then become a brand of trust. A fair institution should help trust become wiser, not automatic.

Trust should also remain revocable. New evidence, changed context, later conduct, office performance, legal findings, or public harm may alter judgment. A City record should not freeze a person into permanent trustworthiness. Public trust is an ongoing relationship between evidence, conduct, law, and citizens. No institution should make that relationship automatic.

Informed distrust is an expected democratic outcome. Some citizens may understand the record and still reject the participant; others may trust a non-City candidate more. That disagreement is not a defect in the public. It shows that the City has not replaced

politics with institutional certification. The institution can improve the evidence field without owning the conclusion.

Research-construct non-use is necessary because scientific constructs can be misread as civic measures. The formal and science domains may discuss candidate estimators, latent phenomenal quantities, and other research objects under strict claim-status rules. The City must not import those constructs as participant scores, readiness rankings, moral balances, psychological grades, trust points, spiritual indicators, or human-worth measures.

Trust remains a judgment made by others under their own standards. Voters may distrust a participant despite an excellent record. Journalists may identify blind spots the City missed. Parties may reject the participant. Courts or appointing bodies may find legal disqualification. A fair City supplies more inspectable evidence and accepts that the public may still say no.

3.5.5 — Research Constructs Are Not Civic Scores

Scientific validation, if ever achieved, would not authorize civic scoring. No index, ledger, composite, utility, contribution unit, hedonic measure, archive summary, public vote, or Artificial Intelligence output may measure worth, rank, loyalty, holiness, eligibility, or trustworthiness.

Score-shaped substitutes create the same danger under softer names. A dashboard that ranks integrity, resilience, transparency, burden carried, apology quality, readiness, or approval converts contested evidence into status and invites people to treat quantified appearance as human truth. The prohibition reaches

both the label and the institutional act of ranking (Espeland and Stevens, 1998; O’Neil, 2016; Eubanks, 2018).

Candidate estimators and latent phenomenal quantities remain outside the City’s civic record architecture. The City records role-bound formation, public decisions, influence, correction, and institutional burden; it does not estimate phenomenal valence or terminal status. Any scientific use requires separate governance, measurement, consent, endpoint logic, and verdict ownership in *The Science of Fairness*. This boundary keeps civic answerability from becoming an unauthorized human experiment.

Non-use does not prohibit operational measurement. The City may count time in role, public deliberations, correction response times, unresolved disputes, staff load, accessibility compliance, budget facts, or record uptime because those measures describe systems or discrete events. They must never be combined into a total person measure. Procurement rules should therefore prohibit person-ranking use and require purpose limitation, human review, appeal, and deletion where appropriate. System measures should remain auditable at the event or process level so useful operational learning does not drift into person scoring.

Research constructs and estimators of felt experience must not be used for participant selection, discipline, readiness, trust, or public ranking. Public-facing interfaces should state that boundary plainly wherever such measures could otherwise be mistaken for judgments about a person.

3.6 — Not Proof of the Law

The City applies the burden question within civic design. Its success can produce meaningful operational evidence, public value, and research questions, while scientific adjudication of PTVC remains a separate task. A persuasive institution should invite stronger testing rather than allow applied coherence to masquerade as proof (Popper, 1959; Lakatos, 1970).

Within its lane, the City can show whether a role-bound active-record institution is lawful, livable, humane, useful, stoppable, and resistant to drift. It can reveal burdens in public-power formation that ordinary systems hide and generate questions for science, law, public administration, privacy governance, and transition design. These contributions are substantial precisely because they are named accurately.

Scientific claim-status authority remains with governed research capable of criticism, replication, narrowing, and defeat. Keeping that authority separate also protects participants, staff, host communities, archives, and public users from being treated as instruments of a claim they did not consent to test. The City serves the research program best by producing cleanly governed civic evidence, not by carrying the proof burden.

The phrase operational evidence names what City success can show about the City. The relevant mechanisms include entry, exit, record integrity, protected nonvisibility, staff sustainability, host legitimacy, public usability, complaint, appeal, correction, care, office interface, and stoppability. Evidence about these functions

can support institutional decisions and wider learning without becoming a scientific verdict.

3.6.1 — Operational Evidence Only

A working rights system, humane exit process, trustworthy archive, useful public interface, and staff system that avoids hidden labor would each be a real achievement. Taken together, they could justify continued pilot work, targeted revision, or carefully bounded consideration of replication. Exact recognition strengthens the result; inflation would only make it easier to dismiss.

The evidence picture must include adverse findings. Complaint rates, correction disputes, staff turnover, participant burnout, nonparticipant harm, host-community objections, public misuse, archive errors, vendor problems, and accessibility failures reveal where design and burden diverge. A City evaluates itself only when unfavorable results remain visible and decision-relevant.

Comparison determines whether those findings justify the added institution. A functioning City may still be less fair than a narrower reform if residence, recording, staffing, and public-interface burdens do not produce corresponding value. Evaluate mechanisms, affected populations, costs, rights burdens, failure rates, and reversibility under common questions rather than treating operation itself as success (Cartwright and Hardie, 2012; Pawson and Tilley, 1997).

Stories and testimony illuminate the evidence without carrying it alone. Participant accounts, staff pride, public praise, and visible improvement require context, including dissenting experience,

selection effects, comparison, and harms. A serious evaluation uses anecdote to reveal mechanisms and consequences, then tests whether the pattern travels beyond the story.

The evidence process creates burdens of its own. Recording, reviewing, summarizing, correcting, and publishing require labor and expose people to interpretation. Evaluation should therefore measure its effects on participants, staff, families, host communities, and public users, and should redesign collection when accountability itself becomes a source of avoidable harm.

Its jurisdiction is City-specific: lawfulness, usability, protection, sustainability, corrigibility, and comparative fit for a declared purpose. Phenomenal ledgers, truth-level endpoints, rival-model adjudication, and scientific verdicts use different objects and evidence rules (Popper, 1959; Lakatos, 1970).

Those bounded findings should feed a transparent decision ladder. The City may continue, narrow, redesign, pause, or close according to whether rights worked, records held, staff loads remained sustainable, exits were practical, nonparticipants were protected, host burdens were addressed, and public information was usable. The decision concerns the institution, never the worth of its participants or the truth of PTVC.

3.6.2 — Scientific Claim-Status Authority

A beautiful and humane City may demonstrate public value, strengthen human salience, and motivate serious inquiry. Those achievements belong to civic learning and public engagement. PTVC evidence still requires governed measurement, measured-to-latent bridges, endpoint discipline, serious rivals, and branch-

matched scientific verdicts. The City's strongest service to science is clean separation: it preserves ethical civic records without pretending they are data for a question they were never designed to answer.

The boundary also protects the City. If the City is framed as a proof test, then every participant becomes part of a public experiment, every failure becomes a threat to the Law, and every operational success becomes pressure to overinterpret. That would be unfair to the people living under the Vow. The City is already severe as a civic institution. It should not add the burden of validating a cosmic claim.

City records are not scientific data by default. Public release is not research consent. Civic capture is not laboratory measurement. Operational records may later support research only through separate lawful authority, ethical review, consent where required, nonparticipant protection, purpose limitation, data minimization, security, correction, and the right to refuse where applicable. The City should maintain that firewall even if researchers are eager.

The research task is to connect the terminal-balance claim with observations capable of distinguishing it from rival explanations. A City can contribute research questions and, through a separately authorized study, relevant observations; its civic record serves a different purpose. *The Science of Fairness* develops the measurement and testing program. Institutional evaluation here asks whether the City delivers earlier, more useful evidence of public-power formation.

Some scientifically interesting questions must remain unavailable. Data may be too intimate, too entangled with children or nonparticipants, too likely to be misused, or too weakly connected to the hypothesis. Scientific curiosity does not automatically outrank dignity. A strong research program knows when not to collect.

The science handoff should be written as deference, not distance. The formal Law should be presented without embarrassment and without status inflation; the City must know exactly what it cannot establish. Its best contribution to science may be disciplined refusal: keeping records cleanly separated so that any future research begins ethically rather than scavenging civic material after the fact.

Scientific adjudication requires prespecified constructs, valid observation, estimands, estimators, serious rivals, appropriate endpoints, and controlled verdicts. The City owns none of those merely by operating. Any research conducted within or around it remains governed by *The Science of Fairness* and independent scientific standards. The City may be a setting for inquiry only when care, rights, consent, and scientific design are independently satisfied.

3.6.3 — No Proof by Adoption

Adoption can even be evidence of risk. A famous participant, respected donor, university, civic leader, journalist, or public intellectual may widen attention, but association supplies scrutiny, not warrant. Institutions adopt ideas for prestige, urgency, ideology, convenience, funding, media value, or the

hope of legitimacy. The relevant question is who pays for adoption speed: participants, staff, host communities, ordinary citizens, critics, local governments, or future replicas.

Replication should be treated as a stronger adoption risk, not proof. A second City may show that some safeguards travel. It may also show that prestige travels faster than protection. Accreditation, decertification, local translation, and stop conditions matter precisely because adoption can reproduce error at scale. Adoption is an implementation fact, not a truth predicate.

Adoption status and evaluation status require separate public labels. A site may be interested, funded, under construction, paused, operating, accredited, suspended, or decertified. None of those states is scientific status. A map of future Cities must not imply that geography is accumulating evidence for the Law.

Adoption pressure can also come from critics. If opponents caricature the City, supporters may rush to build in order to prove them wrong. That is still proof by adoption in emotional form. A fair institution should not ask participants, staff, or hosts to carry the burden of winning a public argument through speed.

Adoption maps should avoid moral geography. If future Cities exist in some countries or regions and not others, the map should not imply that participating places are morally higher. Country readiness, city interest, accreditation, and pilot status are implementation facts. Turning them into ranking would shift public burden onto entire populations and invite geopolitical vanity.

Livability is an operating result, not a scientific verdict. People may sleep, study, deliberate, work, eat, recover, love, argue, correct errors, and leave with dignity inside the City. That would show that a severe civic burden may be survivable under specified conditions. It would not show that conscious life terminates at neutrality.

Adoption can show political interest, institutional demand, funding power, imitation, or symbolic appeal. It can also reproduce error. The spread of a design therefore increases the need for evaluation rather than the weight of its truth claim. Ten Cities would not prove more than one City about PTVC unless a separate scientific program generated valid evidence under the relevant protocol.

3.6.4 — No Proof by Livability

Livability is an operational requirement, not a metaphysical indicator. The City must test whether participants, staff, families, and host communities can carry their roles without hidden injury. It must monitor load, sleep, access, disability, health, recovery, public interface, record burden, family strain, staff exhaustion, and exit. Livability protects people because people matter, not because their endurance proves a theory.

Livability can also deceive. Beautiful spaces, good food, quiet gardens, excellent care, charismatic mentors, selective admissions, devoted staff, and early public sympathy may make a pilot look healthier than it is. The City should interpret livability through selection, support intensity, hidden labor, adverse

reports, and long-term follow-up. A pleasant campus can still hide burden.

Participant growth must not be romanticized. A person may become wiser under visible burden, or merely learn to perform; they may heal, comply, develop public courage, or conceal distress. Livability evidence therefore needs private complaint routes, independent interviews, a right to pause, exit data, staff reports, and nonparticipant-harm review.

Pastoral proof turns happy participants, beautiful routines, moving apologies, or visible growth into evidence that the Law is true; human life has then become an argument. Livability belongs to care and evaluation. It should never be made into proof.

Livability metrics should be oriented toward care, not persuasion. Sleep, health, access, complaints, exit, staff load, public-interface stress, and family burden should be measured to protect people and improve design. They should not be packaged as inspirational evidence that the City transforms human beings into proof of fairness.

Silent nonlivability deserves special attention. Some people comply quietly, smile publicly, avoid complaint, praise the institution, and still carry hidden harm. Independent interviews, protected complaint channels, anonymized pattern review, and exit conversations are essential because visible functioning is not enough to establish livability.

Livability should be allowed to disconfirm institutional ambition. If people cannot sleep, recover, love, dissent, work, or leave under the Vow, the City should narrow or stop. Such a result would not

settle the formal Law, but it would matter morally. An application that harms people is not rescued by the grandeur of the question it asks.

Livability is a genuine City achievement. If people can study, work, rest, dissent, receive care, maintain relationships, and leave without degradation under the Vow, that result matters. Yet it remains evidence about institutional conditions. A comfortable or inspiring place does not identify a phenomenal boundary law, and an uncomfortable place does not refute one.

3.6.5 — No Proof by AI or Archive

Artificial Intelligence may assist City functions where governed: search, accessibility, translation, anomaly detection, provenance checks, summarization under human review, and public navigation. It must not certify sincerity, rank readiness, infer inner life, decide dignity, validate the Law, replace appeal, or issue final judgments about persons. A machine may assist inquiry. It may not become sovereign.

The archive has similar limits. It records conduct under conditions. It does not contain consciousness, ultimate motive, whole-person meaning, or terminal evidence. It does not make the public omniscient. It does not prove the Law. It should show gaps, delays, redactions, restrictions, corrections, reply materials, unresolved disputes, version histories, and status labels. An honest archive is less godlike and more trustworthy.

Artificial Intelligence-generated summaries should identify themselves, state their limits, route users to source materials, provide contest paths, and remain subordinate to human review.

If the machine's language becomes smoother than the evidence beneath it, the system may start to govern interpretation by style. The City should distrust fluency where human burden is at stake.

The final design test is whether the most advanced City system still appears humble. If the archive, search engine, dashboard, or Artificial Intelligence assistant feels like a judge, prophet, priest, therapist, scientist, or moral ledger, the design has failed. The City can organize memory. It cannot convert memory or computation into proof.

Artificial Intelligence and archive governance need a public humility layer. Interfaces should disclose machine assistance, ranking effects, restricted records, source disagreement, fragment repetition, and unendorsed inference. Scale and technical polish can hide error: systems may process millions of records yet misclassify, reproduce bias, hallucinate, or overinfer, while secure archives remain partial. Neither system nor archive becomes an oracle of consciousness, character, fairness, or destiny.

Technical failure also requires a claim-status response. Deepfakes, corrupted provenance, biased search, vendor error, hallucinated summaries, leakage, or unauthorized training can damage trust. None proves or disproves the Law; each tests whether technology remains subordinate to dignity, correction, and review.

The six boundaries in this chapter become credible only when an outside critic can inspect a different operational test for each one.

Each boundary should be tied to observable conditions and a remedy available to the person who would carry the drift.

These tests do not prove safety through labels; they create questions that can fail. If practical exit disappears, dissent becomes costly, exposure becomes entertainment, authority migrates into the City, participation becomes rank, or operational success becomes scientific proof, the institution has crossed a boundary regardless of intent.

Chapter 4 — Prototype, Operational Evidence, and Ethics

The first City should make learning visible before prestige makes correction expensive. Built reality can reveal whether rights, records, staff systems, host relationships, care, and public interfaces work under pressure, but only if continuation is governed by declared questions and stop conditions. The ethical promise of a prototype is not that it will succeed. It is that people will not be asked to carry avoidable harm so the institution can preserve its image.

This chapter begins from a severe but liberating premise: a real City matters, but not because reality turns an idea into proof. Reality matters because burden changes when it leaves the page. A drawing can make transparency look orderly, a vow can sound clean, a record rule can appear exact, and an exit right can seem obvious. The built institution asks harsher questions. Who sleeps? Who repairs the devices? Who answers the complaint? Who is overexposed by accident? Who carries the host cost when the campus becomes real?

A prototype makes burden placement testable in the ordinary institutional sense. A paper City can hide strain inside verbs. A real City cannot. Its lights fail, staff tire, participants misunderstand rules, critics arrive with better questions than designers expected, and public curiosity presses toward spectacle. The first City matters because it lets hidden institutional burden become visible before the project is allowed to multiply that burden.

The first City must remain a prototype: serious enough to inspect, and provisional enough that inspection can change, narrow, pause, or stop it.

This chapter gives the City an ethics of beginning. A fair first version earns attention through explicit purpose, protected people, independent review, traceable decisions, and real authority to pause, narrow, redesign, or stop. Site selection, legal authorization, scientific status, funding, and transition sequence remain with their proper owners. The prototype standard is simple: the institution must be more correctable than its admirers expect and more protective than its momentum demands.

The central danger is monument drift. A promising institution can become emotionally expensive before it becomes operationally trustworthy. Donors may want a landmark. Supporters may want a victory. Designers may want their first concept protected. Critics may want a single failure to become total disproof. Media may want a frame simple enough to sell. The City must be designed against all of these pressures because each of them shifts burden away from reality and into image.

A first City can answer a consequential class of institutional questions. It can show whether the role-bound Vow is livable, protected nonvisibility works, records survive pressure, staff and host communities remain protected, public interfaces improve understanding, and stopping authority is real. These findings can guide design, law, funding, and later evaluation within their proper domains, and their strength comes from answering those questions well.

The distinction serves ambition and skepticism together. Ambition gains permission to build something useful, beautiful, and instructive without claiming an answer to every ultimate question. Skepticism gains inspectable limits, rival explanations,

and the right to demand evidence before expansion. The City can teach, test, reveal, correct, and fail honorably while PTVC adjudication, human worth, and scientific verdicts remain outside its authority.

The first version must protect the people who will meet design error before anyone else. Participants carry the Vow without becoming proof objects. Staff receive visible standing and labor protection. Families, children, and host residents keep separate rights and remedy. Critics and journalists remain independent participants in public scrutiny. A fair prototype measures its integrity by how quickly these people can name burden, obtain protection, and change the design.

Failure thresholds belong at the heart of the chapter rather than in an embarrassed afterthought. A first City that can only celebrate itself will hide harm to preserve its story. A first City that knows when to stop is ethically stronger than one that keeps moving because stopping would disappoint admirers. The power to pause, narrow, redesign, decertify, or close is not pessimism. It is institutional mercy in working form.

Replication receives the final warning. The first City may succeed in one context while remaining unsafe to copy elsewhere. Rights may work because one staff culture is unusually strong. Archive integrity may depend on a technical team that cannot be replicated. Host trust may rest on local relationships that another place does not share. The first City may be real and still not be ready to multiply.

The prototype ethic turns beginning into disciplined stewardship. Before seeking land, scale, imitation, prestige, or political relevance, the City must show that its safeguards can carry the load they promise to carry. It should publish its assumptions, expose its decisions to review, protect the people nearest the experiment, and make stopping authority real. A beginning becomes worthy of history only after it has proved willing to protect people from its own ambition.

The intellectual standard comes from pilot and complex-intervention research: feasibility, process, implementation context, acceptability, fidelity, adverse effects, and continuation criteria are different questions. Combining them into a single success story hides the mechanism of failure. The chapter therefore treats each operational claim as scoped evidence with an owner, method, denominator, limitation, and decision consequence (Eldridge et al., 2016; Skivington et al., 2021). Review protocols should also record when a measure becomes unusable because the prototype itself changed, so evaluation can distinguish design learning from moving the goalposts.

The first City will be evaluated not only by what happens to participants but by what it asks of staff, families, neighbors, critics, visitors, contractors, and host institutions. A system that looks coherent because hidden labor absorbs its contradictions has not demonstrated feasibility. The burdens surrounding the participant are part of the prototype's operating truth. A burden ledger should identify which groups absorbed unplanned work or delay during the pilot and whether that burden was reduced before continuation.

Public attention is itself an intervention. Cameras, donor expectations, social media, prestige, and political symbolism can change participant behavior and institutional decisions before evaluators understand the baseline. The prototype must therefore record how publicity alters the system rather than treating attention as external to the evidence. The design turns moral definition into an ethic of beginning. Paper can align concepts, but it cannot reveal how bodies, labor, records, families, hosts, visitors, critics, and public attention interact under real conditions. Evaluation should compare behavior before, during, and after major publicity events where feasible, so attention effects are not mistaken for ordinary operation.

4.1 — Why One Real City Matters

A real City matters because burden cannot be fully tested in theory. A blueprint can arrange spaces, records, rights, and interfaces into elegant order. A table of safeguards can make the system appear balanced. A chapter can describe how visibility should move upward toward public-power seekers. But the moment people live inside the institution, theory meets pressure. The City's first honest evidence comes from that meeting (Thabane et al., 2010; Eldridge et al., 2016).

Purely symbolic solutions deserve suspicion. If a burden is only named, it may still be hidden. If a duty is only declared, it may still be unfunded. If a protection is only promised, it may still collapse in contact with schedules, bodies, staff, fatigue, money, architecture, technology, and public attention. One real City matters because it turns abstract burden into observable placement.

A real City also creates a common object of criticism. Without a built object, every disagreement can retreat into imagination: supporters imagine the best version, critics imagine the worst version, and both sides speak past the actual burden. Built reality narrows evasion. It lets a reviewer ask where the complaint office is, how records are sealed, where staff rest, how visitors are screened, what happens when a participant de-loads, and how the host community can object without begging for attention.

A real prototype is documented as a system under load. Its first duty is not to produce an inspiring tour, but accountable knowledge about what happens when the Transparent Vow, Total

Record discipline, protected nonvisibility, staff boundaries, host burden, and public interface meet fatigue, conflict, maintenance, error, and criticism. Design becomes serious when it asks whether the people carrying it remain protected.

4.1.1 — Built Reality Tests Burden

Built reality tests administrative friction. A rule that appears clear on the page may become ambiguous when an exhausted participant requests pause during a public-interface window, a record officer receives a release challenge during an outage, or a clinician recommends de-loading before a scheduled event. The prototype must expose these friction points because hidden friction returns burden to people under the cover of good design.

Paper can say that public-power formation should carry more visible burden. A building tests whether that burden can be placed without spilling downward. The distinction matters. A theoretical City can keep ordinary citizens private because the sentence says so. A real City must keep visitors, families, staff, neighbors, journalists, clinicians, lawyers, vendors, and bystanders from being pulled into record fields by habit, architecture, software, confusion, or voyeuristic demand.

Built reality also tests whether the burden has been located at the right scale. Too small, and the City becomes a school, dormitory, platform, or leadership retreat pretending to be a civic ecology. Too large, and it may become a monument, luxury campus, or captured institution whose size protects its image. The first City must reveal whether its scale is sufficient for residence, study,

deliberation, record, recovery, staff work, public interface, and protected nonvisibility without becoming grandiosity.

Built reality also tests sequencing. The City can claim that rights precede records, but a real intake process will show whether participants understand rights before capture begins. It can claim that exit is real, but a real exit pathway will show whether people can leave without losing housing, care, dignity, and future privacy. It can claim that staff are protected, but the duty roster will show whether staff are being quietly consumed. The building reveals whether principles have become procedures.

A built test also reveals sequence burdens. Paper design can list intake, consent, activation, capture, complaint, review, and exit as though they occur in clean order. In practice, a person may seek exit during a record dispute, staff may detect overload before the participant can name it, a host complaint may arrive during a media surge, or technical failure may occur inside a sensitive conversation. Systems become unfair when burden arrives before the protection intended to govern it.

Built reality tests the difference between permission and capacity. A participant may have a right to complain, but no useful capacity to do so if the route is confusing, delayed, socially costly, or controlled by the same office being challenged. A staff member may have a whistleblower channel, but no practical safety if scheduling, supervision, or contract status makes refusal dangerous. A host resident may have a public meeting, but no meaningful recourse if the agenda is ceremonial. The City must judge the lived use of a protection, not merely its written existence.

This is why inspection should begin before ceremonial opening. The burden map should be tested before scandal becomes the first proof that it was false. Pre-opening exercises, access drills, protected nonvisibility tests, complaint walkthroughs, staff workload simulations, visitor pressure drills, record failure rehearsals, and host-community listening sessions all belong to the prototype ethic. They do not make the City safe by declaration. They make it harder for the City to hide that it is not yet safe.

Bodies also reveal whether a burden is distributed or merely admired. A public theory can praise courage, discipline, sacrifice, and transparency, but bodies keep the account. Sleep loss, muscular tension, digestive disruption, panic, numbness, irritability, social withdrawal, sexual difficulty, sensory overload, and grief fatigue may all disclose that the visible life is costing more than the designers imagined. The City must be humble before these signals because the body often tells the truth before institutional language catches up.

4.1.2 — Bodies Test Theory

Formation for public power will involve strain, so the prototype must distinguish demanding work from extractive conditions. Proportion, review, support, recovery, and reversibility determine whether the burden remains humane. A participant who reaches overload triggers de-loading and design review rather than legend-making; a staff member who absorbs chronic excess triggers workload correction rather than praise for devotion. The institution learns by treating strain as information about fit and structure.

Bodies test time. A person may consent to record on the first day and discover by the thirtieth day that constant awareness changes appetite, movement, speech, and rest. A person may perform steadiness at the beginning and later show irritability, numbness, or strategic sincerity. A person may believe they can live under visible public-power formation and then find that the cumulative load requires de-loading, pause, accommodation, or exit. The City must learn from these bodily facts rather than moralize them.

Bodies also test the City's care sequence. If a participant is ill, exhausted, injured, grieving, panicked, ashamed, or overloaded, does the City move first toward care or toward classification? Does it ask what the person needs, or what the record means? Does it protect sleep as civic infrastructure, or does it treat sleep as private weakness? Does it respect clinician independence, or does it quietly turn care into evidence? The answer appears in bodies before it appears in reports.

Bodies test accessibility as well. If the City can only be carried by people with a narrow range of stamina, sensory tolerance, mobility, health, neurological style, or life conditions, then the City has mistaken public-power burden for ableist selection. Disability-aware support and load accommodation are not concessions from the ideal. They are part of the ideal because public power is carried by human beings, not by abstract capacity.

A first implementation must therefore treat bodies as evidence of institutional placement. When bodies recover, strain, adapt, resist, break down, or exit, the City should ask what its design has done. The question is not whether the participant was strong enough for

the City. The question is whether the City placed burden fairly enough for human public-power formation.

Bodies test theory only within a care-first boundary. Participants must never be required to prove distress through endless measurement, and biometric curiosity cannot become another form of exposure. Care teams, consent boundaries, nonpublic health review, and independent clinical authority govern bodily evidence. The purpose is to detect avoidable load and protect people, not to convert exhaustion into public spectacle or a scientific shortcut.

Bodies also test equity. A City calibrated around the unusually resilient person will silently punish those with disability, trauma histories, chronic illness, neurodivergence, caregiving obligations, sensory sensitivity, age-related fatigue, or cultural differences in disclosure. If the first City only works for people already optimized for public strain, it has not demonstrated the livability of visible public-power formation. It has demonstrated selection bias dressed as courage.

Staff systems are also where formal ideals meet ordinary management. Scheduling, supervision, escalation, overtime, breaks, training, grievance routes, role clarity, access privileges, and emergency substitutions decide whether the City is humane in the hours between its public statements. A participant may experience a well-written right through a tired staff member who has been given too little time, too little authority, or too much hidden pressure. If staff conditions are unfair, participant rights become fragile.

4.1.3 — Staff Systems Test Morality

Staff-system health can be documented without making individual workers public material. Workload bands, staffing ratios, vacancy rates, turnover patterns, incident categories, complaint timelines, training completion, recovery rhythms, and anti-retaliation outcomes can reveal institutional strain at the appropriate level. The public does not need a worker's private life. It does need assurance that visible public power is not being purchased with hidden staff burden.

A City can treat participants well and still hide injustice in the people who serve them. Staff systems test morality because every visible institution depends on work that can disappear beneath the visible story. Educators, clinicians, mentors, security staff, archivists, operators, moderators, cleaners, food workers, maintenance teams, accessibility workers, technical staff, and complaint handlers become the hidden structure of the City's promise.

Staff systems require disciplined role separation. Clinicians retain care authority, mentors support learning without hidden sovereignty, archivists preserve evidence without moral adjudication, security staff protect people through lawful and proportionate means, and operators remain reviewable gatekeepers. Role charters, supervision, conflict rules, referral paths, and independent complaint routes keep these distinctions intact when crisis, fatigue, publicity, and institutional loyalty place them under pressure.

Staff systems also test complaint reality and learning speed. If staff see donor pressure, record misuse, participant mistreatment, security drift, public-interface abuse, or archive weakness, can they speak early, appeal safely, and trigger correction without waiting to resign? Protected staff testimony should be structured enough to guide change and independent enough to remain honest. Burnout, turnover, and silence are institutional evidence, not personal fragility.

The prototype must also test whether staff influence is visible without making staff full-life subjects. Material advice, access control, mentorship, scheduling, and record interpretation can shape public-power formation. That influence must be traceable. Staff accountability must be role-bound, not total. That balance can only be tested in real operations.

Staff systems test whether the City's fairness reaches the people who make fairness operational. An institution can speak beautifully about participant dignity while scheduling archive workers into unsustainable vigilance, asking clinicians to carry impossible confidentiality conflicts, treating security staff as moral shock absorbers, or expecting maintenance workers to repair high-risk systems without enough time or authority. Hidden staff burden is one of the easiest ways for a visible institution to lie.

Staff morality also includes influence integrity. Educators, mentors, clinicians, archivists, record officers, security personnel, and public-interface moderators may shape participant experience profoundly. Their role records should capture relevant institutional conduct without exposing their private lives. Advice

logs, conflict disclosures, access events, decision notes, and complaint responses can make role power reviewable. Full-life transparency is not the answer. Role-bound answerability is.

Externalization can be subtle because the City may bring benefits at the same time it creates strain. Local jobs, educational partnerships, cultural interest, infrastructure investment, and civic prestige may coexist with rents rising, traffic changing, emergency services adapting, protest routes shifting, and ordinary residents feeling watched by association. A fair prototype cannot count benefits in public and leave costs as private irritation. Host impact must be read as a mixed burden record of place, not as a promotional narrative.

4.1.4 — Host Communities Test Externalization

A host-community review process should also distinguish immediate disruption from cumulative alteration. A short construction inconvenience differs from a permanent security pattern. A temporary media surge differs from a neighborhood becoming a symbolic battleground. A useful local complaint route should be able to see both. The City's ethics of beginning should include the patience to hear burdens that do not arrive in the vocabulary of the project.

Every City stands somewhere. That simple fact can be forgotten when the project is discussed as a moral architecture or civic breakthrough. A real site has neighbors, roads, schools, clinics, utilities, emergency services, housing markets, local politics, memory, culture, weather, and daily rhythms. The host

community tests whether the City's burden has been externalized onto people who did not choose it.

Host-community standing is part of prototype legitimacy. Residents and local institutions need continuing routes to obtain information, raise cumulative-impact concerns, challenge mitigation failures, and seek remedy. Some objections will be answered by evidence; others will reveal burdens the project could not see from inside its mission. Ongoing review turns the host from scenery into a coequal source of operational knowledge.

Host communities also test replication. A design that works in one place may burden another. Climate, law, culture, infrastructure, density, local trust, language, emergency capacity, and historical experience with institutions vary. If the first City cannot learn from its host, later Cities may copy harm under the language of standards. A pilot must study host burden as seriously as participant burden.

The host community is therefore not outside the City's ethical field. It is one of the places where the City proves whether it understands its own premise. If hidden public-power formation is wrong because it makes others carry unseen cost, then the City must not begin by making its neighbors carry unseen cost in the name of visible power.

Local legitimacy is not applause at a launch event. It requires the surrounding community to keep making burdens visible without being dismissed as parochial, hostile, or insufficiently visionary.

Host review also tests the City's sense of scale. A campus may be modest in civilizational ambition but enormous in local effect. A road closure, water demand, security perimeter, media encampment, or rise in rents can matter more to neighbors than the philosophical purpose of the project. The first City must learn to measure greatness partly by how little avoidable strain it pushes onto those nearby.

The public interface should be tested with people who do not already admire the project. Supporters may forgive complexity. Specialists may navigate labels. Critics may read adversarially but still possess high interpretive skill. Ordinary citizens may encounter one excerpt, one record bundle, one visual, one correction notice, or one hostile commentary before forming judgment. The interface must be designed for that unequal public field, where time, literacy, trust, disability, language, media habits, and prior political injury differ.

4.1.5 — Public Interface Tests Trust

A trustworthy interface also needs humane speed. If correction arrives too late, false meaning hardens. If release arrives too quickly, context may be missing. If public summaries are too polished, they may look like propaganda. If raw records are too exposed, they may become harm. The first City should test not only what it tells the public, but when, how, with what status label, through which appeal route, and under what conditions the object should be withdrawn or revised.

The public interface determines whether the City's memory becomes civic capacity. Citizens need records they can navigate,

summaries they can interrogate, source links they can follow, status labels they can understand, and correction routes they can use. Raw abundance without context shifts the burden of interpretation onto the public; elegant custody without usable access leaves answerability incomplete. A successful interface makes complexity legible while resisting spectacle.

A first implementation must learn how citizens, critics, journalists, scholars, affected persons, institutions, and ordinary voters actually encounter its records. Do status labels make sense? Are corrections visible? Are protected summaries trusted? Can nonexperts distinguish draft from decision, simulation from office conduct, public release from protected source record, and operational evidence from proof? If public interface fails, the City may produce more confusion than trust.

Public interface also tests appetite. The public may seek drama, humiliation, intimate detail, scandal fragments, or simple rankings. Platforms may reward the most sensational pieces of the record. Journalists may compress context. Opponents may clip. Supporters may mythologize. The City must learn whether its interface design can guide attention toward civic relevance rather than public hunger. If not, visibility becomes a new burden on the exposed.

Translation is part of operational ethics. Each release should tell a serious general reader what the material shows, which source supports it, why part of it may be shielded, who reviewed the claim, how correction occurred, and where uncertainty remains. Layered views can serve both public readers and specialists without flattening complexity. The measure of usefulness is

whether citizens can reach an informed judgment without needing graduate training in record architecture.

Trust is tested when the interface disappoints both curiosity and defensiveness. The public may want more intimate access than fairness permits. Participants may want flattering summaries. Staff may want less scrutiny. Leaders may want simpler messages. Critics may want raw material that confirms their fear. The interface must answer to civic use rather than any one appetite. It should provide enough context for judgment while refusing humiliation, entertainment, doxxing, and artificial certainty.

Public trust will also be tested by negative information. A useful interface should show not only staged success but complaint categories, correction histories, outage status, delayed releases, shielded categories, audit findings, and unresolved concerns. Trust grows when an institution can display its incompleteness without asking incompleteness to become scandal or worship. A City that can show uncertainty honestly may become more credible than one that curates confidence.

4.2 — Prototype Versus Monument

A prototype protects learning by keeping correction cheaper than image defense. Money spent, symbolic attention, donor identification, public hope, and institutional reputation can make revision feel like retreat, even when revision is the most responsible result. The first City therefore needs decision rules that prevent sunk cost, prestige, and legitimacy maintenance from determining continuation (Staw, 1976; Brockner, 1992; Suchman, 1995).

The distinction between prototype and monument is not aesthetic. It is ethical. A prototype can be admired, but admiration must remain secondary to testing. A monument can be inspected, but inspection often becomes secondary to preservation. The Transparent City must begin as a prototype because the burdens it carries are too serious for image-protection. If the first City becomes a monument too early, its failures will be hidden, reframed, minimized, or sacrificed to the story of success.

The monument danger is not only aesthetic. It is a governance danger. Once a campus is treated as symbolic proof, every defect becomes embarrassing, every critic becomes a threat to morale, every delay becomes a public-relations problem, and every internal injury risks being reframed as temporary sacrifice for a historic cause. That conversion is incompatible with the book's fairness standard. If the City moves burden upward toward power in theory but moves actual harm downward onto participants, staff, or neighbors in practice, the prototype has failed its own first language.

A prototype treats revision as evidence of institutional maturity. It preserves dated decisions, records why choices were made, invites external inspection, marks changes honestly, and keeps adverse findings close enough to guide later builders. Its dignity comes from traceable learning rather than an untouched surface. This is how a beginning remains credible after admiration and institutional self-interest arrive.

4.2.1 — Prototype Learns

A learning prototype must make disagreement useful. Internal dissent, outside criticism, participant complaint, staff warning, host-community objection, and technical audit should enter the institution through different channels, yet all should be capable of changing practice. If every route ends in the same leadership discretion, the City has not built learning. It has built a funnel. The point of a prototype is that the institution can be corrected from more than one side.

Learning means more than collecting feedback. It requires authority to change. If participants report overload, staff report impossible workload, public interface creates confusion, host communities report disruption, or protected nonvisibility proves difficult, the City must be able to revise. A prototype that hears criticism but cannot change is only a monument with better surveys.

Adverse findings are part of the prototype's yield. A failed practice, an unclear protected-nonvisibility category, a misunderstood public summary, or a misleading Artificial Intelligence flag identifies a mechanism that needs correction.

Each result enters the learning record with an affected-person protection plan, accountable owner, provisional response, and reassessment date. Public reporting should present the lesson before reputation management can absorb it.

Early participants should be protected from symbolic burden. The first cohort already carries unusual visibility and uncertainty; it should not also be required to embody the City's success. Confidential reporting, independent support, de-loading, and protected exit let experience become evidence for correction rather than performance for the institution. The prototype learns most honestly when people can describe strain without threatening the story.

Learning requires custody. The prototype must identify who receives evidence, who protects affected people, who decides a temporary response, who records dissent, who verifies correction, and who reports unresolved risk. A visible cycle moves from observation to classification, protection, review, decision, implementation, reassessment, and status-appropriate publication. Named ownership turns learning from a flattering aspiration into an auditable institutional process.

The learning cycle must receive difficult signals without translating them into disloyalty. Unsustainable staff load, participant requests for de-loading, host-community complaints, and confusing public summaries are information about design, capacity, and communication. Protected reporting and independent review allow the institution to hear those signals before strain becomes harm. A prototype grows stronger when criticism can change its behavior.

A prototype learns best when its pride is attached to correction. This is a different honor culture from the one many institutions know. The proudest sentence is not that no flaw appeared. The proudest sentence is that a flaw was seen before it injured more people, that the persons affected were protected, that the record was corrected, and that the lesson was preserved for those who come later.

Monument logic often appears in the grammar of inevitability. People begin to say that the City must succeed because the world needs it, that critics should be careful because hope is fragile, that staff strain is temporary because the mission is historic, or that participants should remain patient because future generations are watching. Each sentence may sound generous. Together they become a machinery for shifting present burden onto those least able to refuse it.

4.2.2 — Monument Protects Image

A monument also tends to simplify its enemies. It treats the critic as hostile, the complainant as ungrateful, the cautious lawyer as timid, the staff whistleblower as disloyal, and the host resident as narrow. A prototype cannot afford that simplification. Its critics may be wrong, but the burden they identify may still be real. The City should preserve enough humility to learn even from people who misunderstand part of it.

Image protection appears when the institution begins to fear embarrassment more than burden. Staff overload becomes a messaging problem. A participant breakdown becomes an anomaly. A host complaint becomes local resistance. A technical

failure becomes a minor bug. A rights problem becomes misunderstood policy. A public interface failure becomes a user education issue. In each case, the City protects its image by shifting responsibility away from itself.

Donor and public admiration can intensify the danger. If powerful supporters want the first City to stand as a civilizational symbol, staff may feel pressure not to report faults. If public writers call it the beginning of a new era, leaders may resist pausing. If opponents watch for failure, the institution may hide weakness defensively. A monument is often built by fear of both praise and attack.

A monument protects image because image has become part of its authority. A prototype protects learning because learning has become part of its legitimacy. The Transparent City must choose the second path. If its image becomes more protected than its people, the City's purpose has begun to reverse.

Image protection often begins as kindness toward supporters. Leaders do not want donors to feel foolish, participants to feel their sacrifice was wasted, staff to feel blamed, or the public to lose hope. But when kindness to the image outranks honesty to the burden, the institution begins to invert its own morality. It asks real people to carry strain so that the symbol can remain clean. That is monument logic.

A monument can even weaponize gratitude. Participants may be told, subtly or directly, that they are part of history. Staff may be told that their exhaustion is service. Host communities may be told that they should be proud. Critics may be told that they are

endangering hope. The critical question is who benefits when gratitude silences objection. If gratitude lowers complaint, it has become burden transfer.

Prestige is not only expensive architecture. It can be a public mood. A pilot becomes prestige-protected when people speak more about reputation than remedy, more about being first than being safe, more about the symbolic value of the City than the daily conditions of those who carry it. The City should treat prestige as a potential contaminant when it begins to make ordinary corrective action feel too small for the moment.

4.2.3 — Pilot Before Prestige

Pilot before prestige also shapes procurement and design. The first City should prefer inspectable systems over impressive but opaque systems, maintainable spaces over iconic forms that create hidden labor, reversible technical choices over permanent vendor dependence, and plain public labels over dramatic branding. A fair pilot is allowed to be beautiful. Its beauty should make burden easier to see and carry, not harder to question.

The initial City must be a pilot before it is a prestige object. This order matters. Prestige changes incentives. Once an institution becomes prestigious, people seek admission for status, donors seek association, media seek symbolism, staff fear damaging the project, and public interpretation becomes less patient with ordinary learning. A pilot can be humble. Prestige rarely stays humble for long.

Pilot before prestige means the first City should define what it is testing before it defines how it will be celebrated. Livability,

rights, record integrity, staff sustainability, nonparticipant protection, host burden, anti-capture resistance, technical resilience, and stop capability should be the center. Architectural beauty, public recognition, donor pride, institutional reputation, and global attention must remain secondary.

Pilot staffing should be built around competence, boundary discipline, care, resilience, auditability, and willingness to name failure. Reputation can support recruitment, but it cannot substitute for reviewable practice. Advisers and operators alike must accept conflict rules, correction, and removal. The most valuable staff member may be the person who notices drift early and protects the institution from its own prestige.

Prestige may come if the City works. The institution cannot control every public reaction. But it can control whether prestige becomes its design center. A pilot deserves respect because it is willing to learn. A prestige object demands respect because it wants to be seen. The City must earn the first and resist the second.

Pilot before prestige means that scale markers should be delayed. The first City should resist premature architectural grandeur, celebrity endorsement, triumphal donor language, international branding, and public countdowns that make stopping look like defeat. A pilot is allowed to be serious without being grandiose. Seriousness lives in safeguards, review routes, resilient systems, staff protection, and the ability to explain a pause. It does not require the aura of inevitability.

The prestige question can be asked plainly: would the institution still make this decision if no one could admire it? If the answer changes, prestige is governing. The first City should prefer decisions that would remain defensible in a closed safety review, a skeptical audit, a staff complaint, a host-community meeting, and a public explanation after delay. That is how pilot discipline stays ahead of image.

Inspection should not wait for scandal. The first City should be inspected before opening, during operation, after incidents, at fixed intervals, and before any proposed replication. Different inspectors should see different burdens: rights reviewers, record-integrity reviewers, clinical and occupational-health reviewers, accessibility reviewers, host-community reviewers, cybersecurity reviewers, staff representatives, public-interface testers, and outside critics. No single eye can carry the whole burden of seeing.

4.2.4 — Inspection Before Celebration

External inspection should precede ceremonial opening and continue after occupancy. Rights, staff workload, accessibility, protected nonvisibility, records, public interfaces, host burden, donor influence, vendor dependency, cybersecurity, and exit all require review by people able to report adverse findings independently.

Early celebration can make later criticism feel like betrayal. Participants may underreport strain, staff may hide overload, and hosts may hesitate to challenge a project already presented as a

success. Inspection before celebration reduces that pressure while correction remains comparatively easy.

Recognition should attach to specific verified achievements: a complaint that changed practice, an overload corrected, or a host concern that altered the design. An inspection report does not certify permanent safety. It records what worked, what failed, what remains unresolved, and what must happen next. The City's earliest public pledge should be simple: truth outranks image.

Stoppability must be more than an emergency phrase. It requires legal authority, financial reserves, staff transition plans, participant care routes, archive preservation or sealing rules, host-community notification, vendor exit rights, public explanation templates, and review bodies that can act against leadership preference. An institution cannot honestly say it can stop if stopping would strand the very people who relied on it.

4.2.5 — Stoppability Before Scale

Scale without stoppability turns investment into pressure to continue and error into replication. Contracts, donors, public promises, technical entanglement, and network standards can make a system difficult to interrupt even when no person is physically trapped. The City should therefore prove modular stop authority before scale, so a flawed record process, weak child-protection rule, staff-load problem, or donor dependency can be contained before it becomes a network norm.

Stoppability requires funded exit support, post-pause participant protection, staff transition, host notice, proper record sealing or preservation, and public explanation. If the City cannot afford to

stop, continuation becomes financial necessity rather than moral choice.

Stoppability must be institutional, not rhetorical. Leadership cannot hold sole stop authority when image, donors, or fear may capture it. Independent routes need triggers, emergency access, explanation duties, and protection for those who invoke them; no one should become a martyr to make the institution listen. The route should identify a deputy or independent body with authority to act when ordinary leadership is unavailable, conflicted, or implicated. Every activation should create a timestamped record of the trigger, interim protections, and reviewing authority.

Scale without stoppability creates hostage logic. Once too many participants, staff, contracts, buildings, political relationships, public narratives, and donor expectations depend on continuation, stopping becomes materially and emotionally harder. The institution may then argue that it must continue because too much has already been invested. That sunk-cost morality is indefensible. Past investment cannot demand future injury. Every stop rehearsal should assign an owner for care continuity and records so interruption does not create a second failure while correcting the first. Before scaling, planners should price the minimum shutdown reserve and identify contracts, data dependencies, and essential services that could otherwise make a pause coercively expensive. Expansion should not proceed unless those dependencies have a workable interruption or transfer route.

Stoppability should be rehearsed like emergency response. The City must be able to pause intake, protect people, preserve records, maintain care, notify staff and hosts, secure systems, and

begin independent review without panic. Prepared stoppability lowers the burden of interruption. A rehearsal is most useful when it exposes dependencies that would make stopping slower, more expensive, or less human than planners assumed. Each rehearsal should end with a correction record naming the failed dependency, the office responsible for repairing it, and the deadline for retesting. The next rehearsal should verify the corrected route under realistic staffing, communication, and care-continuity conditions.

Before construction, a public prototype ledger records each major claim, evidence threshold, affected group, uncertainty, reviewer, appeal, and stop condition. United Kingdom guidance likewise places assumptions, testing, feedback, adaptation, and scale decisions within evaluation (UK Evaluation Task Force, 2026; HM Treasury, 2026b; HM Treasury, 2026c). The ledger should record who can invoke the stop condition and what evidence is required before activity may resume. Resumption should require a documented finding that the triggering condition has been corrected or reduced to an explicitly accepted residual risk. The ledger should record the corrective action, reviewing authority, remaining uncertainty, and the condition that would trigger another pause.

4.3 — What the First City Must Demonstrate

Operational seriousness begins with declared demonstration categories. A first City can test whether its role burden is livable, rights operate, records retain integrity, staff systems remain sustainable, nonparticipants are protected, host burdens are addressed, and capture pressures are resisted (Glasgow et al., 1999; Proctor et al., 2011). These capacities matter on their own terms. They do not validate PTVC or establish the entire future of public power.

Demonstration is accountable showing under conditions that permit criticism, correction, and failure. Livability, usable rights, record integrity, staff sustainability, nonparticipant protection, and anti-capture resilience are noncompensatory conditions rather than dimensions to be averaged into one success score. Serious failure in any one requires pause, narrowing, redesign, or stop.

The demonstration categories should be read as a pilot evaluation architecture, not as a public-relations checklist. Each category asks a burden question. Can human beings carry the Vow without being crushed by the institution? Can rights interrupt the City when interruption is inconvenient? Can records remain trustworthy without becoming voyeuristic demand? Can staff work inside the system without becoming hidden fuel? Can nonparticipants be protected when the logic of visibility presses outward? Can money, vendors, prestige, and internal identity fail to capture the whole?

A pilot report earns the word demonstration by answering the declared questions under pressure. It should show observed function, independent review, documented limits, correction performance, unresolved uncertainty, and the conditions that would change the verdict. Open buildings, functioning cameras, activity, and admiration are inputs, not conclusions. The City earns a next step through demonstrated competence with burden, rights, records, people, and correction.

4.3.1 — Livability Demonstration

Livability evaluation should distinguish performance comfort from actual restoration. A participant may appear composed in public interface windows while privately becoming brittle, sleepless, lonely, or numb. Another may speak passionately about the mission while avoiding complaint because complaint feels like betrayal. The City must not rely on visible composure as evidence of humane conditions. It needs protected channels where strain can be reported without being interpreted as weakness or disloyalty.

The first demonstration is livability. Can human beings live under the Transparent Vow without being damaged by the institution's ordinary conditions? This question is not sentimental. If participants cannot sleep, eat, learn, recover, dissent, repair, receive care, and retain dignity while under visible public-power formation, then the City has designed a burden too severe for its purpose.

Livability includes the architecture of the day. Morning reentry, work blocks, meals, public interface windows, evening

decompression, sleep preparation, and recovery rhythms must function in practice. Livability cannot be inferred from inspiration or public testimony alone. It should gather operational evidence about load, exhaustion, participation, complaints, health referrals, exit requests, staff observations, and participant feedback.

Livability also includes the ability to remain ordinary in some humane sense. The participant is not an ordinary private citizen while active, but they are still a person. A City that turns every meal into evidence, every conversation into performance, every rest period into suspicion, and every difficulty into public meaning will become unlivable. The first City must show that ordinary human intervals can survive within active role burden.

The demonstration must include different bodies and circumstances. Livability for one unusually resilient participant does not demonstrate livability for the role. Disability, age, health conditions, neurodiversity, caregiving obligations, trauma histories, cultural differences, and varied social backgrounds may all reveal different burdens. Selection must not favor only people who make the system look easy.

A livability demonstration does not mean everyone thrives. It means the City can detect strain, respond to it, support recovery, adjust load, preserve dignity, allow exit, and identify when a pathway is not safe. Livability is not the absence of difficulty. It is the presence of humane conditions under a difficult burden.

A credible livability demonstration should make some public claims smaller. It may show that certain role pathways are too intense, certain release windows too frequent, certain residential

arrangements too exposed, certain support routes too slow, or certain public interactions too performative. Such findings are not embarrassing. They are the prototype doing its work before harm becomes tradition.

A rights demonstration should test friction, not only existence. How many steps does a participant need to complain? Can a staff member report retaliation without alerting the person who controls their schedule? Can a nonparticipant challenge wrongful exposure without becoming more exposed? Can a host resident complain without entering the City's ideological vocabulary? If the route requires too much confidence, legal literacy, time, money, or emotional reserve, the right may exist on paper while failing in life.

Livability should be assessed across time and roles rather than through a launch survey. The review must distinguish acute burden, such as crisis, conflict, exposure, or technical failure, from cumulative burden, such as watchfulness, sensory load, repeated explanation, schedule pressure, isolation, and the slow narrowing of spontaneity. Participants, staff, families, protected visitors, and neighbors may experience the same design differently. A beautiful campus can survive crises and still grind down the people carrying its invisible work.

4.3.2 — Rights Demonstration

Another obligation is to track the burden of using rights. A complaint may protect a person while costing sleep, trust, relationships, professional standing, public dignity, or continued access to support. Remedy must therefore include protection around the process itself. A rights route must be judged not only by its existence, but by what the person pays to use it.

The second demonstration concerns usable rights. Due process, counsel access, complaint, appeal, humane care, exit, nonparticipant remedy, staff grievance, and host-community recourse must function when seniority, urgency, publicity, and institutional self-protection press against them. Rights that exist only in a handbook do not protect a person under the Vow.

A rights demonstration asks whether people know their rights before they need them. Participants should understand complaint routes, appeal processes, counsel access, support boundaries, protected nonvisibility, and exit conditions before activation. Staff should understand labor rights, anti-retaliation protections, workload appeal, and whistleblower channels. Nonparticipants should know how to seek remedy for wrongful exposure. Rights hidden in complexity are not rights in practice.

Institutional practice must demonstrate that rights work against the institution itself. A complaint that embarrasses the City should not be buried, and a staff report about donor pressure should not disappear into leadership discretion. When a complaint produces correction, the institution should preserve repair memory through protected case records and public category-level summaries

where public risk remains, without exposing the claimant. Rights are most real when they constrain the institution, change practice, and leave evidence that the correction mattered.

Rights demonstration also requires notice in plain language. A right hidden in legal architecture may satisfy a drafter and fail a burdened person. The participant who is exhausted, ashamed, frightened, or confused needs to know what can be paused, who can be contacted, what remains private, how fast review should occur, what retaliation is forbidden, and what happens if the first reviewer is implicated. Rights are operational only when the person can reach them under pressure.

A rights demonstration must include the unpopular claimant. Rights are easiest when the harmed person is sympathetic, the complaint is simple, and the institution can fix the problem without embarrassment. The real test comes when the claimant is angry, politically inconvenient, socially disliked, or accusing a beloved part of the City. The City's dignity is measured by how it treats the objection it would rather not hear.

Rights demonstration should include adversarial drills of its own. The City should test what happens when a complaint concerns a senior official, counsel is unavailable on a deadline, a staff grievance risks retaliation, a participant's pause request conflicts with public attention, a nonparticipant seeks emergency masking, or an appeal body misses its decision window. The test is whether rights alter power under pressure, not whether they read well in a handbook (Barak, 2012; Mashaw, 2006).

4.3.3 — Record Integrity Demonstration

The record system should also demonstrate proportional explanation. Not every record problem requires public alarm, and not every record success deserves public praise. The City needs status language for ordinary correction, protected correction, public correction, integrity hold, release delay, access breach, provenance uncertainty, and retired summary. These labels help the public understand function without pushing sensitive details into view.

The third demonstration is record integrity. The City's central promise depends on the public being able to trust that records are captured, preserved, classified, corrected, released, and interpreted under lawful discipline. If records are incomplete, manipulated, misclassified, inaccessible, overexposed, or technically fragile, the City cannot make public-power formation more answerable. It will only create a larger field of confusion.

Record integrity begins at capture. The City must demonstrate that active-period records are created reliably, with status labels, timing, provenance, access controls, and failure logs. Technical systems must account for interruptions, hardware failures, emergency exceptions, and disputed status. A gap is not automatically misconduct, but an unexplained gap is dangerous. Integrity means knowing the difference.

Integrity continues through classification. Not all records belong in the same category. Public release, protected summary, delayed release, restricted access, sealed material, professional interface, nonparticipant contact, and research-ineligible material require

different handling. The City must demonstrate that classification decisions are consistent, reviewable, appealable, and audited. Otherwise privacy language can become concealment or openness can become abuse.

The demonstration should separate capture integrity from release integrity. A captured record may be complete yet not publicly releasable. A public bundle may be lawful yet misleading if context is poor. A redaction may protect a collateral person yet create suspicion if the status label is unclear. A delayed release may be necessary yet dangerous if the review clock is invisible. The City must demonstrate the whole lifecycle because the public will encounter records as interpreted objects, not as raw storage.

The record integrity demonstration should also include hostile conditions: cyber intrusion attempts, deepfake claims, insider misuse, public clipping, media misinterpretation, and political pressure for selective release. The City cannot assume a friendly public environment. If the archive becomes useful only under goodwill, it is not ready to support public-power formation.

Staff sustainability must be evaluated by more than retention. A worker may stay because the job matters, because alternatives are scarce, because loyalty is strong, because leaving would burden colleagues, or because the institution has made exit feel morally costly. Retention can hide strain. The first City should examine workload, recovery, sick leave, turnover reasons, near misses, grievance use, schedule volatility, emotional exhaustion, role conflict, and whether workers can say no without quiet penalty.

4.3.4 — Staff Sustainability Demonstration

This demonstration is one of the City's central moral tests because staff carry the institution in their bodies. Archivists carry attention. Moderators carry public hostility. Clinicians carry distress. Security staff carry alertness. Cleaners carry repetition and exposure to overlooked spaces. Educators carry intellectual and emotional pressure. If the City becomes humane for participants by making staff absorb invisible cost, it has moved burden rather than repaired it.

The fourth demonstration is staff sustainability. The City may be livable for participants only because staff quietly absorb the burden. That would not be success. The first City must demonstrate that the people who educate, feed, clean, treat, moderate, archive, repair, secure, schedule, and operate the institution can work with dignity, privacy, fair load, recourse, and recovery.

Role clarity is part of sustainability. Staff who are asked to be mentor, judge, counselor, operator, security, friend, and record interpreter at once will eventually carry impossible contradictions. The first City must demonstrate that educators, clinicians, mentors, operators, archivists, security personnel, moderators, and auditors have distinct roles, authority limits, complaint routes, and privacy boundaries.

Staff sustainability is a moral demonstration because it reveals whether the City has merely moved hidden burden downward. A City that depends on silent staff sacrifice is not fair, no matter how noble its public purpose. The first City must show that visible

public-power formation can operate without consuming the people who make it possible.

Staff sustainability should be measured before staff become heroic. Institutions often discover their dependence on workers only after burnout, turnover, injury, silence, or scandal. Archive schedules, public-interface load, security vigilance, clinical support expectations, maintenance demands, and complaint processing should be stress-tested before crisis reveals that they are too heavy. The burden of a public-power formation institution is not carried by participants alone.

The design must also test moral injury. Staff may be asked to enforce boundaries against the public, deny inappropriate requests for access, classify sensitive records, respond to participants in distress, challenge leadership, or resist donors. These tasks can carry emotional cost. Sustainability includes the ability to perform necessary institutional duties without being turned into a hidden wall between the ideal and the harm.

Nonparticipant protection should be tested through ordinary spillover, not only rare catastrophe. A passerby may appear in footage. A family member may be mentioned in a recorded conversation. A local business may become part of a public story. A critic may be drawn into a participant's record. A child may be indirectly identifiable through schedule, school, or household context. The City must show that its visibility logic can stop at the edge of those who did not volunteer.

4.3.5 — Nonparticipant Protection Demonstration

Protection also requires remedy after spillover. If a nonparticipant is exposed, correction should not depend on the person understanding City doctrine or possessing legal sophistication. There should be clear notice where appropriate, a private complaint route, emergency shielding, public withdrawal or annotation where needed, and a record of what changed so the same spillover does not recur. The dignity of nonparticipants is the clearest test of whether the City knows its boundary.

The fifth demonstration is nonparticipant protection. The participant chooses the Vow. Others do not. A real City must show that children, families, partners, dependents, staff off duty, visitors, host-community members, clinicians, lawyers, clergy, contractors, journalists, protesters, and incidental contacts do not inherit active record burden by proximity. This is not optional. It is one of the foundations of legitimacy.

Nonparticipant protection begins with recognition. The City must identify when a person appears in a record without accepting the Vow. It must distinguish participant, staff role, visitor, bystander, professional interface, household member, affected person, and public contributor. If the system cannot classify people correctly, it cannot protect them correctly. Misclassification is one of the quickest paths to unfair exposure.

Nonparticipant protection is demonstrated through remedy, not through a promise of care. People must be able to challenge wrongful capture, mistaken release, misleading summaries, unmasked identity, platform spread, data misuse, or other public

harm. The pilot should test complaint intake, correction, masking, compensation where appropriate, and public notice where needed.

Nonparticipant protection must be demonstrated in routine contact, not only in obvious cases. A delivery worker, neighbor, child's teacher, visiting expert, attorney, clinician, protester, journalist, host resident, family member, or passerby may become incidentally entangled with the City. The prototype must show how such persons are identified, shielded, notified when appropriate, given remedy when wrongfully exposed, and protected from being converted into supporting evidence for someone else's Vow.

Protection should not depend on the nonparticipant having power, sophistication, or legal endurance. Many affected people will not know what happened, what record exists, whom to contact, or how to challenge exposure. A fair system carries part of that burden by creating accessible routes, plain notices, advocates where appropriate, and public explanations of categories without revealing protected persons.

Anti-capture resilience should be tested against friendly capture as much as hostile capture. A donor who loves the City may still distort priorities. A vendor with excellent technology may still create dependence. A celebrated participant may still receive soft treatment. A founder, designer, or early staff culture may become difficult to question because people are grateful. Capture often enters as help before it becomes control.

4.3.6 — Anti-Capture Demonstration

The initial City should demonstrate conflict disclosure, gift refusal, vendor portability, procurement review, influence logs where appropriate, rotation of sensitive roles, independent complaint routes, newsroom independence where relevant, and public explanation when a relationship is terminated. Anti-capture is credible when the institution can disappoint powerful friends without treating disappointment as betrayal.

The sixth demonstration is anti-capture resilience. A City created to expose hidden power will attract hidden power. Donors may want influence. Vendors may want dependency. Political actors may want access. Parties may want candidate pipelines. Media may want drama. Staff may develop informal authority. Artificial Intelligence systems may appear neutral while shaping decisions. The first City must demonstrate resistance before claiming trust.

Funding cannot buy admission, naming, archive access, governance priority, favorable reports, appointments, participant influence, or softened criticism. Donors may support public purpose but cannot own the City's threshold, memory, standards, or story; audits must expose even polite pressure.

Because capture adapts, evidence is time-bounded. A pilot can show detection, boundary discipline, independent review, reporting, and practical refusal of money, vendors, politics, or prestige only under tested conditions. Continuing review asks whether those protections survive new tactics and dependencies.

Anti-capture review spans money, access, narrative, staffing, technology, and self-protection. It tests donor gifts and

dependency, vendor lock-in and opacity, and leader charisma, loyalty, and gatekeeping. Watching only obvious bribery misses quieter rule.

Anti-capture testing begins with attractive offers: expansion money before safeguards travel, an unauditable vendor system, special access for a public figure, or media reach tied to narrative control.

Institutional identity is also vulnerable: staff may treat criticism as betrayal, participants may become loyal to support, and designers may defend reputation. Independent mechanisms must protect people from institutional self-belief.

Ownership review, gift refusals, vendor-exit tests, conflict logs, audits, critic access, outside complaints, and explanations of declined opportunities show that fairness is not for sale.

4.4 — Failure Thresholds and the Ethics of Stopping

Stop authority converts institutional humility into a real protection. Failure, pause, and redesign thresholds must be fixed before the evidence arrives, because later incentives will favor reinterpretation, delay, minimization, or narrative rescue. A fair prototype therefore gives accountable reviewers the authority, information, and resources to pause, narrow, redesign, or close the City when continuation would shift avoidable burden onto people (Avery et al., 2017; CIOMS, 2016; HM Treasury, 2026c).

Imagine the first independent continuation hearing after several months of operation. The campus is beautiful, public interest is high, donors are ready to fund expansion, and many participants report that the education is valuable. The same review finds that staff recovery time, host-community complaint response, and bystander-record correction have not met the prospectively fixed thresholds.

Advocates argue that the deficiencies are temporary and that expansion money could solve them. Staff representatives answer that continued scale would increase the very burden under review. Host delegates point to unresolved service and access costs. The independent review body therefore pauses new admissions, protects current care, funds repair, and publishes the reasons without describing the pause as betrayal.

That decision is a successful use of the prototype, even though it interrupts momentum. The institution has learned which safeguards remain nominal under pressure and has prevented prestige from converting uncertainty into exposure. Continuation

may resume after independently verified repair, or the affected track may close if the threshold cannot be met.

A stop rule becomes credible when it has an owner, evidence source, review date, consequence, repair route, and protected appeal. “We will stop if necessary” is not a rule. The decision ledger below turns the promise into an inspectable control and preserves the possibility that the most honorable result of a pilot is a well-explained refusal to continue (Avery et al., 2017; HM Treasury, 2026c).

The ethics of stopping begin with a hard admission: some forms of continuation become unfair. A City can be promising and still need to pause. It can be beautiful and still need redesign. It can be supported by donors, admired by the public, and defended by participants while still needing to stop. A noble mission does not make continuation moral. Continuation is moral only if the burdens remain justifiable.

The ethics of stopping must be designed before stopping is needed because crisis is a poor teacher of humility. Once people are inside, money has been spent, media has arrived, and supporters have emotionally invested, the institution will be tempted to redefine harm as growing pain. The stop threshold protects the harmed person from becoming the argument for continuation. It says that the burden borne by real people is more authoritative than the institution’s desire to look inevitable.

Failure thresholds should also be intelligible to outsiders. The public should not have to guess whether a pause is scandal, prudence, sabotage, weakness, or ordinary review. Status

language matters. The City should distinguish immediate safety stop, protective pause, pathway narrowing, record integrity hold, host-community review hold, staff sustainability hold, and redesign mandate. Those labels are not decorative. They keep public interpretation from making secrecy out of caution.

4.4.1 — Stop Conditions

Stop conditions must exist at several levels because continuation can become unfair in different ways. Acute risk calls for a safety stop; unusable complaint or appeal routes call for a rights stop; compromised capture or release calls for a record stop; and unsustainable labor calls for a staff stop. Unmitigated local burden, repeated public-interface harm, or distorted review may require host, interface, or capture stops. Each trigger needs an owner, evidence threshold, immediate consequence, appeal route, and review date (Avery et al., 2017; CIOMS, 2016; HM Treasury, 2026c).

Stop conditions define when continuation becomes unfair. They are not signs of weak commitment. They are safeguards against institutional self-protection. The first City should name categories of failure that require stopping a process, pathway, admission phase, release mechanism, public interface, office-support system, technical tool, or the pilot itself. Without stop conditions, every failure becomes negotiable under pressure.

Certain failures should trigger immediate stop review. Child exposure, systemic nonparticipant harm, intimate-record misuse, inability to provide exit, severe staff exploitation, repeated record integrity failure, uncorrected donor capture, vendor sovereignty

over public memory, unlawful operation, or inability to protect care before evidence cannot be treated as ordinary growing pains. These failures strike the conditions of legitimacy.

Stop conditions should distinguish levels of stoppage. Not every failure requires closing the whole City. Some require stopping a release category. Some require halting admissions. Some require suspending Artificial Intelligence tools. Some require closing a zone. Some require pausing public interface. Some may require decertification or shutdown. Precision prevents both panic and denial.

Stop conditions must be funded. If stopping would leave participants homeless, staff unpaid, records unmanaged, nonparticipants unsupported, or host communities abandoned, the City will avoid stopping even when stopping is necessary. Reserve design is therefore part of stop ethics. A project cannot honestly promise pause unless it has planned the burden of pausing.

A stop condition is a promise that people matter more than the institution's image. The first City should publish enough about its stop conditions that the public knows continuation is not automatic. The City earns trust not by promising never to fail, but by promising that certain failures will outrank the project's desire to continue.

Stop conditions should be stated in categories before they become cases. Participant harm beyond safe correction, repeated rights failure, unresolved record integrity breakdown, staff extraction, wrongful exposure of nonparticipants, host-community injury,

donor or vendor capture, emergency misuse, or inability to preserve care during operation can each make continuation unfair. The specific threshold may require expert review, but the moral principle should be clear: continuation is not legitimate when it depends on hiding a burden the City was built to reveal.

Stop conditions should protect against both dramatic and quiet harm. Dramatic harm is easier to recognize: serious exposure, abuse, breach, corruption, or crisis. Quiet harm may be repeated sleep erosion, steady staff turnover, complaint delay, defensive culture, host fatigue, record confusion, or public-interface distortion. A fair prototype must learn to stop for patterns, not only for catastrophes.

A stop rule needs a decision owner who is independent enough to use it. Participants, staff, host representatives, rights reviewers, technical auditors, and external experts should have specified triggering powers. Emergency suspension, ordinary review, appeal, preservation of evidence, care continuity, compensation, and closeout responsibilities should be declared before a crisis. Otherwise the people who invested most in continuation will also control the meaning of failure.

4.4.2 — Pause Conditions

A pause should have a caretaker plan. Participants need to know what changes in daily life, staff need workload clarity, affected persons need protection, host communities need explanation where relevant, and the public needs a scoped status. A vague pause can create rumor and fear. A well-labeled pause can

become a sign that the City is serious enough to slow down before people are hurt further.

Pause conditions address failure that may not require ending a system permanently but does require temporary narrowing. A pause is a moral tool when the City needs time to understand burden, protect people, correct procedure, inspect data, relieve staff, or prevent additional harm. A pause says that momentum is not more important than review.

Pause may be appropriate when patterns are unclear but concerning. Participants may show unexpected overload. Staff may report rising burnout. Public interface may invite harassment. Record classification may generate disputes. Host communities may identify new burden. Technical tools may produce biased or misleading outputs. In such cases, continuation at full speed would convert uncertainty into risk.

Pause conditions should be specific enough to guide action. A participant pathway might pause because load has exceeded safe thresholds. A release system might pause because protected summaries are being misread. A public approval tool might pause because bot activity has distorted signal. Admissions might pause because staff ratios are insufficient. Travel corridors might pause because host protocols are not working. Specificity protects the City from vague anxiety and vague denial.

Pause conditions should be available when the City does not yet know whether the failure is local, systemic, temporary, or disqualifying. A pause can stop intake while current participants receive care. It can freeze a release category while record integrity

is reviewed. It can suspend public interface windows while anti-spectacle design is repaired. It can slow construction, narrow a pathway, reduce staff load, or hold replication materials without declaring the whole prototype failed.

Pause also has dignity value. It tells participants and staff that the institution would rather interrupt itself than force them to continue under questionable conditions. It tells the host community that the City is not above local concern. It tells the public that caution is not weakness. A public institution that can pause visibly may be more trustworthy than one that moves steadily through unexamined harm.

Redesign becomes necessary when the underlying form produces repeated burden rather than isolated error. If a complaint route repeatedly exhausts complainants, the route needs redesign. If public bundles repeatedly invite humiliating interpretation, the release form needs redesign. If staff role records fail to capture influence without overexposing workers, the record category needs redesign. Redesign should follow patterns, not only incidents.

4.4.3 — Redesign Conditions

Redesign should also preserve traceability. When a harmful practice is replaced, the institution must preserve the record of what changed and why. A public institution earns trust by showing that it changed because evidence required change. The record of redesign should include what was wrong, what burden it created, what is protected from disclosure, what changed, what remains uncertain, and when the redesign will be reviewed again.

Redesign conditions identify when a failure should become correction rather than closure. Some failures reveal that a mechanism was poorly designed, not that the whole City is impossible. A corridor may invite side-channel access. A public bundle may confuse readers. A sleeping area may increase sensory load. A complaint route may be too complex. A staffing model may undercount emotional labor. Redesign is the City's way of learning through structure.

Redesign must alter the mechanism that placed burden wrongly. Workload changes require staffing, schedule, or authority changes; child protection requires corrected data flow and access control; misleading public bundles require revised provenance, context, and review; dignity language must be matched by enforceable practice. The successor design records what changed, how the new mechanism will be tested, and which signal would require another intervention.

Redesign conditions also require testing before return. A redesigned release process, corridor rule, access class, staff rotation, Artificial Intelligence flag, or public interface should not simply be announced. It should be tested, audited, and reviewed. The City must avoid cycling from failure to confident redesign to repeated failure.

Redesign conditions apply when the problem is real but the purpose may still be pursued through a changed form. A record interface may be too confusing while the capture architecture remains sound. A residential edge may be too exposed while the campus logic remains useful. A staff schedule may be extractive while the role itself remains necessary. A public-interface

practice may invite performance while the public's need for interpretation remains legitimate. Redesign prevents all-or-nothing thinking from hiding fixable burden.

The redesign process should include affected persons without making them carry the whole repair. Participants, staff, host residents, nonparticipants, critics, and experts may all hold knowledge the designers need. But the City should not require harmed people to become unpaid consultants or public symbols. Consultation should be compensated where appropriate, protected, accessible, and connected to actual decision-making.

Public explanation should be written for multiple audiences at once. Participants need to know their immediate rights and support. Staff need to know work expectations and protections. Nonparticipants need to know whether exposure risk continues. Host communities need to know local effects. Critics need enough context to evaluate the institution. Supporters need enough truth not to convert stopping into persecution myth. A single vague statement cannot carry all of these burdens.

4.4.4 — Public Explanation of Stopping

The explanation should also resist the temptation to overdramatize sacrifice. If stopping is ethically required, the people affected should not be turned into symbols of noble difficulty. A good public explanation keeps moral attention on protection, remedy, review, and next steps. It does not ask harmed persons to redeem the institution by becoming part of its inspirational story.

Stopping without explanation can damage trust as much as failure itself. The public will ask what happened, who was harmed, whether the record is intact, whether rights were protected, whether staff are safe, whether participants were abandoned, and whether the City is hiding something. A fair City should be prepared to explain stopping in a way that is truthful, bounded, and dignified.

Public explanation should distinguish category from exposure. The City may need to say that a release system stopped because nonparticipant shielding failed. It does not need to expose the nonparticipant. It may need to say that staff workload exceeded safe thresholds. It does not need to identify every staff member. It may need to say that a technical vendor failed audit. It may not need to release security-sensitive details. Truth and restraint must work together.

The explanation should name responsibility where possible. Was the failure caused by participant misconduct, system design, operator error, vendor failure, donor pressure, technical attack, legal incompatibility, staffing shortage, host burden, or ambiguous interaction? Blurred responsibility protects institutions. Overconfident responsibility can scapegoat. The City must speak with enough precision to guide remedy and enough humility to avoid false closure.

Public explanation should include what happens next. Pause, review, redesign, compensation, staff support, participant care, nonparticipant remedy, record correction, vendor exit, public audit, or shutdown each require follow-through. A statement of

concern is not explanation. A fair public explanation tells readers how the burden is being carried after the failure is named.

Public explanation of stopping protects the City from conspiracy and mythology. A clear notice states what threshold was crossed, who decided, which people are protected, what repair follows, what evidence remains restricted, and when the decision will be reviewed. This teaches the public how a corrigible institution behaves. The promise is honest exposure and responsible response when failure occurs.

Public explanation should begin by identifying scope. Did the City stop a pathway, a release category, an intake class, a technology, a building use, a public interface practice, an office-interface arrangement, a vendor relationship, or the entire prototype? Without scope, the public will supply its own story. Some will see total failure where there was prudent narrowing. Others will minimize serious harm because the institution uses vague language. Status precision prevents both panic and denial.

Public explanation is a test of whether the City's record culture can survive shame. Many institutions are transparent while they are proud and opaque when they are embarrassed. The City must reverse that. The more painful the finding, the more carefully the explanation should carry context, limits, remedy, and future review. This is how stopping becomes public trust rather than rumor.

A public stop notice should distinguish the finding, the decision, and the unresolved questions. It should state what happened, which threshold was crossed, who decided, what evidence was

considered, how affected people are protected, what records remain disputed or incomplete, what appeal exists, and whether redesign or requalification is possible. A truthful stop notice neither humiliates the people involved nor hides the seriousness of the failure.

4.4.5 — No Shame in Failure Memory

The next requirement is to preserve near-failures. A near-failure is a mercy if it is remembered. A staff intervention that prevented wrongful release, a host complaint that caught externalization early, a participant pause that revealed overload, or a technical audit that found access risk before exposure should all become protected learning. Institutions usually remember disasters. A fair institution remembers warnings.

Failure memory is the alternative to institutional amnesia. If the City forgets why something failed, future people will pay for the same mistake. If it remembers failure only as scandal, people will hide it. The City needs a form of memory that preserves lessons without turning people into permanent examples for humiliation.

Failure memory loses its moral value if it becomes shame. A participant may discover misfit, staff may report burnout, a host community may reveal burden, a public interface may fail, or a technical system may be withdrawn. These events should teach the institution rather than become stains on human worth.

Failure memory should classify the failure carefully. Misfit, misconduct, exhaustion, design error, technical failure, legal incompatibility, staff overload, host burden, and donor pressure should not be collapsed. The lesson depends on the category.

Shame thrives where categories are blurred because people begin to fear that every difficulty will be interpreted as personal failure.

Failure memory also protects replication. Later Cities should know what failed in the first City, what was redesigned, what was abandoned, what required pause, and what should never be copied. If the network remembers only successes, it becomes a mythology engine. If it remembers failures with shame, local sites will hide their own. If it remembers failures as learning, safeguards can travel more honestly.

No shame in failure memory does not excuse misconduct. Harm still requires remedy, consequence, and public notice where needed. The phrase means that the existence of failure is not itself dishonor. In a fair prototype, failure honestly remembered may be one of the highest forms of fidelity.

Failure memory should preserve negative findings and honorable refusals. A donor refused because conditions would distort governance, a vendor rejected because exit rights were weak, a replication request delayed because staff protections could not travel, and a public release withdrawn because context was unsafe all belong in the record. These are moments when burden was prevented before it became injury.

An institution committed to no-shame failure memory does not need to pretend it was pure from the beginning. Trust can grow when danger is found, recorded, and corrected. The public should not be asked to believe that a serious civic experiment never encountered risk.

A continuation decision should be reconstructible after enthusiasm, disappointment, and institutional self-interest have entered the room. The ledger below identifies the minimum domains that require evidence, an accountable owner, and a predetermined response. If the same warning reappears later, the continuation file should link the new decision to the earlier unresolved signal.

Table 4.1. Prototype Decision Ledger and Stop Rule.

Decision domain	Threshold and required response
Livability and care	Pass when burden, sleep, health, access, refusal, and recovery meet declared floors under independent care and rights review. If missed, pause admissions, provide care, reduce load, repair conditions, and reassess.
Rights operation	Pass when notice, privacy, complaint, appeal, nonretaliation, and exit work in practice under ombuds and external legal review. If missed, protect the person, suspend the implicated process, remedy harm, and verify correction.
Record integrity	Pass when capture, custody, access, release, correction, and status labels remain accurate, logged, and reviewable under independent records oversight. If missed, restrict release, preserve evidence, notify affected people, correct or retract, and audit.
Staff sustainability	Pass when workload, role clarity, compensation, recovery, complaint, and turnover stay within declared limits under labor review. If missed, reduce scope, add capacity, pause expansion, repair conditions, or close the track.

Decision domain	Threshold and required response
Nonparticipant protection	Pass only when the pilot's declared third-party protection tests are met. For example, a public bundle that identifies a protected child triggers immediate suspension of that release route, restriction of the exposed object, safe notice to affected people, and independent incident review. The release function resumes only after an authorized reviewer verifies the correction and repeats the failed protection test. Applicable reporting and remedy duties continue separately.
Host-community burden	Pass when services, access, environment, labor, housing, and public cost remain within agreed limits under host review with independent support. If missed, pause growth, compensate or repair, renegotiate, relocate, or close.
Anti-capture resilience	Pass when donors, vendors, leaders, parties, platforms, and prestige do not control continuation or interpretation under independent conflicts review. If missed, freeze the decision, disclose influence, recuse or remove actors, diversify support, or terminate funding.
Public usability	Pass when released records remain understandable, contextual, accessible, correctable, and useful under public-interface and accessibility review. If missed, redesign the interface, reduce release, restore context, correct artifacts, and delay broader use.

The prototype decision ledger is noncompensatory. Architectural beauty cannot offset failed rights; participant enthusiasm cannot erase staff harm; donor support cannot replace host legitimacy; and useful records cannot excuse inaccurate or coercive capture.

Continuation is earned separately in every domain where the prototype creates burden. A red threshold therefore triggers its declared response even when other rows look successful. Each cleared threshold should retain the evidence that justified continuation so later reviewers can distinguish improvement from optimism. A disputed threshold should remain visibly unresolved until the accountable authority determines whether its stated evidence standard has been met. Returning a domain to cleared status should require verification of the corrective condition that originally failed, rather than improvement elsewhere in the ledger. If two subthreshold warnings arise together, the ledger should also record whether their interaction creates a stop condition that neither warning would trigger alone.

4.5 — Operational Evidence, Not Formal Proof

The City's evidence discipline should be as strong as its rights discipline. The cited literature supports particular risks, mechanisms, comparators, and evaluation methods; it does not establish that the integrated City is lawful in every jurisdiction, psychologically sustainable, superior to less intrusive reforms, or ready to build. Those are pilot questions. A pilot can yield operational knowledge about whether the institution can function, protect people, learn, and stop, while scientific adjudication of PTVC remains with governed research.

The operational question set is concrete. Can the City be built and maintained? Can people live there under humane conditions? Do rights, records, public interfaces, staff systems, nonparticipant shields, and anti-capture controls work under pressure? Answers can justify continuation, redesign, pause, or closure within City scope. They do not become formal proof or scientific validation.

Public response can magnify a pilot finding beyond its scope. A humane day under the Vow, a trustworthy archive, visible correction, or a staff system that protects workers may rightly inspire attention. Their proper evidential role is to inform judgments about the City and to open better civic tests. They do not establish PTVC or moral superiority.

Release each finding with its scope. A public summary may report that record uptime, complaint resolution, participant health review, staff workload, host-community response, and correction speed met declared pilot ranges during a stated period. The same summary should identify the population, limits, reviewer,

uncertainty, and next decision. This lets City evidence sound strong in its own lane without asking *The Science of Fairness* to repair inflated language later.

4.5.1 — Evidence of Feasibility

Feasibility evidence should include independent replication of process before replication of site. Can another reviewer understand the record lifecycle? Can another staff team follow the complaint route? Can another host community see what it would need to evaluate? Can another legal context identify what remains unresolved? If feasibility depends on tacit knowledge possessed only by founders or early staff, the City may function locally while remaining unready to travel.

Evidence of feasibility asks whether the City can operate at all under real conditions. This includes land, legal envelope, construction, staffing, admissions, activation, record systems, rights processes, public interface, technical stack, complaint routes, host review, and exit. Feasibility is basic, but not trivial. Many beautiful civic ideas fail before they become institutions because they do not survive operational contact with reality.

Feasibility evidence should be concrete. Did the campus open under lawful conditions? Were staff hired and trained? Did active record systems work? Did participants understand the Vow? Did complaint routes function? Did nonparticipants remain shielded? Did public interface produce usable feedback? Did emergency systems work? Did the budget match the actual burden? These are operational questions that deserve operational answers.

Feasibility should be defined by functioning under constraint, not by opening day existence. A building can open. A website can launch. A record system can capture data. A staff roster can be filled. These are preliminary accomplishments, not feasibility. Feasibility asks whether the system can continue to operate while preserving rights, care, privacy boundaries, staff sustainability, host legitimacy, and correction routes under ordinary and adverse conditions.

Feasibility evidence should also include cost honesty. A prototype may be technically possible while materially unfair if it depends on hidden donor control, underpaid labor, unpriced maintenance, host subsidy, fragile cybersecurity, or heroic staff overload. Feasibility cannot be claimed by excluding the burdens that make the institution appear possible. Hidden cost is not external to feasibility. It is part of feasibility.

The public value of feasibility evidence lies in its discipline. It can help future builders avoid fantasy, help critics engage concrete design, help adjacent books hold their boundaries, and help the public distinguish promise from capacity. Feasibility is the City saying, under review, what it can carry now and what it cannot yet carry without pushing burden where it does not belong.

Evidence of livability must be protected from halo language. A participant who lives well under the Vow has not become a higher kind of person. They may have benefited from selection, support, timing, health, personality, staff competence, family protection, or luck. The City should honor their effort without converting it into a public rank. Livability evidence belongs to role design, not human worth.

Contemporary public-sector guidance places theory of change, proportionate evaluation, governance, feedback, and use of findings near the beginning of an intervention. Before operation, the pilot should state its theory of change, baseline, burdens and harms, strongest lower-burden comparators, follow-up, missingness plan, subgroup analysis, and stopping consequences. Use comparison sites or cohorts where ethical and feasible. If the City offers no material benefit over a lower-burden option—or performs worse at greater cost, exclusion, or observation—the evidence supports narrowing or ending it. Program evaluation serves the civic prototype; PTVc validation remains separately governed.

4.5.2 — Evidence of Livability

Livability evidence asks whether human beings can carry the active burden while remaining protected, supported, and free to leave. A City can operate while still imposing unacceptable load on participants, staff, families, or host communities. Livability therefore places bodies, relationships, time, and ordinary life inside the evaluation rather than treating functioning systems as sufficient.

Exit data belong inside that inquiry with dignity. When people leave, the review asks why they left, what support they received, which records remain protected, what the institution learned, and whether departure was treated as information rather than disgrace. An exit can show that safeguards worked. A prototype that counts only completion misunderstands the burden it is studying.

The livability picture combines participant health, sleep, stress, complaint rates, de-loading, exit, daily rhythm, relationship burden, crisis incidents, support use, staff observations, and long-term adaptation. Qualitative accounts matter alongside operational measures because some harms first appear as hesitation, fatigue, silence, or ordinary dread. The City should listen to the texture of life as carefully as it counts visible outcomes.

Livability evidence concerns fit among person, role, support, institution, and burden. Struggle may reveal a design problem, a support need, a role mismatch, or changed circumstances; stable functioning may show that a particular arrangement works under tested conditions. Neither result ranks the person. Reporting should therefore describe conditions and mechanisms while protecting participants from shame, halo effects, and endurance-based status.

Human stories give livability findings much of their meaning and much of their overclaim risk. A participant may sincerely report clearer judgment, repaired habits, deeper public purpose, or less dependence on image. That testimony matters as lived evidence under stated conditions. It remains one channel within a structured evaluation rather than proof of the formal Law, moral superiority, or universal benefit.

Credible livability analysis keeps testimonial evidence, clinical or wellbeing review, operational load data, complaint patterns, exit analysis, staff observation, and independent audit distinct before interpreting them together. Each channel has a characteristic strength and bias: gratitude can shape testimony, role can shape

staff observation, care duties constrain clinical disclosure, and metrics can miss meaning. Triangulation earns confidence only when those limits remain visible. The pilot must also estimate two distortions created by the institution itself: self-selection and observation effects. It should report who applied, declined, was excluded, entered, paused, and exited; compare outcomes with the strongest feasible lower-burden pathway where ethical; and test whether apparent improvement survives changes in audience intensity or later lawful public-role conditions without extending City surveillance after exit. If those distortions cannot be estimated well enough to support a claim of benefit, the claim should be narrowed rather than inferred from participant performance.

The finding remains role-bound: it concerns adult voluntary public-power formation under declared support, not private citizenship or continuous visibility in ordinary life. Keeping that boundary inside the result protects the evidence and people outside the institution.

Livability reports can harm when readers mistake labels for verdicts, shields for corruption, or machine summaries for judgment. Testing nonexpert interpretation protects people and prepares record-function review.

4.5.3 — Evidence of Record Function

Evidence of record function asks whether the City's memory systems preserve accountability, context, protection, correction, and public usability across the full lifecycle. Extent alone is not enough: a system may capture too much and explain too little,

preserve raw material while losing context, protect sensitive material while hiding power, or remain secure but inaccessible. Record function is the quality of governed memory, not the volume of storage.

That quality includes restraint. A record system that can prove why it did not release material may be as trustworthy as one that proves what it released. Withheld, delayed, sealed, summarized, or category-reviewed material needs lawful status, accountable review, and a visible reconsideration route. Integrity includes disciplined nonrelease as well as disclosure.

Correction is the next test of governed memory. Participants must be able to challenge misleading labels; nonparticipants need routes to correct wrongful exposure; affected people need reply; public summaries need amendment; and version history must show what changed. Without these routes, an early error hardens into durable public harm.

Archives function as civic infrastructure when they support public evaluation without claiming access to inner life. A complete-looking system can seduce readers into mistaking memory for truth, so every output must preserve the difference between recorded conduct, governed interpretation, and scientific or moral verdict. Precision protects the archive from becoming an authority it was never designed to be.

The public-use test asks whether records support judgment without feeding voyeuristic demand. A functioning archive preserves provenance, separates capture from access, protects nonvisibility, supports correction, resists tampering, explains

scope, and provides bundles that help citizens understand conduct without devouring private dignity. Its craft is ethical interpretation under custody, not maximal release.

Evaluate the lifecycle as one connected system: creation, classification, storage, access, review, release, correction, delay, sealing, lawful deletion, research use, and machine summary. A weakness at any stage can distort the whole. Secure capture does not make release wise; careful release does not repair weak provenance; and a compelling summary does not replace the underlying record. Lifecycle review prevents one success from concealing another failure.

Record function reaches its democratic purpose only when the public can use it. The next question is whether citizens ask better questions about formation, influence, correction, readiness, limits, and uncertainty; whether journalists can report with context; whether critics can challenge claims using accessible evidence; and whether voters rely less on campaign theater and late scandal. Usefulness is civic capacity, not audience size.

4.5.4 — Evidence of Public Usefulness

Evidence of public usefulness asks whether citizens, critics, journalists, institutions, and affected people can use the City's records and interfaces for civic judgment under real conditions. The test belongs with nonexpert readers, concrete questions, accessibility needs, and ordinary attention limits. A system usable only by specialists has limited democratic value, however accurate its internal architecture may be.

Audience size is a poor proxy for that value. High traffic, long viewing time, viral clips, or intense commentary may signal spectacle rather than understanding. Clarity, correction, context, lawful challenge, accessibility, and reduced guesswork are more relevant measures. An addictive, punitive, or humiliating interface fails even when many people use it.

Public usefulness includes accessibility. Can nonexperts understand status labels? Can disabled readers access the material? Are translations adequate? Do context layers help? Can citizens distinguish evidence from interpretation? Can they see dispute labels and correction history? Can affected persons find remedy? Can journalists report responsibly without having to reconstruct missing context? These questions belong to the pilot.

Usefulness also includes public restraint. Does the interface reduce appetite or intensify it? Does it help readers focus on role-relevant evidence, or does it reward the most personal fragments? Do platform pathways encourage context, or do they encourage clipping? Can public input be received without turning into mob pressure? A useful interface guides civic attention toward burden, not toward humiliation.

The resulting evidence is civic. It can show whether the City improves democratic interpretation under tested conditions and can guide redesign, public education, or closure. It does not select candidates, rank participants, authorize universality, or adjudicate PTVC. A strong public-function finding remains strongest when its decision scope is explicit.

A useful public object also shows adverse results. Complaint categories, correction rates, release delays, staff-burden signals, host-community objections, and unresolved disputes belong beside successful formation stories. Showing imperfection without exposing people teaches readers how to evaluate the City instead of asking them to admire it.

Jurisdictional clarity completes usefulness. Public materials should identify whether the reader is encountering an operational finding, readiness bundle, public explanation, audit summary, protected-nonrelease stub, or claim-status label, and they should state that City materials do not confer office, legal authority, constitutional validity, scientific validation, or moral rank. Clear status lowers the burden of civic interpretation.

Because these materials travel, scope must stay beside the claim. Reports, bundles, guides, diagrams, donor summaries, media kits, and excerpts should identify their evidence type—feasibility, livability, record function, public usefulness, unresolved concern, or adverse finding. Portable labels prevent language from outrunning evidence.

4.5.5 — Claim-Status Labels

Claim-status labels describe what a result supports, for whom, during which period, under which conditions, and for which decision. Feasible under tested conditions differs from proven good; livable for an early cohort differs from universally livable; record system functioning differs from truth access; public usefulness differs from democratic endorsement. The label keeps

observation, interpretation, and authorization in their proper order.

City labels should align with *The Science of Fairness* without copying its verdict system. The City needs practical language for institutional evidence, while the science volume owns scientific adjudication. Terms such as validated, proven, confirmed, demonstrated true, or scientifically established therefore appear only when the relevant governed process has authorized them. Strong City evidence should sound strong in its own lane.

Before reporting begins, the evidence register should separate three fields: what occurred under declared conditions, what the finding may mean and which alternatives remain, and what action the evidence can justify. Useful labels may include design assumption, operational observation, provisional finding, demonstrated function, unresolved risk, adverse finding, redesign required, replication ineligible, and scientific non-claim. This structure prevents a local result from quietly becoming a scaling, legal, or scientific conclusion.

Labels give journalists, supporters, critics, donors, and public officials a common interpretive frame. Supporters may otherwise call functioning proof, opponents may treat one failure as total disproof, donors may call a demonstration scalable, and officials may treat interest as authorization. Clear status slows each distortion without weakening legitimate disagreement.

When a City finding becomes relevant to science, law, elections, funding, or replication, it travels through a separate handoff rather than by rhetorical promotion. Research requires consent and

scientific governance; office requires lawful democratic authority; scaling requires portability evidence; funding requires anti-capture review. This routing rule keeps local evidence useful without letting it borrow another domain's warrant.

A good label is public humility in working form. It tells readers how far evidence travels, identifies the decision it can support, and leaves room for correction. For the Transparent City, that discipline protects people and institutions from the pressure to teach more than the pilot has learned.

Labels should be compact enough to travel across reports, diagrams, speeches, websites, and machine summaries. Useful forms include operational finding, pilot demonstration, unresolved condition, protected nonrelease, external review pending, replication not authorized, scientific validation not implied, and public-usefulness finding. The exact vocabulary should be harmonized with the wider series, but every claim should carry its scope within the claim.

Readers need that scope at the point of interpretation. A statement that a record system demonstrated integrity should indicate whether the finding is local, time-limited, audited, contested, provisional, or dependent on a particular technical stack. A livability summary should carry population limits, exit data, clinical boundaries, and unresolved risks. The label is the compact sentence that keeps beauty from becoming false certainty.

Stable language is equally important for adverse and ambiguous results. The City should be able to report that a safeguard failed,

a burden was underestimated, a result remained inconclusive, or the available record was inadequate for judgment. Evaluation becomes credible when those findings can change the next decision (Eldridge et al., 2016; Skivington et al., 2021).

The same status discipline must propagate through every public artifact. When a claim narrows, fails, expires, or is superseded, summaries, diagrams, donor materials, websites, speeches, and automated outputs should be corrected or withdrawn together. Technical governance frameworks likewise treat validity, monitoring, and lifecycle control as continuing obligations rather than one-time certification (NIST, 2024b).

Claim-status labels should also identify the reviewer and make clear when a finding supports another bounded test rather than replication.

4.6 — Why Replication Must Wait for Safeguards

Replication becomes responsible only when safeguards can travel. A useful first City may attract supporters, regions, donors, and public officials before rights, staff protections, archive integrity, host review, and decertification capacity have proved portable. Part IX later examines network discipline in detail; the ethical rule begins here: the institution may scale only as fast as its protections, evidence, and local legitimacy can scale with it (Greenhalgh et al., 2004; Milat et al., 2015; McLean and Gargani, 2019).

Replication is not copying a campus. It is transferring a burden ecology. A later City must carry rights, records, staff dignity, protected nonvisibility, nonparticipant shielding, host review, Artificial Intelligence limits, donor and vendor constraints, exit pathways, failure memory, and decertification capacity. If only the attractive pieces travel, the result will be a weaker institution using a powerful name. The City should fear bad copies more than scarcity.

Replication is morally dangerous because copying amplifies both virtue and defect. A weak complaint route copied to ten locations does not become stronger. A hidden staff burden copied into a network becomes institutional extraction. A fragile archive copied under public excitement becomes a durable privacy hazard. A host-community blind spot copied into new jurisdictions becomes burden dumping with a noble vocabulary. The City should fear premature replication not because the idea is weak, but because the idea is powerful enough to spread its errors.

Accordingly, the first City should treat every replication request as a burden-transfer question. What exactly is being copied? Which rights have proven usable? Which staff protections are documented rather than improvised? Which record systems have passed stress, breach, correction, and access review? Which host-community routes can be translated into the next legal and cultural context? Which decertification body can remove standing from a copy that fails? Until those answers exist, replication is enthusiasm ahead of fairness.

4.6.1 — Rights Must Travel

Rights travel only when their supporting ecology travels. A complaint right requires notice, safe filing, representation or support, independent review, anti-retaliation protection, remedy authority, record correction, and appeal. If a later City copies the word complaint but lacks the ecology, it has copied a sign rather than a right. Replication should therefore test the whole route, not the vocabulary.

Rights must travel before the City's name travels. Adult voluntary entry, informed consent, due process, counsel access, complaint, appeal, humane care, protected nonvisibility, nonparticipant remedy, staff grievance, and real exit are not optional features of the first site. They define the institution's moral type. A copy without them is exposure wearing borrowed language.

Rights must travel in practical form, not only in principle. A later site must have trained personnel, accessible complaint routes, independent review, counsel pathways, protected categories, emergency procedures, remedy budgets, and public explanation

discipline. A rights statement without operating capacity will fail the first time the institution is pressured. The safeguard must be built, staffed, and funded.

Rights must also travel to people who are not central participants. Children, families, staff, visitors, professionals, host communities, public contributors, and bystanders must receive protection wherever the City appears. A replicated City that protects participants but exposes nonparticipants has not carried the safeguard. It has carried a narrower and more dangerous version of the design.

Accreditation should test rights before allowing replication. It should not be enough for a new site to claim alignment. The site should demonstrate complaint capacity, remedy capacity, legal review, staff training, protected nonvisibility handling, nonparticipant masking, and exit support. Rights must be visible in operations before active participants enter.

If a right depends on the founding team's goodwill rather than trained staff, funded procedures, and independent authority, it has not become portable. Accreditation must test whether a replacement team can operate the same protection under pressure.

Rights must also translate across legal and cultural contexts without dilution. A host jurisdiction may have different labor law, privacy law, family law, public-record law, disability protection, or protest culture. The City cannot assume that a safeguard travels because the title travels. The invariant is dignity under reviewable burden. The legal shell may need adaptation, and where adaptation cannot preserve the right, replication should wait.

The same pre-opening rule applies to staff anti-retaliation and stop authority. Safeguards added only after exposure are late repair, not fair design.

Replication should require a portable rights packet rather than a promise to preserve values. The packet should include the operative covenant, protected categories, complaint and appeal routes, exit support, child and third-party protections, staff standing, emergency rules, independent review terms, translation and accessibility requirements, and public status labels. A new site should demonstrate these systems before it receives the City name.

4.6.2 — Staff Protections Must Travel

The staff-protection travel test should include whether a new site can recruit without desperation, train without haste, rotate sensitive roles, protect refusal, manage emotional load, prevent hero culture, and compensate workers fairly enough that mission does not become wage suppression. If the first City depends on unusually devoted staff, that is not a replicable safeguard. It is a warning.

Staff protections must travel because every City will depend on hidden labor unless it deliberately refuses to hide it. If replication spreads active record systems, public interfaces, education, archives, care, security, and maintenance without spreading staff dignity, it will scale unfairness downward. Later Cities may look successful because staff silently absorb the cost.

Staff protection is an accreditation requirement established before opening. Role-bound records, off-duty privacy, complaint and

appeal, anti-retaliation, labor standards, workload monitoring, burnout response, rotation, recovery, staffing ratios, and whistleblower protection must have owners, budgets, and audit routes. A site demonstrates readiness only when it can sustain these protections through ordinary operations and crisis.

Staff protections also guard against institutional capture. Staff often see failure first. They may detect donor influence, vendor dependence, record misuse, child risk, public-interface abuse, or participant overload before leadership does. A replicated network that silences staff will lose its early warning system. Protecting staff is therefore also protecting the public.

No City should be accredited if its staff protections are weaker than its participant record demands. An institution cannot make future leaders visible while hiding the workers who sustain them. Staff protections must travel because public-power formation cannot be fair when its support labor is sacrificed.

Staff protections travel only when staffing is costed honestly. A later City cannot copy the visible participant model while trimming the quiet supports that made the first City survivable. Archive workers, clinicians, mentors, security staff, maintenance teams, accessibility support, public-interface moderators, records officers, ombuds staff, legal support, and host-community liaisons all carry different burdens. If those roles are underfunded, outsourced without accountability, or compressed into heroic overwork, the copy begins unfairly.

Staff protections must also travel through labor culture. A legal policy is weak if local managers reward devotion over

boundaries, treat whistleblowing as disloyalty, or normalize emergency pace as institutional identity. The replication gate should examine training, supervision, compensation, scheduling, recovery, complaint independence, and leadership discipline. A City that protects public-power seekers while consuming workers has copied the wrong thing.

Archive integrity is hard to replicate because it combines law, technology, culture, staffing, interpretation, and public trust. A later City might copy storage software but not correction culture, provenance discipline, access review, contextual release, machine-output controls, or public comprehension testing. The archive is not a device. It is a public memory institution under ethical constraints.

4.6.3 — Archive Integrity Must Travel

The archive travel test should include breach response, vendor exit, human audit, protected-category handling, delayed release governance, correction routes, right of reply, public status labels, research-use separation, no cross-architecture dossier discipline, and machine-summary review. If any of these cannot travel, replication should not proceed in full. A weak archive can harm people for decades.

Archive integrity must travel because the record is the City's central public memory. A later City with weak provenance, weak custody, poor classification, unclear release rules, insecure storage, inaccessible public interface, or unreliable correction systems would create more harm than transparency. It would expose people without producing trustworthy public evidence.

Archive standards must include capture integrity, metadata, chain of custody, tamper alerts, version history, protected categories, delayed release, redaction rules, public bundles, status labels, correction logs, access logs, breach response, and independent audit. These are not technical preferences. They are the conditions under which memory can serve fairness rather than appetite.

Archive integrity also requires vendor discipline. Replication may tempt sites to adopt cheaper systems, proprietary platforms, or simplified tools. A weak vendor can become a hidden sovereign over public memory. Later Cities must preserve audit rights, portability, redundancy, public memory without private ownership, and Artificial Intelligence subordination. A technical shortcut can become a moral failure.

Archive integrity must travel before replication because records are hard to repair after harm. A wrongful release, corrupted chain of custody, leaked intimate record, exposed child, or machine-generated false summary can injure people beyond local correction. The City's memory must be strong before the City's name spreads.

Archive integrity is a nonnegotiable replication capability because trust in records is cumulative across sites. A later City must demonstrate provenance, chain of custody, access logs, correction, protected nonvisibility, release labels, cybersecurity, human review of machine summaries, incident response, and vendor exit. A beautiful campus with a weak archive carries visibility risk rather than transparent civic capacity. Accreditation therefore treats record integrity as an operating system, not a decorative layer.

Fewer sites with trustworthy records are preferable to many sites with fragile ones. Scale can make weak memory appear authoritative, especially when interfaces look consistent across locations. Replication should wait until record integrity, rights, learning, and correction travel in substance rather than merely in design (Greenhalgh et al., 2004; Milat et al., 2015; McLean and Gargani, 2019).

4.6.4 — Host-Community Review Must Travel

The host travel test includes compensation and mitigation capacity. A later City must identify infrastructure costs, security burdens, price pressure, emergency-service demand, environmental effects, and public attention before authorization, then fund the agreed response. Replication earns legitimacy by paying its local burden and preserving local authority to challenge the arrangement.

Host-community review must travel because every City stands somewhere. A replicated City that protects participants but burdens neighbors has failed its own standard. It carries traffic, housing pressure, public services load, emergency complexity, media attention, political interpretation, construction disruption, and cultural meaning.

Host review also protects against donor and prestige pressure. The review must ask who benefits, who pays, who is displaced, who is inconvenienced, who is exposed, and who can object. A prestigious location may not be a fair location.

Replication should report host benefits and burdens separately. Jobs, infrastructure investment, public learning, and local services

may create value. Housing pressure, service demand, disruption, environmental effects, and security spillover may impose costs on different people. Host review must identify who receives each benefit and who carries each burden; an aggregate gain cannot resolve a specific rights claim.

No City should be replicated as a burden dump. If the host community lacks meaningful voice, remedy, and review, the project has moved burden onto the people least able to shape it. Host-community review must travel because public-power formation cannot be made fair by making local life unfair.

Host-community review cannot be copied by exporting a public-meeting format. Each place has its own land history, housing pressure, infrastructure capacity, local politics, indigenous or historic claims, environmental conditions, labor market, transport system, media ecology, and trust wounds. The review route must fit the host, not only the blueprint.

Host-community review must include the power to slow or alter plans. Consultation without consequence is performance. The host community may not own every institutional decision, but it should have meaningful routes to challenge siting, traffic, security, utilities, emergency coordination, environmental burden, local hiring promises, media management, and mitigation failures. A City that cannot be locally answered is not ready to stand locally.

Decertification must be real before replication begins because a copied City can fail after admiration has attached to it. A later site may drift toward spectacle, weaken rights, hide staff burden,

mishandle records, defer too much to donors, overexpose nonparticipants, or resist host review. If there is no recognized route to remove standing, the network will protect its own image by treating local harm as reputational inconvenience.

4.6.5 — Decertification Must Travel

A decertification system should specify who can trigger review, what evidence begins inquiry, and which emergency protections apply. It should also define the public status label, the treatment of participants and staff, archive preservation or sealing, host-community notice, and any route to requalification after repair. It is what keeps replication from becoming irreversible drift.

Decertification must travel because accreditation without removal becomes branding. A site that violates core standards should be able to lose standing. If a City can keep the name despite child exposure, staff exploitation, record misuse, donor capture, weak exit, Artificial Intelligence overreach, or ordinary privacy erosion, then the network protects itself more than people.

Decertification is not punishment for embarrassment. It is a safeguard for participants, staff, host communities, nonparticipants, and public trust. The system must protect both fairness and due process.

Decertification must be governed carefully to avoid political weaponization. Decertification should be tied to nonnegotiable standards: adult voluntary entry, Transparent Vow integrity, ordinary privacy protection, staff dignity, record integrity, nonparticipant shielding, Artificial Intelligence subordination, rights, exit, host review, and failure memory.

Decertification must be more than reputational embarrassment. A later City that violates rights, hides staff extraction, corrupts records, ignores host burden, uses Artificial Intelligence beyond limits, invites spectacle, or inflates operational evidence into proof should be able to lose standing in a way the public understands. If the City name can be used after the safeguards fail, the name becomes a brand rather than a burden discipline.

Decertification must travel because scale creates imitation risk. Unauthorized or diluted copies may borrow the language of the Transparent Vow while weakening rights, staff protections, record integrity, host review, or nonproof discipline. A fair network names bad copies before bad copies define the whole.

Decertification is credible only if the public can see what status remains after it occurs. Records, participants, staff, and host obligations should survive loss of status. Otherwise decertification protects the brand while abandoning the people who carried the failed institution.

Part II — Ground, Form, and Spatial Charter

Every institution that hopes to change public life eventually reaches the ground. At that moment, aspiration becomes a neighbor, employer, utility customer, legal occupant, and physical presence. Land carries prior claims, infrastructure carries limits, and ordinary people already live around whatever parcel appears available. Part II begins where a civic idea becomes accountable to place: roads, water, housing, workers, weather, ecosystems, budgets, and the people who will carry the result.

The first Part established the City's type before allowing architecture to become attractive. It defined an adult, voluntary, lawful institution for the formation of public power under a demanding record burden, bounded by protected nonvisibility and ordinary-citizen privacy. That sequence matters because beautiful renderings can conceal category error. A campus image shown too early can look like a university, a private capital, a surveillance compound, a diplomatic enclave, a spiritual settlement, or a prestige project rather than a bounded civic institution carrying public burden.

Ground, form, and spatial charter come after the Vow because the built environment gives daily force to the City's ethical boundaries. A room can shelter dignity or intensify scrutiny. A gate can orient lawful access or create status by architecture. A public plaza can make answerability approachable or turn service into spectacle. Trust begins when those distributions are named, tested with the people who experience them, and revised when use reveals a burden the drawings missed.

The phrase spatial charter names the distribution of access, exposure, labor, quiet, danger, movement, repair, and

maintenance across a place. It asks who may approach, who waits, who can leave, who is recorded, who is shielded, who carries equipment, who responds at night, and who bears the cost when systems fail. These choices have constitutional effects in daily life even when constitutional law remains the responsibility of *The Constitution of Fairness*.

Space begins deciding before a rule is read. Paths, edges, thresholds, landmarks, spatial syntax, and territorial cues influence who can orient, approach, withdraw, linger, or dominate. The City should use that body of design knowledge as a source of questions and tests, not as a substitute for law or a promise that conduct can be engineered (Lynch, 1960; Hillier and Hanson, 1984; Lefebvre, 1991).

No physical form receives automatic preference. Each option must be judged by whether it preserves the City's required functions, rights, accessibility, resilience, and host legitimacy with the least total burden.

Law and land history enter before design confidence. A candidate site has to withstand review of lawful tenure, planning, environmental effects, building and fire safety, accessibility, labor, privacy, records, emergency authority, taxation, insurance, and remedy. Formal title may coexist with tenancy, customary or communal use, Indigenous governance, sacred meaning, heritage, livelihood, easements, contamination, or memories of displacement. Purchase resolves none of those questions by itself. Inquiry begins while alternatives remain real, before affection for one parcel turns principled refusal into apparent obstruction (UN-Habitat, 2015; United Nations, 2007).

Host legitimacy is ongoing rather than ceremonial. Because local groups experience land, services, housing, work, and public attention differently, host review must preserve standing, objection, remedy, and recurring review after opening.

The workforce becomes visible before the buildings look complete. Construction workers, cleaners, drivers, maintenance crews, technicians, food workers, care staff, security staff, archivists, and subcontracted workers carry the City through ordinary labor that publicity rarely celebrates. Site design therefore includes safe routes, fair scheduling, accommodation, worker voice, occupational protection, privacy, grievance, and responsible subcontracting. Burden honesty is credible only when the people who build and maintain the institution receive the same seriousness as the people shown in its public images (International Labour Organization, 1988, 2022b).

Proximity must make the City reachable without turning surrounding life into an exhibit. Host residents, critics, journalists, inspectors, affected people, visitors, experts, protesters, and lawful authorities need workable routes of approach. Constant approach, however, can expose homes, overwhelm streets, disturb recovery, invite harassment, and turn service into destination culture. Neighboring households cannot become background footage, families cannot inherit participant visibility, and workers cannot surrender whole-person privacy. Visitor systems, media areas, protest routes, cameras, lighting, transport, security, and digital infrastructure must create governed adjacency rather than remoteness or exposure without limit.

Climate, utilities, and maintenance test whether the City can remain safe and repairable without consuming the host community's resilience margin. Part II therefore treats service continuity, adaptation, and maintenance as design constraints, not visual features (IPCC, 2023; UNDRR, 2022).

Civic seriousness does not require luxury, intimidation, monumental scale, or a visual language of destiny. Beauty can support orientation, calm, dignity, public memory, and delight, but it earns no exemption from host legitimacy, accessibility, maintenance, or cost discipline. The City's task is to define the spatial tests that any later lawful decision must survive, leaving macroeconomic capacity to *The Peace of Fairness*, legal validity to *The Constitution of Fairness*, and public administration to *The Government of Fairness*.

The movement ahead is deliberately concrete. It begins with parcels, leases, land histories, utility margins, commutes, permits, and host standing; moves through bands, doors, corridors, signs, light, sound, and refuge; then enters bedrooms, classrooms, dining rooms, libraries, clinics, archives, kitchens, gardens, loading routes, server rooms, lifts, alarms, and repair budgets. By the end of the Part, architecture should read as a public account of who moves, waits, works, rests, objects, repairs, and pays.

Chapter 5 — Site, Host, and Shared Responsibility

Every ambitious institution eventually says that it needs a place. The sentence becomes meaningful only when the proposed place is treated as an existing world rather than an empty map pin. Land already carries users, histories, utilities, ecosystems, neighbors, emergency systems, routines, and public meaning. Finding a home therefore begins by asking what relationships the City would enter, what capacities it could strengthen, and what burdens it would have to prevent, fund, monitor, repair, or accept as reasons not to build.

Site selection becomes disciplined only when host standing, alternatives, lawful authority, rights, service capacity, climate exposure, lifecycle cost, and remedy remain visible together. The City is still a candidate institution, so lawful authorities, host processes, and later transition gates retain power to refuse, redirect, or stop a proposal. Evidence must be able to change the answer, not merely decorate a preferred parcel.

The chapter's strongest spatial proposition is that campus scale may be the minimum whole. That proposition earns attention because public-power formation may require residence, learning, deliberation, recovery, staff ecology, public interface, and record continuity to work as one system. It also carries a heavy burden of proof. Co-location must outperform distributed and leased alternatives on rights, host cost, accessibility, resilience, and total lifecycle burden rather than relying on imagery or prestige.

Six spatial forms enter the comparison together. A purpose-built campus offers strong co-location and clear boundaries but carries the greatest land, capital, symbolism, and maintenance burden. A distributed network can reduce enclosure and land concentration

while increasing travel, fragmentation, coordination, and record risk. Embedded, leased, phased, and multi-site forms create other combinations. The question is not which form looks most complete, but which form preserves the City's functions with the least total burden.

The comparison turns on functions rather than architectural preference. Residence may require continuity without requiring one enclosed estate. Formation may need multiple kinds of rooms without requiring every activity to occur on one parcel. Recovery may benefit from immediate access while still needing clinical independence. Public interface may need a clear edge while some services remain more accessible in ordinary civic locations.

The campus proposition contains its own defeat condition. When a distributed, embedded, or leased model can preserve role clarity, rights, care, record continuity, staff dignity, public access, and emergency response with less land, displacement, cost, or dependency, a larger campus is disproportionate. A good design theory makes that conclusion easy to reach rather than treating it as disloyalty.

No spatial form exists outside a legal envelope. Land tenure, zoning, planning, building and fire codes, accessibility, environmental review, labor law, privacy, public records, professional licensing, emergency authority, taxation, insurance, assembly rights, and judicial review may interact differently across candidate forms. A campus can clarify responsibility or produce an opaque maze of entities and exceptions. Lawful authority therefore surrounds design from the beginning rather than arriving after construction.

The host is not a single voice. A landowner may support a sale while tenants fear rent pressure. Businesses may expect customers while residents fear traffic and attention. Public officials may welcome revenue while emergency workers see capacity risk. People closest to the site may carry burdens that a jurisdiction-wide majority never experiences.

A legitimate host process separates representation from attendance. Its record should show who was invited, who could realistically participate, which interests were absent, what assistance made participation possible, what alternatives remained open, which objections changed the proposal, and what issues stayed unresolved. A crowded meeting can still be unrepresentative; a smaller process can still be meaningful when barriers, dissent, and decision effects are visible.

Benefits and consent remain in separate columns throughout the chapter. Local jobs, procurement, infrastructure, public access, educational partnerships, or revenue may be valuable and should be evaluated honestly. They do not erase prior rights, justify displacement, or convert material need into agreement. A specific burden receives its own standing, response, and remedy even when the wider project has public benefits.

Buildings hide labor easily. Construction and operation depend on workers whose wages, safety, schedules, accommodation, representation, privacy, subcontracting status, refusal rights, and grievance routes determine whether the institution's ethical claims are real. A project can look transparent at the public entrance while relying on opaque labor chains behind the service door. Worker protection therefore begins before ground is broken

and continues through maintenance, renovation, and eventual closure (International Labour Organization, 1988, 2022b).

Proximity needs equal discipline. Inspection, journalism, protest, complaint, public education, lawful visitation, and emergency access all require workable routes. At the same time, unmanaged attention can create traffic, surveillance spillover, harassment, housing pressure, and permanent disturbance around nearby homes. The spatial objective is governed adjacency: public power remains reachable, ordinary life remains buffered, and routes can expand, narrow, or move when crowds, media cycles, security conditions, or host experience change.

Physical resilience broadens the host question beyond the property line. Water, energy, transport, communications, wastewater, food access, heat, smoke, flood, fire, storm, seismic risk, public health, and emergency response are shared systems. A fair site does not preserve itself by consuming the host's last margin of capacity. It identifies dependencies, restoration priorities, thresholds, and external owners before the first design promise is made.

Cost discipline follows the institution through its whole life. Land, legal review, design, mitigation, labor protection, accessibility, utilities, insurance, operations, maintenance, replacement, climate adaptation, cybersecurity, host review, complaint and remedy systems, and eventual closure belong in the same comparison. A low opening price can conceal a costly institution when future labor and renewal are excluded. Expansion becomes responsible only when service capacity,

maintenance reserves, rights protections, and host limits expand with it.

Replicability is equally limited. A design that works in one legal, climatic, cultural, or infrastructural setting cannot simply be copied elsewhere. What may travel are functional requirements, rights boundaries, review duties, and failure tests. Any later site selection, jurisdictional choice, funding decision, pilot authorization, or rollout sequence still requires lawful host decision, constitutional scrutiny, and transition governance.

The City has no entitlement to approval because its stated purpose is fairness. A host may conclude that no available form is proportionate, another public need should use the land, services lack capacity, or trust is too weak for the proposed burden. Where approval is lawfully granted, it is not a blank check: conditions need owners, indicators, reporting intervals, affected-person access, escalation routes, expiry, and renewal. Expansion requires fresh review rather than treating first approval as permanent consent.

The chapter moves from form to authority, then from authority to the people who must live with the result. It tests whether co-location is functionally necessary, places each candidate form inside law and land history, builds a host-burden and remedy route, disciplines proximity, examines climate and utility dependence, and ends with whole-life cost and bounded replication. The destination is not a preferred rendering. It is a defensible sequence of reasons, evidence, challenge, correction, and retreat.

To keep these comparisons honest, the chapter treats siting as a decision file rather than a design pitch. Each candidate form should name the functions it serves, alternatives it excludes, people it burdens, legal assumptions, infrastructure dependencies, uncertainty, mitigation, review date, and withdrawal route. A campus form earns no presumption from scale or symbolism; a distributed form earns none from appearing lighter. Both must show how rights, continuity, correction, and maintenance survive ordinary operations and stressed conditions. This makes the chapter useful before any site exists: it turns spatial ambition into a set of questions that a host resident, worker, participant, reviewer, or skeptic can independently test.

5.1 — Why Campus Scale May Be the Minimum Prototype

Campus scale is a rebuttable functional claim rather than an aesthetic entitlement. It earns the phrase minimum whole only when residence, learning, deliberation, recovery, staff support, record continuity, protected nonvisibility, public interface, and emergency response work more coherently together than they would in a less intrusive form. Minimum therefore names the smallest integrated arrangement that can carry the complete institutional task. It does not name the smallest parcel, the most impressive composition, or a permanent preference for construction.

Each form must face the same functional test. Can it maintain active-period continuity without dragging ordinary households into the Vow? Can it distinguish formation, recovery, care, public interface, and protected domains? Can staff work safely without hidden travel or unpaid coordination? Can records remain coherent without turning location tracking into whole-person surveillance? Can visitors, critics, and affected people reach the institution without exposing residents or neighbors? (Dober, 1992; Kenney et al., 2005; Inkelas et al., 2018)

Each form also faces the same burden test. Land use, displacement, transport, utilities, construction, operating cost, staff time, accessibility, security, media pressure, and host-service demand must be counted across the full lifecycle. A distributed design that looks inexpensive can externalize travel and coordination; a campus that looks efficient can concentrate

risk and prestige. Total burden, not capital cost alone, governs the comparison.

The campus proposition loses force when a less intrusive form can preserve continuity, rights, record integrity, recovery, staff ecology, public access, and emergency readiness with lower total burden. The first decision is comparative and revisable: define the functions, publish the assumptions, retain genuine alternatives, and let hosts, workers, disabled users, participants, responders, and operators change the preferred form. A distributed or leased answer is not a lesser City when it performs the City's work more honestly.

5.1.1 — Residence Requires Continuity

Residence matters because public-power formation extends beyond scheduled instruction. Fatigue, repair, ordinary conflict, care, return, and the use of unstructured time can reveal whether a role burden is humane and whether the institution is exporting its cost. Yet continuity does not automatically require every participant to live inside one purpose-built boundary. It requires a governable relation among active status, place, record, rights, and nonparticipant protection.

A clustered leased model may provide continuity without permanent construction. Participants might live in several nearby buildings under common standards, with protected routes to formation spaces and clear boundaries for visitors, staff, and incidental neighbors. This form can lower capital and land burden, but it creates landlord dependence, mixed-use privacy problems, transport demands, and the risk that ordinary tenants

become collateral participants. Those risks require contractual and spatial safeguards before the form is credible.

An embedded model may use ordinary urban housing with tightly defined active periods and institutional facilities nearby. It can reduce enclave logic and keep participants in contact with ordinary civic life. It can also make the Vow leak into streets, shops, transit, and households, especially if devices or location systems are used to compensate for spatial ambiguity. An embedded form fails if continuity is purchased through pervasive tracking or if nonparticipants cannot remain outside the record.

A distributed model may be appropriate for participants whose care, disability, family, safety, or legal circumstances make relocation unfair. Continuity could be carried through defined work blocks, governed travel, remote participation, and explicit status changes. The burden then shifts from land to coordination, cybersecurity, records, time zones, home privacy, and staff availability. A fair comparison must count those burdens rather than treating distribution as costless flexibility.

Residence should therefore be specified by function. The institution needs reliable sleep conditions, private bodily dignity, care access, food, laundry, accessibility, ordinary recovery, visitor boundaries, emergency support, and a clear answer to when active role status begins and ends. It does not need monastic control, aesthetic uniformity, or constant public availability. The room exists to keep the person human under a public burden.

Continuity must remain compatible with pause and exit. A participant should be able to step out of active status, leave the

site, receive care, attend to family need, or withdraw without being treated as a security breach. Housing arrangements should include transition periods, anti-retaliation rules, relocation support where dependence was created, and protection against sudden homelessness. A City that makes housing contingent on silent endurance weakens consent.

Residence also changes host burden. Purpose-built housing may consume land or increase local prices. Leased clusters may remove units from the ordinary market. Commuting models may add traffic and emissions. Embedded housing may increase visitor and media pressure on residential streets. The site comparison must include these external effects before calling one form modest.

If a distributed or leased residential form answers those questions better than a campus, it should prevail. If only co-located residence can preserve continuity while shielding ordinary life, campus residence may be justified. The conclusion follows from burden and function, not from the romance of living together.

5.1.2 — Formation Requires Multiple Spaces

Public-power formation cannot be reduced to one classroom or one digital platform. Learning, deliberation, drafting, opposition, simulation, reflection, care, and public explanation impose different demands on attention and dignity. The need for multiple spaces is real. The unresolved question is whether those spaces must occupy one campus or can be assembled through a governed network.

A distributed network can place functions where they are strongest. Existing universities may host instruction, civic buildings may host public deliberation, leased rooms may support drafting, and independent care providers may support recovery. This can reduce construction and diversify authority. It can also fragment records, increase travel, create inconsistent accessibility, and make responsibility unclear when harm occurs between sites.

An embedded model can use ordinary civic space rather than creating a separate world. Deliberation in a public building, study in a library, and community meetings in local venues may keep formation accountable to the society it hopes to serve. Yet borrowed spaces carry their own users, rules, labor, and privacy. The City cannot take over public facilities, displace ordinary programs, or treat community institutions as a free infrastructure layer.

A leased cluster offers a middle path. Nearby facilities can be adapted for study, deliberation, public interface, staff work, and recovery before permanent construction. The form is easier to leave, resize, or reconfigure and can reveal which functions require proximity. It also creates lease instability, inconsistent building quality, landlord leverage, and hidden retrofit costs.

No room should exist merely because it looks civic. Each must answer what burden it contains, what risk it reduces, who works there, who may enter, what is recorded, what is protected, and how the space returns to ordinary use if the pilot stops. This discipline prevents a collection of symbolic halls from masquerading as a functional institution.

Multiple sites can also reduce capture if authority is intentionally separated. Independent complaint, clinical care, legal counsel, and oversight may be safer outside the participant's primary formation environment. Not every function should be co-located. Some distance protects independence. The spatial model should distinguish integration from institutional monopoly.

Substitution is the strongest test. If a proposed space can be removed while a lawful, accessible, lower-burden alternative preserves the function, it is not required. If distribution destroys continuity, rights, or reviewability, co-location gains weight. Every dedicated space should show what burden it prevents from becoming hidden, unsafe, or unfair.

5.1.3 — Recovery Requires Place

Recovery is not an amenity added after serious work. Visible public-power formation can produce fatigue, hypervigilance, sensory overload, shame, performance drift, conflict, and difficulty returning to ordinary rhythm. A spatial design that makes those costs invisible will overstate the institution's success. Recovery therefore requires protected time and a credible place.

Co-located recovery can reduce travel and make support available before distress becomes crisis. It can also create role confusion if the same institution controls training, evaluation, housing, and care. Participants may fear that seeking help will affect readiness judgments. Staff may become both helpers and record sources. The design should preserve clinical, legal, and ethical independence even when care is nearby.

Distributed care can strengthen confidentiality and professional autonomy. It may allow participants to choose licensed providers outside institutional culture, while a campus may justify dedicated recovery capacity when immediate support, continuity, or safe de-loading truly requires proximity. The comparison should ask where recovery can be carried with the least combined burden. Transport, scheduling, continuity, emergency communication, jurisdiction, and incidental-record risks must be governed, and the City should not duplicate capable local care systems merely to appear complete.

Staff require recovery too. Care workers, moderators, record custodians, security staff, maintenance crews, food workers, and administrators may absorb conflict and emotional load without the public recognition given to participants. Their break rooms, schedules, confidential support, and routes away from public attention are part of the recovery ecology. A site that restores participants by exhausting staff merely shifts burden.

Recovery must not become disciplinary isolation. A person should not be removed from view because distress is embarrassing to the institution. De-loading needs clear status, consent, care, review, and return routes. When safety requires separation, the reason and duration should be governed without turning health information into public material.

Co-location also risks turning continuity into dependency. A participant may become reliant on one housing provider, one care network, one record system, one security structure, and one social world. Any campus proposal must therefore show how independent rights, outside relationships, lawful services, and

realistic exit remain usable in practice. Continuity is valuable only while it does not become the machinery that makes refusal unaffordable.

Failure tests whether recovery is real. Communications failure should not prevent a participant from sleeping, a clinician from exercising independent judgment, staff from stepping away without losing wages, or emergency care from reaching the site. The place is humane only if it protects people under the conditions for which recovery was designed.

5.1.4 — Staff Ecology Requires Scale

The City cannot be sized only around participants. Staff make continuity possible through food, cleaning, maintenance, records, care, accessibility, transport, scheduling, security, facilitation, legal support, technology, and administration. A spatial form that appears efficient because staff travel farther, work in cramped back areas, remain on call, or disappear into subcontracting has not reduced burden. It has relocated it.

A distributed model may allow staff to work nearer their homes or within existing professional institutions. It can diversify authority and reduce the sense that one site owns every function. It may also multiply travel, coordination, shift handoffs, security systems, and unpaid communication. Those burdens must be counted as part of the spatial form rather than treated as individual inconvenience.

Worker voice belongs before final design. The people who clean rooms, move food, maintain servers, repair water systems, support disability access, and respond at night often see

operational burdens that plans miss. Their participation should not be limited to post-occupancy complaints. Design review, procurement, construction phasing, staffing models, and emergency planning should include workers or legitimate representatives.

Scale must also include accommodation. Disability access, pregnancy, caregiving, religious practice, language, heat exposure, shift fatigue, transport reliability, and safe return after late work all affect the staff footprint. An institution that provides generous participant spaces but leaves staff without accessible or dignified facilities teaches the wrong civic lesson through architecture.

Local hiring can create real value, but only when the jobs are safe, fairly compensated, trainable, durable, and connected to advancement. Employment promises ring hollow when a contractor chain suppresses wages, reserves skilled roles for outsiders, or drains essential workers from local public services. The labor plan must show who is hired, under what terms, with what protections, and at what effect on the surrounding labor market.

Spatial comparison must count staff hours, travel, shift coverage, service routes, callouts, training, rest, and turnover. Small sites can hide commuting costs; campuses can demand continuous staffing. The right scale makes work sustainable and reviewable.

Without staff space, voice, rest, privacy, and exit, the institution is not ready to form power. Staff ecology tests whether the burden rule protects those least visible.

5.1.5 — Public Interface Requires Boundary

A City devoted to public-power formation must be reachable. Citizens, host residents, critics, journalists, inspectors, experts, protesters, and affected persons need routes to information, observation, question, complaint, and challenge. Reachability does not require that the entire site become public space. It requires a boundary that explains what the public may reach, what remains protected, and how decisions about access are reviewed.

An embedded or distributed model may place public interfaces in ordinary civic buildings, libraries, or accessible urban locations. This can reduce the symbolic divide between the City and the public. It can also shift security, crowd, and staffing burdens onto institutions that were not created for the purpose. Shared space must be governed through fair agreements rather than borrowed as though public facilities have no prior users.

Public interface requires context. Visitors should know whether they are entering a public band, an oversight route, a media zone, a meeting space, or a protected area. Rules should be understandable before a person crosses the threshold. Access decisions should produce reasons and appeal routes rather than unexplained exclusion.

The interface should be tested from the perspective of a person without status. Can a host resident find the complaint office? Can a disabled visitor reach a hearing? Can a critic attend without donor invitation? Can a person without digital access receive records help? Can a journalist challenge an access denial? If the route depends on insider knowledge, the boundary is not public.

The interface also supplies a falsification test for campus scale. If an embedded public office and distributed formation network can provide better access with fewer neighborhood burdens, a separate campus edge may be unnecessary. If scattered interfaces produce confusion, inconsistent rights, and hidden control, a bounded campus gains force. The decision follows from use, not image.

The minimum whole is therefore not a single footprint. It is the smallest spatial arrangement that keeps residence, formation, recovery, staff ecology, and public interface coherent while preserving independent care, ordinary privacy, host rights, and real exit. Any larger form must justify the additional land and cost. Any smaller form must show that it is not hiding fragmentation.

The minimum-whole claim should be recorded as rebuttable, not permanent. Its evidence packet should separate functions that require co-location from those that can remain distributed, compare each arrangement's burdens, identify evidence that would reopen the choice, and name who can contract or abandon the footprint. A campus is defensible only if the tests that justify it can also defeat it; otherwise, 'minimum whole' becomes an evidence-proof slogan.

5.2 — Host Jurisdiction and Legal Envelope

A credible City enters the legal order already governing the ground. Its charter, nonprofit status, public purpose, or government relationship creates no independent permission to build or operate. Land, planning, construction, labor, privacy, records, assembly, health, taxation, emergency authority, disability access, environmental protection, and remedy may belong to different bodies. The legal envelope maps those authorities and review routes without pretending design can create power.

The legal envelope must be assessed across every candidate form. A purpose-built campus may require acquisition, rezoning, environmental assessment, utilities agreements, building approvals, and long-term public-service arrangements. A leased cluster may require change-of-use approval, tenant and landlord protections, retrofit compliance, and contractual control over records and security. A distributed model may cross municipal, regional, or national boundaries and multiply legal responsibilities rather than reduce them.

Land history belongs inside the legal analysis. Formal title may not exhaust lawful or legitimate interests. Tenants, customary users, Indigenous peoples, communal owners, easement holders, nearby residents, cultural custodians, and people exposed to displacement may possess rights or claims that cannot be cleared by a simple purchase. International frameworks offer reference points, but applicable law and affected-rightsholder review control each case (UN-Habitat, 2015; United Nations, 2007).

The legal envelope should be adversarially tested before site enthusiasm hardens. Independent counsel, planning and environmental review, labor and accessibility expertise, privacy and public-records analysis, host representation, and rights review should be able to identify a fatal defect. A project that treats legal advice only as a route to approval will miss the law's protective function.

No final jurisdiction, legal vehicle, covenant wording, record regime, tax status, or special authority is chosen here. Those matters remain subject to constitutional, legal, and transition review. The operative rule is simpler: the City may not ask law to ratify a site it has already decided to love. Tenure, planning authority, record status, tax treatment, covenant language, and exceptional powers must remain open until the competent legal routes have examined them.

5.2.1 — Legal Preconditions

Defensible land use may rest on ownership, lease, license, public grant, partnership, or another lawful arrangement, each with different powers and dependencies. A lease preserves relocation options but creates landlord leverage. Ownership secures control while increasing capital, displacement, and symbolic burden. A public grant may transfer public value or create political dependence.

Title review must be joined to land-history review. The file should identify prior uses, current occupants, tenants, informal users, easements, contamination, heritage, sacred or cultural significance, communal interests, and unresolved claims. Where

Indigenous peoples or customary communities may be affected, review must engage their representative institutions and applicable legal orders early enough to influence whether and how a proposal proceeds. Articles 10, 19, and 32 of the United Nations Declaration on the Rights of Indigenous Peoples offer relevant reference points on relocation, consultation, land and resource decisions, and free, prior and informed consent in specified circumstances; they do not replace jurisdiction-specific law or determine by themselves which consent rule governs a particular site.

The second precondition is lawful planning and land use. Zoning, comprehensive plans, density, height, access, traffic, noise, mixed use, housing impacts, environmental review, and public-hearing requirements may apply differently to campus, leased, embedded, or distributed forms. Any land-use category must disclose the project's actual functions rather than hide them behind a broad label. Residence, education, public assembly, records infrastructure, clinical interfaces, food service, offices, security, and public visitation should be described honestly.

Environmental and social assessment becomes the third precondition because direct effects are only part of the site's burden. The review follows construction, operation, induced development, cumulative pressure, expansion, failure, and closure, and it identifies who is affected at each stage. The World Bank Environmental and Social Framework offers one integrated reference across land acquisition, displacement, Indigenous Peoples and historically underserved traditional local communities, stakeholder engagement, disclosure, and grievance.

Its contribution is disciplined lifecycle inquiry, not universal legal authority or legitimacy by checklist (World Bank, 2017a).

The fourth precondition is access to necessary infrastructure without unlawful preference. Water, wastewater, energy, roads, transit, communications, waste handling, emergency response, and public services may require agreements, permits, upgrades, or cost sharing. Civic purpose creates no presumption that public systems will absorb new demand. Any priority, subsidy, or dedicated capacity must be lawful, transparent, and justified against other public needs.

The fifth precondition is a complete building and life-safety route. Code compliance, fire and evacuation planning, structural review, accessibility, occupational safety, public-health requirements, food service, clinical licensing where applicable, and emergency coordination belong before occupancy. Temporary or pilot status does not justify inferior protection. A leased or modular form may require more careful review precisely because adaptation can hide compromises.

The sixth precondition is lawful institutional capacity. The entity that signs leases, employs staff, holds insurance, contracts with vendors, receives funds, manages records, and responds to claims must have clear authority and accountability. The City cannot operate through a maze of entities that distributes liability while concentrating control. Beneficial ownership, conflicts, delegated authority, and dissolution routes should be visible.

The seventh precondition is reviewability. Affected persons need access to courts, regulators, administrative review, ombuds

processes, labor inspection, privacy authorities, and other lawful remedies. The project should not use arbitration, donor conditions, lease clauses, confidentiality terms, or private governance to remove disputes from public law where rights or public burdens are involved.

A pre-opening legal file should therefore state what has been verified, what remains disputed, who has authority, who may challenge, which approvals expire, what conditions attach, and what events require renewed review. This is not a final legal blueprint. It is the minimum evidence that the City is entering land through law rather than asking law to bless an accomplished fact.

5.2.2 — Rights Compatibility

Rights compatibility asks whether the site and its operating assumptions can protect people before they protect the institution. Participants accept a severe role burden, but consent does not waive bodily dignity, due process, labor rights, disability access, clinical and legal privilege, freedom of conscience, family protection, or lawful confidentiality. Nonparticipants accept nothing merely by living, working, traveling, or owning property nearby.

The first compatibility test concerns ordinary privacy. Site design, cameras, access controls, identity systems, visitor management, transport, and communications must not pull neighbors, workers, service users, or passersby into participant records. A campus that requires outward-facing surveillance to feel secure may be incompatible with the project's central direction. Security must

be designed inward toward role-bound risk, not outward toward routine public life.

The second test concerns equality and accessibility. Physical routes, transportation, information, communication, emergency procedures, digital interfaces, housing, work areas, and public services must be usable by disabled people without exceptional permission, segregated routes, or humiliating workarounds. Article 9 of the Convention on the Rights of Persons with Disabilities, read with the Committee's General Comment No. 2, treats accessibility as an *ex ante* obligation and a condition for independent living and full participation, offering a strong design reference for the site. Applicable disability, building, transport, employment, and digital-access law still controls the enforceable requirements.

The third test concerns labor. Staff and construction workers retain rights to safe work, fair pay under applicable law, association, representation, grievance, nonretaliation, accommodation, and privacy. ILO Convention No. 155 provides a useful baseline for prevention, defined responsibility, consultation, and worker participation in occupational safety and health, while national labor law controls the enforceable route. A transparency institution should not treat workers as if their employment makes their whole lives recordable, and role records must remain proportionate to public function and distinct from participant records.

The fourth test concerns community health and safety. Traffic, construction, air and noise pollution, security operations, crowd activity, emergency demand, and hazardous materials can impose

risk beyond the property line. Neighbors deserve the same health and safety standard as participants. Safety planning should include affected communities and public authorities rather than remaining a private security document.

Rights compatibility is not proven by a list of policies. It requires standing, records, independent review, remedies, and the ability to stop a practice. A person whose route is blocked, home exposed, work made unsafe, rent destabilized, or data captured needs more than reassurance. They need a lawful path to protection and correction.

A candidate site fails if the institution can operate only by narrowing rights, relying on exceptional waivers, or making remedies practically inaccessible. The City's purpose is to place greater burden on public-power formation. It cannot begin by asking less powerful people to surrender the protections that make that burden legitimate.

5.2.3 — Public-Records and Privacy Compatibility

The City's record architecture must fit the host jurisdiction rather than hover above it. Public-records duties, privacy rights, data-protection rules, evidence law, archival obligations, labor records, clinical confidentiality, legal privilege, child protection, security restrictions, and cross-border data rules may pull in different directions. Site selection should identify those tensions before infrastructure makes one answer expensive to change.

A purpose-built campus may create a dense technical environment with cameras, sensors, access logs, communications systems, archives, and public interfaces under one operator. That

can strengthen provenance and continuity. It can also concentrate sensitive data, increase breach consequences, and tempt the institution to treat technical capture as lawful authority. The host legal system must recognize each stage of record use separately.

A leased or embedded model may place record systems inside buildings controlled by landlords, shared vendors, public institutions, or other tenants. Network equipment, physical access, maintenance, incident response, and backup custody can become legally and technically complex. Contracts must not be allowed to decide questions that belong to rights, law, and public accountability.

Record compatibility begins with purpose limitation. The site should identify which systems support active participant records, staff operations, visitors, security, building management, care, public access, research, and ordinary administration. Those systems should not merge merely because a vendor can connect them. Location, access, utility, and security data can reveal intimate patterns even when no camera image is public.

Compatibility also requires protected handling of incidental people. Neighbors near an entrance, contractors repairing equipment, delivery workers, emergency responders, visitors, protesters, and family members may appear in records. The law and the design should support masking, restricted access, correction, challenge, and deletion or sealing where applicable without creating an off-record route for active public-power formation.

Public-record status cannot be presumed from the City's self-description. Depending on jurisdiction, funding, delegation, function, and contractual form, different bodies and record classes may carry different disclosure, privacy, retention, and review duties. Those classifications belong to competent legal authority. The spatial charter can require only that each record class, custodian, access route, protected category, correction process, and appeal path be declared before collection begins.

The candidate site is ineligible when lawful record separation cannot be maintained, essential custody remains vendor-controlled, third-party rights cannot be protected, or record continuity and legal compliance pull in opposite directions without a defensible resolution. The practical response may be redesign, a different jurisdiction, narrower operations, or no site. Legal compatibility is part of site fitness rather than a problem deferred to opening day.

5.2.4 — Labor and Building Law

Labor and building law bring the City's moral language into contact with work that can injure, exhaust, displace, or silence people. Construction is not a neutral interval before the institution begins. Design decisions determine lifting, exposure, working at height, heat, noise, traffic, hazardous materials, shift length, emergency access, and the ability of workers to refuse unsafe conditions. The ILO Safety and Health in Construction Convention and Recommendation provide an international reference for preventive duties across design, planning, execution, and worker protection.

The legal route must identify the employer, principal contractor, subcontractor, site controller, designer, owner, and safety duty holder under applicable law. The International Labour Organization's revised construction code offers a nonbinding review reference for prevention, clear responsibility, worker participation, and continuous improvement (International Labour Organization, 2022b). Complex contract chains can make responsibility disappear precisely when risk is highest. Procurement is unacceptable when the cheapest layer carries the most danger while the institution preserves distance from employment obligations.

Worker voice should enter before final plans. Construction workers and their representatives can identify unsafe sequencing, inaccessible welfare facilities, unrealistic schedules, material hazards, and maintenance traps that drawings conceal. Operating staff should review service routes, storage, cleaning access, waste movement, equipment replacement, night work, and emergency procedures. Participation is a design input, not a courtesy after tender.

Worker accommodation, where needed, should be designed as ordinary dignified housing rather than a second invisible settlement. Safety, privacy, sanitation, transport, freedom of movement, tenancy or occupancy clarity, and accessible grievance routes belong inside the labor plan. Migrant and temporary workers need special protection against tied housing, passport retention, debt dependence, and retaliation. The construction image never outranks the worker's independent life.

Building law also protects the future. Structural integrity, fire safety, ventilation, sanitation, energy systems, material health, seismic or wind requirements, and safe egress must be appropriate to local hazards and uses. A modular or temporary building is not exempt from life safety. A beautiful adaptive reuse is not acceptable if hidden conditions make workers or occupants unsafe.

Scheduling can transfer burden to neighbors and workers. Night construction may reduce daytime traffic while harming sleep. Accelerated delivery may create overtime and shortcuts. Phased work may prolong noise, dust, access disruption, and uncertainty. The construction plan should explain who benefits from the schedule and who carries its cost.

Grievance and nonretaliation routes must reach through the contract chain. Workers should be able to report safety, wage, harassment, discrimination, environmental, or integrity concerns without losing employment or immigration security. Complaints should be logged, reviewed, and capable of stopping work. A hotline controlled only by the contractor is not independent remedy.

Operation continues the same duty. Cleaners, food workers, technicians, drivers, security staff, care staff, and maintenance crews need lawful pay, safe staffing, rest, training, equipment, privacy, and representation. Generous participant environments cannot be financed through chronic understaffing. Lifecycle cost must include dignified labor.

The labor and building gate is passed only when the project can name duties, resources, inspection, worker voice, enforcement, and remedy from design through closure. If compliance depends on informal tolerance or exceptional sacrifice, the site is not ready. The City should be difficult to build because human beings are not disposable inputs.

5.2.5 — Constitutional Deferral

Site planning cannot confer constitutional status on the City. It does not decide whether participation may be connected to candidacy, office, public funding, records law, or any legal class of public power. Those questions belong to the constitutional and legal architecture of the series, to jurisdiction-specific review, and to lawful democratic authority. Site design can prepare for rights; it cannot enact them.

The distinction protects the City from private sovereignty. A landowner, foundation, university, municipality, or host government cannot create superior public legitimacy simply by granting a site. The City remains an institution subject to law, not a jurisdiction above law. Its internal covenant, record rules, review bodies, and spatial boundaries cannot displace courts, regulators, labor authorities, emergency services, or constitutional rights.

Site contracts need an explicit authority boundary. A lease governs possession, not the scope of lawful public records. Donor agreements cannot control admissions or governance. Host agreements remain subject to individual rights, and community-benefit agreements remain distinct from planning law and

affected-rightsholder consent where required. The contract register should show what each instrument can decide, what it cannot decide, who reviews it, and where challenge or remedy begins.

Constitutional deferral requires status labels in public communication. A proposed site, pilot agreement, model covenant, or access rule should be described as candidate architecture under review. The language should not imply that the project has authority to certify leaders, alter eligibility, bind governments, or create a new civic class. The host public deserves to know what has and has not been authorized.

The site process should include a legal stop gate. If constitutional or rights review finds that the institution's core burden cannot be carried lawfully, the answer is not to search for a weaker jurisdiction. The design must change, narrow, or stop. Jurisdiction shopping for lower protection would be a form of burden evasion.

A legal-envelope matrix should identify authority separately for land tenure, planning, construction, labor, accessibility, data, public records, health, emergency action, inspection, complaint, closure, and asset transfer. For each lane it records the responsible public body, governing instrument, required permission, evidence threshold, review trigger, appeal route, emergency exception, expiry, and unresolved condition. The matrix prevents permission in one domain from being misrepresented as authority in another. Conflicting claims of authority should remain unresolved until the lawful forum identifies which rule controls.

A jurisdictional boundary map should accompany the legal envelope. It should show which public body controls land use, building safety, labor, utilities, emergency response, environmental review, public access, records, taxation, and remedy; where private agreements operate; and where no City actor has authority at all. The map should also identify conflicts, appeals, renewal dates, and the consequences of losing a permission. Such a document prevents a lease, memorandum, or special-purpose entity from being mistaken for sovereignty and lets residents see which promise can be enforced by whom. Delegated powers should also display their expiry or renewal condition so temporary authority cannot quietly become permanent.

5.3 — Host-Community Burden and Local Legitimacy

A host community is the living system through which the City becomes possible: people, institutions, histories, services, ecologies, rights, and ordinary routines. Residents may experience rent pressure, traffic, noise, security attention, media presence, utility demand, political conflict, or the symbolic burden of becoming known primarily as the project's location. Workers, schools, clinics, utilities, emergency services, and local government may carry demands absent from the campus budget. Host standing begins by making those distributed effects visible before they become facts on the ground.

Local legitimacy cannot be reduced to a supportive mayor, a land agreement, a public meeting, or a majority poll. Communities are internally plural. Owners and tenants, long-term residents and recent arrivals, Indigenous peoples and public authorities, workers and employers, young people and elders, nearby streets and distant districts may experience the project differently. A fair process identifies whose rights are at stake and whose burdens are likely to be hidden by aggregate approval.

The host-burden register should begin before site selection and continue through construction, operation, expansion, pause, and closure. It should cover land history, displacement, housing, utilities, transport, schools, health and emergency services, environmental effects, cultural meaning, security externalities, visitor and media pressure, construction disruption, workforce demand, public finance, and long-term maintenance. The register is not a score. It is a map of duties, evidence, uncertainty, owners,

review dates, and remedy routes (Arnstein, 1969; Fung, 2006; Tyler, 2006; De Barbieri, 2016).

Participation has consequence when affected people can shape alternatives, conditions, monitoring, and remedy while change is still possible. That requires understandable materials, independent expertise, accessible and non-digital routes, conflict disclosures, time, continuing engagement, and a public account of what changed and why. UN-Habitat's planning guidance, the Habitat Professionals Forum's International Participatory Charter, and the World Bank's ESS10 provide useful reference points for inclusive participation, timely disclosure, responsive grievance, and lifecycle influence (UN-Habitat, 2015; Habitat Professionals Forum, 2024; World Bank, 2017b). None of them turns attendance, a survey, or a meeting into automatic legitimacy.

Refusal must retain legitimacy. A resident, worker, tenant, rightsholder, local official, or community organization may oppose the project without being called anti-fairness, anti-science, anti-progress, or hostile to the wider series. Moral vocabulary becomes coercive when disagreement is treated as evidence of bad character. A proposal that cannot survive principled opposition is not ready to impose a local burden.

5.3.1 — Local Residents as Burden Bearers

Local residents become burden bearers before construction begins. Rumor, land speculation, political attention, donor interest, security planning, and media curiosity can change a place while the project remains only a proposal. The City should

therefore begin local engagement before announcing a preferred site, not after the narrative has made refusal seem destructive.

Residents are not one category. People closest to the site may face noise and traffic. Tenants may face rent pressure without receiving property compensation. Small businesses may gain customers or lose access. Disabled residents may experience route changes differently. People with limited language access, digital access, time, or political confidence may be least visible in formal meetings. The process should be designed around those differences (Bullard, 1990; Schlosberg, 2007; Tyler, 2006).

Community standing should not depend on proving individualized financial harm. Noise, public attention, cultural change, pressure on services, and loss of ordinary privacy can be real even when they are difficult to monetize. Standing can be structured by proximity, affected interest, service responsibility, rightsholder status, work relation, or demonstrated burden rather than by property ownership alone.

Early information includes genuine alternatives rather than a sales case for the preferred plan. Residents receive comparable accounts of campus, leased, distributed, embedded, phased, multi-site, and no-build options, with the same assumptions for cost, traffic, utilities, housing, labor, and environmental effects. The process becomes meaningful when people can change the form, scale, location, conditions, or decision itself. Consultation that can only decorate a settled choice is public relations, not shared planning.

Host review should distinguish broad jurisdictional preference from concentrated burden. A citywide majority may support a project while one block carries traffic, noise, construction, surveillance spillover, or rent pressure. Aggregate approval cannot erase local injury. The process needs a route for the most affected people to state, document, challenge, and revisit burdens that a wider electorate may never experience.

Residents should be able to condition a proposal. Conditions may concern routes, hours, housing mitigation, public-service capacity, environmental monitoring, visitor limits, construction schedules, workforce standards, security boundaries, public access, or review clocks. The project should not present mitigation as generosity. Conditions are part of the burden allocation that makes authorization intelligible.

Residents should also be able to oppose the proposal after benefits are offered. A new transit stop, training program, local contract, park improvement, or revenue payment may be valuable and still insufficient. The existence of need does not make agreement free. A community should not have to choose between material support and the right to say no.

Local legitimacy is therefore a continuing relationship rather than an opening event. Representation changes, effects emerge, and promises age. Monitoring bodies, public reports, review dates, and renegotiation routes should remain active throughout the site lifecycle. The City must be willing to narrow, compensate, repair, pause, or close when burdens exceed what was represented.

Host participation also needs conflict disclosure. Landowners, officials, nonprofit partners, universities, contractors, donors, and community organizations may have financial or institutional interests in the outcome. Those interests do not disqualify a voice, but undisclosed alignment can distort local legitimacy as readily as concealed opposition funding. The decision file should state relevant interests, funding relationships, and representative roles so readers can distinguish participation from undisclosed influence.

The final resident test is simple. Can a person who does not believe in the project obtain information, challenge evidence, receive a reasoned response, and seek remedy without entering the project's culture? If not, the host process has become recruitment rather than legitimacy.

5.3.2 — Housing and Traffic Effects

Housing effects can begin with expectation. Speculation may raise land prices before workers or participants arrive. Owners may convert long-term housing to short-term accommodation. Landlords may market proximity to the City as prestige. Staff demand may compete with local households. A site assessment should therefore establish a housing baseline and monitor change from announcement through operation.

Purpose-built participant housing may reduce ordinary-market competition but consume land and create an enclave. Leased housing may be easier to relinquish yet remove existing units. Staff housing supports late shifts while deepening employer dependence. Commuting protects housing supply but increases

transport burden. Each option shifts cost, distance, security, and choice.

Displacement includes more than formal eviction. Rent increases, loss of informal use, redevelopment pressure, landlord harassment, conversion of local services, and changes in tax or insurance costs can force people out without one compulsory acquisition. Human-rights guidance on adequate housing and involuntary resettlement offers relevant reference points for secure tenure, genuine consultation, notice, alternatives, and remedy (Committee on Economic, Social and Cultural Rights, 1991; World Bank, 2017a).

Where housing pressure remains, mitigation must be specific, funded, and reviewable. Depending on local law and evidence, tools may include workforce-housing support, preservation of affordable units, anti-displacement funds, transport benefits, restrictions on short-term conversion, or public investment selected through lawful local processes. No universal package fits every host. The governing rule is that project-created cost remains attached to the project rather than being transferred to households with the least capacity to absorb it.

Transport planning must follow actual daily chains rather than a ceremonial traffic count. Construction shifts, safe school routes, care visits, deliveries, emergency and disability access, public transit, cycling, walking, protest, media events, and late-night service work create different peaks and hazards. Event demand must not consume emergency space or make ordinary routes unsafe. When the project adds load, it should fund the capacity,

safety, mitigation, and monitoring needed to carry that load rather than leaving the host to absorb it.

Monitoring should compare predicted and actual effects. Traffic models, parking plans, housing forecasts, and visitor assumptions are often wrong. Review clocks, public data, complaint records, and trigger thresholds should require correction when reality diverges. Temporary relief may be needed before long-term infrastructure is completed.

Benefits do not cancel housing or traffic harm. A local job does not compensate a tenant forced out. A new road does not justify unsafe construction traffic. A transit investment may improve the area while also increasing property pressure. The host-burden register should preserve these effects separately rather than netting them into a single positive result.

The site form passes only if housing and mobility remain compatible with ordinary life. When the City's presence makes nearby people less secure, less mobile, or less able to remain in place, the institution is exporting the burden it claims to reveal.

5.3.3 — Services and Infrastructure Load

The City will rely on systems that already serve other people. Water networks, wastewater treatment, electricity, communications, waste collection, roads, transit, hospitals, clinics, fire services, policing, emergency management, schools, and public administration may all absorb demand. The project should not count these systems as free background simply because taxes or fees are paid.

A service-load assessment should identify existing capacity, planned demand, peak conditions, failure points, deferred maintenance, staffing shortages, and competing public needs. Average capacity is not enough. A system may appear adequate until heat, drought, storm, fire, epidemic, protest, or a major event produces simultaneous demand.

Utility agreements should state who funds connection, upgrades, redundancy, repair, and decommissioning. Priority service that weakens ordinary users during scarcity is unacceptable. Dedicated capacity may be justified for continuity, but it should not create a private island or leave the host responsible for stranded infrastructure if the pilot stops.

Public-administration load also matters. Planning staff, inspectors, privacy authorities, labor inspectors, courts, record offices, environmental agencies, and local councils may spend substantial time reviewing and monitoring the site. Application fees may not cover complex oversight. The project should fund lawful review without purchasing favorable decisions or creating dependency.

Infrastructure benefits should be separated from project need. An upgraded water line, road, transit service, communications link, or clinic may serve the host and deserve support. It may also have been required primarily because the project created demand. Public reporting should show who paid, who benefits, who controls the asset, and what happens after closure.

Service agreements should include performance and review. Consumption, outages, emergency calls, response times, waste,

maintenance, and public costs can be monitored without turning residents into data subjects. Trigger thresholds should require mitigation, reduced activity, or pause when local systems become strained.

The host agreement must plan for withdrawal. If the pilot closes, does the host inherit expensive infrastructure, unused buildings, debt, contaminated land, or reduced staffing elsewhere? Decommissioning and asset-transfer terms belong in the original agreement. Closure should not reveal that the host was the long-term guarantor of a temporary experiment.

A legitimate site makes service demands visible, funded, monitored, and adjustable when capacity tightens. The City receives no moral discount on capacity residents need for ordinary life. When demand exceeds agreed limits, mitigation, reduced operations, added funding, or pause must come before strain is transferred to the host.

5.3.4 — Cultural and Political Spillover

The City will change the meaning of its location even if its physical footprint is modest. A place may become known internationally as the host of a controversial institution. Residents may encounter visitors who assume support, opponents who assume complicity, and media stories that reduce a complex community to the project. Cultural and political spillover begins when the site becomes a symbol.

Symbolic meaning should be assessed before selection. A capital city, border region, conflict-affected area, sacred landscape, university district, economically distressed community,

Indigenous territory, former industrial site, military area, or climate-vulnerable region will communicate different stories. The project should not choose a place for symbolism while asking residents to carry the consequences.

Indigenous and customary relationships to land require more than cultural acknowledgment. Territory, water, sacred sites, governance, livelihood, memory, and future generations may be legally and morally implicated. Local tradition cannot be borrowed as an aesthetic resource or tied to fairness without invitation, authority, and rights-sensitive review.

Cultural pressure can also arrive through design. Architecture, naming, ceremonies, landscaping, public art, and language may make the City look like a civilizational center or sacred headquarters. A host community may reasonably resist being recast as the birthplace, capital, or proving ground of a global movement. Modesty is not only aesthetic. It protects local identity from institutional appropriation.

Cultural benefit should be defined by the host, not announced by the project. Public space, education, art, landscape repair, archives, or local programs may be valuable, but they should not be used to claim gratitude. Communities may want material mitigation rather than symbolic partnership, or may prefer no association at all.

Media attention and civic tourism can change local life even when no building expands. Visitors may seek photographs, proximity to participants, symbolic access, or participation in a public narrative; nearby businesses may gain customers while residents

lose quiet, parking, privacy, or control over neighborhood meaning. The host review should therefore track attention as an operating burden and redesign routes, hours, visitor capacity, and public interfaces when the burden grows.

The host should retain the right to describe the project in its own terms. Local journalists, scholars, organizations, critics, and residents should not be pressured to use official language. The City's public materials should distinguish the institution from the host so that neither praise nor failure is assigned to everyone who lives nearby.

Political and cultural effects require continuing review because symbolism changes. A modest pilot may later become globally prominent. A donor event, controversy, public appointment, security incident, or replication debate may transform attention quickly. Agreements should include review when scale or meaning changes, not only when buildings expand.

The host must remain a place in its own right. If the City's story consumes local history, politics, or identity, the project has taken more than land. The institution remains a guest under law even when it owns property, attracts attention, or becomes economically important.

5.3.5 — Host Complaint and Review

A host complaint system is the practical evidence that local burden is not merely acknowledged. It should accept concerns from residents, tenants, workers, businesses, public agencies, visitors, community organizations, rightsholders, and others with a plausible affected interest. Standing should be broad enough to

identify cumulative and indirect harm before it becomes irreversible.

Complaints should receive a visible lifecycle. Acknowledgment, classification, immediate safety action, investigation, response, remedy, appeal, closure, and follow-up should have stated clocks. Complex matters may take time, but delay should produce explanation rather than silence. Ongoing harm may require interim relief while facts are reviewed.

Independence matters. Routine operational issues may be resolved locally, but complainants should have escalation to an ombuds function, host body, regulator, court, labor authority, privacy authority, or other independent route appropriate to the issue. The office that created the burden should not possess final authority over whether the burden exists.

The system should distinguish complaint from participation. A resident need not first attend consultations or accept benefits to preserve the right to remedy. Nor should a complaint be dismissed because the project was lawfully approved. Authorization permits activity under conditions; it does not erase later harm.

Community benefits should be recorded separately from complaint outcomes. Jobs, procurement, infrastructure, grants, access, or revenue do not offset a rights violation or specific injury unless the affected person freely accepts a lawful remedy. General benefit cannot make a specific involuntary burden tolerable.

Review clocks prevent consultation from becoming a one-time performance. Housing, traffic, utilities, noise, security, local

labor, procurement, complaints, environmental effects, and emergency capacity change over time. Each material condition needs a review date, responsible owner, affected-person access, escalation threshold, and consequence. A promise without a clock is easy to forget and hard to enforce.

Complaint and review also require public memory. The record should show what was raised, how it was investigated, what remedy occurred, what deadlines were missed, and what remains contested. Public summaries should preserve privacy and legal limits while preventing recurring harm from being treated as a new surprise each time.

The host standing, objection, and remedy route can be read as an eight-stage sequence: early notice, standing determination, access to relevant evidence, an opportunity to object or propose conditions, a reasoned decision, proportionate remedy, independent appeal, and scheduled review after operations begin. Each stage needs a named owner, clock, status label, and public or protected record appropriate to the issue.

Standing begins with plausible exposure, not allegiance to the project or proof of completed injury. A tenant facing rent pressure, a utility operator facing capacity risk, a worker facing changed conditions, a rightsholder facing land or cultural impact, or a nearby resident facing noise and traffic should not have to become a supporter, disclose a worldview, or wait for irreversible harm before being heard.

Objection has meaning only when it can change the decision. The response may revise the site boundary, reduce scale, add

mitigation, fund independent monitoring, change visitor patterns, delay construction, narrow operations, reject expansion, or abandon the site. Participation that can alter scope, conditions, timing, or outcome becomes part of design intelligence rather than ceremonial consultation (OECD, 2022b; World Bank, 2017b).

Remedy must match the burden. It may include restoration, compensation where lawful, service correction, protective conditions, labor repair, environmental remediation, access limits, operational pause, relocation, or closure. General benefits do not erase a specific rights violation, and no community-benefit package may purchase silence or convert involuntary burden into consent.

Continuing standing survives approval, ownership transfer, leadership change, and public enthusiasm. The route remains open for cumulative effects, changed climate or utility conditions, new evidence, recurring complaints, and expansion proposals. A host agreement is credible only if the people living with the institution can still correct it after the opening ceremony.

5.4 — Proximity Without Overexposure

Reachability and protection form one design problem. Too much distance can shelter secrecy; too little can turn attention into siege. The site therefore distributes public approach, observation, protest, media, visitation, service, residence, and emergency access across distinct routes and time conditions. No single street, household, worker group, or protected zone should become the unpaid carrier of public curiosity. A good plan makes accountability easy to reach without making ordinary life impossible to inhabit.

Proximity is not measured only in kilometers. Transit, digital access, language, disability access, opening hours, security procedures, cost, and social confidence determine whether a person can actually reach the institution. A central urban site may be physically near but inaccessible through status and screening. A remote site may be reachable through good transport and public interfaces, or it may become a controlled legend.

Overexposure also extends beyond participants. Staff entrances, family visits, delivery routes, nearby homes, schools, shops, clinics, protest areas, and local streets can become part of the City's public image. The project should carry the crowds, cameras, traffic, and security it attracts rather than using the neighborhood as an unmanaged buffer (Jacobs, 1961; Whyte, 1980; Lynch, 1960; Gehl, 2010).

The design should prefer layered access over either openness or closure. Public interfaces can be generous, records can be usable, criticism can be visible, and oversight can enter without turning

residential, care, staff, or protected domains into public space. The boundary earns legitimacy when it gives reasons and routes rather than relying on intimidation.

A proximity plan should be tested under ordinary days and intense attention. Elections, scandal, protest, celebrity visits, emergencies, hostile campaigns, and viral media may change demand quickly. The fair site is not the one that looks open in calm conditions. It is the one that preserves accountability and dignity when attention becomes a force.

5.4.1 — Near Enough for Accountability

Accountability requires practical nearness. A person harmed by the City should not need specialized transport, insider knowledge, expensive counsel, or a public campaign to reach the institution. Complaint, inspection, protest, visitor, media, and public-learning routes should be legible, affordable, accessible, and safe enough to use under ordinary pressure.

Nearness may include transport access, visitor pathways, public-interface spaces, record-site assistance, local reporting, scheduled events, and routes for inspection or oversight. Physical entry by everyone is neither necessary nor desirable. What matters is that distance never becomes a tool of mystique or control. A site that ordinary critics cannot reach, understand, or challenge is not meaningfully public.

Accountability nearness also matters for emergency and legal systems. Courts, hospitals, emergency responders, inspectors, labor authorities, accessibility reviewers, and public administrators may need practical access. A beautiful remote site

that cannot be reached by the systems that protect people is not fair. It may be picturesque, but it externalizes risk.

Reachability must be tested for disability, language, cost, time, digital exclusion, and stress. An accessible route is not merely a compliant door. It includes transportation, signage, hearing and visual access, quiet support, human assistance, and a non-digital way to ask questions or challenge a decision. The public interface should work for people who arrive without status or confidence.

Digital nearness also matters. The participant record site, public explanations, complaint systems, accessible formats, translation, and public reporting can reduce the need for constant physical access. But digital access must not replace all physical accountability. A civic institution that forms public power should be visible in both record and place.

Near enough for accountability means the City accepts public proximity as part of its burden. It does not ask for trust from a distance or hide behind controlled publicity. It makes itself reachable through governed routes for inspection, complaint, learning, journalism, and lawful protest because public-power formation belongs to public concern, even when personal boundaries remain protected.

The site should also support ordinary oversight visits. Inspectors, auditors, accessibility reviewers, labor reviewers, and emergency planners should be able to enter without elaborate performance. If every visit becomes an event, the City will begin to manage the gaze instead of being answerable to it.

Accountable proximity means the City can be reached by more than insiders. Public transportation, accessible routes, lawful protest space, expert visit procedures, media orientation, local institutional partnerships, and affected-person access all matter. A City that can be reached only by invitation, car, status, or technical fluency will teach hierarchy before it teaches accountability.

Nearness should not be confused with constant exposure. The public must be able to approach the City's civic interface, not invade every layer of life within it. Accountable proximity is the right to test the institution's explanations, not the right to consume the human beings under the Vow.

Accountability proximity should be tested by a skeptical citizen's route. Can that person find the City, understand where to go, know what is public, submit a question, observe available materials, and leave safely without permission from insiders? If not, the City is still too inward.

5.4.2 — Far Enough From Harassment

Accountability does not make a participant permanently available. Staff need protected work and recovery, families and nonparticipants retain ordinary privacy, and neighbors should not live inside a permanent pressure zone. Harassment distance is therefore a positive design obligation: public concern receives clear routes, while ordinary people receive shielding, complaint channels, and rapid changes when attention becomes threatening.

Distance can protect without isolating. Buffer zones, visitor scheduling, protest design, media staging areas, residential

shielding, staff access routes, and transportation management can reduce pressure while preserving public oversight. The aim is not to hide the City. The aim is to prevent public approach from becoming a burden imposed on those who did not consent to carry it.

Participants need protection from both enemies and admirers. Fan culture can be as distorting as hostility. A public-power seeker surrounded by constant praise may learn dependence on admiration. A participant surrounded by hostility may learn defensiveness or fear. The City's distance rules should protect formation from becoming reaction to the loudest external presence.

Protection should not be purchased through neighborhood securitization. The City should avoid outward-facing surveillance, routine identification of local residents, road closures without necessity, or police practices that make nearby people feel watched because the institution attracts controversy. Security externalities belong in host review and should narrow when the triggering risk passes.

Harassment protection also extends to the host community. If crowds, media, or protest activity spill into neighborhoods, local residents carry the burden of the City's public meaning. The site should place public attention where it can be managed, not where ordinary homes, schools, clinics, or small businesses become collateral stages.

Far enough from harassment means the City treats attention as a force that must be governed. The public has a right to inspect

public-power formation. It does not have a right to turn the campus, staff, participants, families, or neighbors into targets.

Harassment distance should be designed for staff as well as participants. Staff may become targets because they operate systems, moderate platforms, maintain records, or provide care. Staff entrances, break areas, and service routes need shielding from points where public anger can become personal pressure.

Distance from harassment should not become distance from critique. The distinction must be operationally clear. A protest with signs, chants, and harsh criticism may be lawful and important. A targeted campaign to expose a child, follow a clinician, or threaten staff is not critique. The site should help security make that distinction without overreaction.

Distance from harassment should be designed into routes, not improvised through force. Setback, landscape, arrival sequencing, protected entrances, protest spacing, media staging, visitor scheduling, lighting, and emergency access can lower threat without turning the City into a bunker. The best protection often comes from calm design rather than dramatic security.

Harassment protection should not rely on making the City emotionally forbidding. A fortress may reduce intrusion while increasing public fear and resentment. The better design is calm distance: enough space, clarity, and enforcement to prevent harm without teaching that civic seriousness requires intimidation.

5.4.3 — Media Distance Discipline

Narrative pressure makes a governed media perimeter necessary. Independent journalism cannot depend on institutional self-

narration, yet constant visual access, stakeouts, selective filming, or harassment can turn public formation and surrounding life into content. The site should remain reportable and inspectable while protecting participants, staff, families, visitors, and neighbors from a permanent set.

The media-access protocol separates governed public record from journalistic capture. The official record site supplies contextual, correctable material with status and provenance; independent media remain free to investigate, question, compare, criticize, and interpret it. Access is assigned by public purpose rather than pressure, friendliness, audience size, or spectacle value. That separation protects journalistic independence, equal treatment, and the dignity of people whose lives are not a raw-content reservoir.

Media activity should carry its own spatial and operational cost. Queues, satellite vehicles, lighting, temporary structures, interviews, and breaking-news crowds belong where they can be managed without occupying sidewalks, blocking businesses, illuminating homes, or converting local streets into a permanent broadcast set. The right to report remains intact; the costs of reporting should not be exported to the host.

Media distance also protects the host community. A camera pointed at the City may capture homes, children, local workers, protesters, visitors, or neighbors who never consented to public attention. The site should anticipate sightlines, gathering points, parking, broadcast equipment, noise, and resident exposure. Public attention travels physically, not only narratively.

Media distance makes journalism durable rather than theatrical. Stable access, records, questioning routes, and inspection cannot depend on institutional friendship or audience size. Surrounding streets and private lives are not scenery. Public judgment should rest on a complete, contestable record rather than the fragment that travels fastest.

Media distance should include local-media respect. National or global outlets may dominate attention, but local journalists often understand host burden better. Access rules should not privilege prestige outlets in ways that make local accountability weaker. The host community's press is part of the City's public environment.

Official communications must distinguish documentation from dramatization. Photographs, diagrams, renderings, tours, and videos produced by the City can create the same spectacle risk as outside coverage. Public-communication review should ask what an image omits, whether it invites voyeurism or shrine logic, how it treats workers and neighbors, and what correction or withdrawal route applies when the image misleads.

Independent journalism is necessary because the City's record site cannot be its only interpreter. Access should support investigation, criticism, comparison, and adversarial reporting while preventing siege, stalking, doorway ambush, or family exposure. Reporters need routes to public truth without forcing unrelated people to live inside the story.

Press zones, briefing rooms, background materials, credential routes, complaint channels, and protected no-filming boundaries

should exist before controversy begins. Rules written only after a scandal will look self-protective, while rules designed, published, and reviewed in advance can be judged as part of the institution's ordinary ethics. Media access should reveal public-purpose work without converting homes, care, staff labor, or incidental persons into content.

Media-distance rules should be symmetric in principle and reviewable in practice. Access rules cannot reward friendly coverage or punish hostile, local, or independent journalism with distant suspicion. Access can be tiered by safety, capacity, protected-person rights, and lawful process, but not by loyalty, praise, prestige, or willingness to reproduce the institution's preferred narrative.

5.4.4 — Visitor Approach Design

Visitor approach design turns public access into a sequence rather than an accident. A visitor should know before arrival what kind of access is possible, what record status applies, what identification or screening is required, where they may go, how to request accommodation, how to submit questions or complaints, and how protected areas are shielded. Confusion at the gate creates unnecessary burden.

A visitor should be able to approach the City without being recruited, intimidated, or staged. Before entering, the route explains where to go, what status applies, how long a process may take, where recording changes, and where help, complaint, appeal, or exit can be found. The public edge communicates ordinary lawful access through legible paths, seating, signs,

shelter, and staff assistance. It does not use prestige choreography to make understanding feel like admission to a special order.

Public interface spaces should be close enough to be meaningful and bounded enough to be safe. A visitor may attend a briefing, submit evidence, ask a public question, meet a designated role, observe a lawful public area, or use the public record site interface. They should not be able to convert the campus into a scavenger hunt for private material. Curiosity should be routed into civic channels.

Visitor design should be tested under peak demand rather than an ordinary tour. Large events, controversial hearings, diplomatic visits, school groups, protests, and viral public interest can overwhelm parking, transit, toilets, accessibility support, security, and staff. Timed entry, remote participation, overflow plans, and event limits may be fairer than assuming the host can absorb every wave of attention.

Peak visitor design must account for protest, disability, language, emergency access, media, and ordinary local movement. Queues cannot block roads, overload transit, spill into residential streets, or create intimidation. Capacity limits, overflow routes, and event controls keep institutional attention from becoming a host burden.

A complete visit includes a clear exit. Someone who submitted a complaint, witnessed a difficult interface, or encountered sensitive material should know what record exists, what review follows, how to correct an error, and where help can be found. Civic access should end with orientation, not dismissal.

Visitor approach design should be readable before a person enters the building. The sequence from road, path, transit stop, parking, gate, sign, waiting area, screening, orientation, accessible route, and public interface should teach what kind of institution this is. Confusion at arrival becomes unnecessary suspicion, and suspicion becomes burden for staff, visitors, and critics alike.

The approach must also protect the dignity of refusal. A visitor who does not accept the City's claims should still understand how to observe, question, protest, complain, and leave. The City should never require emotional allegiance as the price of basic navigation.

First contact carries an emotional burden. Visitors may arrive skeptical, anxious, angry, curious, confused, or shaped by earlier encounters with government, surveillance, neglect, or public shame. A legible entrance, calm welcome, non-digital help, and clear route to question or leave reduce fear without demanding trust in advance.

The visitor approach should be tested with people who are stressed, disabled, unfamiliar with civic institutions, skeptical of the project, and not fluent in the main language. If the route works only for confident insiders, the entrance is already distributing burden unfairly.

5.4.5 — Residential Shielding

Residential shielding protects the human interior of the City and the ordinary life around it. Participants live under the Vow without becoming public displays. Staff and families may live or move nearby without becoming record subjects by proximity.

Layered access, quiet approaches, visitor schedules, camera limits, protected windows, and emergency routes make residence possible while keeping active public-power conduct inside the governed record.

Shielding begins with sightlines, sound, access, and circulation. Residential quarters should not be exposed to casual public view. Windows, paths, planting, setbacks, walls, lighting, and visitor routes should reduce unwanted visibility without creating a fortress atmosphere. Sound shielding matters because constant public noise, media presence, protest, or visitor circulation can make residence feel unsafe.

Shielding can resemble secrecy when its purpose is obscure. The City therefore explains that residential shielding protects dignity, sleep, care, and nonparticipant boundaries while the active record still follows public-power conduct. Evaluating formation does not require raw visual access to bedrooms or recovery spaces.

An independent challenge route makes shielding enforceable. Anyone exposed by a camera, visitor path, media position, drone rule, event schedule, or security practice can seek rapid review without proving bad faith. Protection is credible when the people protected can trigger correction.

Residential shielding gives spatial form to ordinary privacy. The City asks more of public-power seekers without abolishing protected rest or a neighbor's right to remain ordinary. Visibility stops before it absorbs every nearby life.

Attention changes, so shielding is reviewed after controversy, campaigns, events, or route changes. A quiet edge can become a

media edge. Protection is a continuing duty, not a one-time drawing.

Residential shielding extends beyond the fence. Nearby homes cannot become background footage, drone scenery, parking spillover, crowd overflow, rumor territory, or an informal security buffer without notice, consent where legally required, complaint, and remedy. The City's visibility stops before it enters ordinary windows or converts domestic life into collateral public material.

Participants also retain shielding inside the City. The public may inspect role conduct under the Vow, not modesty, fatigue, family contact, medical routing, or private recovery. Design makes active record and public display visibly different.

Audit ordinary disturbance as well as formal privacy: light spill, noise, crowd drift, drones, parking, deliveries, patrols, and press behavior. People can feel watched without being recorded, and that atmosphere is a real burden.

Post-occupancy perimeter review combines resident reports, incident records, route observation, noise and light measures, privacy breaches, complaint outcomes, and repairs. Its purpose is not to suppress lawful presence. It detects when the City shifts its visibility burden onto nearby homes, workers, or public space and requires redesign before the transfer becomes normal.

5.5 — Climate, Utilities, and Physical Resilience

A responsible site is designed around the conditions most likely to interrupt ordinary operation. Water, energy, communications, transport, heat, smoke, fire, flood, storm, drought, seismic risk, landslide, public health, and emergency access differ by place and interact across systems. The relevant profile is therefore local, multi-hazard, and service-based. A sustainability label matters less than evidence that people can remain safe, essential functions can narrow gracefully, and the host is not left with the project's displaced risk.

Resilience must be assessed as a shared condition with the host. A private microgrid, water reserve, secure network, or protected route may strengthen continuity, but it may also consume scarce capacity, shift cost, or create priority during crisis. Resilience fails when the campus survives by weakening systems around it.

Risk review joins exposure, vulnerability, capacity, consequence, and interdependence in one decision record. The Sendai Framework contributes a governance and preparedness lens, while the UNDRR Principles for Resilient Infrastructure add socially engaged, environmentally integrated, protected-by-design, and system-wide resilience tests. Local hazard maps, codes, engineering standards, public-health authority, and host knowledge still control the practical decision. The central question is whether the City produces a net resilience gain for the systems it joins rather than merely fortifying itself (IPCC, 2022; UNDRR, 2015, 2022; ISO, 2019).

Graceful degradation is a design requirement. Essential care, life safety, protected records, communications, access, water, sanitation, and exit should remain possible when one or more systems fail. Continuity does not mean that every program continues unchanged. It means that people remain protected, degraded status is explained, manual authority is named, and the institution can narrow or pause without hiding the loss of capacity.

Resilience also includes the ability not to build. A site with unmanageable hazard, inadequate water, fragile emergency reach, severe host vulnerability, or adaptation costs that depend on future public subsidy may be unsuitable. The City should prefer a modest form in a safer setting to a dramatic form that turns foreseeable risk into someone else's emergency.

5.5.1 — Water and Energy Burden

Water and energy are not background utilities. They are the material preconditions of daily life, record continuity, health, hygiene, cooling, heating, food, emergency response, and staff work. A City built for public-power formation will use water and energy in ways that must be counted before the site is chosen. The question is not only whether supply exists. It is what the City's demand does to others.

Water burden includes source reliability, drought risk, local rights, treatment capacity, wastewater handling, stormwater, landscape needs, emergency supply, and host-community competition. Restorative landscapes, housing, kitchens, clinics, and public facilities cannot be planned as though water were

symbolic. If the host region is water-stressed, the City must justify every demand and reduce use before asking the place to carry it.

Energy burden includes ordinary consumption, record systems, cooling, heating, communications, lighting, kitchens, medical interfaces, emergency systems, cybersecurity, and data infrastructure. Energy does not become invisible because it arrives through a wire. Energy demand carries cost, emissions, grid stress, backup requirements, and failure consequences. A campus that depends on fragile or dirty energy has hidden part of its burden.

Redundancy matters, but redundancy can also be burden. Backup power, storage, microgrids, fuel, batteries, generators, and load management each have costs and risks. Continuity cannot be purchased by exporting pollution, noise, fire risk, or fuel vulnerability to neighbors. Redundancy must be designed as a public responsibility, not private insulation.

Resource analysis should use a host-wide balance rather than a project-only efficiency claim. On-site generation, storage, recycling, or conservation may reduce demand, but the plan should also identify embodied cost, maintenance, emergency draw, seasonal scarcity, and who receives priority during shortage. The City is not resource-resilient if its continuity requires another user to lose basic service.

Water and energy discipline should shape campus design. Orientation, shade, passive cooling, insulation, efficient systems, water reuse, low-water landscapes, maintenance access, metering, public reporting, and emergency planning are not

decorative sustainability features. They are evidence, in the ordinary operational sense, that the City is trying not to externalize its own material existence.

The City's water and energy burden reveals whether the institution understands that even public ideals have pipes, meters, contracts, maintenance crews, reserve margins, and competing users. A civic project that cannot count its resource demand, fallback needs, seasonal stresses, and effects on neighboring capacity cannot honestly claim to count public burden. Utility discipline is therefore a test of institutional truthfulness, not merely environmental branding.

Water and energy planning should also include repair. Efficient systems that require rare parts, specialized vendors, or expensive service may become future burdens. A system is not fair merely because it performs well on opening day. It must remain maintainable under ordinary budgets and local capacity.

The rationing plan must be ethically ordered before scarcity arrives. If heat, drought, grid stress, or supply interruption requires reduction, the order of protection should be predeclared around life, clinical care, emergency systems, record integrity, staff safety, and host impact. Scarcity should not be governed by improvisation or institutional self-preservation.

A water and energy review should also identify what the City will do during regional emergencies. It may need to reduce nonessential loads, open certain resources to emergency coordination, or suspend public-facing functions so life-support

systems remain stable. Resource privilege must not masquerade as resilience.

5.5.2 — Climate Risk Review

Climate risk review asks whether the site can carry the City under foreseeable physical stress. Heat, flood, fire, smoke, storm, sea-level rise, drought, freezing, wind, disease vector shifts, and infrastructure fragility may all matter depending on the region. The City cannot choose a site based only on present beauty or current convenience. It must ask what future conditions will do to participants, staff, records, host communities, and emergency systems.

Risk review should include both acute hazards and chronic pressure. A flood may happen suddenly. Heat may accumulate. Drought may change water politics. Smoke may affect health. Storms may interrupt power and communications. Insurance costs may rise. Maintenance may become more expensive. A site that appears affordable today may become a burden trap over decades.

Climate risk is also unequal. Vulnerable host communities may already carry environmental burdens. Building the City there could bring investment, but it could also intensify displacement, infrastructure strain, or emergency competition. Climate-vulnerable land is not a bargain when its price reflects political weakness, neglect, or existing environmental burden. The burden account must include environmental justice.

Compound events reveal whether the plan understands systems or only hazards in isolation. Heat may coincide with grid failure,

smoke with evacuation limits, flood with wastewater failure, or a storm with communications loss. Adaptation can also move risk outward: a wall redirects water, cooling raises peak demand, hardening blocks access, or vegetation increases fire exposure. The site decision therefore traces secondary effects beyond the property line and rejects any safety strategy that depends on exporting danger to the host.

False resilience storytelling is another design hazard. A campus can market green features while remaining physically fragile, deploy impressive technology while neglecting maintenance, or claim climate awareness while increasing regional burden. Independent review, public assumptions, operational testing, and visible correction are needed precisely because attractive resilience narratives can outrun the systems beneath them.

Resilience may sometimes let the City reduce host burden during crisis through communications, coordination, shelter, supplies, or accessible space where lawful and jointly planned. Such capacity cannot be improvised as heroic self-narration. The host must help define the function, activation rule, priority order, resource limit, liability, and condition under which the City withdraws rather than competes with public responders.

Climate review must look beyond yesterday's maps. Heat, flood, wildfire smoke, storm surge, drought, extreme precipitation, wind, landslide, poor air quality, and compound events should be considered as future operating conditions. A site that is safe under old assumptions can become a future burden trap.

The review must also avoid maladaptation. A wall that protects the City may push water toward neighbors. A cooling system that protects participants may strain the grid during heat emergencies. A hardened road may speed emergency access while increasing runoff. Resilience is not fair unless the protection is counted outside the boundary as well as inside it.

Future climate uncertainty should be reported with humility. Honest planning does not claim to know every future risk; it states assumptions, review intervals, trigger points, adaptation budgets, retreat conditions, and the authority that can require redesign. A resilient City is not one that never fails. It is one that is honest before failure.

Climate risk review should be tied to stop conditions. If heat, flood, fire, drought, insurance withdrawal, evacuation fragility, or utility instability crosses a defined threshold, the site may need redesign, narrowing, seasonal limits, or rejection. A climate report without authority is decoration.

Climate risk should also affect insurance, financing, construction phasing, and long-term affordability. A site that is technically buildable but financially fragile under foreseeable hazard costs may become a future abandonment problem. Civic hope cannot rest on ground the institution cannot insure, maintain, or protect.

5.5.3 — Communications Redundancy

Communications redundancy is central because the City depends on record continuity, public interface, emergency response, staff coordination, archive integrity, and affected-person access. If communications fail, the City may lose more than convenience.

It may lose the ability to explain status, preserve records, contact families, coordinate care, report breach, maintain public access, or distinguish emergency from concealment.

Redundancy should include multiple communication pathways, backup power for communications, secure internal networks, external reporting channels, emergency alerts, accessibility formats, translation support, staff communication, public status updates, and offline fallback protocols. Modern networks are not naturally reliable. Reliability is designed, tested, maintained, and funded.

The archive gives communications redundancy special importance. Record capture may continue during a network disruption while validation, remote backup, tamper alerts, public-site updates, and oversight notice are impaired. A communications plan should specify what continues locally, what pauses, which manual fallback applies, when status notices issue, and how later reconciliation identifies gaps without pretending uninterrupted service.

Communications redundancy must also protect privacy. Backup pathways can become weak pathways. Emergency channels may expose sensitive information. Redundant systems may create duplicate data, inconsistent logs, or vendor dependencies. The City must design redundancy with the same record-use separation that governs the archive: capture is not release, access is not public disclosure, and emergency communication is not general reuse.

Host-community coordination belongs inside communications design. Local emergency responders, utilities, public officials, transportation providers, and affected neighbors may need status communication during disruption. Technical isolation is incompatible with physical reliance on the host. Redundancy should connect the City to lawful support systems without exposing protected information.

Communications redundancy is the infrastructure of public trust during stress. When everything is calm, communication feels like service. During failure, communication becomes legitimacy. The City must be able to tell the truth under degraded conditions, or its silence will become part of the burden others carry.

Communications redundancy protects more than convenience. The City's records, emergency signals, public explanations, legal notices, clinical routes, staff coordination, visitor updates, and host-community alerts all depend on communication systems that can fail under stress. A fair record regime cannot require perfect connectivity before people can be protected.

Redundancy should guard against informational inequality. If digital systems fail, participants, staff, visitors, host residents, families, emergency responders, and public users should not receive safety information according to status. The fallback system must be designed for the person least able to access the primary channel.

Communications planning should also include misinformation and impersonation. A City with high public attention will attract false alerts, fake records, deepfakes, spoofed messages, and

rumor surges. Redundant channels must therefore include verification methods that are simple enough for the public to use under stress.

Record continuity and public communication should not compete. During crisis, it may be more important to tell families, staff, visitors, host authorities, and the public what is happening than to preserve a perfect public-facing data stream. The redundancy plan must know which duty comes first.

5.5.4 — Emergency Services Reach

Emergency services reach asks whether life can be protected before record formalities, public image, or institutional continuity. Medical response, fire response, evacuation, security incidents, weather emergencies, mental-health crises, family emergencies, infrastructure failures, and mass-casualty scenarios must be planned with the host systems that may respond. A City that cannot be reached in crisis is not humane, no matter how noble its purpose.

Reach is also institutional. Local responders must understand the City's record status, protected zones, clinical spaces, nonparticipant protections, security protocols, and emergency exception rules. This does not mean responders become part of the City. It means the City must coordinate so emergency care can occur without unnecessary privacy breach or procedural delay.

Emergency-services reach should be designed for varied bodies, senses, stamina, communication needs, medications, and mobility devices. Evacuation, alerts, shelter, transport, and clinical handoff need more than one sensory or movement pathway. A route is

ready only when disabled users, support persons, and responders have tested it under time pressure and the resulting changes are recorded.

The host community should not be surprised by emergency demand. If the City may create unusual scenarios, such as media crowds, protests, cyber-physical incidents, participant overload, archive breaches, or security threats, host emergency systems should be prepared and supported. Reliance on public services must be costed and supported rather than disguised as a costless civic externality.

Emergency services reach is a moral test because it places care before institutional pride. The first question in crisis must not be how to preserve the image of the City. It must be how to protect life, dignity, and lawful continuity with the least hidden burden.

Emergency planning should also protect records from becoming obstacles. Staff should know when record continuity must yield to life, and how to document the exception later. A City that forces people to choose between saving a person and preserving a perfect log has designed the wrong hierarchy.

Emergency reach must be designed with local responders, not merely announced to them. Fire, medical, mental health crisis, security threat, severe weather, family emergency, evacuation, and utility failure each require different routes and authorities. Local services cannot be expected to improvise around a building culture they were never invited to understand.

Readiness itself has a public cost. Training, familiarization, equipment, mutual-aid planning, road access, drills, specialist

response, and protected communication may require resources before any incident occurs. Capacity agreements should identify who pays, how frontline workers are consulted, and whether preparedness for the City weakens ordinary obligations elsewhere. Declaring emergency services available is not enough when the host has never been resourced to provide them.

During emergency, care must outrank record elegance. The City may preserve logs where lawful and possible, but no record rule should delay evacuation, treatment, rescue, de-escalation, or notification of appropriate help. A system that protects its archive faster than it protects a person has failed its first duty.

Emergency services reach also requires practical familiarity before crisis. Responders should know the campus layout, protected nonvisibility zones, access bands, medical routes, family-contact procedures, hazardous systems, and record-sensitive areas without being absorbed into City ideology or public theater. This knowledge should be rehearsed, updated, and available across shifts so life protection does not depend on one relationship or one remembered tour.

Emergency routes should be rehearsed under realistic conditions. A sunny-day tour does not reveal whether a gate, corridor, elevator, bridge, security procedure, or records protocol will slow rescue in smoke, panic, flood, heat, or night confusion. Drills should be humble enough to discover embarrassment.

Emergency-service planning should include the public record consequences after the crisis, not during rescue. Once life is protected, the City should explain what happened, what records

exist, what was withheld, what failed, and what will change. The sequence matters: care first, explanation after, learning always.

5.5.5 — Resilience Before Beauty

Resilience before beauty is a governing rule for the first City. Beauty matters because human beings should not be formed in places that degrade the spirit. But beauty becomes false when it outruns water, energy, maintenance, climate risk, communications, emergency reach, accessibility, and staff sustainability. The City should be beautiful because it is honest, not beautiful instead of being honest.

This rule protects the City from donor aesthetics. A funder may want iconic architecture, dramatic images, symbolic plazas, named buildings, or a visual assertion of historic importance. The City must resist the idea that a public image can justify hidden fragility. A leaking roof, overheated dormitory, inaccessible path, underfunded service corridor, or fragile data room is more important than a ceremonial facade.

Architectural beauty proves itself through durability. A building that depends on hard-to-repair materials, proprietary systems, water-intensive landscapes, or soon-obsolete technology may impress when new and burden future people later. Maintenance belongs in the original design decision. A campus that cannot be sustained passes debt forward under the language of hope.

Procurement, design review, fundraising, public presentations, and guided tours must all reveal this priority. Public-facing images should include maintenance work, staff routes, utilities, climate adaptation, accessibility, and host context so that

effortless-city mythology cannot take hold. Visual culture teaches what an institution honors. Here it should honor repair, interdependence, and ordinary use rather than architectural self-congratulation.

This rule disciplines beauty rather than opposing it. A cooling feature that strains water, a facade that blocks repair, or a landscape that raises fire risk must change even when it photographs well. An institution teaching future leaders to notice displaced burden must first see the burden inside its own admired design.

Beauty can hide fragility, so resilience should be part of design review rather than a later correction. Glass, height, water features, grand atria, symbolic plazas, complex facades, and ceremonial approaches may increase heat load, maintenance cost, water demand, glare, security difficulty, accessibility burden, vendor dependence, or evacuation complexity. A proposal should lose standing when visual impact rises by shifting those burdens elsewhere; the City's beauty must answer to resilience as well as taste.

Nothing in this discipline requires ugliness. The City can be beautiful through durability, clarity, shade, repairability, accessibility, proportion, material honesty, local fit, quiet, and the visible care of systems. Civic form is most convincing when it protects people after the weather turns, the power flickers, the crowd grows, and the first plan fails. Beauty that continues to serve is more demanding, and more humane, than spectacle that ages into obligation.

The beauty test is whether a feature remains honorable when maintenance staff describe it. If a beautiful surface creates constant repair burden, unsafe cleaning conditions, energy waste, water demand, glare, or inaccessible routes, the beauty is borrowing dignity from hidden labor. A fair City does not decorate itself with someone else's exhaustion.

The resilience standard should be public enough for the host to inspect. If a feature is described as beautiful, the host may still ask how it performs under heat, flood, power loss, crowding, aging, repair, disability access, and emergency evacuation. Beauty should answer those questions without resentment.

A compound-failure rehearsal should test interdependence rather than one utility at a time. Heat may coincide with power loss; smoke may close outdoor routes while communications are degraded; water interruption may arrive during high occupancy; a regional emergency may make outside responders unavailable. The exercise should identify the first endangered function, the people who cannot safely wait, the local systems on which the City depends, the resources it might draw away from the host, and the decision point for reducing occupancy or closing. Resilience becomes credible when the City can protect life without presenting neighboring scarcity as someone else's problem.

5.6 — Cost Discipline, Expandability, and Replicability

Cost discipline begins by replacing the opening budget with a whole-life account. Capital, labor, utilities, technology, security, care, host mitigation, accessibility, insurance, renewal, adaptation, decommissioning, and foregone alternatives all enter the decision. Maintenance and staff recovery are not optional future details, and closure is not free. The disciplined proposal shows when each cost appears, who carries it, which assumptions drive it, and how the institution changes course when those assumptions fail.

Comparison must be lifecycle-wide and form-neutral. A purpose-built campus carries capital cost but may reduce coordination and lease risk. A leased cluster simplifies relocation yet creates retrofit, landlord, and move costs. Embedded and distributed forms may reduce land burden while increasing congestion, travel, technology, staff time, and legal complexity.

Expandability is capacity for learning, not an intention to grow. Modular form may let the first pilot correct mistakes, but every addition increases host, labor, utility, record, and governance burden. Expansion is justified only after existing functions are safe, used, maintainable, and independently reviewed. Otherwise, empty future capacity becomes a monument to anticipated importance (Flyvbjerg, 2014; ISO, 2006a, 2006b, 2024; Thomashow, 2014).

Replicability concerns principles and performance before appearance. Later cities may learn from standards for rights, host

review, staff dignity, record separation, accessibility, resilience, maintenance, and decertification. They should not be expected to copy climate-inappropriate buildings, symbolic axes, donor-funded materials, or a single cultural style. Local adaptation is part of fidelity.

Infrastructure-governance frameworks emphasize lifecycle planning, appraisal, procurement, asset management, monitoring, and decommissioning. Those disciplines offer a useful reference for the City, but they do not supply political authorization or prove that a site should exist. The final cost test remains comparative: does this form carry the required functions with fewer hidden burdens than the alternatives, and can the institution afford to stop?

5.6.1 — Anti-Luxury Baseline

The anti-luxury baseline protects the City from confusing dignity with prestige. Participants, staff, visitors, and workers need safety, accessibility, quiet, light, thermal comfort, durable materials, decent food, humane rooms, and restorative landscape. They do not need opulence, scarcity theater, signature architecture, or materials chosen to signal civilizational importance.

Luxury is not defined only by price. A costly feature may be necessary for accessibility, resilience, climate performance, safety, or long-term maintenance. A cheap feature may impose discomfort, repair burden, energy waste, or staff labor for decades. The relevant question is whether the feature protects

function and dignity or purchases image (Flyvbjerg, 2014; Kahneman, 2011).

Public areas should resist spectacle. Grand arrival sequences, monumental halls, donor walls, ceremonial staircases, and overdesigned record spaces can turn public access into awe. A citizen should feel able to enter, understand, question, and leave. Architecture that induces reverence may weaken the equality the institution claims to serve.

Landscape should also remain functional. Shade, water management, biodiversity, walking, recovery, and noise control can justify investment. Decorative water use in a scarce region, imported planting that demands heavy maintenance, or large lawns that signal abundance may externalize environmental cost. Beauty should emerge from fit with place.

The baseline should be published as criteria rather than a universal aesthetic. Local materials, climate, culture, accessibility, maintenance skill, and existing buildings will shape different answers. A restrained building in one region may be expensive or inappropriate elsewhere. Replication should preserve burden logic, not a visual brand.

Anti-luxury review should include lifecycle cost and replacement. A surface that looks modest but fails quickly may be more wasteful than a durable material with higher initial cost. A complex mechanical system may reduce energy while increasing dependence on proprietary maintenance. The City should prefer understandable, repairable, and locally supportable systems where performance allows.

The baseline also protects the host from symbolic comparison. Participant conditions that substantially exceed nearby schools, clinics, worker housing, or public spaces require a clear functional justification. Necessary differences should be explained, shared benefits should be pursued where feasible, and prestige should never be staged beside ordinary deprivation.

Strip away names, renderings, ceremonies, and donor stories, then ask what each feature does. A feature that protects dignity, access, resilience, work, maintenance, or recovery may belong. A feature built mainly for admiration consumes land, money, labor, and attention without carrying the civic task.

5.6.2 — Expandable Modules

Expandable modules allow the City to learn without pretending that its first plan is final. Housing, formation rooms, staff space, archive capacity, public interface, utilities, recovery, and service systems may need to change after real use. A rigid monument turns learning into expensive retrofit or denial. A modular plan keeps correction physically possible.

Expansion is earned through a noncompensatory gate. Existing spaces must remain fit for purpose; staffing must remain sustainable; host conditions and utility margins must remain intact; and maintenance must be funded. Material failures of rights, accessibility, safety, labor protection, complaint handling, or record continuity must be corrected and independently verified before expansion. Lesser defects may remain under a dated corrective plan only when reviewers show that they do not breach

a prerequisite. Demand, donor enthusiasm, media attention, or a waiting list cannot offset a failed gate.

Modules should preserve independent functions at every phase. Participant growth cannot displace care space, staff rest, public access, emergency routes, accessibility, maintenance staging, or protected nonvisibility. Phasing is credible only when each occupied stage is complete enough to be humane and safe on its own, rather than relying on promises attached to a final build that may never arrive.

A leased or multi-site phase may be better than construction. The project can test whether proximity is necessary by operating a cluster of existing facilities under common standards. If coordination, care, records, and public access remain strong, permanent campus expansion may be unnecessary. Learning should be allowed to defeat the original spatial hypothesis.

Host review must accompany expansion. More participants or facilities may change traffic, housing, utilities, security, media attention, and service demand even without new land. Material changes should trigger updated information, participation, conditions, and remedy routes. Initial approval should not become an unlimited growth license.

Modularity should avoid vendor lock-in as carefully as it avoids construction excess. Proprietary building systems, access controls, communications, energy systems, or prefabricated units can make later change dependent on one company's prices, permissions, or continued existence. Interoperability, repair documentation, spare parts, local skill, data portability, and

credible vendor exit should therefore be assessed alongside speed, convenience, and initial cost.

Modularity can mean safe connections, adaptable dimensions, separable systems, demountable partitions, honest utility margins, and the ability to return space as needs change. It should preserve local materials, codes, skills, climate fit, and repair capacity rather than impose a branded kit. Its value is learning and contraction, not visual sameness.

The final modular test is whether the City can become smaller without humiliation. An institution that treats contraction as defeat will use expansion to protect identity. A design that can pause, repurpose, and return space makes learning more credible because the physical form does not demand triumph.

5.6.3 — Maintenance Affordability

Maintenance is the long memory of design. Roofs, drainage, cooling, heating, water, lifts, doors, sensors, networks, kitchens, landscape, accessibility features, fire systems, roads, and archives all require inspection, repair, replacement, and skilled labor. A building is not affordable until those obligations are funded across realistic cycles.

Lifecycle costing should include routine operations, preventive maintenance, major renewal, emergency repair, energy and water, software and licenses, cybersecurity, insurance, compliance, cleaning, waste, landscape, staff training, spare parts, and decommissioning. It should also include host mitigation, public-service agreements, and the cost of remedy when the institution causes harm.

Maintenance affordability is inseparable from labor dignity. Understaffing, deferred repair, unsafe shortcuts, unpaid on-call work, and contractor churn can make operating budgets look balanced while workers absorb deterioration. The City should fund adequate staffing, training, equipment, rest, and worker voice before it funds optional enhancement.

Accessibility requires maintenance too. Lifts, ramps, automatic doors, hearing systems, signage, lighting, accessible paths, digital interfaces, and emergency devices must remain functional. A building that was accessible at opening but allows access features to fail has converted rights into a launch-day image.

Climate adaptation should be budgeted as an ongoing duty. Heat, smoke, flood, drought, storm, erosion, and changing insurance or code requirements may alter maintenance needs. The project should not assume that the host or future donors will fund foreseeable adaptation. Resilience without reserves is a promise made to future people.

Maintenance reserves should be protected from prestige spending. Ceremonies, expansion, public events, new technology, and aesthetic upgrades should not consume funds needed for roofs, water, safety, staff, records, or accessibility. Governance should make deferred maintenance visible before failure becomes public crisis.

Public reporting should distinguish capital gifts from recurring capacity. A donated building may create permanent operating obligations. A vendor may provide introductory pricing that later rises. A host may contribute infrastructure that requires public

upkeep. Temporary generosity is not evidence of sustainable affordability.

Affordability review makes its assumptions visible and tests them together. Asset life, inflation, energy and water prices, insurance, climate exposure, staffing, occupancy, vendor terms, technology refresh, and reserve levels may move in the same unfavorable direction. Scenario analysis therefore asks what happens when costs rise, donations fall, a major system fails, or planned expansion never occurs. A lifecycle budget is a range of survivable futures with declared decision triggers, not one optimistic total.

A site is affordable only when essential function continues without extraordinary sacrifice. Dependence on unpaid devotion, perpetual fundraising, political favor, monopoly vendors, or repeated deferral means the form exceeds honest capacity. A smaller, leased, distributed, or simpler arrangement should replace it before prestige turns excess into obligation.

5.6.4 — Replicable Standards

Replicability should begin with a warning. The first City will be shaped by one jurisdiction, climate, land history, labor market, culture, infrastructure system, and host relationship. Copying its physical form elsewhere may reproduce the wrong burdens. A standard should identify what must be protected and what must remain locally determined.

Replicable standards should distinguish an invariant layer from an adaptable layer. The invariant layer concerns rights and burden: adult voluntary entry, ordinary-citizen privacy,

nonparticipant shielding, protected nonvisibility, real exit, staff dignity, host standing, lawful records, accessibility, complaint, remedy, maintenance, and stoppability. The adaptable layer concerns form: campus, embedded, distributed, leased, phased, or multi-site arrangements; materials, density, landscape, transport, energy, public interface, housing, route geometry, technology, and visual language. Replication preserves the first layer while allowing the second to respond to local law, climate, culture, land, and host preference.

Replicable standards need an alternatives analysis. A later proposal must explain why its chosen form imposes less combined burden than feasible leased, embedded, distributed, phased, or multi-site arrangements. One successful campus cannot establish campus necessity elsewhere. Every new site returns to the beginning of the comparison rather than inheriting an architectural presumption.

Replication should also require local expertise, affected-person knowledge, and visible disagreement. Plans should be reviewed by local planners, rights experts, workers, disability organizations, emergency services, host residents, environmental specialists, and relevant Indigenous or customary rightsholders where applicable. Central approval cannot substitute for knowledge of place, and consultation cannot be treated as complete merely because a meeting occurred.

Interoperability should not become central control. Record standards, status labels, audit methods, and public interfaces may need compatibility, but local institutions should not feed a global dossier or submit to an unreviewable City authority. Network

learning must preserve record separation, jurisdiction, and local remedy.

Failure information must travel with success. Later sites should receive incident records, host complaints, labor problems, cost overruns, accessibility failures, design changes, donor conflicts, closure plans, and rejected alternatives. A standard built only from the features admired by visitors will reproduce hidden burden.

A replicable City is therefore not one that can be franchised. It is one whose protective logic can be tested in another place without requiring loyalty to the first site. The standard succeeds when local adaptation strengthens fairness rather than when every City looks related.

5.6.5 — Donor-Prestige Controls

Donor-prestige controls protect the site from being purchased in the language of generosity. A donor may sincerely support the project and still seek naming, design influence, proximity, speed, access, symbolic ownership, preferred vendors, favored applicants, or association with future public power. The City should govern those pressures before a gift makes refusal difficult.

No donation should influence admissions, participant pathways, staff appointments, public access, archive access, complaint outcomes, site review, formal standing, or governance. The rule applies to written conditions and to softer expectations conveyed through relationships, events, advisers, naming opportunities, or

future funding. Influence does not become harmless because it remains polite.

Design gifts deserve the same scrutiny as money. A donor may offer land, architecture, art, landscaping, technology, or a building at no purchase price. The gift may carry high maintenance, climate mismatch, inaccessible features, vendor dependence, symbolic burden, or conditions that narrow host choice. Some free assets are too expensive to accept.

Procurement should prevent donors from steering vendors, receiving indirect returns, or converting philanthropy into a private supply chain. Review should cover beneficial ownership, conflicts, pricing, data rights, labor practices, maintenance, subcontracting, performance history, and vendor exit. A donor-connected company should gain no advantage from urgency, gratitude, personal access, or threatened withdrawal of funding.

The strongest control is the ability to refuse, return, or restructure a gift. Governance should include reserve planning, diversified funding, public conflict records, and decision rules that allow the project to delay construction rather than accept capture. A City that cannot afford to say no cannot credibly teach resistance to hidden influence.

Refusal should be publicly explainable without becoming performance. The public can learn when gifts were declined, conditions changed, names removed, or designs simplified, while lawful confidentiality remains protected. That record distinguishes financial need from ownership and shows future sites what anti-capture costs in practice.

Donor review should continue after acceptance because influence can arise through renewal, rescue funding, social access, crisis support, media defense, or relationships with participants and officials. Periodic conflict review, access logs, governance disclosure, and external audit may remain necessary even when the original gift was clean.

The final donor test is institutional freedom under pressure. Can the City change design, reduce scale, move, choose another vendor, publish failure, compensate the host, pause construction, or close without donor permission or fear of retaliation? If not, prestige has become governance and the gift a hidden constitutional fact. Anti-capture design preserves the ability to disappoint benefactors.

Chapter 6 — The City's Spatial Order

Architecture is often praised as though beauty makes it innocent. A civic institution formed around public responsibility cannot accept that innocence. A wall, corridor, threshold, stair, waiting area, or room allocates time, access, exposure, influence, and retreat. Built form decides who can approach, who waits, who is seen, who is protected, who can object, who can leave, and who carries the cost of everyone else's design choices (Lefebvre, 1991; Hillier and Hanson, 1984; Markus, 1993).

The spatial order begins by routing visibility toward consequence-bearing roles and away from ordinary people who did not choose it. A campus that exposes participants while erasing staff has preserved hidden burden. A campus that opens public corridors while exposing children, families, clinicians, intimate care, or nearby residents has merely redirected harm. The design task is to make public responsibility legible while giving every protected person a clear, usable, and reviewable boundary (Dovey, 1999; Sennett, 2018).

Architecture gives civic rules a physical life before anyone reads them. Here, constitutional meaning is practical rather than juridical: walls do not replace law, and architects do not write rights, but built form can strengthen or weaken access, shielding, review, and remedy. A right reached only through a confusing route is weaker in use than on paper. A record rule that depends on an untraceable corridor is already compromised by the place meant to carry it.

One continuous plane of exposure would be injury, not transparency. One continuous plane of concealment would restore hidden influence. The City therefore needs visibility gradients

and access bands because roles, records, bodies, emergencies, and rights change across thresholds. The design challenge is to make those differences legible without turning them into caste.

Movement is one of the City's most revealing moral surfaces because influence often travels before it becomes a formal decision. Side entrances, unmarked waiting rooms, privileged shortcuts, service paths, informal pauses, and late-night exceptions can carry power precisely because their status is uncertain. Spatial order makes consequential movement interpretable through declared routes, access purposes, threshold memory, and review. It does so without turning ordinary walking, care, rest, or staff life into performance.

Legibility is also a form of mercy. Participants under record, staff under operational pressure, visitors under uncertainty, disabled people navigating stress, critics arriving to inspect, families approaching protected boundaries, and emergency responders entering crisis all need the City to explain itself through space. Confusion transfers burden to the person with less power, familiarity, time, mobility, language access, or emotional reserve.

Legibility must be multimodal. A coherent plan, distinctive landmarks, consistent naming, tactile and audible cues, readable signs, and staff who can give reliable directions reduce the cognitive burden of navigation. These supports are especially important under stress, disability, unfamiliarity, language difference, or emergency conditions. Wayfinding succeeds when the environment carries part of the reasoning load instead of treating confusion as a personal failure (Lynch, 1960; Arthur and Passini, 1992; Jamshidi et al., 2020).

Sensory atmosphere must be governed with the same seriousness. Light, sound, materials, scale, texture, temperature, glare, echo, crowding, and refuge shape the body before the mind has time to argue. A building that is overlit may turn accountability into interrogation. A building that echoes may make deliberation feel like exposure. A building that resembles a detention facility may tell the nervous system that the Vow is captivity even when the law says it is voluntary.

The chapter rejects both fortress and shrine by offering a stronger positive standard: civic gravity without fear. Protection can be calm, boundaries can be legible, public edges can be welcoming, and protected rooms can remain accountable through declared purpose and review. Beauty, modesty, and ordinary scale help the City communicate that authority is a temporary human responsibility rather than a sacred possession.

Spatial order also determines whether record disciplines can function. Recordability is not merely a device problem; it is a property of rooms, thresholds, routes, acoustics, sight lines, access states, and exception handling. A well-designed threshold clarifies who entered, under which role, with what privacy condition, and where responsibility moved. Spatial clarity lowers the technical and human burden of later interpretation.

The spatial charter must survive several kinds of scrutiny at once. Architects and planners test buildability and operation. Civil-liberties reviewers ask whether visibility rises toward consequential power instead of falling on ordinary life. Disability experts examine access, sensory load, communication, refuge, and emergency movement as foundations. Labor, security,

public-administration, and host-community reviewers test whether maintenance, inspection, protest, visitation, and crisis can be handled without making the campus punitive, exclusionary, or dependent on hidden work.

The governing answer is a spatial charter. It does not choose exact dimensions, materials, vendors, jurisdiction, or professional drawings. Those remain for expert design, legal review, host negotiation, safety and accessibility review, budget discipline, and later pilot gates. The charter supplies the burden grammar any credible plan must satisfy: who carries visibility, who is protected from collateral exposure, how movement can be reconstructed, how staff labor is dignified, and how an affected person can understand and challenge the place.

The chapter advances through six linked design problems. Architecture first becomes practical constitutional meaning by assigning access, shielding, burden, recordability, and civic tone. Visibility gradients distinguish public, participant, staff, protected, emergency, and oversight bands without converting them into rank. Thresholds and corridors become anti-shadow infrastructure; wayfinding becomes civic clarity; light, sound, materials, and refuge become human-load architecture; and the final movement asks how gravity can be created through competence and care rather than fear, shrine logic, or luxury enclosure.

Five linked checks organize the analysis: burden placement, access clarity, dignity shielding, record trust, and reachable repair. The checks restrain aesthetic enthusiasm. Access without shielding becomes exposure. Shielding without recordability

becomes hidden power. Recordability without sensory sustainability becomes strain. Repair that cannot be found or requested is only a promise.

The chapter prepares every inhabited system that follows. Residential quarters, study precincts, deliberative halls, commons, recovery zones, archive interfaces, service routes, capture infrastructure, accessibility systems, and maintenance disciplines all depend on this grammar. Weak spatial order later demands more rules, staff, surveillance, exceptions, and apology. Strong spatial order reduces that compensatory machinery because the building already carries part of the burden honestly.

A place designed to expose hidden public power can hide power in its own walls. Chapter 6 teaches the reader to inspect doors, bands, corridors, signs, light, sound, scale, and refuge as practical distributions of fairness. Trust begins only when the form can be read, challenged, repaired, and refused without making ordinary people transparent.

6.1 — Architecture as Constitutional Meaning

Architecture acquires constitutional meaning in the City because it gives practical force to values before anyone reads a rule. A door decides whether a person has to announce themselves. A hallway can expose staff influence or hide it. A room can protect bodily dignity or turn private need into public display. A path can help a visitor understand their status or carry them into a context where their presence changes another person's burden. The built form is therefore reviewed as a distribution of rights, responsibilities, and foreseeable consequences.

Architecture does not replace law. Its narrower power is practical: built form can make rights usable or exhausting, public access meaningful or theatrical, protected life secure or trapped, staff work visible or hidden, and emergency response possible or delayed. Constitutional and legal authority remain where law places them; the spatial question is whether the room, route, or threshold helps people exercise those rights in practice.

In a conventional institution, bad spatial design may be an inconvenience. In the Transparent City, bad spatial design can corrupt the record. If a protected room is poorly placed, it may become a hidden influence channel. If a public edge is too porous, public access may become intimidation. If service routes are invisible, labor burden disappears. If the archive path is obscure, oversight becomes dependent on insiders. Space shapes not only movement, but trust (Lefebvre, 1991; Hillier and Hanson, 1984; Markus, 1993; Dovey, 1999).

Architecture's institutional significance can be tested through five linked questions: where burden is placed, how access becomes legible, how dignity is shielded, how record integrity is supported, and how repair can be reached. Neglecting any one of them can leave the City visually organized while practical power remains unfairly distributed. The relevant object is not scenery but the pattern of usable rights and obligations created by space.

The spatial accountability test converts those questions into a working standard. No major room, route, threshold, or access band should be approved until its burden, access, shielding, recordability, and civic tone can be described in ordinary language, assigned to responsible owners, and tested after occupation. A design team that cannot explain those effects has not yet explained the institution it is building.

The professional version of this claim is not mystical. It asks designers, lawyers, operators, disability reviewers, civil-liberties reviewers, clinicians, archivists, security staff, and public representatives to read the same plan from different burden angles. A corridor is an access question for one expert, a record question for another, a security question for another, a fatigue question for another, and a dignity question for the person who must walk it under pressure.

The section therefore treats architecture as a pre-legal condition for usable rights. A right to complain means less if the complaint room is hidden behind an intimidating checkpoint. A right to public inspection means less if the public path is confusing, humiliating, or available only to those who already know the campus. A right to protected nonvisibility means less if the

protected space sits beside an obvious camera line, a public queue, or a staff route where incidental exposure is inevitable.

The burden-route-review triangle offers a compact professional check. Burden asks who pays for the spatial choice. Route asks how people, records, support, protest, emergency care, supplies, and oversight actually move. Review asks who can test whether the first two answers remain true after opening. Together they prevent plan approval from being mistaken for moral completion.

This triangle should travel from concept sketches to post-occupancy audits. Early plans can show intended burden placement. Construction documents can show route and access logic. Opening reviews can test whether the built result matches the claim. Annual reviews can ask whether informal habit has changed the building. The City's spatial order should be governed as a living public instrument, not frozen as architectural intent.

The spatial order must also avoid a hidden professional caste. Architects, planners, security experts, accessibility reviewers, lawyers, clinicians, archivists, and operators each see part of the truth. None should be allowed to make the whole space serve one discipline alone. Security without dignity becomes fortress. Accessibility without record logic may miss influence routes. Record logic without trauma awareness becomes harsh. Beauty without labor review becomes prestige. The City needs coordinated review because burden crosses professional boundaries.

A spatial decision register should preserve the reasons for major choices. This register would record why a major spatial choice

was made, which burdens it was expected to move, which groups were consulted, which alternatives were rejected, which risks remain, and when the choice will be reviewed. It would not be a public decoration. It would be institutional memory against amnesia, allowing later operators to know whether a wall, door, route, material, or threshold is still doing the ethical work it was built to do.

Such a register keeps architecture from becoming frozen charisma. Buildings often outlive the arguments that justified them. When those arguments disappear, staff improvise and later leaders mythologize. A spatial decision register lets the City admit that design is provisional. If the burden has moved, the record should say so. If the form no longer serves the burden, the City should be able to repair the form without pretending the original plan was sacred.

Every design choice has both symbolic and operating meaning. Symbolic meaning concerns what the building appears to say; operating meaning concerns what it makes easy, difficult, visible, shielded, reviewable, or delayed. Operating meaning governs in the City. A beautiful symbol that weakens access, privacy, record integrity, maintenance, or repair fails as civic architecture, however impressive its image.

Every design stage should include a user-burden walkthrough. Designers should walk the plan as a participant, staff member, disabled visitor, critic, journalist, family member, clinician, auditor, maintenance worker, emergency responder, host resident, and ordinary citizen. The exercise is not theatrical

empathy. It is practical risk discovery. Each user reveals a different way the same wall can move burden.

A walkthrough is an early conflict detector, not an approval ritual. The shortest emergency route may disrupt protected dignity; the clearest public route may increase participant exposure; the warmest material may raise maintenance cost; and the most secure entrance may frighten ordinary visitors. Design improves when those conflicts are named, assigned, tested, and revised before construction hardens them into routine.

This is why the chapter uses the language of constitutional meaning carefully. The design is not law, but it can make law easier or harder to live. If the built form routinely frustrates a right, forces a workaround, or hides an exception, the legal rule will be blamed for a spatial failure. The City's architecture must therefore be humble enough to support law rather than pretend to embody it fully.

6.1.1 — Space Assigns Burden

Space assigns burden because every built path asks someone to carry a cost. A long route may burden a disabled visitor. A narrow hallway may burden emergency response. A dramatic public plaza may burden participants with spectacle. A hidden staff route may burden workers by making their labor invisible. The City cannot treat these consequences as neutral byproducts of design. They are part of the institution's public burden record.

A burden map should accompany every major spatial proposal. It should ask who walks farther, who waits longer, who is seen more, who can avoid being seen, who must pass through security,

who receives help, who can complain, who cleans, who repairs, who absorbs noise, and who bears failure. Without this map, beautiful architecture can become a moral disguise.

A governing distribution rule follows: burdens created by public-power formation should fall first on the institution and on adults who voluntarily carry the Transparent Vow, not by accident on ordinary citizens, children, families, staff, or host neighbors. Staff still carry real work and risk, but those burdens must be recognized, limited, compensated, resourced, and reviewable rather than hidden behind participant visibility.

The first burden is time. A distant complaint office, a long security queue, an elevator that routinely fails, or an inaccessible route converts minutes and uncertainty into unequal access. Spatial review should therefore count waiting, detours, repeated explanations, and failed trips as institutional burdens rather than personal inconvenience.

The second burden is attention. People under active record already manage unusual visibility, while staff, visitors, families, critics, and affected people may need to navigate rules they did not design. A fair spatial order does not make each person continuously calculate whether a door, camera, hallway, or pause will be misread.

For later architectural teams, the burden map should become a required design artifact at schematic design, design development, construction documents, post-occupancy review, and replication review. If the map changes, the ethical review changes with it. A corridor widened for visitor flow, a room relocated for efficiency,

or a facade altered for beauty can all shift burden in ways that require renewed review.

The burden analysis should identify decision owners and repair routes. When a queue, corridor, room assignment, checkpoint, or schedule produces recurring harm, the affected person needs more than a general complaint address. The City should name who can change the design, what evidence triggers review, how interim relief works, and when the correction is checked again.

This burden statement should be tested under ordinary days and stress days. A calm tour will not reveal what happens during protest, medical emergency, media pressure, staff shortage, power outage, or participant breakdown. The City is unfair if its design works only when the world behaves gently. The built environment must be read under pressure because public power is most dangerous when pressure arrives.

The spatial burden statement should also include a maintenance future. A beautiful decision may be fair on opening day and unfair ten years later if it requires rare parts, specialized labor, inaccessible repair, constant staff workaround, or expensive replacement that later leaders will quietly defer. The spatial charter cannot stop counting at the first impression. It asks who inherits the worn hinge, the failed lift, the confusing sign, the glare added by a new screen, and the corridor that becomes too narrow after use patterns change.

6.1.2 — Space Creates Access

Access is not only permission. It is the practical ability to reach a person, room, record, complaint route, public interface, or

emergency help under defined conditions. A rule may say that citizens can ask questions, but if the public interface is confusing, inaccessible, intimidating, or buried behind status rituals, access has not truly been created. The City's architecture must make lawful access real.

Public-power formation depends on controlled access because both overaccess and underaccess corrupt the institution. Overaccess can become harassment, crowd capture, or spectacle. Underaccess can become secrecy, elite insulation, or unchallengeable authority. The City must build access that is bounded enough to protect dignity and open enough to make power answerable.

The access map should distinguish role and purpose. A citizen seeking a public record bundle does not require the same route as a clinician, an auditor, a family member, a staff operator, an emergency responder, or a participant returning from an external corridor. When roles are spatially confused, people either receive too much access or too little. Both errors move burden unfairly.

Access becomes real only when the route is usable. Formal permission means little if a person cannot find the entrance, reach it safely, afford the trip, endure the wait, use the interface, communicate a need, or obtain accommodation. Spatial access must therefore be evaluated through complete tasks rather than door width or policy text alone.

Access also creates influence. The person who can reach a participant repeatedly may shape public-power formation. The donor who can enter through a side room may become a hidden

actor. The volunteer who can bypass queue discipline may become informal staff. The architecture must treat repeated access as a source of power, not as a convenience.

A fair access system does not simply ask who may enter. It asks who can reach whom, how often, by what path, under what record status, with what explanation, and with what remedy if access is misused. The City's walls and doors must answer those questions before public trust can.

Privileged convenience exposes failure. When powerful, famous, wealthy, or socially fluent visitors find private routes while ordinary citizens face queues and confusion, the architecture has created hierarchy. The City must make access disciplined enough that influence cannot hide as hospitality.

Access must be differentiated without becoming exclusionary in spirit. Some rooms should be public, some participant-only, some staff-only, some professional, some protected, some emergency-only, and some oversight-accessible. The ethical question is whether each restriction has a reason that can be stated, logged, reviewed, and challenged where appropriate. An unexplained locked door teaches hierarchy. A reasoned threshold teaches burden.

Access should be evaluated as a sequence rather than a door. Arrival, identification, waiting, explanation, movement, encounter, record, support, complaint, and exit form one continuous burden path. A person who can enter but cannot orient, communicate, rest, understand a status, or leave independently does not yet have meaningful access. User testing

should follow the entire route and reverse design choices that fail it.

6.1.3 — Space Creates Shielding

Shielding is not secrecy. Shielding is the spatial protection of dignity, care, lawful counsel, nonparticipants, staff boundaries, and vulnerable moments from the wrong kind of visibility. The Transparent Vow requires full active-period record, but the City cannot confuse record with indiscriminate exposure. Space must help maintain that distinction.

The strongest shielding rule is that protection cannot become a hidden channel for active public-power conduct. Legal counsel, clinical care, family contact, and protected recovery need real privacy. Strategy, donor influence, party direction, staff manipulation, and consequential deliberation need the governed record. Declared purpose, access control, transition logs, independent review, and correction keep those functions separate without dissolving either privacy or answerability.

Shielding also protects people who did not choose the City. Visitors, children, household members, clinicians, lawyers, clergy, emergency responders, critics, and host-community members may need to move near the City without becoming part of participant exposure. Architecture should let them pass, consult, complain, work, or receive help without being absorbed into the participant's record burden.

Legible shielding tells people why a space is protected, who may enter, and how its boundary can be challenged. A shielding audit records the purpose, protected class, access rule, necessary

logging, responsible reviewer, and review date. Public explanation describes the category at a safe level; it does not expose the person, visit, or content being protected. Medical confidentiality, legal counsel, family life, staff privacy, and security restrictions retain their distinct rules. This lets the City explain a boundary without making privacy depend on public access to what lies behind it.

The most difficult shielding decisions will involve mixed spaces where public-power formation, staff support, clinical care, family contact, and record obligations sit near one another. These interfaces require professional review before they require aesthetic judgment. Shielding that is too weak exposes the wrong people. Shielding that is too broad hides consequential influence. The City's burden is to make the boundary as narrow, visible, and reviewable as dignity allows.

Shielding must remain reviewable and correctable without becoming publicly penetrable. If a protected boundary is alleged to hide improper influence, the review route should already exist. An authorized reviewer can inspect access logs, purpose classifications, time windows, custodial decisions, and the basis for nonrelease without exposing the protected content itself. That arrangement distinguishes dignity from opacity and gives both claims a lawful test.

6.1.4 — Space Creates Recordability

Recordability is a spatial condition before it is a technical one. A camera, sensor, log, or archive protocol cannot compensate for a room placed in the wrong relation to a threshold. If movement is

unclear, status becomes unclear. If status is unclear, the record becomes interpretable only by insiders. If insiders alone can explain the record, public trust weakens.

Honest recordability must be designed into the room. A deliberation hall should make participants, advisers, materials, and public-purpose activity legible; a drafting room should preserve revision without turning every rough thought into spectacle; a staff route should reveal role-relevant influence without exposing private life; and a protected zone should declare its category without revealing protected contents.

This does not mean every space becomes constantly public. Recordability means the City can later explain what kind of space a person was in, what status applied, who had access, what was protected, what was released, and what review exists. The public does not need raw exposure to understand status. It needs trustworthy classification and context.

Spatial recordability also helps prevent false accusation. When paths and rooms are legible, a participant is less likely to be accused of secret conduct because the environment can show lawful protected handling, emergency status, staff access, or public-interface closure. Clear space protects both the public and the person under burden.

Public memory fails when interpretation depends on insiders. When a future reviewer can understand a record only because someone from the institution privately explains how a room or route works, spatial design has failed public memory. The City must make meaning legible beyond the people who built it.

Recordability has a precise architectural limit. Space can clarify context, access, status, custody, and the conditions under which an event occurred; it cannot reveal motive, wisdom, honesty, conscience, or moral worth. A clear room may improve the evidentiary record while leaving interpretation uncertain. The City's design language should therefore encourage careful reconstruction rather than confidence that the built environment has captured the whole person.

Recordability should be designed into rooms and routes rather than attached later by devices. A deliberation room needs clear entry states, interpretable seating, stable audio, visible document surfaces, secure equipment, contextual labels, and defined privacy exceptions. A protected room needs equally clear purpose, access, transition, and oversight rules. The architecture should make the correct record state easier to follow than an improvised exception.

The recordability standard must distinguish reconstruction from constant technological appetite. More capture is not automatically better capture. Poorly placed cameras, microphones, sensors, or logs can create noise, expose the wrong people, invite abuse, or make users perform for the apparatus. A recordable space is one where the right event can be reconstructed with integrity, not one where every human movement is devoured by machines.

Recordability also requires human interpretability. A technically captured event may still be useless if the room context is unclear, if sight lines distort who was present, if microphones cannot separate voices, if access metadata is missing, or if later viewers cannot tell whether a silence was choice, intimidation, technical

failure, or protected withholding. Spatial design should therefore produce records that can be read responsibly, not merely data that can be stored.

6.1.5 — Space Teaches Civic Tone

Every institution teaches through atmosphere before it teaches through curriculum. A courthouse, school, hospital, airport, prison, shrine, luxury hotel, and civic plaza each instruct the body differently. The Transparent City must know what it teaches by scale, material, path, light, sound, waiting, entry, and public edge. The first lesson of the City should be seriousness without fear.

Materials, proportions, thresholds, and public edges should therefore avoid both intimidation and flattery. A calm entrance may do more civic work than a monumental gate. A modest deliberation hall may teach better public reason than a grand chamber. A warm staff area may reveal the City's ethics more deeply than a spectacular public facade.

A civic-tone review should involve participants, staff, disability reviewers, critics, host-community representatives, and ordinary visitors, not only architects and donors. Each group should be asked what the place teaches the body about power. If the answers include fear, reverence, elite comfort, confusion, or performance, the tone needs correction.

The tone review should continue after occupancy because buildings change through use. A room intended as calm may become intimidating when security gathers there. A public edge intended as welcoming may become fan culture during high

attention. The City should treat atmosphere as something maintained, not merely designed once.

Civic tone is not decoration because institutions teach people how to behave before they issue instructions. A cramped waiting room teaches scarcity. A theatrical hall teaches performance. A marble entrance can teach distance. A hidden staff door can teach invisibility. A warm, clear, durable, modest room can teach that public power is serious work carried by human beings under review.

Tone must also be resistant to drift. A room that begins as solemn can become ceremonial, then reverent, then untouchable. A security station that begins as practical can become aggressive. A public edge that begins as open can become branded, crowded, or fan-like. The City should review tone after use because buildings acquire social meanings through habit, not only through design. Symbolic meaning becomes operational through who can see, enter, wait, withdraw, and remain unseen. Post-occupancy review should compare intended tone with actual use and remove ceremonial cues that begin functioning as status markers.

6.2 — Visibility Gradients and Access Bands

Transparency in the City is differentiated by purpose. The active-period record does not make every place equally public, every moment equally releasable, or every nearby person equally visible. Gradients let the institution distinguish public explanation from participant work, staff function from whole-life exposure, protected care from off-record influence, emergency movement from permanent exception, and oversight access from prestige. Fairness here depends on distinctions that can be understood, challenged, and audited.

A visibility gradient is the relationship between public-power relevance and exposure risk. Visibility should increase where public-power formation, influence, reasoning, access, or official continuity is at stake. Visibility should decrease where dignity, care, legal counsel, nonparticipant status, bodily vulnerability, staff privacy, or emergency protection is at stake. This is not a compromise with secrecy. It is the structure that keeps visibility fair.

Visibility bands are not labels pasted onto rooms. They are operational regimes that govern purpose, eligible users, capture status, access, release, escort, emergency override, retention, correction, and review. A band that cannot explain those elements is a color on a diagram, not a safeguard.

The central rule is that bands must be clear enough to prevent accidental breach and flexible enough to respond to real life. If bands are too rigid, care fails. If they are too vague, secrecy returns. If they are too public, dignity collapses. If they are too

hidden, trust collapses. The City must design bands as living boundaries with labels, access rules, logs, complaint routes, and review.

A second working standard is the gradient rule: visibility should rise with public-power relevance and fall with dignity vulnerability, nonparticipant status, care need, and voyeuristic demand. The bands exist to make that rule usable in space rather than merely admirable in principle.

Access bands should be drawn before beauty is optimized. If bands are drawn late, the building will already have taught the wrong habits: casual shortcutting, staff invisibility, visitor drift, public crowding, or protected spaces that function only because everyone promises to behave. Spatial order should carry foreseeable burden openly instead of depending on private virtue.

Visibility bands answer the most immediate hostile misreading of transparency. The City is not one glass plane in which everyone is visible to everyone else. Privacy, dependence, professional duty, intimacy, incidental presence, and ordinary citizenship increase the duty to shield; a consequential and voluntarily chosen public-power role may increase the duty of legibility, record, and review. The bands separate those duties without turning them into human rank.

The access-band system should be written as an operating charter before any permanent floor plan is approved. Each band should identify ordinary users, lawful visitors, prohibited users, record expectations, release rules, emergency override, oversight route, complaint route, and review clock. Without those elements, a

band is only a colored area on a plan. With them, it becomes a civic boundary people can understand and contest.

Band changes should be rare, documented, and publicly explainable at the right level. If a protected zone quietly expands, the City may be hiding influence. If a public zone quietly expands, the City may be exposing the wrong people. If a staff zone shrinks, labor may be absorbing institutional growth. If an emergency route becomes routine, crisis logic may be normalizing itself. The band map is therefore a governance object, not only an architectural diagram.

The band system should also include an anti-status sentence wherever it is publicly displayed. Public, participant, staff, protected, emergency, and oversight bands do not measure human worth. They measure role, purpose, risk, and duty inside a bounded institution. This matters because people will be tempted to read spatial access as rank. The City must refuse that reading before social habit creates it.

The band map should be readable at three levels: public explanation, operational detail, and protected oversight. The public level tells citizens why different zones exist. The operational level tells staff how access works. The protected oversight level allows reviewers to examine disputed boundaries without exposing protected content. Separating those levels prevents both overexposure and empty reassurance.

Access bands should also be stress-tested against social power. Donors, famous visitors, former officials, founders, media figures, party leaders, relatives, experts, and charismatic

participants may create pressure to bend the map. A fair band system works precisely when a socially powerful person wants an exception. If the building quietly privileges informal status, the City will rebuild the hidden pipeline it was meant to interrupt.

Visibility gradients should guide behavior without branding people. A protected boundary signals a rule, not fragility. A staff boundary marks role and safety, not inferiority. A participant boundary indicates the scope of a chosen public burden, not exhibition. Consistent cues, equivalent routes, accessible explanations, and discreet review points can organize different responsibilities without turning spatial difference into human hierarchy.

Band transitions should include pause points where people can confirm consent, ask questions, adjust support, or refuse entry. A threshold crossed too quickly can become accidental consent. A threshold crossed under crowd pressure can become coerced movement. The City should use small spatial pauses to let people understand what changes before the change happens.

The public version of the band system should be teachable in minutes. If the basic logic cannot be explained to a visitor before a tour, the logic is too obscure. The City can contain complex rules behind the scenes, but its public ethic should be simple: public power becomes more legible, ordinary and collateral life becomes more protected, and every boundary has a reason that can be reviewed.

Band audits should include people who dislike the City. Friendly reviewers may accept explanations too quickly. Skeptics will ask

whether protected bands hide favoritism, whether participant bands become punishment, whether staff bands conceal labor, and whether public bands perform openness. Their questions should be welcomed because band legitimacy depends on surviving suspicious reading.

6.2.1 — Public Band

The public band is the part of the City where citizens, visitors, critics, educators, journalists, and lawful public participants may approach the institution without entering active participant life. It should be visible, legible, accessible, and bounded. Its purpose is not to create a viewing platform over human formation. Its purpose is to make the City understandable and answerable.

A fair public band includes orientation spaces, public learning interfaces, record-site access points, complaint routes, visitor reception, exhibit-like explanations of rules, and places where citizens can ask questions without becoming surveillance subjects. It should teach people how to read the City's boundaries before they encounter participants, records, or protected zones.

Spectacle is the central risk at the public boundary. Balconies or tours that turn participants into performers confuse public understanding with appetite. Access should be organized around explanation, context, accountable observation, and the right to leave. The public may inspect an institution without consuming the people inside it.

The public band begins with accessibility. Citizens should not need elite fluency, technical knowledge, physical ease, wealth, or insider status to understand how the City works. Clear signs,

translation, disability access, plain-language explanations, quiet options, and staffed guidance turn approach into usable civic access rather than symbolic openness.

A public-band audit should track how a first-time visitor learns the City's purpose, boundaries, complaint routes, public record interface, and nonparticipant protections. The audit should include visitors who are skeptical, disabled, linguistically diverse, anxious, elderly, young adults, and unfamiliar with civic institutions.

A skeptical citizen should leave better informed without feeling recruited. An interface that produces admiration too quickly shortens the distance between curiosity and allegiance. The stronger design invites understanding, criticism, complaint, and return while preserving the visitor's freedom not to belong.

Informed approach, not passive viewing, defines the public band's purpose. Citizens should know what they may do there: learn, inspect, request records, attend public explanations, file complaints, observe designated proceedings, ask questions through lawful channels, protest in appropriate places, and leave without being enrolled in anything. Access becomes symbolic when it is too thin and coercive when it reaches too far behind protected boundaries. The design must make both errors visible and correctable.

This band should be tested against four forms of capture: spectacle capture by crowds and media, security capture by overguarding, donor capture by prestige entrances, and insider capture by social codes only supporters understand. The public

band succeeds when a skeptical ordinary person can enter, understand the rules, find the record route, see where criticism belongs, and exit with dignity.

Explanation keeps curiosity from hardening into appetite. Before asking for more exposure, visitors should understand the difference between public record, protected nonvisibility, participant burden, staff dignity, and ordinary privacy. An interface that merely invites viewing can produce a crowd that treats exposure as entitlement. An interface that teaches burden can instead help citizens understand why some matters must be visible and why others must remain shielded.

6.2.2 — Participant Band

The participant band is where active public-power formation occurs. It includes learning, deliberation, drafting, daily rhythm, mentoring, public-interface preparation, and role-specific formation under the Transparent Vow. This band carries the strongest record burden because participants have voluntarily accepted the active role. It is also where dignity must be most carefully preserved because the burden is continuous.

Life in the participant band cannot be organized as a fishbowl. Active record obligations coexist with study, work, rest, correction, disagreement, ordinary movement, and norms against performance. Constant staging teaches participants to perform, while convenient disappearance weakens the Vow. The architecture must hold the narrow middle in which accountability remains real and ordinary life remains possible.

Access to the participant band should be role-bound. Educators, mentors, staff, clinicians, auditors, security, and authorized visitors may need entry for defined purposes. Donors, fans, partisan actors, curious visitors, and unbounded media should not receive access simply because participants are public-power seekers. The City must treat access to participants as influence, not hospitality.

Participant space should avoid the illusion that chosen record burden abolishes dignity. Bedrooms, bathrooms, care areas, recovery rooms, intimate consultation, family contact, and protected de-loading require differentiated treatment. The Vow governs public-power formation, not the conversion of a person's entire body and every relationship into public material.

The participant band is the operational center of the active Vow, not the center of human worth. It supports chosen formation toward public responsibility. Spatial seriousness may reinforce that role, but it may never make participants sacred, superior, or objects of civic devotion.

Heightened burden under the Vow does not create unlimited public curiosity. Participants accept accountability connected to public-power formation, not the surrender of every dignity boundary to spectatorship. The band must support education, deliberation, work, correction, record, and review while routing health, intimacy, family, professional counsel, and recovery through protected interfaces. Accountability is strongest when its purpose is precise enough to stop at the edge of private life.

Because participants are under unusual pressure, this band also needs anti-performance design. A room that constantly invites being watched may teach acting. A hallway that feels like a stage may reward persona. Participant spaces should support honest work under record, not continuous self-display. The design question is whether the participant can think, learn, revise, apologize, and fail without turning every movement into a campaign image.

Staff space must reflect role visibility without demanding whole-life visibility. Educators, clinicians, maintenance workers, security staff, food workers, technicians, and administrators carry different operational duties. Their routes and work records may need review, but their private lives do not become extensions of the participant record.

6.2.3 — Staff Band

The staff band protects the people who make the City work. It includes operations, teaching preparation, moderation, food service, cleaning, maintenance, archive administration, security coordination, technical support, staff rest, and complaint channels. Staff need visibility where their role influences participants or public records. They also need privacy, recovery, and professional boundaries. Their employment duties differ from the participant's active-role record obligation; neither status authorizes full-life surveillance.

A staff band that is too hidden will recreate invisible labor. A staff band that is too exposed will turn workers into auxiliary participants without consent. The City must design role-bound

staff visibility. Material influence, safety decisions, access control, records handling, and participant-facing advice may need traceability. Off-duty life, ordinary bodily needs, private relationships, and rest do not become public simply because a person works in the City.

Staff movement deserves the same design dignity as participant and public routes. Service corridors, break rooms, maintenance access, changing space, rest areas, and staff entrances should be safe, direct, legible, ventilated, accessible, and free of symbolic inferiority. When public-facing beauty depends on cramped back routes, concealed exhaustion, or humiliating entry, the architecture has shifted burden downward. A staff route is successful when it supports work without making workers disappear.

Staff complaint and appeal must not depend on the authority being challenged. Record misuse, overexposure, misconduct, donor pressure, security excess, or unsafe load can remain invisible when reporting requires permission from the problem's owner. Location, confidentiality, language access, and independent escalation determine whether a channel works.

Separation among staff roles matters. Clinicians, educators, security, archivists, operators, maintenance workers, and mentors should not all share the same informal channel into participant life. Role separation prevents one staff ecology from becoming a hidden government inside the City. Architecture can support that separation by giving roles distinct but connected zones.

A staff-band audit should ask whether staff can move efficiently, rest safely, complain independently, perform role duties, protect privacy, and remain visible where influence matters. The staff band should be reviewed with staff themselves, because architects and participants may not notice the burdens staff carry every hour.

Workers who make the City possible cannot be treated as background machinery. They need privacy, rest, complaint routes, secure work areas, professional boundaries, and protection from being used as unrecorded influence channels. Role records may make consequential work visible, but they may not absorb the worker's whole life. Dignified staff space and bounded role transparency must advance together.

A weak staff band will corrupt the City quickly. If staff must improvise routes, hide exhaustion, absorb public anger, carry participant distress without support, or use informal access because formal access is unworkable, hidden burden returns through labor. The staff band should therefore be audited for workload, travel distance, exposure, rest, safety, influence risk, and ability to refuse improper requests.

Staff areas deserve the same design seriousness as participant areas. Workrooms, lockers, rest spaces, kitchens, control rooms, archive stations, security posts, clinical support areas, and maintenance shops cannot be leftovers after the public and ceremonial plan is complete. Workers will quickly discover whether the institution's moral vocabulary reaches the people who carry its operation. Hidden inconvenience is already a form of burden transfer.

6.2.4 — Protected Nonvisibility Band

The protected nonvisibility band holds the City's most delicate distinction: dignity is not secrecy, and record is not public exposure. This band includes spaces for clinical care, legal counsel, crisis de-loading, intimacy and modesty handling, grief, optional worship or reflection, and sensitive third-party protection. It exists because the Transparent Vow cannot be humane without protected domains.

The band must be narrow and named. If protected nonvisibility becomes a general private zone inside active life, the Vow is weakened. If it disappears, the City becomes cruel. The architecture must therefore make the protected purpose explicit enough for review while protecting the contents from voyeuristic demand.

Access controls for this band should be unusually precise. Entry should be limited to role, need, and lawful purpose. Logs should identify category without exposing content. Oversight should be possible without turning clinical, legal, intimate, or crisis material into public material. The City must be able to say what kind of protection occurred without exposing what the protection was for.

The band also protects nonparticipants who enter the City for limited reasons. A child, partner, family member, clinician, lawyer, clergy member, emergency responder, or affected person may need shielded movement. The architecture must prevent their path from becoming participant record exposure. Proximity is not consent.

A protected-band audit should separate category, content, access, review, and public explanation. The public may need to know that clinical protection, counsel protection, crisis protection, or nonparticipant shielding occurred. It does not need raw contents. This distinction should be built into the spatial and record systems together.

The protected band should also include appeal and challenge pathways. Participants and affected persons need a way to contest underprotection, overprotection, mistaken categorization, or delayed release decisions. Protection without remedy becomes discretionary power, even when the original intention is humane.

The protected nonvisibility band demonstrates that an answerable institution can become skilled at restraint. It protects categories that public exposure would damage: children, dependents, intimate life, medical care, legal counsel, clinical support, family contact, staff dignity, and safety-sensitive interaction. Protection is lawful, reviewable, purpose-limited, and separated from influence over public power. The band therefore answers the surveillance criticism through competent boundary design rather than a general promise of discretion.

This band should be physically humble. If it looks like a secret wing, it will invite suspicion. If it is too exposed, it will betray its purpose. The right design makes the existence of protection understandable without making protected content available. The public should know that the band exists, why it exists, who governs it, how abuse is challenged, and why dignity requires limits.

The protected band should be designed for category clarity. Medical shielding is not the same as legal confidentiality, family protection, child protection, intimate dignity, staff complaint, or security-sensitive nonrelease. The building should not collapse these into one vague private zone. Vague privacy invites both suspicion and misuse. Category clarity allows the City to explain limits without overexposing the person the limit exists to protect.

6.2.5 — Emergency Band

The emergency band exists because life, safety, and continuity sometimes require movement that ordinary bands cannot handle. Fire, medical crisis, security incident, family emergency, technical failure, weather event, threat, or evacuation may require rapid crossing, temporary confidentiality, specialized access, and altered record handling. A City without emergency bands is not humane. A City with ungoverned emergency bands is not trustworthy.

Emergency access must be designed before emergency arrives. Routes should be clear, accessible, redundant, and legible to responders who may not know the City's internal culture. Protected nonvisibility rules, participant status, staff roles, public access, and archive protection all have to survive crisis. Confusion during emergency can become injury.

Emergency routes cannot become permanent licenses for shadow conduct. Every exceptional path needs a declared trigger, a log, review, and a rule for returning to ordinary authority. Some details may require delayed disclosure, but later accountability

should survive wherever law and safety permit. Opacity that outlives the emergency becomes a habit of power.

Emergency design must include nonparticipants from the start. Medical responders, family members, visitors, neighbors, and others who never accepted the Vow need protected routes, minimal capture, clear status, and rapid correction when incidental recording occurs. Life-safety movement can be documented later at the level necessary for review without folding every person in the evacuation path into the participant record.

Crisis design reveals the record system's order: record serves fairness, and fairness serves life. Immediate care comes first. Emergency action must still leave enough trace to prevent necessity from becoming unreviewed authority after the danger passes.

An emergency-band audit should simulate fire, medical crisis, security event, infrastructure failure, severe weather, and family emergency with participants, staff, visitors, disabled users, and outside responders. Emergency design that works only in the planning room will fail when people are frightened.

Emergency design breaks down when improvisation suspends either care or all record discipline. The City should never make responders choose between saving a person and preserving institutional meaning. Emergency bands must make the life-first path obvious and the later-review path possible.

Emergency band design should be integrated with host-community services. Local fire, medical, police, and emergency-management actors must understand where they may enter, what

record status applies, how protected persons are handled, and who communicates after the crisis. The City cannot design emergency routes as if it stands alone.

Pre-design matters because crises punish ambiguity. Fire, medical collapse, violence, natural disaster, cyber-physical failure, protest escalation, severe weather, or infrastructure breakdown cannot wait for ad hoc interpretation of who may cross which boundary. Emergency access must cut across ordinary bands lawfully, remain limited to the event, generate a reviewable trace, and close when the trigger ends. Post-event review then tests whether necessity was used narrowly or became a route for excess.

Emergency design also protects against opportunistic exception. If every crisis creates informal permission for unrecorded movement, the City will learn that emergencies are useful. The emergency band should make lifesaving access fast and exception creep visible. It must allow responders to act without forcing them to become experts in City ideology, while also preventing crisis language from becoming a hidden corridor for power.

Emergency-band planning should include degraded technology. Fire alarms, backup power, access-control failure, communications loss, elevator outage, network interruption, smoke, flooding, or hostile disruption can make normal systems unavailable. The City cannot rely on ideal digital permissions in the moment when bodies need help. Physical cues, mechanical overrides, trained staff, non-digital maps, accessible refuge, and after-action logging must be part of the emergency architecture.

6.2.6 — Oversight Band

The oversight band allows inspection without public overexposure. It gives auditors, ombuds, external reviewers, rights monitors, technical inspectors, safety reviewers, and designated experts the ability to see deeper than the public band while remaining bound by purpose, confidentiality, and review. Without an oversight band, the City either exposes too much to everyone or hides too much from everyone.

Oversight must be spatially protected from both performance and capture. If reviewers are always escorted through curated public paths, inspection becomes theater. If they receive unbounded access without role discipline, oversight becomes voyeurism. The oversight band should let reviewers reach records, spaces, staff, participants, and systems according to defined powers, not according to charm or institutional favor.

The band should include workrooms, secure review stations, interview rooms, protected evidence access, complaint routes, and independent entry where appropriate. These spaces must be close enough to inspect the institution and separate enough to prevent the institution from controlling the reviewer's entire experience.

Oversight access must remain independent enough to inspect the other bands. Auditors, ombuds, accessibility reviewers, labor inspectors, data-protection authorities, fire officials, and other lawful reviewers should not depend on the institution they inspect for selective routes, curated evidence, or supervised

interpretation. The band needs secure access, protected reporting, and a record of obstruction or delay.

The oversight band should include ways for reviewers to hear from people without leadership presence. Participants, staff, visitors, host neighbors, and nonparticipants may speak differently when operators are nearby. Spatial independence can become testimonial independence, which is essential when the institution itself is under review. Protected interview routes should therefore be available without requiring the reviewed office to arrange or witness the contact. Interview scheduling should preserve enough metadata to prove that protected contact occurred while keeping the substance outside the reviewed office until the governing process permits disclosure.

This band must also be protected from becoming a superior caste. Oversight access is for review, not prestige. Inspectors should have enough access to verify claims, test boundaries, examine failures, interview protected persons through lawful safeguards, and see staff conditions. They should not become untouchable insiders whose presence creates a new hidden authority. Oversight itself must be logged, limited, and reviewable. Conflict disclosures and access logs should make the reviewer's own use of privileged space visible to later audit. A reviewer who exceeds the declared purpose should face the same correction and access-restriction mechanisms that govern other privileged users.

Oversight routes should be designed for adversarial inspection, not only cooperative visits. A reviewer may arrive because something has gone wrong, because staff report retaliation, because a participant alleges hidden influence, because a

protected category has been mishandled, or because the public record appears incomplete. The oversight band must function when the institution is embarrassed. If oversight depends on the City's good mood, it is not oversight. Obstruction, delay, or selective routing should itself become a reviewable event rather than disappearing into inspection logistics. Repeated routing delays should be trended across reviews so a pattern of soft obstruction cannot hide behind individually plausible scheduling decisions.

6.3 — Thresholds, Corridors, and Anti-Shadow Circulation

A threshold marks a change in status. It may be a door, gate, vestibule, desk, access check, floor transition, lighting change, acoustic shift, sign, or digital confirmation. In the City, thresholds are civic instruments because they tell people when duties, recording conditions, access rights, or emergency rules change. Participants, staff, visitors, auditors, clinicians, journalists, and responders should encounter the same core clarity: what this boundary means, why it exists, and where to ask, refuse, appeal, or turn back.

Corridors matter because power moves. It does not only sit in chambers. It passes through hallways, side rooms, waiting areas, service routes, elevators, stairwells, vehicle bays, private entrances, and informal meeting places. If the City does not govern circulation, hidden influence will find circulation. Anti-shadow design is not paranoia. It is the recognition that informal movement often shapes public power more quietly than formal rooms.

A threshold is a moment of status change. Before a person crosses, the environment should make purpose, capture, access, conduct, escort, appeal, and exit understandable. The design need not recite a legal code at every doorway, but it must prevent uncertainty from becoming a source of pressure or hidden privilege.

The circulation standard is continuity without captivity. People should be able to move for lawful purpose, care, work, inspection,

emergency, and public access without creating hidden influence or feeling imprisoned by control. The City's paths must protect movement from both chaos and secrecy.

Circulation is where civic architecture most often betrays its principles. A building can have a beautiful public plan and still maintain a hidden social plan through back hallways, private waiting rooms, preferred entrances, unmarked staff corridors, and informal routes known only to insiders. The City must treat those routes as constitutional risk, not operational trivia.

Anti-shadow circulation does not require every movement to become public spectacle. It requires movement to be classed, justified, logged where appropriate, reviewable when consequential, and protected when disclosure would harm dignity or safety. The difference between a hidden route and a protected route is purpose, record, access control, review, and the possibility of challenge.

A circulation review should include at least five maps: ordinary participant movement, staff and service movement, public visitor movement, protected professional movement, and emergency movement. A sixth map should show oversight movement. A seventh should show likely misuse. The misuse map is essential because hidden power does not obey the official route. It looks for overlooked doors, social shortcuts, poorly supervised transition spaces, and plausible excuses.

The misuse map belongs to an adversarial design process. Critics, staff, former public administrators, security specialists, civil-liberties reviewers, disabled users, and people experienced in

institutional manipulation are invited to show how they would bypass, capture, confuse, or weaponize the circulation plan. Their findings become design inputs with owners and closure evidence, not signs of disloyalty. Red-team reading is the cheapest point at which a hidden route can still be corrected before it harms someone.

Circulation rules should remain comprehensible. If a route requires a manual too complicated for ordinary staff to remember, the building will be run by informal knowledge. If exceptions require excessive approval, people will route around them. The City needs enough structure to prevent shadows and enough simplicity that lawful movement remains usable under fatigue.

The circulation system should include a correction path for design-discovered shadows. If staff or participants notice that a corridor has become an informal meeting place, that a door is being used to avoid record, that a service route is being used for social access, or that a waiting area creates pressure, they should have a direct way to report the spatial failure. The remedy may be redesign, signage, access control, staffing, schedule change, or record adjustment.

A mature City treats spatial failure as correctable evidence. When ordinary use reveals a hidden route, confusing threshold, or recurring workaround, the institution records the defect, protects affected people, tests a repair, and preserves the reason for the change. Credibility comes from that demonstrated capacity to correct the building, not from assuming the original plan was complete.

Threshold design should preserve the dignity of refusal. A person should be able to stop before crossing a more burdensome boundary without becoming a spectacle, delaying a crowd, or appearing disloyal. Refusal is meaningful only when the space allows it. A pressured doorway is not a consent architecture.

Corridors should also be designed against social possession. If a corridor becomes known as the route used by founders, donors, party figures, celebrity visitors, senior advisers, or favored participants, it will acquire unofficial meaning. The City must monitor not only physical movement but social reputation attached to movement. A corridor can become a privilege even when its access control is technically equal.

Anti-shadow circulation should include ordinary hospitality without private capture. Visitors need places to wait, ask, eat, rest, and meet staff. Participants need brief conversation without every human interval becoming public theater. Staff need practical flexibility. The design challenge is to create lawful, bounded, record-appropriate human spaces so people are not driven into unofficial ones.

The best corridor system will feel almost boring when it works. People know where to go, know when they have crossed a boundary, know who may accompany them, know how the event is recorded, know where to ask for help, and know how to challenge misuse. Hidden power thrives on drama, mystery, and special access. Fair circulation should be legible enough to deny those pleasures.

6.3.1 — Threshold Clarity

Threshold clarity means that a person can tell when they are crossing into a different status of space. Public to participant, participant to protected, staff to operational, public to oversight, ordinary visitor to record-affected visitor, emergency to crisis route: each transition changes rights, duties, visibility, access, and interpretation. Those changes in spatial status must remain visible.

A clear threshold assigns each person a usable route. Participants receive advance notice before entering public-interface space; visitors encounter unmistakable cues before active formation zones; staff enter protected areas only through role-based access; and auditors reach review rooms without depending on social permission. Signage, lighting, door logic, floor texture, digital prompts, and staffed assistance should make the lawful action the easiest action.

Threshold clarity requires more than signs. Light, floor texture, acoustics, door form, access controls, reception sequence, staff presence, digital status, and orientation may all communicate that a person has crossed into a different regime. The design task is to make status perceptible without making it menacing. A threshold can be serious without being hostile.

Every threshold should also have a remedy logic. If someone crosses by mistake, what happens? If a sign is unclear, who can report it? If a threshold becomes a site of harassment or status display, how is it redesigned? A threshold is not only a boundary. It is a place where the City can learn from confusion.

A threshold audit should ask a simple question: can a person standing at this point say what space begins, what status applies, what rights change, what record condition exists, and whom to ask if confused? If not, the threshold is asking the person to carry a burden the building should carry.

Thresholds should be tested with people who have not read the manual. If they cannot infer the main rule from cues, signs, and staff posture, the threshold is too dependent on prior instruction. Avoiding an accidental breach cannot require doctrinal fluency.

Threshold clarity should include physical, visual, procedural, and emotional cues. A person should know when they have crossed from public to participant space, from participant to protected space, from staff support to public interface, or from ordinary visitor status to a more record-intensive role. Ambiguous thresholds burden the least informed person and benefit the person most comfortable with informal power.

Every major threshold should carry four pieces of information at the right scale: what the boundary is, why it exists, what changes after crossing it, and how to ask for help or review. The answer may be given through architecture, signage, staff orientation, digital confirmation, tactile cue, color discipline, or escort protocol. The method matters less than the result: no one should accidentally become visible, excluded, recorded, or exposed because the threshold was unclear.

Thresholds need institutional memory at the level appropriate to their consequence. A material crossing can be classified as ordinary, protected, escorted, refused, appealed, corrected,

emergency, or exceptional, with purpose, authority, duration, and review captured without exposing unrelated content. That record protects people as well as the institution. It prevents a later reviewer from treating an authorized emergency route as misconduct or a privileged informal route as normal movement.

6.3.2 — Corridor Traceability

Corridor traceability prevents movement from becoming invisible influence. A corridor is not morally minor in a City designed around public-power formation. People meet in corridors. Staff intercept participants in corridors. Visitors ask questions in corridors. Donors may seek informal proximity. Security may redirect people in corridors. Much of institutional power lives in the path between official rooms.

Corridor traceability is spatial metadata, not public footage. The City should be able to identify the corridor class, access authority, applicable record status, and any exception when movement through that threshold later becomes relevant to review.

A fair corridor system reduces side-contact risk. If a participant can be reached casually by people who should have used a formal interface, the corridor has become a political channel. If staff can shape decisions through repeated informal corridor contact without any record of material influence, the corridor has become governance. If media can position themselves at movement chokepoints, the corridor has become spectacle.

Traceability also protects legitimate movement. A participant who uses an emergency route should not automatically be suspected of hiding. A staff member moving through a restricted

corridor should have a role basis. A clinician entering a protected route should have category protection. A traceable corridor system reduces rumor because status can be explained later.

A corridor audit should classify each corridor by role: public, participant, staff, service, protected, emergency, oversight, or mixed-status. Mixed-status corridors require special design because they are where accidental contact, informal influence, and record ambiguity are most likely to appear.

Corridor design should also consider pause points. Benches, alcoves, waiting areas, and transitions can be humane, but they can also become informal meeting sites. The City should intentionally classify where people may pause so rest does not become hidden influence and traceability does not eliminate human interval.

Corridor traceability is not about creating a public map of every private movement. It is about preventing consequential movement from becoming unaccountable. A route used to meet participants, reach deliberation rooms, access archives, approach office interfaces, enter protected bands, or move visitors through the campus should have a class, a purpose, and an audit logic. Otherwise the corridor becomes a political instrument while pretending to be infrastructure.

Traceability should be proportionate. A staff member going to a rest area does not need the same record as an adviser entering a participant deliberation zone. An emergency responder does not need the same preclearance as a recurring visitor. A journalist does not need the same access as an auditor. The City's

circulation record should ask what consequence the movement can have, then apply the least intrusive record sufficient to protect that consequence from shadow.

Traceability should also include the negative record of denied movement. If an adviser, donor, visitor, media representative, staff member, or participant is refused access to a corridor or band, the refusal may matter as much as the entry. Denial records can reveal pressure, patterns, attempted side channels, or discriminatory gatekeeping. Denied movement matters; the record cannot capture only successful entries.

6.3.3 — Anti-Side-Channel Design

A side channel is any path by which influence reaches public-power formation outside the intended structures. It may be a side door, private elevator, unmarked office, donor lounge, informal staff route, unsecured communication corner, or privileged visitor path. Side channels are dangerous because they look like convenience while functioning as hidden power.

The anti-side-channel plan begins from the fact that side channels will be sought. Important people will want informal access. Donors will want private reassurance. Political allies will want quiet strategy. Friends will want exceptions. Staff may create shortcuts to solve daily friction. Participants may seek relief from the burden of formal channels. These pressures are normal. Architecture must not make them easy.

Anti-side-channel design begins with path inventory. Every route to a participant, record space, office interface, protected zone, archive custody point, and staff influence site should be mapped.

If a person can reach a public-power formation site without passing through a role-appropriate threshold, the design should be changed or the route should be formally classified.

This does not mean eliminating all informal life. The City must still allow humane contact, ordinary kindness, staff support, and spontaneous conversation where appropriate. The difference is whether the contact materially affects public-power formation, access, decision, record, or status. Design should make harmless human interval possible while blocking private channels into power.

An anti-side-channel review should test the building like an adversary. How would a donor seek private access? How would a staff member shape a participant without a record? How would a participant create convenience outside the Vow? How would a journalist reach protected material? A design that cannot answer these questions is not ready.

A route called practical only by insiders is a warning. Hidden power often begins as a practical workaround. The City must treat repeated workarounds as evidence that either the formal path is flawed or an illicit path is being normalized.

Temporary arrangements need the same side-channel discipline as permanent routes. Construction detours, event layouts, media days, emergency access, and delegations create improvised paths through which exceptions can become habits. Each temporary route needs an owner, purpose, duration, affected-person review, and closure date.

Side channels are attractive because they feel human. People want the quick word, the private favor, the informal introduction, the hallway correction, the donor walk, the mentor aside, the staff shortcut, the late-night visit, the unrecorded apology, or the unofficial briefing. The City cannot eliminate human texture, but it must prevent consequential influence from hiding inside texture.

Legitimate small channels are necessary; pretending otherwise drives influence underground. Participants may need office hours, counsel, conflict mediation, private support, expert advice, staff clarification, and personal repair. Each channel should be named, bounded, logged when consequential, shielded when dignity requires, and reviewable if abused. Honest alternatives allow friendship, mentorship, counsel, disagreement, and care to continue without letting privilege disguise itself as informality.

Participants and visitors should encounter side-channel rules as protections rather than blanket suspicion. Most conversations are not corrupt, and an institution that treats ordinary human contact as misconduct will produce fear and evasion. The relevant threshold is consequential influence that becomes unavailable to review. Clear channels preserve humane relationships while making it harder for access and privilege to hide inside casual form.

6.3.4 — Service Route Integrity

Service routes are essential. Food, waste, supplies, repairs, cleaning, equipment, medical materials, archive hardware, emergency tools, and maintenance staff all need movement that

does not disrupt participant life or public interface. The danger is that service routes become both invisible labor corridors and unregulated influence paths. Service route integrity protects against both failures.

A dignified service route is not a servant tunnel. It should be safe, accessible, ergonomic, properly lit, climate-controlled, secure, and integrated into staff rights. If the public face of the City is beautiful while service routes are cramped, unsafe, or degrading, the architecture has split its ethics in two. Staff dignity begins in the spaces where staff actually work.

Operationally, service routes must be traceable enough to prevent misuse. Vendors, maintenance teams, deliveries, technical staff, and contractors may need access to sensitive locations. Without logs, supervision, and role limits, operational convenience can become a path into archive systems, participant spaces, or protected areas. The word service cannot hide security risk.

Staff privacy remains firm within service-route visibility. A log may record role, purpose, and movement status without turning the worker into a full-life subject. Visibility stays attached to the public function and ends when that function ends.

A service-route audit should count travel distance, safety, accessibility, ergonomic burden, lighting, privacy, access logs, vendor movement, and exposure to participant spaces. The purpose is to keep service routes functional without making them morally invisible.

The service route should appear in the same moral drawings as public space. If presentations show plazas, halls, and participant

rooms but omit service movement, the design conversation is already hiding labor. The City should make operational burden visible to reviewers without exposing staff private life.

Service routes are often where institutions reveal their true ethics. If maintenance workers, kitchen staff, cleaners, technicians, drivers, security staff, archivists, waste handlers, and emergency crews move through neglected or hidden spaces, the building has placed dignity on the public face and burden in the back. Visible power loses credibility when service labor is made invisible by design.

Service route integrity also protects the record regime. A route created for maintenance can become a route for informal access if it is not governed. A loading dock can become a political entrance. A technical room can become a meeting point. A storage corridor can become a place where cameras, sensors, or documents are bypassed. Service routes need respect, security, and review because operational humility and anti-shadow discipline meet there.

Service route review should include workers' own testimony. Plans can make a service route look efficient while the actual worker experiences heat, noise, danger, isolation, harassment, fatigue, or invisible status. The route may also force staff to pass through participant or public zones in ways that blur boundaries. Service integrity cannot be decided from drawings alone; the workers who carry the carts, tools, food, waste, records, medicine, security duties, and repairs must be heard.

6.3.5 — Visitor Flow Control

Visitors are necessary to the City's legitimacy. Citizens, critics, experts, journalists, inspectors, family members, professionals, volunteers, public officials, and emergency responders may all need to enter under different conditions. Visitor flow control ensures that openness does not become boundary collapse. It is the spatial discipline that lets the City be inspectable without becoming porous.

The first requirement is role clarity. A visitor should know whether they are entering as a citizen learner, a critic, an expert reviewer, a journalist, an affected person, a family member, a vendor, or an emergency responder. These roles have different rights and limits. If the City treats all visitors alike, it will either overexpose protected spaces or block legitimate access.

Flow control should begin before arrival. Appointment systems, visitor notices, route maps, accessibility information, prohibited conduct, record status, nonparticipant protections, and complaint routes should be explained in plain language. Visitors need the rules before arrival, not after they are inside and anxious.

Visitor routes should teach the institution without exploiting proximity. They can reveal public-purpose rooms, current status, complaint access, and the limits of observation while bypassing protected nonvisibility, staff operations, and participant movement that serves no public need. Timed entry, sightline control, acoustic separation, alternative routes, and host-facing wayfinding reduce accidental contact and rumor without converting openness into concealment.

Visitor flow needs exit and confusion discipline. Post-visit records should be limited by role, complaints and corrections should remain available, and media or expert visitors should leave only the review traces their role requires. Visitors must also have a simple way to report unclear boundaries, signage, or record status. Repeated confusion is evidence of spatial failure, not a visitor flaw.

Visitor flow must welcome scrutiny without letting visitors become the City's weather. Too little access makes the City suspicious. Too much unstructured access makes participants perform, staff defend, protected persons hide, host communities absorb crowds, and security overreact. Flow control should make public approach predictable, legible, respectful, and narrow enough to protect the work being inspected.

A visitor system should distinguish learning visits, public tours, expert inspections, media visits, legal visits, family visits, host-community interfaces, protest proximity, donor visits, and emergency access. Each has a different burden profile. The City becomes unfair when all visitors are treated as threats, all visitors are treated as guests, or socially powerful visitors are quietly treated as exceptions.

Visitor-flow control should preserve the right to be unimpressed. A visitor should be able to approach the City as a critic, not only as a learner or admirer. The route should not choreograph emotional conversion. It should show enough to allow informed judgment, explain enough to prevent false inference, protect enough to prevent exposure, and leave enough room for

disagreement that the public edge does not become recruitment by architecture.

The circulation-and-privacy control plan links six layers that are too often separated: role, zone, route, record status, exception, and review. For every consequential threshold, the plan states who may cross, for what purpose, what is captured, which people or information remain protected, what assistance is available, and who reviews an error.

Visitor flow control should prevent both exclusion and uncontrolled access. Arrival slots, queue management, escort rules, accessible routes, protest adjacency, media staging, storage, screening, and departure need enough structure to protect rights without turning every visitor into a suspect. The public edge remains public only when its rules are intelligible and proportionate. Peak-period review should test whether the same route remains accessible and protective when queues, media attention, protest activity, and service traffic rise together.

The plan fails if spectator visibility outruns occupant privacy, if security turns ordinary movement into suspicion, or if accessible circulation is treated as an exception. Its purpose is narrower and harder: make public-power formation legible while leaving ordinary bodies, bystanders, staff, and protected life outside unnecessary exposure. A recurring exception should be treated as evidence that the route design needs revision rather than as proof that users must learn to tolerate ambiguity.

The circulation system also needs an incident-to-redesign route. A missed turn, locked accessible door, repeated escort request,

crowd pinch point, security misunderstanding, service collision, or protected-route breach should not disappear into anecdote. Each event should be classified by the burden it created, reviewed with affected users and workers, assigned to a decision owner, and closed only after the physical or procedural repair has been tested. A route that repeatedly requires explanation is communicating a design failure, not user incompetence. Closed incidents should remain linked to the redesign they produced so recurring failures can be recognized across seasons, events, and staffing changes.

6.4 — Wayfinding, Legibility, and Civic Clarity

A place can comply with rules and still be unreadable. Uncertainty about location, status, recording, help, complaint, or exit becomes an avoidable burden: participants fear accidental breach, visitors enter protected contexts, staff lose time, disabled people face exclusion, and responders lose minutes that matter. Legibility therefore joins spatial and institutional information. A person should be able to know where they are, what kind of authority operates there, and what practical choices remain.

Wayfinding is therefore more than signage. It is the City's promise that people will not be forced to carry unnecessary cognitive load in order to respect its rules. Legibility helps rights function. It helps records make sense. It helps public access remain safe. It helps staff operate without improvising every boundary. It helps critics inspect the City without submitting to insiders.

Wayfinding is a distribution of practical power. Insiders can compensate for poor signs, ambiguous naming, hidden elevators, changing access rules, or unannounced closures. Outsiders pay with time, exposure, dependence, and failed access. A fair City places enough information in the environment that rights and services do not require social familiarity.

The legibility standard is that the City should be understandable by a serious outsider. If only insiders can explain how to move, complain, access records, find protection, or identify status, the building has produced a new hierarchy of interpretation.

Wayfinding is a democratic competence test for the building. A person should not need social capital, insider vocabulary, perfect memory, fluent language, ideal vision, high confidence, or a calm nervous system to understand the basic routes of the City. When a place becomes legible only to insiders, the architecture has created a hierarchy before any official hierarchy appears.

Legibility prevents avoidable breaches. Participants under load need unmistakable cues before a boundary changes; staff need room names and access rules that do not require improvisation; visitors need public routes that remain clear under crowding; and emergency responders need standardized, accessible direction that outruns institutional symbolism. Wayfinding becomes a rights system when it works under fatigue, urgency, language difference, and low visibility.

Wayfinding should use a three-reader test. The first reader is an ordinary citizen arriving for the first time with skepticism. The second reader is a participant under stress who must avoid accidental breach. The third reader is an emergency responder who must protect life without learning the theory. If all three can read the place, the signage and spatial cues are close to civic legibility.

A fourth reader should be added for accessibility: a person whose body, cognition, sensory processing, language, or technology access differs from the default imagined user. This reader should not be asked whether an alternate route exists only in theory. They should be asked whether the route feels equal, safe, timely, understandable, and dignified. A main civic path for some and a burdened workaround for others is not equal access.

Legibility should also include institutional legibility. People should understand not only where rooms are, but what kinds of authority live there. A record site, complaint office, visitor reception, protected boundary, staff-only route, public learning room, deliberation hall, archive interface, and emergency refuge should not blur into one another. The building should teach the difference between public access, public record, professional care, and protected dignity.

Wayfinding should be language-conscious without assuming one global solution. The first City may operate in a host jurisdiction with its own languages, legal signs, emergency conventions, disability requirements, and cultural expectations around public authority. Fairness has no single aesthetic accent; routes, rights, warnings, and help points must be translated into forms people in the host place can actually read.

Legibility survives when basic movement and rights do not depend on a device. Phones, accounts, biometrics, apps, wearables, and digital maps may assist, but the built environment itself still communicates entrances, exits, emergency routes, complaint paths, help points, public-record access, and changes in status. This preserves access for people who refuse device-mediated participation and keeps the City readable when batteries die, networks fail, screens break, or stress narrows attention.

Wayfinding should avoid institutional riddles. Many public buildings are easy for staff and punishing for newcomers. The City cannot adopt that habit. Every major destination should be named by function before brand. A person should find the complaint route, record access point, visitor help, emergency

refuge, public learning room, and protected boundary because the building says plainly what each is for.

A change log should preserve wayfinding failures and repairs. When a room changes purpose, when a route is temporarily closed, when a sign is revised, when a new access device is introduced, or when a digital map changes, users should not be left to absorb the confusion. Wayfinding drift is a form of hidden burden because it turns institutional change into user error.

Legibility also requires restraint. Too many signs can become noise. Too many colors can become code. Too many warnings can make the campus feel dangerous. Too much brand language can make public power feel marketed. The City should use a disciplined visual vocabulary where each sign earns its place by reducing burden rather than decorating authority.

The wayfinding system should be tested in silence. If a person cannot understand the main routes without a staff member explaining them, the building may be relying on labor to carry design failure. Staff help should remain available and humane, but it should not be the hidden crutch for a confusing plan. A good City lets the architecture carry part of the explanation.

6.4.1 — Public Signage

Public signage is the City's first act of explanation. It tells citizens where they may go, what they may see, what they may not see, how to ask questions, how to file complaints, where record-site access begins, where protected domains are located as categories, and what behavior is expected. Good signage reduces rumor because people can understand boundaries before they test them.

The language should be plain without being simplistic. The City must explain terms like public band, participant band, protected nonvisibility, oversight access, record site, and complaint route in language a nonexpert can use. If only insiders understand the signs, the City has built a hierarchy of interpretation.

Signage should avoid propaganda. Public signs should not praise the City, flatter participants, or create movement language. They should guide, protect, warn, explain, and route. Civic clarity is different from branding. A sign that inspires but does not clarify has failed its first duty.

Public signage must also be accessible. Visual contrast, tactile cues, braille where appropriate, audio alternatives, multilingual support, icon discipline, plain-language maps, and low-stress layouts are part of fairness. A sign that works only for a calm, sighted, fluent, high-literacy visitor is not enough.

Signage explains boundaries in usable civic language. A protected-zone sign identifies dignity and lawful handling rather than secret privilege. A public-record sign explains provenance, status, context, and correction. A complaint sign makes relief and appeal visible before a person has to ask an insider. The City's values are strongest when they appear as clear directions, choices, and responsibilities rather than praise, slogans, or movement language.

A signage audit should test comprehension, not merely presence. Reviewers should ask first-time visitors to explain what a sign means, where it routes them, what behavior it expects, and what

remedy it offers if they are harmed or confused. Signs that look official but do not teach are decorative bureaucracy.

Public signage should be written for the person who is skeptical, tired, unfamiliar, and unwilling to decode institutional language. It should not sound like marketing, legal fog, sacred invitation, or security command. It should say what the space is, what one may do, what one may not do, where help is found, where records are requested, where complaints go, and how protected boundaries work.

The signage system should also be hostile-cropping aware. A single photographed sign may travel online without context. If the sign says only restricted area, critics may read secrecy. If it says total record, critics may read surveillance. If it says protected nonvisibility with no explanation, critics may read hidden privilege. Public signs should carry enough short context to survive being seen alone.

Public signage should also establish status-label discipline. If a room is public, protected, staff-only, participant-only, oversight-accessible, delayed-release, emergency-access, or non-digital-access supported, the label should not be decorative. It should correspond to a real rule, real route, real custodian, and real remedy for misuse. False labels teach cynicism faster than no labels at all.

6.4.2 — Participant Orientation

Participant orientation begins before the first active day and continues after activation. A participant must know not only what the rules say, but how the space carries those rules. Which doors

change status? Which routes are public? Which rooms are protected? Which thresholds require log confirmation? Which spaces may include incidental visitors? Which paths are emergency-only? The participant should not have to learn by mistake.

Orientation should reduce shame. A person under the Vow will already carry public burden. If they are constantly afraid of accidental breach, the City has added avoidable load. Maps, walk-throughs, scenario rehearsals, plain-language spatial guides, mentor review, and repeated refreshers help the participant inhabit the City without excessive self-monitoring.

Orientation also protects the record. When participants understand spaces, later record interpretation becomes more trustworthy. A person who enters the wrong zone because of poor orientation should not be treated as though they intended misconduct. The City must distinguish a participant failure from a design failure.

Participant orientation should include the dignity map. Participants need to know where care, counsel, protected nonvisibility, modesty handling, de-loading, complaint, and appeal are located. Rights that cannot be found are weaker than rights that can. The City should make help physically legible.

Orientation should produce informed agency, not reverence. It explains rules, burdens, rights, access bands, shielding, complaint, appeal, and remedy in plain language, then confirms understanding through questions and practice. The tone remains

sober and humane. Entry into a demanding civic role never implies entry into a higher human state.

A participant-orientation audit should include actual walking, not only documents. The participant should cross thresholds, identify bands, practice emergency routes, locate protected spaces, find complaint channels, and explain record-status changes in their own words. Orientation is not complete until the body understands the map.

Participant orientation should not be a one-time lecture buried at entry. Spatial rules become real through repetition, practice, maps, reminders, clear room naming, staff availability, and review after confusion. Participants will be under cognitive, emotional, public, and relational load. Predictable confusion is an operating condition, not a moral failure.

Orientation should also preserve adult dignity. Participants are not prisoners being processed, patients being managed, or students being patronized. They are adults entering heightened public-power burden by consent. The orientation should be serious, reciprocal, reviewable, and plain. It should explain rights as clearly as obligations, exit as clearly as participation, and protected boundaries as clearly as record duties.

Participant orientation should be audited through errors. The question is not whether a participant can repeat the rules after training. The question is what kinds of mistakes still occur after ordinary fatigue, conflict, media pressure, illness, grief, family stress, or schedule compression. Repeated accidental breaches reveal design failure before they reveal character failure. The City

should revise orientation and spatial cues before it moralizes predictable confusion.

6.4.3 — Staff Navigation

Staff navigation is operational dignity. The people who teach, feed, clean, repair, protect, archive, moderate, care, audit, and operate the City should not have to solve spatial confusion as an everyday burden. If staff navigation is poor, staff become the human patch for architectural failure. They answer the same questions repeatedly, correct preventable errors, carry stress during crisis, and absorb blame for unclear systems.

Staff routes should be clear by role. A clinician should know the protected path to care spaces. An archivist should know secure custody routes. Maintenance staff should know which paths protect operations without exposing them to participant or public pressure. Security should know how to move without making the City feel carceral. Educators should know how to reach participant zones without creating side channels.

Navigation tools for staff should include role maps, access-status dashboards, emergency route training, physical cues, and update procedures when spaces change. The City is likely to evolve. A changed route that is not communicated can create record gaps, safety risks, and staff frustration. Spatial updates are governance events.

Staff navigation must also protect staff privacy. A route that constantly exposes workers to public visitors may become harassment or performance pressure. A route that hides them entirely may erase labor. The design should give staff efficient

movement, role clarity, and protection from both invisibility and overexposure.

Good staff navigation improves public trust indirectly. When staff know where to go and what status applies, participants experience fewer contradictions, visitors receive clearer guidance, records become cleaner, and crisis response is faster. An institution that respects staff navigation respects the public it serves.

A staff-navigation audit should follow a full workday for each staff category. Educators, clinicians, security, archivists, food workers, maintenance workers, moderators, and operators should be asked where the building makes their work harder, less safe, less private, or more likely to create record confusion.

Staff navigation should be protected against constant public interruption. A staff member who must repeatedly act as impromptu guide, interpreter, security buffer, or emotional absorber is doing unrecorded public-interface labor. Good wayfinding reduces that hidden labor before it becomes burnout.

Navigation systems should also protect staff independence. If staff must pass through participant-heavy zones to reach supervisors, complaint offices, rest areas, or clinical support, the architecture may create pressure to appear loyal, calm, or available. Staff routes should allow service without surrendering boundaries. The City's labor ethic is tested in the routes no visitor praises.

Staff navigation should include safe routes to dissent. A staff member who sees misconduct, unsafe workload, influence pressure, or protected-boundary misuse should know where to go

without passing through the authority they are challenging. The geography of complaint matters. If the path to an ombuds office runs through a supervisor's territory, the map has already weakened the right.

6.4.4 — Accessibility Wayfinding

Accessibility wayfinding serves people whose bodies, senses, cognition, language, trauma histories, stress levels, or temporary conditions make ordinary navigation difficult. It must be designed from the beginning, not added after the main path is complete. A City that treats accessibility as secondary has already decided whose burden counts first.

Accessibility wayfinding must work as a chain. An accessible entrance is not enough when the route to reception, toilets, lifts, refuge, complaint, care, public records, and emergency exit breaks elsewhere. Review should follow complete journeys under ordinary and stressful conditions, including temporary closures and maintenance detours.

Accessibility wayfinding is especially important under record conditions. A participant with cognitive overload may misread a threshold. A visitor with sensory sensitivity may avoid public access. A staff member with mobility needs may be forced into inefficient routes. A critic with disability may be excluded from inspection. Each failure changes whose voice and burden the City can hear.

Accessibility uses the same dignified circulation whenever possible. Disabled people are not routed through service doors, hidden corridors, improvised lifts, or longer paths merely because

the main route was designed around an ideal body. Where a distinct route is technically necessary, it remains direct, safe, equally legible, and equivalent in status and destination. User testing then examines the complete chain, including arrival, waiting, threshold, room use, emergency movement, and return.

Accessibility wayfinding expresses the City's claim that public-power formation must be answerable to human variation. A place that cannot be understood by varied bodies cannot claim civic clarity.

An accessibility-wayfinding audit should not be performed only by code compliance review. It should include disabled users, neurodivergent users, older adults, people under stress, people with low vision, deaf or hard-of-hearing users, wheelchair users, and people unfamiliar with the language of the institution.

Accessibility wayfinding should be updated whenever technology changes. New check-in systems, record kiosks, security gates, public interfaces, and mobile tools can create new barriers even when paths remain physically accessible. The City should treat digital wayfinding as part of spatial justice.

Accessibility wayfinding should begin from variety rather than exception. People navigate with different vision, hearing, mobility, cognition, language, stress levels, trauma histories, sensory tolerances, and technological access. A fair system uses multiple cues: clear words, tactile information, visual contrast, audible support where appropriate, predictable landmarks, simple maps, non-digital alternatives, staff help, and routes that do not segregate disabled users into inferior paths.

Accessibility wayfinding should be maintained as conditions change. Temporary construction, event barriers, security adjustments, weather closures, broken elevators, altered lighting, crowd lines, media staging, and emergency drills can all make an accessible route inaccessible in practice. The City should treat access as a living condition. It should not let temporary inconvenience become a repeated transfer of burden to disabled people.

6.4.5 — Crisis Wayfinding

Crisis wayfinding is the architecture of clarity when ordinary cognition is reduced. Fire, medical emergency, security threat, severe weather, cyber-physical incident, family crisis, protest escalation, or technical failure can turn a complex institution into a maze. The City must design for the moment when people have less attention, less time, and more fear.

A crisis route should be visible, redundant, accessible, and role-aware. Participants, staff, visitors, nonparticipants, clinicians, security, emergency responders, and oversight personnel may need different paths or different information. A single evacuation map may not be enough in a City with protected records, dignity zones, archive custody, and active participant status.

In crisis, the route to life and care outranks record formalities. No one should be delayed because a status label is uncertain, yet emergency movement should leave enough trace for later reconstruction when conditions permit. The spatial system therefore protects first and reviews afterward, without allowing emergency to become an unrecorded channel of power.

Crisis-navigation drills must rehearse the route under stress. Dry runs should test whether signs are understood, whether disabled people can move safely, whether staff roles are clear, whether public visitors know what to do, whether protected spaces have safe exits, and whether emergency responders can navigate without insider dependence. Unrehearsed clarity is often imaginary.

Crisis communication prevents uncertainty from hardening into rumor. When a door is locked, a route closes, or a protected area is shielded, people need a clear status message, a reliable information point, and a later explanation. Silence invites fear to invent motives, while timely communication preserves orientation without exposing protected details.

A crisis-wayfinding audit should test comprehension under noise, time pressure, low visibility, crowding, staff absence, power loss, and conflicting instructions. The City should assume that crisis will reduce comprehension. Good design lowers the intelligence burden required to survive.

Emergency directions must remain legible when attention narrows. In danger, people cannot depend on complex diagrams, subtle symbolism, unfamiliar jargon, or conditional instructions. Routes to exits, refuge, medical care, shelter, safe assembly, and staff coordination must remain understandable through darkness, noise, smoke, crowding, injury, language difference, and device failure.

Crisis wayfinding drills exist to prevent confusion from becoming harm, not to keep the City in a permanent atmosphere of threat.

After every drill or real incident, reviewers should ask who became lost, delayed, uninformed, dependent on informal help, or unable to use the designated route, and which privacy or protected-space boundaries were stressed by emergency movement.

Crisis wayfinding should be coordinated with local responders before crisis arrives. Fire, medical, police, emergency management, transit, utility, and host-community responders should know how the City's bands work without needing to accept the City's theory. A responder's job is life protection. The City's job is to make that protection possible while preserving after-action review, dignity, and lawful boundary repair once immediate danger has passed.

6.5 — Light, Sound, Materials, and Sensory Burden

The body reads space before the mind explains it. Glare can feel interrogative; echo can feel exposing; stone can feel dignified or cold; glass can feel open or merciless; silence can feel restful or disciplinary. The City counts these responses because participants, staff, visitors, critics, and nonparticipants encounter the institution through their nervous systems before they master its rules. Sensory design therefore becomes part of civic accuracy, not an aesthetic afterthought.

Sensory design is not decoration. It is human-load architecture. A City under the Vow already creates unusual attention pressure. If the built environment adds constant brightness, noise, disorientation, harsh materials, lack of refuge, or carceral cues, it increases load in ways the record may later misinterpret as personal weakness. A fair City reduces avoidable sensory burden where doing so does not weaken public-power accountability.

Light, sound, materials, sensory refuge, and trauma-aware atmosphere are conditions of dignity. The objective is not therapeutic softness in place of civic seriousness. It is a built environment where necessary public burden can be carried without avoidable bodily harm (World Health Organization, 2022c; CIE, 2018; Mostafa, 2014; Ulrich et al., 2008).

The sensory standard is that the City should reduce avoidable load without reducing public accountability. The burden of the Vow is already heavy. Sensory design should not add theatrical harshness, nervous-system strain, or elite softness in order to make the institution feel important.

The sensory field is part of the City's ethical field because bodies do not wait for philosophy. A person under record may experience glare as interrogation, echo as exposure, hard surfaces as threat, crowding as loss of control, and constant brightness as a demand to perform. Good sensory design does not weaken accountability. It makes accountability survivable.

Sensory neglect is also a false economy. Cheap sensory design can become expensive through fatigue, mistakes, clinical overload, staff turnover, public hostility, maintenance failure, and participant collapse. A humane material and sensory strategy is therefore not decoration added after justice. It is one way the City refuses to hide the biological cost of visible public-power formation.

A sensory-load review should separate intensity, duration, predictability, personal control, and recovery. A bright room for ten minutes differs from the same room for eight hours under public record; a rare, explained alarm differs from continuous low-level noise; and a beautiful material may still be acoustically harsh. The review is a qualitative design memory, not a scientific score: it asks what stimulation occurs, for how long, for which body and role, and whether the person can leave, pause, adjust, shield, or recover.

Sensory review should include staff, participants, visitors, disabled users, clinicians, security personnel, maintenance workers, and host-community interfaces. Staff may experience alarm fatigue. Participants may experience exposure fatigue. Visitors may experience confusion. Host neighbors may experience event noise. Maintenance workers may experience

material off-gassing, heat, or repetitive strain. The sensory field is shared, and fairness requires noticing who absorbs its hidden costs.

Procurement and maintenance can quietly reverse sensory intent. Designers may specify adjustable lighting, quiet equipment, non-glare surfaces, acoustic separation, and calm signage, only for substitutions or neglect to reintroduce load. Material, fixture, equipment, alarm, screen, and furnishing changes should therefore receive a sensory-impact review before the burden drifts through budget decisions no one calls ethical.

Sensory reporting must be ordinary and dignified. People often hesitate to say that a place is too loud, bright, cold, crowded, harsh, or triggering because the complaint is treated as weakness. A report about glare or echo may identify a design failure with consequences for judgment, health, access, and staff retention. The institution should learn from bodies before strain becomes collapse.

The sensory system should include user control wherever control does not undermine record integrity, safety, or dignity. Adjustable light, quiet rooms, predictable alarms, choice of seating, non-glare screens, acoustically protected conversation areas, and the ability to step away can reduce burden without hiding power. Control is not indulgence. It is one way the body participates in fairness.

Designers should also understand that sensory burden accumulates. A participant may tolerate light, sound, record pressure, public interpretation, social conflict, and schedule

intensity separately, yet break under their accumulation. Staff may tolerate workload, alarms, visitor pressure, and emotional support demands separately, yet burn out under their accumulation. The City should review combinations, not isolated features only.

Sensory dignity extends to visitors, complainants, critics, and host residents. Public record rooms need calm acoustics and readable lighting; complaint rooms need privacy without isolation; reception must allow people to orient before making decisions; and protest-adjacent areas need sound and crowd management that respects both expression and neighboring life. The sensory ethic belongs at every edge, not only in the participant interior.

The chapter's sensory standard can be stated plainly: the City may ask people to carry necessary civic burden, but it should not add avoidable bodily burden to prove seriousness. This sentence should guide lighting choices, acoustic choices, materials, furniture, temperature, crowd movement, screen placement, alarm design, and recovery adjacency. A needless burden hidden in the nervous system is still burden.

6.5.1 — Light as Load

Light can make a space legible, safe, and honest. It can also turn life into exposure. The Transparent City must design light with unusual care because participants already live under record pressure. Brightness, glare, visibility, shadow, reflection, and time of day all affect whether a person feels held in public accountability or trapped in constant inspection.

A deliberation hall may need clear light so facial expression, documents, and shared reasoning remain visible. A recovery space may need softer light so the body can downshift. A public interface may need balanced light to feel open without making participants feel displayed. A protected nonvisibility space may need enough light for safety and care without turning vulnerability into exposure.

Light also affects the archive. Poor lighting can distort records, obscure movement, create false impressions, or make later interpretation harder. Overly dramatic light can produce theater. Too little light can create suspicion. Lighting design should support record integrity without making every space feel like a set.

Daylight should be used with care. Natural light can support health, orientation, and dignity, but transparent surfaces can also create unwanted visibility. A glass wall may seem democratic and still expose people who need shielding. The rule should be daylight with boundaries, not exposure as aesthetic ideology.

A light audit separates the jobs that one lighting scheme cannot perform at once: orientation, safety, record quality, privacy, sleep, circadian support, public interface, glare control, and protected dignity. Deliberative rooms may need clear facial and document visibility, while residential and recovery spaces need shielding, adjustability, and darkness. Testing occurs across times of day, seasons, screen use, emergency conditions, and varied vision. Honest light reveals what matters without turning a person into a display.

Lighting fails when it turns participants into displays or protection into suspicion. Light should support truth without theatricalizing the person. Illumination must serve record integrity and human endurance together.

A light plan should distinguish visibility, surveillance, safety, circadian health, glare control, public dignity, and emotional tone. These are related but not identical. A room bright enough for record integrity may still need softened contrast. A public edge bright enough for safety may still need warmth. A protected space may need evidence of lawful use without exposing faces, bodies, or intimate care to public glare.

Lighting review must monitor drift. Temporary security lights, media staging, donor events, repairs, seasonal changes, screen installations, and emergency equipment can slowly change the sensory contract of a place. A building may be designed humanely and later operated harshly. Light should therefore be reviewed through maintenance logs, user complaints, staff reports, clinical feedback, and accessibility audits.

Lighting should be tested at different times and seasons. Morning, afternoon, night, winter, summer, storm conditions, screen use, media events, emergency lighting, and power-saving modes can all change the felt burden of a space. A design that feels gentle in a rendering may become harsh under maintenance reality. The City should therefore treat lighting as an operational obligation, not a finished aesthetic choice.

6.5.2 — Sound as Load

Sound is one of the fastest ways a building places burden on the body. Echo, crowd noise, mechanical hum, alarms, footfall, corridor speech, doors, ventilation, and public-interface audio can make a place exhausting even when it appears calm. The City must treat sound as a civic design issue because judgment, care, sleep, staff work, and public interaction all depend on acoustic conditions.

Visible public-power formation can increase social vigilance. If every voice carries, participants may become guarded. If public questions bleed into recovery spaces, the City becomes siege. If staff workspaces are noisy, mistakes increase. If protected spaces are acoustically weak, privacy fails. Sound design protects both dignity and record integrity.

The acoustic plan must distinguish zones. Public bands may carry low civic sound, orientation, and controlled interaction. Deliberation spaces need clarity without theatrical amplification. Protected nonvisibility spaces need sound shielding. Staff work areas need concentration. Recovery zones need quiet. Emergency systems need alarms that are unmistakable without creating avoidable panic.

Sound also affects accessibility. Some people process noise differently because of disability, trauma, age, cognitive load, migraine, anxiety, hearing difference, or stress. A City that constantly stimulates hearing will exclude people long before it denies them entry. Quiet routes, sound-dampened waiting spaces,

captioning, assistive listening systems, and low-noise alternatives are fairness tools.

The record may also be affected by sound. Poor acoustic design can misrecord speech, make deliberation unclear, produce false impressions of tone, or make public records harder to interpret. Acoustic integrity is therefore part of evidentiary integrity. A record of reasoning is weaker if the space made reasoning hard to hear.

A sound audit should measure more than decibels. It should review speech privacy, echo, cognitive load, staff fatigue, public-interface noise, sleep disturbance, alarm stress, and the ability to deliberate without shouting or retreating. Sound is a route by which burden enters the body.

Acoustics fail when protected life becomes audible or public life becomes siege. If confidential care can be overheard, dignity fails. If public edges roar into participant spaces, visibility becomes siege.

Acoustic stress can interfere with speech comprehension, concentration, comfort, and recovery, with effects that vary by person, task, duration, and sound source. The City should test those outcomes through measurements and user reports rather than infer poor character from behavior in an exhausting room. Acoustic stewardship means that sound supports the civic activity taking place and avoids unnecessary load on people nearby.

Sound should be mapped across adjacent uses. A deliberation hall beside a recovery space may transmit tension. A public queue beside a complaint route may expose distress. A kitchen corridor

beside a protected professional room may create interruption. The acoustic map should ask not only whether spaces meet technical criteria, but whether one group's ordinary function becomes another group's hidden burden.

6.5.3 — Material Warmth

Materials teach the body what kind of institution it has entered. Steel, stone, glass, wood, fabric, concrete, ceramic, plants, water, texture, color, and wear patterns all carry meaning. Material choices are not superficial. They signal whether the place is punitive, elite, fragile, durable, accessible, repairable, humane, or false.

Material warmth does not mean luxury. It means the City resists institutional coldness without becoming a retreat for the powerful. Warmth may come from repairable surfaces, humane texture, modest craft, natural materials where appropriate, visible maintenance, comfortable seating, and rooms that respect the body. It should not come from extravagance or donor display.

Materials that evoke punishment without functional need weaken the institution's civic meaning. Harsh grilles, punitive lighting cages, echoing concrete, excessive barriers, and conspicuous surveillance can make lawful boundaries feel like custody. Security may require durable separation, but its form should communicate purpose, proportionality, assistance, and review rather than punishment.

Material warmth loses its civic value when it hardens into monumentality. Height, marble, symmetry, echo, and procession can create awe, and awe can make criticism feel like desecration.

The City's materials should instead humanize use, age honestly, show repair, and remain approachable to workers, residents, visitors, and skeptics. Beauty is strongest when it supports dignity and memory without implying that the institution is sacred or historically chosen.

Material selection also carries environmental and labor burden. A beautiful surface sourced through hidden extraction or maintained through excessive cost contradicts the City's purpose. Warmth must be compatible with lifecycle review, repair, labor dignity, climate burden, accessibility, and future replication.

Material warmth should survive age, repair, and ordinary use. A City that feels humane only when new will become cold, stained, noisy, or degrading as finishes wear and systems are patched. Repairable materials, understandable joints, replaceable parts, and dignified maintenance access are more faithful to the City's fairness commitments than fragile perfection protected from the people who live and work there.

Material warmth should be understood as humane durability, not decorative softness. The City needs materials that can endure public use, maintenance, cleaning, security requirements, climate stress, and replication while still telling the body that it has not entered a machine for exposure. Wood, fabric, stone, plants, texture, color, and daylight may matter, but only when they serve dignity, maintainability, access, and public justification.

Materials also carry class signals. Luxury finishes can imply elite retreat. Cheap institutional surfaces can imply punishment. Sacred materials can imply reverence. High-tech surfaces can

imply surveillance. The material palette should therefore be reviewed for social meaning as well as performance. The question is not only whether a material lasts, but what burden, status, fear, or exclusion it teaches while it lasts.

Material choices should be explained through the same public-burden grammar as other choices. If a warm material costs more, the justification should be durability, repairability, accessibility, climate performance, sensory mercy, or long-term dignity rather than prestige. If a cheaper material is chosen, the City should be honest about whether the savings create noise, glare, breakage, fatigue, or staff maintenance burden. The material budget is a moral document.

6.5.4 — Sensory Refuge

Sensory refuge is the place where a person can reduce stimulation without leaving the moral structure of the City. It is not a hidden active-life zone. It is not an escape from the Vow. It is a protected design feature that acknowledges that bodies under public burden need recovery. Without refuge, the City will punish sensitivity, disability, grief, overload, and ordinary fatigue.

Refuge spaces should be distributed, not rare. If relief is too far away, only people with time, status, or physical ease can use it. Small quiet rooms, low-stimulation routes, shaded benches, sound-dampened alcoves, accessible rest areas, and de-loading rooms can make the City livable without undermining record discipline.

Each refuge space needs a clear category. Some may be general low-stimulation areas. Some may be protected nonvisibility.

Some may be clinical interface. Some may be staff recovery. Some may be public visitor rest. Category clarity prevents refuge from becoming either suspicion or loophole. A person should know what privacy, record status, and access rules apply.

Refuge also protects decision quality. A participant who can regulate after conflict may reason better. A staff member who can recover after moderation burden may work safely. A visitor who can step out of sensory overload may remain able to engage. A City without refuge may create the very brittleness it is supposed to test and correct.

The public should understand refuge as dignity, not secrecy. Public materials can explain that some spaces reduce load while remaining governed. This reduces rumor and helps citizens understand that humane design is not evasion. Fairness includes conditions that allow people to remain human under serious burden.

Refuge spaces should be included in public explanations without revealing users. The public can understand that the City provides low-stimulation and de-loading spaces because visible burden is heavy. Normalizing refuge helps prevent a culture in which only hidden collapse is treated as serious.

Sensory refuge should be integrated into the ordinary plan rather than hidden as a special exception for people who cannot cope. The visible life of the City is intense by design. Recovery must therefore be normal, nearby, dignified, and nonpunitive. A participant, staff member, visitor, critic, or affected person should

be able to step down from sensory load without being marked as weak or unfit.

Refuge spaces need rules too. A refuge that is unrecorded in every respect can become a side channel. A refuge that is overrecorded defeats refuge. The design should separate content privacy from access integrity: enough record to know the space is used lawfully and safely, enough shielding to keep recovery from becoming performance, and enough staffing to prevent abandonment.

Refuge should have gradients too. Some people need brief low-stimulation pause. Others need clinical support, private recovery, protected family contact, quiet work, prayer or reflection where lawful and optional, or medical intervention. A single quiet room cannot carry all those burdens. The City should design refuge as a small ecology, with clear boundaries between ordinary decompression, professional care, emergency support, and protected nonvisibility.

6.5.5 — Trauma-Aware Atmosphere

A trauma-aware atmosphere recognizes that many people enter public institutions with histories of fear, humiliation, medical harm, policing, surveillance, poverty, violence, coercion, or institutional betrayal. The Transparent City must not assume that seriousness will be read as safety. It must design spaces that do not unnecessarily recreate carceral, clinical, authoritarian, or humiliating cues.

Trauma-aware design is a relationship between form and procedure rather than a palette of soothing finishes. Predictable sequences, visible exits, non-coercive waiting, control over

proximity, privacy during care, understandable security, and staff practices that do not translate distress into misconduct by default all matter. Choice is offered where safety and function permit it. The result is not a promise of comfort in every difficult moment, but a setting that removes unnecessary re-enactments of fear.

Security must be included in trauma-aware atmosphere. The City needs safety, but security posture should not dominate civic tone. Uniforms, weapons, barriers, cameras, and screening procedures should be reviewed for the burden they place on bodies. Safety without fear is not weakness. It is disciplined design.

Trauma-aware atmosphere also helps public interpretation. A City that looks oppressive will be interpreted as oppressive even if its policies are careful. Skeptics will not be wrong to ask what the place teaches. The City must make its non-carceral character visible in physical experience, not only in text.

A trauma-aware atmosphere says that public-power formation can be severe without becoming re-enactment of harm. The City should challenge participants through burden, not through preventable fear.

Trauma-aware design removes avoidable institutional triggers; it does not classify people with histories of harm as fragile or incapable. Predictability, control, refuge, clear authority, restrained alarms, noncoercive routes, and dignified support can make difficult civic work possible without allowing the built environment to dominate attention or reproduce needless fear.

Trauma-aware atmosphere does not mean assuming fragility in everyone. It means refusing preventable triggers that serve no

civic purpose: domination cues, surprise confinement, harsh commands, narrow chokepoints, humiliating queues, excessive uniformed presence, unpredictable alarms, involuntary exposure, and spaces that mimic courts, prisons, hospitals, or interrogation rooms without necessity. Seriousness does not require borrowing the language of threat.

This standard should be reviewed by people with clinical, disability, veteran, survivor, and lived-experience knowledge. Designers without that input may accidentally create spaces that look neutral to power and threatening to those who have been harmed by power. Trauma-aware design protects truth because people speak, learn, remember, deliberate, and repair better when the environment does not require constant self-defense.

Trauma-aware design should include predictability. People can endure difficult settings more safely when they know what will happen, who may enter, where exits are, how long a process lasts, what is being recorded, how to ask for pause, and who can help. Predictability does not remove public burden. It prevents unnecessary fear from attaching to public burden and distorting the very formation the City is trying to make honest.

6.6 — Seriousness Without Fear

The City needs gravity because it prepares people for consequential public power, preserves an unusual civic record, asks staff to support difficult work, and asks a host community to live beside an institution with public meaning. Gravity, however, can be communicated through competence, clarity, proportion, repair, and calm rather than intimidation. A place that feels casual will trivialize the work; a place that feels majestic will overstate the institution. The desired tone is serious enough to focus attention and human enough to remain recognizably ordinary.

Yet seriousness is often built through fear. Institutions have long used height, gates, uniforms, silence, stone, surveillance, procedural opacity, and restricted movement to make people feel small. The City cannot borrow that grammar. It needs gravity without intimidation, boundary without custody, beauty without shrine, comfort without luxury enclosure, and authority without distance from ordinary humanity.

Seriousness should be conveyed through care, clarity, competence, and durable materials rather than threat. A calm entrance, intelligible public desk, visible help route, well-kept threshold, and proportionate security can carry more civic gravity than guards, barriers, dark stone, or monumental emptiness.

The final tone standard is gravity without domination. The City should feel important because its burden is important, not because the building overwhelms people. Authority should become more legible inside the City, not more majestic, mysterious, or frightening.

The institution needs gravity because formation for consequential public power is not entertainment, lifestyle branding, or elite retreat. Gravity becomes fear when the building borrows too much from prisons, military compounds, sacred monuments, luxury campuses, or sovereign palaces. The task is to carry consequence without teaching participants that they inhabit a higher order of person.

The safest visual language will be neither casual nor majestic. It should be clear, durable, warm, repairable, accessible, and publicly understandable. It should allow a citizen to approach without awe, a critic to object without sacrilege, a participant to carry burden without role intoxication, a staff member to work without disappearance, and a host community to see that the institution has not mistaken seriousness for superiority.

The final spatial tone should pass a public-courage test. Does the place make ordinary citizens more willing to ask questions, inspect records, challenge claims, and demand repair, or does it make them feel small before an institution that seems morally grand? The City fails if its architecture silences criticism through awe. Public power becomes answerable when the public can approach it without reverence.

It should also pass a participant-humility test. Does the place remind participants that public service is burden-bearing, learning, correction, and lawful answerability, or does it make them feel selected by history? Spaces that flatter future power are dangerous even when they use the vocabulary of sacrifice. The City should form steadiness, not grandeur.

Finally, it should pass a staff-truth test. Does the place allow staff to tell the truth about overload, breach, misuse, fear, or unfair expectation without having to challenge an architectural myth? If staff feel they are damaging a beautiful mission when they name a practical problem, beauty has become coercive. Seriousness without fear means the building helps people tell the truth about the building itself.

Seriousness without fear must survive public representation as well as construction. Renderings and published explanations can mislead as powerfully as a building. Glass towers, guarded plazas, monumental halls, luxury residences, sacred light, or crowds gazing at participants may reasonably suggest surveillance, spectacle, elite retreat, or cult architecture. Public images should instead make the institution's bounded, adult, voluntary, role-based, reviewable, and ordinary-life-protective character visible, including the workers and maintenance systems that sustain it.

Architectural humility is the condition that lets civic ambition remain corrigible. Beauty serves orientation, dignity, memory, and delight without overruling burden. Security protects life without becoming custody. A memorable place resists shrine logic and leaves visible evidence of repair. Seriousness remains small enough for a citizen to question, a worker to maintain, a disabled visitor to use, and a tired person to endure. The building's highest achievement is to make responsibility feel possible rather than destiny feel announced.

Gravity is earned through intelligibility. People understand the stakes because the routes, rooms, records, rights, and burdens make sense, not because stone, glass, guards, ceremonial silence,

or luxury makes them feel small. The building teaches that public power is answerable work performed by fallible people. Its atmosphere invites attention, criticism, and care without implying that the City is history's chosen vessel.

Fear often enters through small choices before anyone names it. A guard who stands too close, a door that locks too loudly, a room with no visible exit, a queue that resembles processing, a sign written in command language, a hall that swallows ordinary speech, or a camera placed like a threat can change the felt meaning of the City. The tone audit must notice these small signals.

The civic tone must also avoid casualness that trivializes consequence. A campus that feels like a coworking retreat, wellness resort, innovation lab, theme park, or lifestyle school would betray the seriousness of public-power formation. The right tone is neither punitive nor playful. It is disciplined, humane, and reviewable.

Seriousness without fear is finally a promise to the ordinary person. The City exists so public power carries more burden before ordinary people carry the consequences of hidden formation. If the place itself makes ordinary people afraid, awed, excluded, or entertained at others' expense, it has broken that promise at the threshold. The final spatial order must let the public approach power with clear eyes.

6.6.1 — Non-Carceral Gravity

Non-carceral gravity means the City can feel weighty without feeling like punishment. It has rules, thresholds, screening, record

systems, protected spaces, and security needs. But those features must not produce the atmosphere of custody. A participant enters under a voluntary civic burden, not a sentence. Architecture should reinforce that difference.

Carceral cues can appear unintentionally: harsh lighting, echoing corridors, heavy doors, constant visible surveillance equipment, command posture, confusing checkpoints, windowless rooms, controlled silence, and humiliating search procedures. The City must review these cues because they teach the body that the institution is a place of control rather than answerability.

Public interpretation begins with the built message. A perimeter that resembles custody, a screening point that resembles suspicion, or a corridor that resembles control will be read accordingly, and that response is evidence rather than hostility. Non-carceral gravity therefore uses proportionate security, visible purpose, ordinary materials, humane waiting, and clear exit. The design should communicate a civic boundary that protects people, not a prison that prose later has to explain away.

Non-carceral gravity also protects staff and participants from role distortion. Security rooms should support coordination without teaching warden behavior; operations centers should distribute authority rather than invite command theater; and participant routes should require understanding rather than obedience. Civic gravity is strongest when architecture invites responsibility without rehearsing submission.

A non-carceral audit should review perimeter, screening, room proportions, security posture, doors, windows, furniture, lighting,

sound, uniforms, and response protocols. The question is not whether the City has controls. It must. The question is whether the controls teach custody or civic responsibility.

The design has already failed if prose must convince occupants it is not a prison. The design should carry the distinction before argument tries to repair it.

Non-carceral gravity should be tested against ordinary architectural habits of control. Are entrances dominated by barriers? Do corridors feel like supervision lines? Do rooms suggest compliance more than deliberation? Are security personnel positioned as the first human meaning of the place? Are waiting areas designed like holding spaces? If the answer is yes, the City may be teaching captivity even while declaring consent.

The alternative is not softness without structure. Non-carceral gravity can use clear thresholds, well-trained staff, transparent rules, visible complaint routes, calm security, humane waiting, proportionate screening, restorative materials, and spaces where people can stand, sit, speak, and leave without humiliation. The City should make the seriousness of public power visible without making the body feel seized.

Security review should include a dignity test. The City can use controlled access, trained personnel, emergency protocols, and protective infrastructure without making the first experience of the place a command. Reviewers should ask whether security staff are positioned as guides as well as guardians, whether barriers are proportionate, whether searches are lawful and

respectful, and whether people can distinguish safety from dominance.

6.6.2 — No Sacred Monumentality

No sacred monumentality means the City must resist becoming a shrine to itself. The City may carry public hope, but hope can harden into reverence. Architecture can make a place feel untouchable. Tall axes, grand entrances, ceremonial paths, founder-centered spaces, symbolic chambers, and excessive symmetry can turn a civic institution into an object of devotion. Architecture must not invite the City to become a shrine to itself.

This is especially important because the City sits near The Religion of Fairness without being a religious institution. Participants may be religious or secular. Some may participate in the Religion of Fairness. Some may not. The City cannot use sacred atmosphere to create belonging pressure. Its legitimacy comes from lawful public-power burden, not from awe.

Monumentality can also silence criticism. People hesitate to criticize what feels sacred. Staff may hesitate to report problems. Participants may perform gratitude. Visitors may feel they should be reverent. Donors may enjoy having built something that seems historically holy. The City should avoid architecture that makes dissent feel like desecration.

A non-sacred civic place can still be beautiful. It can have light, proportion, gardens, durable materials, public art, and meaningful rituals of orientation. The difference is whether beauty points back to human responsibility or upward to institutional worship.

Beauty should make the City more humane, not more untouchable.

The first City should avoid founder-centered spaces and sacred-original narratives that would make replication feel like imitation of holiness rather than transfer of safeguards.

A monumentality audit should ask whether the building makes criticism feel emotionally inappropriate. If visitors lower their voices as though entering a holy site, if staff hesitate to challenge founders, or if rooms are named as though history has already blessed them, the design may be teaching reverence.

No sacred monumentality is especially important because first institutions attract myth. The first hall, first archive, first participant cohort, first public edge, first record site, and first successful pilot may become objects of reverence if the architecture invites it. The City must be allowed to matter deeply without asking the public to kneel before its origin story.

Designers should therefore be careful with axial processions, founder rooms, heroic naming, ceremonial thresholds, monument walls, elevated platforms, excessive vertical symbolism, and lighting that makes spaces feel consecrated. The City can use beauty, memory, and ritual of orientation, but the emotional lesson should be responsibility under review. A critic should be able to enter without feeling that criticism is a kind of desecration.

Sacred monumentality would also distort the wider project. The built form cannot present the Law as proved, participants as a chosen class, or the City as the beginning of an inevitable future. It remains a corrigible institution under objection. Its architecture

should preserve failure memory, revision, criticism, decommissioning, and the visible possibility that the proposal may need to contract or end.

6.6.3 — No Luxury Enclosure

The City needs humane support without becoming an elite retreat for people seeking public power. Dignified residence, recovery space, good food, health care, accessibility, beautiful commons, and durable materials can reduce the real burden of the Vow. Prestige design, exclusive amenities, donor-driven elegance, and excess comfort serve a different purpose. The distinction lies in whether a feature protects health, function, dignity, or public duty.

Anti-luxury design does not mean austerity. A miserable City would also fail. It would train resentment, exhaustion, secrecy, and false endurance. The right standard is dignified sufficiency: enough comfort to sustain health, enough beauty to respect humanity, enough durability to protect public investment, and enough modesty to avoid class separation.

Luxury enclosure can also appear through access. If only insiders, donors, experts, or political allies feel comfortable entering, the City becomes socially enclosed even if its gates are open. Furniture, language, food, dress expectations, visitor protocols, and public edges can all signal who belongs. The City must be legible to ordinary citizens, not only to elite visitors.

Cost discipline belongs here. Every aesthetic choice should pass through maintenance, replication, labor, climate, accessibility, and public justification. A costly feature may be justified if it

reduces load, protects dignity, lowers long-term maintenance, or strengthens safety. It is not justified because it makes the City feel important.

A luxury-enclosure audit should compare participant amenities, staff conditions, host-community conditions, maintenance cost, and replicability. Comfort that protects health may be justified. Comfort that signals superiority, donor prestige, or escape from ordinary life is a corruption of the City's tone.

Comfort is defensible when its public purpose can be named. Good food, humane rooms, medical care, recovery spaces, beauty, and durable materials may protect health, stability, access, and the capacity to carry visible responsibility. Comfort that cannot explain its relationship to function, dignity, maintenance, accessibility, or burden reduction becomes privilege rather than support.

Comparison reveals whether participant support has become enclosure. Participant spaces must be judged beside staff spaces, public edges, host-community effects, maintenance routes, and local conditions. If visible-service residents live comfortably while workers strain, hosts absorb cost, or public areas feel inferior, the building has reproduced hierarchy. Support for the burden of public formation is fair only when the surrounding burdens remain equally visible.

A plain-language support rationale should accompany major amenities. Ordinary citizens may accept that visible public-power formation requires stabilization if the explanation is honest: sleep protects judgment, health care reduces leverage, debt relief

reduces corruption risk, recovery space prevents collapse, durable materials reduce maintenance burden. They will not accept a vocabulary of sacrifice wrapped around luxury signals. The building must make the explanation visible.

6.6.4 — Calm Public Edges

Public edges are the City's civic handshake. Entrances, visitor reception, protest-adjacent areas, public-record access, learning interfaces, exterior paths, and host boundaries tell people whether the institution expects approach or obedience. The edge should neither seduce nor repel. It should make public responsibility understandable, reachable, and safe.

A public edge that is too dramatic becomes spectacle. A public edge that is too guarded becomes fortress. A public edge that is too porous becomes harassment. A public edge that is too hidden becomes secrecy. Calmness is not weakness. It is the spatial discipline that lets public access occur without turning access into pressure.

The public edge should give citizens time to orient. It should explain what the City is, what it is not, what spaces may be entered, how records are accessed, how complaints are filed, how protests are handled, how media requests work, and how nonparticipants are protected. Confusion at the edge becomes burden inside the City.

Host communities also bear the public edge. Crowds, cameras, protests, traffic, tours, and events can spill into streets and routines that did not volunteer for the institution. Arrival design, queuing, noise, security, transit, and visitor expectations must

prevent the surrounding place from becoming an unpaid shock absorber.

Neither the loudest public force nor institutional fear may capture the boundary. A workable edge protects approach, criticism, assembly, observation, and departure while preventing one energy from dominating access for everyone else. That balance requires proportionate rules and review beyond immediate institutional command.

The tone of a public edge changes through use. Sign clutter, security creep, crowd-control equipment, media staging, vendor kiosks, temporary fencing, or repeated protest barriers can make an originally calm boundary feel hostile. Review after major events should restore orientation, access, and dignity instead of allowing emergency furniture to become permanent architecture.

A calm public edge should be designed for several public moods: curiosity, skepticism, anger, grief, protest, media pressure, celebration, emergency, and ordinary transit. If the edge works only for respectful visitors, it is not a civic edge. If it works only by overwhelming visitors with security, it is not a public edge. The right edge allows approach while keeping the City's internal burdens from spilling outward.

Event review is necessary because temporary objects slowly rewrite the boundary. Barricades, cameras, signs, security booths, vendor tables, donor plaques, protest zones, tour queues, and media staging can accumulate until the edge communicates a different institution than the one formally designed. After each significant event, the City should ask who was invited, who was

frightened, who was exposed, who was delayed, and who absorbed the public energy. Calm is maintained through repeated correction, not achieved once by landscape design.

Waiting is part of public access. Shade, seating, restrooms, water, accessible queues, clear time estimates, multilingual explanation where needed, non-digital assistance, and complaint routes determine whether approach is dignified or punitive. An institution devoted to visible responsibility cannot make ordinary citizens carry avoidable discomfort at its gate.

6.6.5 — Human-Scale Authority

Human-scale authority is the final spatial standard of the chapter. It means that the City can carry public seriousness while remaining proportioned to human bodies, ordinary movement, conversation, rest, work, and repair. Public power may be consequential, but the people who carry it remain human. The architecture should never let scale erase that fact.

Human-scale authority resists oversized symbolism. It favors rooms where people can see one another without domination, halls where public reason is audible, thresholds that do not humiliate, offices that do not inflate status, and public interfaces that let citizens speak without feeling swallowed by the institution. Scale should support responsibility, not grandeur.

This standard also protects participants from role intoxication. If the spaces of formation constantly imply historical greatness, participants may begin to imagine themselves as exceptional simply for being there. Human-scale rooms remind them that

public power is work, not elevation. The City should make humility easier to practice.

Staff dignity also depends on scale. A human-scale institution allows workers to be seen as people, not invisible components of a machine. Workstations, rest areas, maintenance paths, kitchens, archive rooms, and staff meeting spaces should be designed for actual bodies and actual fatigue. Authority that cannot see its support labor is not human-scale.

Human-scale authority should guide the relationship between the City and its future copies. A design too dependent on grand form will be hard to replicate without prestige. A design based on legibility, dignity, access, record integrity, and modest beauty can travel more easily. Safeguards travel better than monuments.

The City's spatial order ends here because human-scale authority gathers the chapter's argument. Space must assign burden honestly, create access clearly, shield dignity, support recordability, guide movement, reduce sensory harm, and carry seriousness without fear. Anything larger than that may be architecture. It is not yet fairness.

A human-scale audit should ask whether a person can speak, wait, learn, complain, rest, and disagree without being swallowed by the building. It should include the scale of rooms, furniture, sight lines, acoustics, queues, staff desks, record interfaces, and public explanation points.

Human-scale authority becomes visible in small decisions: desk height, room size, chair spacing, the ability to sit while waiting, the clarity of help points, the warmth and repairability of

materials, the proportion of halls, the placement of staff, and the ease with which a person can object without shouting upward at the institution. These details are where public answerability becomes physically credible.

The final approval question should be asked from the ground, not the aerial rendering. Can a person with ordinary height, ordinary worry, ordinary impatience, ordinary skepticism, and ordinary bodily need understand where to go and what the institution is asking of them? Can they leave? Can they complain? Can they find help? Can they see power without being swallowed by the place built to reveal it? If the answer is no, the design is not yet human-scale authority.

Chapter 7 — Zones, Commons, and Service Ecology

The City is an inhabited ecology before it is a diagram. People sleep, study, deliberate, eat, walk, recover, work, meet strangers, maintain systems, and return to private selves within the same institutional day. Chapter 7 tests whether those ordinary arrangements deepen public responsibility while preserving friendship, rest, staff dignity, and unmeasured life. The quality of the City appears not only in its formal rooms, but in the transitions that let people remain human between them.

Daily zones reveal where burden is hidden. A participant room can protect dignity or quietly punish the person who lives there. A dining hall can support shared life or reproduce hierarchy. A classroom can cultivate public reason or reward performance. A service ecology becomes fair when each zone names its users, workers, dependencies, access states, conflicts, and correction route rather than relying on an atmosphere of benevolence.

The inhabited City is composed of several interdependent worlds. Residence, study, deliberation, commons, recovery, archive, logistics, landscape, and water are not lifestyle features. They are the moral ecology of visible public-power formation. If the City asks a participant to live under the Transparent Vow, it must provide spaces where the person can remain human under burden. If it asks staff to operate the institution, it must give their work dignity, boundaries, and visibility without forcing staff into full-life exposure. If it invites the public to inspect public-power formation, it must separate civic review from spectacle.

The chapter's first concern is residence. Participant rooms and household edges must carry a difficult double truth: the participant is under active record, and the participant is still a

human being with bodily dignity, rest needs, modesty, and relation to others. A room in the City is not a hotel room, prison cell, dormitory spectacle, or campaign backdrop. It is the place where visible burden meets sleep, illness, fatigue, grief, privacy boundaries, household contact, and the ordinary work of becoming able to face the day again.

Deliberative halls and drafting rooms make the formation of judgment visible. Public power drafts, listens, revises, resists, tests, fails, and tries again before it speaks with authority. The spatial design therefore supports source access, minority reports, revision history, burden analysis, and reasons that can be reconstructed later. At the same time, unfinished thought is not treated as final character. Inspectability attaches to the work of reasoning without converting every hesitation into performance theater.

Commons, dining, libraries, and walking grounds preserve the City from becoming only a machinery of seriousness. Ordinary shared life matters because public power is revealed in small things: how a person waits, listens, interrupts, thanks, ignores, eats, reads, walks, apologizes, and stops performing. The commons are where formal role loosens enough for patterns to appear. A City without ordinary intervals would train people in appearance, not formation.

Education needs rooms for evidence, interpretation, disagreement, drafting, and correction, but the rooms must not become credential theater. The City forms public judgment rather than a prestige class. Faculty and mentors require visible role

boundaries, intellectual-dependency records where relevant, and no authority to convert admiration into civic rank.

Deliberation also needs spatial differentiation. A hall for public reasoning, a drafting room for revision, a simulation chamber for pressure, an opposition room for adversarial challenge, and an after-action space for correction do not serve the same purpose. One open room for everything would confuse performance, unfinished thought, expert input, and public record.

Landscape, water, and the restorative exterior complete the ecology because the City is not made of interiors alone. Bodies need walking loops. Nervous systems need horizon. Host communities need public edges that are welcoming but bounded. Water systems carry ecological burden and symbolic weight. Climate adaptation reminds the City that the land is not scenery but a living condition. If exterior space is treated as decoration, the City will fail to understand how much recovery, resilience, and civic modesty belong outside.

Recovery areas protect sleep, clinical independence, quiet, reflection, and crisis de-loading. Their purpose is neither indulgence nor preparation theater. They prevent the City from misreading overload as moral failure and prevent the record from turning care into spectacle. Recovery is part of institutional sustainability, not a hidden privilege.

The archive, public record site, operations core, kitchens, loading areas, waste routes, repair spaces, landscape, and water systems belong to the same moral map. Public beauty that depends on

hidden service labor, inaccessible logistics, degraded ecology, or unreviewable maintenance is an incomplete account of the City.

An inhabited City is necessarily interdisciplinary because burden does not remain inside professional boundaries. Residence depends on privacy law and family protection. Classrooms require educational judgment and public-risk control. Deliberation requires record status and resistance to performance theater. Commons depend on service labor, recovery depends on clinical independence, archive interfaces depend on public-memory governance, and landscape depends on ecology and host review. The zones become credible only when those responsibilities meet in the lived place rather than remaining separate promises on paper. A joint review of a single route from residence to work can reveal whether those responsibilities connect at each doorway and handoff.

The chapter follows a braided ordinary day rather than a collection of amenities. A participant wakes near a protected household edge, moves through study and deliberation, eats food carried by visible labor, uses commons without performing sociability, reaches care without spectacle, encounters the public record site, and walks an exterior whose water and maintenance costs are not hidden. Each movement tests whether the City's values survive routine. Walking that route with operating staff brings the timing of meals, cleaning, maintenance, and assistance into the design before occupancy.

Field experts will look for different failures. Housing scholars will ask about household edges and institutional dependency. Educators will test learning design and mentor power. Labor

experts will look behind dining, cleaning, logistics, and landscape. Clinicians and disability experts will inspect recovery, access, and de-loading. Archivists and public-law readers will ask whether the archive and record site remain distinct. The chapter must make those questions meet without becoming a lifestyle catalogue. Service ecology begins where people sleep and return. Families, neighbors, landlords, and staff retain independent rights. Residential design must protect private rooms, shared facilities, visitors, care, meals, quiet, and pause without turning the home or ordinary household life into institutional property. A resident should be able to locate the person responsible for a broken lock, a noise dispute, or an inaccessible shared facility without navigating the entire institution.

7.1 — Residential Quarters and Household Edges

Residence is the first inhabited test of the Transparent Vow. A charter can describe active record with elegance; a person still has to wake, dress, grieve, recover, think, sleep, and return to the day inside it. The participant room therefore condenses the entire institution into human scale. It reveals whether record systems can coexist with bodily dignity, whether recovery is real, whether boundaries are understandable, and whether public responsibility leaves enough private interior for a person to remain whole.

Participant rooms cannot be treated as logistical units. A room decides where exhaustion goes. It decides whether modesty is protected or improvised. It decides whether household contact becomes safe or confusing. It decides whether nonparticipants are shielded or pulled into exposure. It decides whether recovery is near enough to be used or distant enough to become a sign of failure. A room is a burden-routing device before it is a residential feature.

The difficulty is not whether a participant room is private; it must be private for ordinary bodily and personal life. The difficulty is preventing the room from becoming an off-record venue for consequential role formation. Sleep, hygiene, medication, reflection, family contact, and unrelated personal activity stay outside routine capture, while role-relevant meetings, advice, financial influence, and strategic work remain subject to declared record rules. The Vow follows the public-power role; it does not follow the body through every act.

Household edges make this harder. A participant may have a partner, child, dependent, elder, caregiver, former spouse, visitor, or family member whose life touches the City but does not enter the Vow. The City must count household burden without inheriting household life. It may need to know whether a dependent has care needs, whether a partner is being pressured, or whether a child is being exposed by proximity. It may not turn those people into public record subjects because they stand near someone who chose visible formation.

Residential design therefore belongs to rights, records, architecture, health, family, and staff ecology at once. Modesty design protects bodily dignity. Access limits protect nonparticipants. Recovery adjacency protects the body from collapse. Household boundary rules protect families from becoming public objects. Participant rooms protect the person from becoming only a role. The residential quarter is where the City proves that severity does not require degradation.

The section also prepares later chapters on health, family, intimacy, and staff by refusing to postpone their concerns. Residential design is where those concerns first appear as architecture. A door, bed, visitor rule, acoustic wall, and recovery path can either protect later safeguards or make them impossible. Later policy cannot repair residential design that places burden badly from the beginning.

A residence quarter in this City should be drafted as carefully as a constitutional clause, because it is where the rule of visible burden touches the smallest vulnerable acts of the day. The design should name the record status of the zone, the dignity protections

inside it, the status of staff entry, the status of emergency entry, the status of visitor adjacency, and the route by which a participant can challenge a residential rule that has become humiliating or unsafe. Without those details, residence becomes a loophole in two opposite directions. It can become a hidden active life, or it can become a place where the participant is exposed more than public trust requires.

The residential quarter should also be planned from the standpoint of the people who do not live under the Vow. Partners, children, elders, dependents, clinicians, lawyers, maintenance workers, delivery staff, and visitors may all touch the edge of residence without becoming subject to its public-power burden. The City must therefore treat household edge design as a form of nonparticipant protection. The floor plan, entry routine, scheduling system, staff training, acoustic treatment, visitor rules, emergency protocol, and record classification should all say the same thing: the participant carries chosen visible burden, but adjacent lives remain shielded unless a lawful, narrow, reviewable reason says otherwise.

7.1.1 — Participant Rooms

A participant room is the smallest complete argument the City makes about visible burden. It must say, in form and routine, that the person living here is under the Transparent Vow and still remains a human being. The room should not resemble a prison cell, a luxury suite, a hotel room designed for guests, or a theatrical set for public fascination. It should be modest, durable, rest-supporting, record-compatible, and dignity-protective.

The room must contain the conditions of ordinary bodily life without becoming a hidden channel for consequential role formation. Sleep, hygiene, dressing, medication, reading, reflection, and quiet recovery are not captured as ordinary content. Record continuity is satisfied through declared status changes, narrowly necessary environmental or safety data, and separate handling of any role-relevant interaction—not through audio or video observation of bodily life. The spatial charter therefore distinguishes noncapture, protected status, restricted handling, public release, and interpretation.

Residential design begins by reducing load that performs no civic work. Harsh light, poor acoustics, confusing devices, exposed controls, institutional coldness, and a constant sense of display consume capacity without increasing answerability. The room supports sleep, bodily care, ordinary possessions, accessibility, emotional decompression, and clear control over protected functions. Its purpose is not to help a person merely endure today, but to preserve enough steadiness for accountable work tomorrow.

Record integration must be clear enough to prevent hidden role formation and restrained enough to prevent humiliation. The participant should know which systems operate, what is protected, what requires restricted handling, what may later be summarized, and how continuity breaks are logged. Ambiguity would create anxiety and invite abuse. A room under the Vow should be more legible, not more mysterious, than ordinary institutional housing.

A useful residence audit should ask whether the room would remain defensible if every design choice were explained to the participant, staff, family, an ordinary citizen, a disability reviewer, and a privacy critic. If one of those audiences would see needless burden, the room is not yet simple enough or humane enough.

The participant room also needs a threshold script for moments of entry. Staff entry, emergency entry, maintenance entry, clinical entry, and visitor-adjacent entry cannot all mean the same thing. A person living under record should know why a door opened, what status applied, who was present, and whether the event created a record category requiring later explanation. A room without entry clarity invites fear.

The room's material choices should also answer the City's central anti-spectacle duty. Durable furniture, controllable light, acoustic protection, simple storage, modest personal effects, accessible controls, and clear emergency signaling can lower daily burden without creating luxury. A participant should not have to perform austerity to prove civic seriousness, and the City should not offer comfort so extravagant that public burden begins to look like privilege. The design should say: this person is carrying a chosen role burden, and the institution is responsible for making that burden lawful, humane, and maintainable.

7.1.2 — Household Boundary Rules

Household boundary rules protect the people around the participant from becoming part of the participant's public burden. The Transparent Vow is chosen by the active participant. It is not

inherited by a spouse, partner, child, elder, dependent, caregiver, roommate, visiting parent, former partner, or friend. The City must never confuse relational importance with record consent.

The household edge is difficult because household life can shape public-power formation. A person's obligations, conflicts, dependencies, pressures, care duties, and emotional patterns may matter to public readiness. The City cannot pretend households are irrelevant. It also cannot use relevance as permission to consume household life. The correct posture is bounded knowledge: enough to count burden, not enough to turn others into exhibits.

Boundary rules should define who may enter residential areas, when, under what notice, under what record condition, and with what shielding. They should distinguish routine household contact from active formation conduct, crisis contact from ordinary visitation, and protected family communication from hidden public-power strategy. These categories should be understandable to participants and nonparticipants before the first contact occurs.

Families also need complaint routes that do not require public exposure. A partner who feels pressured, a dependent whose care is disrupted, or a household member who believes the City is misplacing burden must be able to speak without becoming material for public interpretation. The household complaint route is not an attack on the participant. It is protection against the City's gravity pulling private life into its record field.

Household support should remain private relationship rather than public virtue display. A supportive spouse, patient child, or caregiving family member is not evidence of the participant's goodness and should not be recruited into an institutional narrative. Household dignity includes the freedom to help, disagree, limit contact, seek support, or leave without becoming a public symbol.

A household boundary rule should begin with a household map that is not a public record of the household's soul. The City may need to know who is a partner, dependent, caregiver, emergency contact, legal representative, or protected minor for purposes of safety, consent, scheduling, and shielding. That does not mean the City owns the intimacy, conflict, belief, grief, finances, or private history of those persons. Household information should be purpose-limited, role-labeled, access-limited, and subject to correction. The participant's public-power formation may require household context, but context is not permission to expose the household.

The boundary also has to survive pressure from affection. A participant may want to prove transparency by bringing family life into view, or a supporter may want access in the name of loyalty. The City should resist both impulses. Household protection is not distrust of the participant's love. It is protection of persons who did not enter the Vow and may be unable to refuse exposure without injuring the relationship. The fairest household rule often says no before the vulnerable person has to become brave enough to say no alone.

7.1.3 — Modesty Design

Modesty design is not prudishness. It is the spatial and procedural protection of bodily dignity under a severe record regime. A City that cannot preserve modesty will quickly become indefensible because it will teach the public to confuse transparency with access to the body. The Transparent Vow may burden active public-power formation, but it does not turn the participant's body into public property.

A modesty protocol begins by asking whether collection is justified. Ordinary dressing, hygiene, sleep, and intimate life remain outside routine audio or video capture, as the participant-room rule requires. A separately authorized safety or care process may need narrowly limited records under its own lawful authority; that does not create a civic archive of bodily life. Consequential role business is recorded through an appropriate channel without recording unrelated bodily content. Access restrictions and protected summaries govern justified records, not material collected without a proper purpose.

The design must serve varied bodies, disabilities, religious practices, gender realities, medical needs, trauma histories, and cultural expectations without allowing any one framework to dominate the City. Modesty should not become a tool for shame, purity culture, gender policing, or exclusion. It should be a plural dignity architecture under law and expert review.

Modesty design succeeds when a participant can live under record without feeling that the body has become a civic exhibit. It fails when the City treats bodily dignity as a weakness in transparency.

The City is not less honest when it shields the body from spectacle. It is more honest about what public-power formation actually requires.

Modesty design should be tested in ordinary failure conditions as well as ideal conditions. What happens when a device breaks, a staff member enters at the wrong time, a medical emergency occurs, a door fails, a visitor wanders, or a release queue mislabels a protected category? The strongest dignity rules are the ones that still function when systems are strained.

Modesty design should be practical rather than decorative. The City should identify bodily acts, medical routines, dressing, hygiene, rest, reproductive health, grief, distress, and disability support as categories requiring strong handling before a single participant enters. This is not because bodies are shameful. It is because public curiosity can distort bodies into spectacle faster than public reason can restore context. The design should make the participant's dignity a default condition through sightlines, device placement, room layout, access logs, staff training, delayed release rules, and independent review of intimate or bodily material.

The test of modesty design is whether it protects the person even when the institution is embarrassed, rushed, curious, under attack, or tempted to prove that nothing is hidden. A panic response to criticism can turn dignity rules into public sacrifice. The City must be able to say that lawful record exists without displaying what would humiliate, sexualize, medicalize, or degrade a person beyond public-interest need. Modesty is not secrecy against

accountability. It is the discipline that keeps accountability from becoming consumption.

7.1.4 — Nonparticipant Access Limits

Nonparticipant access limits protect both directions of the threshold. They prevent nonparticipants from being exposed by proximity, and they prevent outside persons from entering active residential spaces in ways that create hidden influence, pressure, or record confusion. The purpose is not isolation. It is role clarity.

A nonparticipant who enters a residential edge may become visible in incidental records. That person may not understand the City's categories, future release rules, or public interpretation risks. Presence is not consent. Access rules should include notice, masking, purpose limits, escorted entry where appropriate, and protected handling for incidental contact.

Access rules should preserve real relational life. Participants need family, friendship, care, ordinary conversation, and contact with people who do not belong to the institution. Outside relationships are not capture risks merely because they cross a residential edge. The design task is to distinguish ordinary human support from active public-power influence and to route each through the appropriate privacy or record state.

Different nonparticipants require different handling. A child requires stronger shielding than an adult visitor. A clinician requires professional protection. A lawyer requires legal boundaries. A maintenance worker requires staff role protection. A family member requires household privacy. A journalist

requires media rules. One access policy cannot flatten these differences without creating unfairness.

Access should also create an exit path for the nonparticipant. A visitor or family member who enters a City boundary should know how to leave, revoke future access, challenge exposure, and ask what record category applied. Proximity should never create a trap that only the institution understands.

Nonparticipant access limits should include more than visitor badges. They should define approach routes, waiting areas, contact windows, escort duties, recording notices, incidental-capture responses, child restrictions, family-consultation procedures, and emergency exceptions. The person who comes near a participant should not be forced to guess whether a hallway, lounge, garden edge, dining threshold, or residential doorway has changed their status. Boundary clarity lowers burden for nonparticipants because it removes the need to negotiate exposure moment by moment.

The household noninheritance rule must assume that nonparticipants will sometimes be pressured by public curiosity. Journalists, activists, donors, supporters, opponents, family members, and online spectators may try to use proximity to obtain stories, images, impressions, or emotional leverage. Access limits should protect against that secondary capture. A nonparticipant who leaves the City should not discover that their face, voice, grief, presence, or refusal has become public evidence for someone else's theory of the participant. The Vow binds the participant, not everyone in the participant's orbit.

7.1.5 — Recovery Adjacency

Recovery adjacency means that rest, de-loading, sleep support, and basic care must be near the places where participants actually live. Recovery that is physically distant, socially stigmatized, or administratively difficult will not be used early enough. Care should be close enough to arrive before collapse.

Visible public-power formation creates a distinctive kind of fatigue. The participant may be tired from study, public interface, archive awareness, relational strain, and the effort not to perform. Recovery must therefore be placed into the residential ecology, not exiled to a clinical corner that feels like failure. A person should be able to move from burden into restoration without crossing a threshold of shame.

Staff burden also matters. Recovery adjacency should not create constant emergency demand on clinicians, mentors, or residential support staff without staffing ratios, triage rules, and protected downtime. A recovery zone that saves participants by exhausting staff has merely displaced the burden. Care architecture must include care for the carers.

Recovery works only when people can use it without acquiring a public identity of weakness. The City should protect quiet, clinical care, decompression, and temporary de-loading as normal supports for demanding service. Records should capture only the role-relevant facts needed for safety, continuity, review, or accommodation, while public materials avoid turning vulnerability into spectacle or authenticity theater.

Recovery adjacency should be measured not only in distance, but in social ease. If a participant must cross a humiliating public path, ask permission from the wrong authority, or risk visible stigma to recover, the recovery space is functionally farther away than the floor plan suggests.

Recovery adjacency needs an operational threshold, not only a compassionate intention. The City should know what level of fatigue, sleep loss, panic, sensory overload, illness, grief, conflict, or cognitive strain triggers easier access to rest or care. The trigger should not require public breakdown. It should be available through self-request, mentor observation, clinical referral, staff concern, or scheduled review, with privacy and record categories defined in advance. If a participant must dramatize distress before recovery becomes legitimate, the City has taught performance even in care.

Adjacency also matters for staff and household protection. When recovery is far away or socially difficult to reach, distress spreads into residential corridors, dining rooms, staff interactions, family calls, and public interface windows. The burden does not vanish; it moves. Placing recovery near residence, with clear routes and low stigma, keeps the burden from being carried by the wrong people. The goal is not to hide difficulty, but to route it toward care before it becomes institutional atmosphere.

7.2 — Educational and Study Precincts

The City is not a university, yet it needs a serious learning ecology. Public-power seekers encounter law, economics, administration, history, science, media, ethics, diplomacy, systems, and the lived consequences of institutional choice. The educational precinct earns its place when knowledge appears in better questions, revised drafts, calibrated uncertainty, listening, service, and the ability to explain burden to people outside the room. Completion of study remains evidence of work, never a certificate of readiness by itself.

Educational design begins with the burden of learning. What does a future public-power holder need to know so that their later decisions do not shift hidden cost onto others? They need law, administration, material burden, history, conflict, data limits, media literacy, systems thinking, institutional craft, and humility before expertise. But knowledge becomes dangerous if it becomes prestige. The City must teach without creating another elite fluency ladder.

Learning spaces are designed against three recurrent distortions. Credentialism turns course completion into presumed readiness; performance turns learning into a display of intelligence; hidden mentor sovereignty lets advisers shape public judgment without visible responsibility. The counterdesign combines plural sources, traceable assignments, accessible rooms, role clarity, learner reflection, disagreement records, and independent challenge. Education becomes structured, demanding, and

humane without producing a new civic caste (Barrett et al., 2015; Cleveland and Fisher, 2014; Byers et al., 2018).

Study also requires quiet. A public-power seeker must have time to read difficult material without immediately turning it into public statement. The City cannot train careful judgment if every learning process is rushed toward a visible product. Deep work is part of public responsibility because shallow public knowledge becomes future public burden. Study rooms protect the discipline of not speaking too soon.

The educational precinct should be modest about what teaching can accomplish. No classroom guarantees courage, compassion, independence, or judgment. Education can create better conditions: strong knowledge, practice with disagreement, exposure to affected people, feedback, correction, and habits of explaining decisions. Readiness remains a public claim supported by a broader record, not a diploma conferred by the City.

The educational precinct should be read as formation space rather than prestige space. Its test is not whether participants can pass through impressive syllabi, quote institutional vocabulary, or perform fluency before observers. Its test is whether they learn to locate burden, distinguish evidence from status, identify affected persons, ask for expertise without surrendering judgment, and revise their view when the record shows that people were being injured, ignored, rushed, or misclassified. Education under the Vow should produce a slower and more answerable mind, not a more polished political actor.

Educational space also needs an anti-capture ecology. A mentor, professor, visiting expert, founder, donor-funded chair, commentator, or Artificial Intelligence assistant can shape a participant before the public sees the resulting position. The answer is not suspicion of teaching. It is plural exposure, declared roles, traceable influence where public-purpose relevance exists, protected intellectual struggle, and release labels that distinguish learning, testing, adopted view, rejected view, and formal readiness.

7.2.1 — Classrooms for Public Reason

Classrooms for public reason are not ordinary lecture rooms with a civic name. They are spaces where participants learn to justify decisions in terms that can be examined by people who do not share their private loyalties. Public reason is not the erasure of conviction. It is the discipline of making power explain itself to those who must live under it.

The classroom must train participants to ask how an argument moves burden. A policy claim should not be evaluated only for elegance, ideology, or rhetorical force. It should be asked who waits, who pays, who is exposed, who is protected, who has appeal, who is forgotten, and who carries the error if the claim fails. This is burden-aware instruction in practice (Barrett et al., 2015; Byers et al., 2018).

Classroom design should reduce prestige theater. Seating, speaking rules, facilitation, source access, and participation norms should prevent the most fluent person from appearing most ready by default. Public power is often captured by those who can

speak quickly in institutional language. The City must teach fluency but not worship it.

A classroom for public reason succeeds when participants learn that authority must give reasons under burden. It fails when participants learn only how to sound enlightened. The City's educational spaces should produce slower confidence, not smoother self-presentation.

The classroom should also teach burden translation. A participant should be able to take an abstract principle and translate it into administrative cost, human risk, appeal pathway, staff load, nonparticipant effect, and failure mode. Public reason becomes real only when it can survive this translation.

A public-reason classroom should also teach listening as a measurable civic practice, though not as a human-worth score. Participants should be asked to restate rival arguments, identify missing affected persons, and explain what would change their mind. The skill is not intellectual submission. It is the discipline of letting reality push back before authority arrives.

Classrooms should include an affected-person discipline built into the room's pedagogy. Before a participant speaks as if a problem belongs to policy alone, the classroom should ask who experiences delay, surveillance, cost, humiliation, risk, hunger, disability, heat, paperwork, policing, litigation, or loss when that policy fails. This is not a sentimental exercise. It is the translation that prevents public reason from becoming an elegant abstraction. A classroom that cannot force an argument to meet the person who carries it is not yet a classroom for public power.

The classroom record should distinguish attendance, assigned sources, questions raised, corrected errors, adopted conclusions, and unresolved disagreements. A future public record should not flatten those categories into a single image of virtue or ignorance. Learning requires the freedom to be wrong within a protected process that still leaves a trace of correction. The City should make the improvement of reasoning visible without turning every imperfect sentence into a permanent weapon.

7.2.2 — Study Rooms

Study rooms protect the part of public-power formation that should not always be public-facing. A participant needs spaces for reading, note-making, comprehension, language work, legal review, policy comparison, and personal intellectual struggle. Constant visibility does not require constant communicability. A person can be under record and still need quiet before speech.

Deep work is a fairness issue because bad public decisions often come from shallow processing. A leader who has only skimmed a topic may still speak with confidence if the culture rewards immediacy. The City must train the opposite habit: pause, read, test, ask, and return. Study rooms are where the participant learns that public responsibility sometimes begins by not performing understanding too early.

Different kinds of study require different arrangements. Some rooms may support solitary reading. Others may support paired source review, assisted learning, translation, accessibility support, or supervised archive education. Intellectual work does

not fit one body, one language, one neurotype, or one academic style. Cognitive access is part of the educational ecology.

Study rooms also protect staff time. If participants have no proper place to struggle independently, they may overuse mentors, faculty, or staff for work that should be self-directed. Conversely, if study rooms are isolating and unsupported, participants may quietly fail. The correct design creates both independence and reachable assistance.

Study-room records should protect the dignity of slow learning. The public may need evidence of effort, sources, completion, and revision, but not a humiliating minute-by-minute exposure of confusion. A City that punishes the visible process of learning will produce participants who pretend to understand sooner than they do.

Study rooms should be designed for many kinds of cognition. Some participants will need silence, some will need assistive technology, some will need translation support, some will need large print, some will need movement breaks, some will need reduced visual stimulation, and some will need supervised source handling. The room should not silently privilege one academic body as the normal body. A City that claims to form public power should understand that intelligence under burden is often shaped by sleep, disability, language, trauma, time, and previous access to education.

The study room must also resist becoming a private influence chamber. Device rules, meeting permissions, source access, visitor restrictions, and staff support should prevent a person from

using quiet as cover for shadow meetings or off-record direction. The design problem is delicate: the participant needs protected concentration, and the public needs confidence that protected concentration has not become hidden power formation. The answer is not constant interruption. It is clear purpose, limited access, logged exceptions, and reviewable use categories.

7.2.3 — Research-Literacy Spaces

Research-literacy spaces teach participants how to encounter evidence without turning evidence into overclaim. Public-power seekers will read studies, dashboards, audits, expert summaries, statistics, model outputs, public comments, and technical reports. Many will be tempted to use evidence as decoration for a position already chosen. The City must teach evidence as discipline.

Scientific claims and measurement concepts deserve a substantive place in the curriculum. Participants can learn to examine evidence, uncertainty, bias, method, and rival explanations. City operations provide observations about the institution itself. Testing PTVC requires a defined account of felt experience and its true endpoint, with the methods developed in *The Science of Fairness*.

These spaces should include access to methodological instruction: sampling, causal inference, measurement error, observational limits, qualitative evidence, administrative data, replication, statistical uncertainty, and ethical review. The goal is not to make every participant a scientist. The goal is to prevent public power from misusing science as a costume of certainty.

Research-literacy spaces also teach the difference between operational evidence and research evidence. A City record may show that a participant responded to correction, carried load, or revised a draft. That is operational material. It is not automatically research data, and it does not by itself prove general claims about human fairness. Participants should learn this boundary before they ever cite the City as evidence.

Artificial Intelligence literacy belongs here too. A summary generated by a system may help navigate records, but it can distort salience, omit context, reproduce bias, or sound more certain than the underlying record allows. Participants should learn to challenge machine output, request provenance, and ask what data, prompt, and classification system shaped the result.

Research-literacy spaces should train participants to see uncertainty as a public duty. A graph, study, model, dashboard, expert memo, poll, audit, or AI-generated summary should enter the room with questions attached: What was measured? What was excluded? Who was missing? What is the error range? What competing explanation still stands? What use would overstate the evidence? Public power often injures people when it treats a confident chart as if it were the whole life it only samples. The City must teach evidence as humility before consequence.

Operational success, public records, or visible personal change within the City cannot support the formal Law merely by resembling its themes. Research-literacy spaces should teach that City records can illuminate behavior, process, burden, repair, drift, and institutional feasibility within City scope. They cannot validate PTVC, measure inner worth, or issue a scientific verdict.

Evidence becomes safer when its boundary is taught with its power.

7.2.4 — Faculty and Mentor Zones

Faculty and mentor zones are necessary because public-power formation requires guidance. Participants need teachers, advisers, critics, interpreters, and people experienced enough to help them see what they cannot yet see. But guidance is also influence. If mentor influence is hidden, the City will reproduce the invisible formation channels it was built to correct.

Advice logging must be proportional. Material intellectual influence, role guidance, policy direction, and readiness interpretation should be traceable. Ordinary encouragement and humane support should not become an impossible documentation burden. If every sentence is logged as influence, mentors become stilted and participants lose human guidance. If nothing is logged, hidden authority returns.

Mentor zones also need safeguards against dependency. A participant who relies too heavily on one mentor may begin to borrow judgment instead of forming it. A mentor who enjoys influence may begin to shape the participant as an extension of themselves. The City should diversify guidance, rotate review, and make intellectual dependency visible without shaming legitimate learning.

Faculty and mentor spaces must protect staff dignity. Mentors are not always charismatic sages; they are workers under burden. Their time, emotional load, privacy, and professional boundaries must be protected. A City that celebrates mentorship while

burning out mentors has hidden a cost beneath educational language.

Mentor-zone design should include a conflict-of-influence review. If one mentor's vocabulary, ideology, professional network, or approval begins shaping a participant's public reasoning too strongly, the City should diversify review before dependency becomes invisible formation.

Faculty and mentor zones should make influence visible without humiliating teaching. A mentor needs room for correction, counsel, challenge, and support. A participant needs room to ask foolish questions without instantly performing for a public audience. At the same time, mentor influence is public-power formation. The City should know when a mentor helped shape a policy view, calmed a crisis, redirected a relationship with evidence, or repeatedly favored one interpretation. Influence is not corruption by default, but untraceable influence is a burden placed on the future public.

Mentor spaces therefore require role clarity. A faculty member is not a therapist unless properly licensed and acting in that role. A mentor is not an owner of the participant's judgment. A founder, donor, celebrity expert, or admired official should not become an invisible authority through repeated private access. Mentor-zone records should identify role, purpose, frequency, and influence category without exposing protected care content. The goal is to preserve guidance while preventing guidance from becoming hidden command.

7.2.5 — Public Learning Interfaces

A public learning interface converts legitimate civic interest into inspectable educational objects. Curriculum purposes, standards, reading paths, public lectures, explanatory diagrams, and structured outputs can show what the City teaches and why. Raw access to every classroom moment would add spectacle rather than understanding, especially when a learner is uncertain, receiving support, or revising an error.

Accessibility matters because civic education should not be reserved for experts. Public learning materials should be readable, translated where needed, disability-accessible, and clear about limits. A public interface that only trained academics can understand will not create democratic trust. A public interface that oversimplifies until safeguards disappear will create public risk.

Public learning should reveal methods, limits, and released outcomes without exposing vulnerable learning processes. Citizens can learn from anonymized examples, structured demonstrations, faculty explanation, participant-authorized material, and contextualized record bundles. Constant access to uncertainty, embarrassment, or unfinished thought would turn civic education into educational voyeurism.

The interface must work for skeptical readers as well as sympathetic ones. Curriculum boundaries, evidence labels, public-risk limits, correction histories, complaint routes, and unresolved questions should be easy to locate without passing through decorative optimism. A reader should be able to disagree

with the City and still understand exactly what it claims, what it withholds, and how it can be challenged.

The interface should let citizens inspect the formation system without consuming the person being formed. Nonconfidential syllabi, curriculum maps, public lectures, sample exercises, annotated cases, aggregate themes, and later reflections can make the educational burden clear. Private disability support, grief-shaped difficulty, household interruption, and raw confusion remain protected because the public needs accountable formation, not human vulnerability as content.

These interfaces also help prevent elite closure. If the public cannot understand what the City teaches, the City becomes another institution speaking in protected codes. Public learning material should be clear enough for citizens, critics, journalists, and host communities to ask serious questions. It should explain evidence limits, public-power burden, rights, record categories, and correction duties in language that respects nonexperts. Future officials should not be educated in a dialect ordinary people cannot challenge.

A learning-space evidence packet should accompany each major room type. It records the room's public task, accessibility assumptions, recording status, protected discussion boundary, staff load, equipment dependencies, reset procedure, and the conditions under which the room may not be used. A seminar room that excludes a wheelchair, a simulation room that cannot de-load a distressed participant, or a public-learning interface that requires specialist dialect is not merely inconvenient. It is producing a distorted formation environment and should be

corrected before the distortion is interpreted as individual performance.

Learning spaces also need a periodic room-ecology review. Reviewers should examine who routinely gains the floor, who is interrupted, which bodies can remain comfortable for a full session, whether remote and translated participation is genuinely equivalent, what staff labor makes the room function, and whether the technology privileges polished speed over careful thought. The review should connect pedagogy to space without treating architecture as a cure for educational failure. When the same people repeatedly disappear from discussion, the room, timetable, facilitation, and record process all become subjects of inquiry.

7.3 — Deliberative Halls and Drafting Rooms

Deliberation is the point at which knowledge becomes shared judgment under disagreement. A participant may understand law, administration, science, and history yet still fail to listen, revise, state uncertainty, or account for people outside the room. The City therefore creates spaces where reasoning can be observed before office through sources, alternatives, minority positions, burden notes, draft histories, and correction. The goal is not eloquence on display. It is judgment whose formation can be reconstructed and challenged.

Deliberation is a burden-routing process. A decision is not merely a sentence on paper. It moves labor, time, risk, exposure, cost, care, and authority into people's lives. Deliberative spaces should force participants to ask who carries the burden of a proposal, who benefits from its language, who is absent from the room, who has appeal, and what hidden cost would appear if the decision were implemented.

Reasoning must become traceable without becoming performance. Participants may begin speaking for the archive rather than the problem, staging apology, or treating dissent as brand management. Deliberative rooms should therefore preserve drafts as drafts, simulations as simulations, structured opposition, source routes, revision history, and after-action learning without converting intellectual risk into public humiliation (Habermas, 1984; Mansbridge et al., 2012; Fishkin, 2018; Gastil, 2008).

Deliberative halls and drafting rooms also protect the public from the false simplicity of final decisions. In ordinary politics, the

public often sees the vote, order, press conference, or apology without seeing the path. The City can provide deeper evidence: what alternatives were considered, what sources shaped the draft, who objected, how the participant responded, what was revised, and where uncertainty remained. This is not proof of wisdom. It is a better object for judgment.

These spaces prepare later office interface without becoming office themselves. They are pre-authority formation zones. Their purpose is to help public-power seekers learn how to reason before decisions carry legal power. The City may observe, record, and teach. It does not replace government. It makes future public reasoning harder to hide.

These spaces also create a library of public reasoning for future study inside the City, though not research by default. Participants can learn from earlier deliberations when privacy, status, and consent rules permit. They can see how past cohorts mishandled evidence, corrected language, misread opposition, or improved through after-action review. Formation becomes cumulative without turning earlier participants into permanent exhibits.

Deliberative and drafting zones are where the City most visibly refuses campaign theater. In ordinary politics, the public often sees the speech, the vote, the interview, the polished platform, or the crisis performance after the real formation has already happened elsewhere. The City reverses that timeline by locating argument, revision, dissent, and testing in rooms designed for traceability. Yet traceability should not become a punishment for thinking aloud. These rooms need status labels, release timing, protected deliberative categories, context notes, and correction

paths so that unfinished reasoning can be studied without being misrepresented as final character.

The design of these rooms should also anticipate the most subtle burden shifts of intellectual power. Who controls the agenda? Who decides which policy draft is live? Who has access to experts? Who is interrupted without consequence? Who is asked to represent a whole affected group? Who bears the emotional cost of opposition? Who records the objection that was inconvenient but correct? If deliberation halls and drafting rooms cannot answer those questions, they will simply reproduce hidden power in a more elegant building.

7.3.1 — Deliberation Halls

Deliberative halls are arranged around relationships among people, sources, proposals, and affected interests rather than a heroic speaker. Sightlines, acoustics, shared displays, accessible seating, translation, note access, and visible drafting help participants hear one another and examine evidence. The room also keeps absent people conceptually present through burden maps, testimony, data, and stated uncertainties. Spatial form supports democratic reasoning when it makes listening and revision as visible as speech.

The physical arrangement matters. Seating that creates a single throne of attention will train the wrong habits. A deliberative hall should support equality of voice, visible facilitation, accessible participation, translation, disability access, and clear record status. The room should not reward height, volume, charisma, or proximity to the front as though those were signs of readiness.

Record design in the hall should capture reasoning pathways, not merely quotable statements. Who introduced an argument? What evidence was cited? What objection was raised? What alternative was considered? What changed? These questions matter more than a polished sentence. Public-power formation requires a record of judgment in motion.

Deliberation halls must protect minority positions. A dissenting participant should not be treated as disruptive merely because they slow consensus. The City should make space for minority reports, unresolved concerns, and structured objection. Sometimes the burden that later proves decisive first appears as an inconvenient voice in the room.

The hall must also resist public applause culture. If public-facing deliberations become occasions for spectators to reward speakers, participants may begin to deliberate for reaction rather than truth. Public access should be carefully governed, often delayed, contextual, and protected from crowd capture. Deliberation is civic work, not performance sport.

Deliberation halls should be arranged to make power in the room visible. Seating, microphones, facilitation, turn-taking, source screens, interpreter access, accessibility paths, quiet supports, and observer positions decide who can reason under pressure. A hall that looks neutral may still reward the loudest, fastest, most credentialed, most socially secure, or most physically comfortable person. The City should audit deliberation design for who gets interrupted, who gets summarized unfairly, who carries emotional explanation, and who is treated as a symbol instead of a participant in reasoning.

Deliberation also carries the burden of silence. Some participants contribute by listening, annotating, requesting sources, using interpretation or assistive support, or identifying uncertainty after reflection rather than speaking immediately. The hall should not convert talkativeness, speed, or comfort under interruption into readiness, nor should it mistake quiet processing for civic weakness. Turn-taking, written contribution, pause, and later amendment should remain legitimate forms of public reasoning.

The hall's record should preserve argument structure, not only dramatic moments. Public review needs to know what claim was made, what evidence supported it, what objection was raised, what affected persons were named, what changed after challenge, and what remained unresolved. Without that structure, the record can reward performance over thought. A deliberation hall worthy of the City should make reasoning reconstructible enough for accountability and contextual enough to prevent the public from mistaking one tense exchange for a final civic soul.

7.3.2 — Drafting Rooms

Drafting rooms are where public reasoning becomes text. A policy, statement, rule, budget note, public explanation, or institutional recommendation does not appear fully formed. It is drafted, revised, annotated, challenged, simplified, expanded, and sometimes abandoned. The City must make this formation visible enough to weaken the myth of effortless public judgment.

Drafting is a burden-sensitive act. The way a sentence is written can shift responsibility, hide uncertainty, soften harm, imply certainty, erase affected persons, or turn a cost into an abstraction.

A drafting room should train participants to ask what every phrase does to the people who must later live under it. Public language is not harmless because it is verbal. It routes burden through interpretation.

Drafting rooms must also protect unfinished thought from false finality. A rough draft can contain testing language, provisional options, or arguments rejected later. If the public reads every draft as settled belief, participants will stop drafting honestly. The City must teach readers how to distinguish exploration from commitment. This is why release timing and status labels matter.

Staff influence is especially important in drafting spaces. Staff and mentors may shape language, provide research, challenge claims, or insert caution. That influence is not corruption by itself. It becomes a problem when it is hidden or when the participant's public reasoning is merely staff reasoning in the participant's voice. Source integrity protects both participant and staff.

Drafting-room practice should include a burden footnote habit. Major drafts should ask, in some visible form, whose time, money, privacy, safety, labor, and appeal rights the proposed language touches. This does not need to become formulaic, but the discipline should be present before public office.

Drafting rooms should treat the text under construction as a burden object. A policy draft is not merely language. It is a future route for money, force, eligibility, care, delay, data, duties, exceptions, and remedies. The drafting room should therefore track why a clause exists, who proposed it, what problem it addresses, what burden it shifts, what alternative was rejected,

and what review is still needed. This does not require turning every edit into a public scandal. It requires refusing the myth that final wording appears without formation.

The room should also expose the difference between writing and laundering. A participant may receive expert help, legal drafting assistance, data analysis, translation, or administrative modeling. That help can be legitimate, even necessary. But the public should later be able to see whether a participant understood the draft, whether advice became hidden authorship, whether donor or factional language entered the text, and whether affected-person concerns were removed for convenience. Drafting traceability protects the public from polished documents with concealed ancestry.

7.3.3 — Simulation Chambers

Simulation chambers allow the City to place participants under bounded pressure before real public harm is at stake. Public power often requires judgment under incomplete information, time pressure, competing goods, fear, uncertainty, and public consequence. A participant who reasons well in calm seminars may behave differently when a crisis compresses time. Simulation helps reveal that difference.

Simulation should create disciplined difficulty without manufacturing trauma. Its purpose is to observe decision patterns, authority use, uncertainty handling, communication, team behavior, and recovery under bounded pressure. Scenario design needs informed participation, stop authority, clinical review where appropriate, aftercare, and a clear rule against humiliation

or dramatic footage. Seriousness is measured by what the exercise teaches, not by how much distress it produces.

Scenario design should be explicit about what is being tested. Is the exercise about evacuation, public explanation, budget triage, misinformation, diplomatic confidentiality, emergency care, staff conflict, or legal constraint? Without defined aims, simulation becomes vague stress theater. With defined aims, it can produce operational evidence about specific capacities and limits.

Record status must be carefully labeled. Simulation is not office. It is not real authority. It is not destiny. A participant may fail a simulation and learn. Another may succeed in simulation and still be unready. Public release should include context, limits, debrief, and correction. The City must prevent simulated pressure from becoming a public ranking of courage.

After the simulation, care matters as much as performance. Participants and staff need debrief, emotional reset, error classification, and a path from stress into learning. If the City stages crisis and then leaves people alone with the load, it has turned education into extraction. Simulation must include recovery by design.

Simulation chambers should be designed around pressure without humiliation. Public power often fails under crisis because the person has never been tested inside realistic complexity: incomplete information, time pressure, conflicting duties, public anger, legal limits, staff fatigue, media distortion, security risk, and the suffering of affected people. Simulation can reveal habits before office. But if simulation becomes a spectacle of collapse,

the City will train defensive performance. The chamber should be serious, bounded, consent-aware, trauma-aware, and evaluated for learning rather than public entertainment.

Simulation records should separate performance, stress response, correction, and readiness signals. A participant who freezes once in a difficult scenario may need training, not shame. A participant who repeatedly hides evidence, blames staff, humiliates opponents, refuses correction, or sacrifices protected persons under pressure may reveal a more serious readiness concern. Simulation is evidence, not destiny. Reviewers should use these records as one evidence family within a broader formation assessment, with context, independent review, and an opportunity to learn.

7.3.4 — Opposition Rooms

Opposition rooms are the City's refusal to form public power only among friends. Allies are important, but allies often protect people from the sharpest questions. Serious opposition reveals blind spots, weak evidence, hidden assumptions, and emotional reactions to challenge. A participant who cannot face opposition before office should not first discover that fact while governing.

The opposition room should support adversarial dignity. Critics need enough independence, preparation, and protection to challenge assumptions, incentives, evidence, and power without becoming props. Participants should face strong arguments and real consequences, while abuse, harassment, and theatrical humiliation remain outside the exercise. The room succeeds when disagreement changes drafts and decisions.

Record handling must protect opponents as well as participants. A critic entering the room should not become a public target. Their argument may be recorded, summarized, or referenced under agreed terms, but their private life is not part of the participant's formation record. Opposition cannot work if critics are punished for helping the City learn.

Opposition rooms should be protected from ideological tokenism. Bringing in one critic from a group, class, tradition, or political tendency cannot stand for the whole position. The City should treat opposition as an ongoing discipline of serious rival modeling, not a symbolic encounter staged for institutional credibility.

The opposition program must prevent critique from becoming self-branding. A person may learn to appear brave by inviting attack, or appear open-minded by collecting critics they never truly hear. Opposition rooms should examine what changed after critique. Without change, question, or accountable refusal, adversarial presence can become another performance.

Opposition should be evaluated less by who appears to win than by how a participant receives, tests, and answers challenge. Does the person listen, restate the objection fairly, ask better questions, retaliate, collapse into performance, or revise a position? The record should distinguish disagreement with a critic from refusal to engage the critic's evidence or affected-person account. These patterns matter because campaign debates rarely reveal whether a future officeholder can remain answerable after prestige and power are at stake.

Opposition rooms should be safe for the critic as well as useful for the participant. A person invited to challenge a future public-power holder should not become a prop for the participant's growth or a target for supporters. The room should define the critic's role, consent, record status, compensation if appropriate, exit right, privacy protections, and complaint path. Opposition is not fair if the critic carries all emotional risk while the participant receives all civic credit for listening.

Opposition rooms should welcome different forms of challenge: legal, scientific, material, historical, religious, ordinary-life, disability, labor, host-community, administrative, and ideological. The purpose is not to collect enemies for display. It is to make formation answerable before power hardens. An opposition room becomes a primary formation record when it shows that a serious institution can place its own assumptions under pressure without demanding that critics join, admire, or soften the critique to protect the City's image.

7.3.5 — After-Action Spaces

After-action spaces convert stress, error, conflict, and decision into learning. Without after-action review, the City risks collecting dramatic events without producing correction. The purpose of formation is not to watch people fail. It is to help failure become legible, reparable, and less likely to harm others later.

After-action space should make classification possible without turning the room itself into a tribunal. It needs enough time, privacy, source access, and facilitation to separate what

happened, what kind of error occurred, what burden followed, and what correction belongs next.

After-action spaces should also include care. Pressure exercises, opposition sessions, public interface failures, and household conflicts can leave real residue. Immediate self-analysis should not be demanded from a body still under threat. Care before interpretation remains a rule here. A person must be safe enough to learn.

Public summaries may be appropriate, but raw after-action material should not become spectacle. The public needs to know that correction occurred, what general pattern was identified, and what safeguards changed. It does not always need every vulnerable detail. After-action review should create trust through repair, not attention through exposure.

After-action review should also ask what the City learned about itself. A participant's error may reveal bad instructions, unclear thresholds, poor simulation design, staff overload, or a flawed record interface. If review only studies the participant, institutional failure will hide behind individual correction.

After-action records should avoid both confession theater and institutional image management. A participant's visible humility is not the outcome, and the City's ability to narrate every mistake as maturity is not the outcome. A trustworthy record identifies the problem, relevant context, corrective action, affected people, remaining uncertainty, follow-up owner, and date of review so repair can be tested after the emotional moment has ended.

The deliberative precinct should preserve revision as carefully as speech. A room-level revision record can identify the question considered, source materials supplied, significant exclusions, declared conflicts, unresolved dissent, changes made after critique, the reason for any accountable refusal, and the person responsible for follow-up. It does not record private thought or reward ideological movement. It shows whether the institution created a real path from disagreement to correction instead of treating opposition as a scheduled performance.

One further test lies between the room and the record. A chamber is not transparent merely because microphones are present or minutes are eventually posted. The architecture should make it possible to identify what question was open, which evidence was available, who could speak, where exclusion occurred, what remained unresolved, and when a decision moved from discussion to authority. Displays, clocks, document screens, annotation surfaces, translation channels, and accessible seating should support that trace without turning faces, hesitations, or private reactions into evidence. When the record is released, a person outside the room should be able to distinguish proposal from decision, dissent from obstruction, correction from retreat, and silence from consent. If the room produces only polished clips or a final vote, it has made performance visible while leaving reasoning hidden.

7.4 — Commons, Dining, Libraries, and Walking Grounds

Seriousness cannot occupy every hour in the same register. Commons, dining spaces, libraries, and walking grounds create intervals in which a person stops performing the roles of candidate, student, participant, or future official and encounters others through meals, reading, humor, quiet, and ordinary reciprocity. Those intervals are part of formation because they reveal whether civic discipline can coexist with friendship, difference, fatigue, and unmeasured life. A place without them will train rigidity more reliably than judgment.

The commons reveal burdens small enough to disappear from formal review. Who cleans the table? Who interrupts? Who is thanked? Who is ignored? Who makes space for a slower speaker? Who uses informal time to dominate? Who withdraws because the room is too loud? Who treats staff as scenery? Who turns every conversation into a public signal? The commons reveal patterns that formal sessions can conceal.

Ordinary shared spaces also protect participants from becoming only record subjects. The City cannot produce fair public-power formation by keeping people in constant formal posture. Human beings need meals, books, walking, silence, chance conversation, and noninstrumental time. Without these, the City will train people to appear principled while quietly losing the ordinary capacities that help power remain humane (Ostrom, 1990; Whyte, 1980; Gehl, 2010; Klinenberg, 2018).

Commons can become performance stages unless their ordinary purpose is actively protected. Participants may act for future release, visitors may press for unscheduled access, staff may carry invisible service burdens, informal conversations may become influence channels, dining may reproduce hierarchy, and libraries or walking grounds may become prestige backdrops. Each space needs enough governance to prevent capture without killing ordinary life. The test is whether people can use the commons naturally while consequential power remains visible and reviewable.

Commons function as civic intervals. They are not leisure amenities. They are places where routine, recovery, relation, and nonperformance norms support a visible life that remains livable. Public power is formed not only by what a person says under pressure, but also by how they inhabit unglamorous shared time.

The commons also protect against another error: the fantasy that public-power seekers should always be improving themselves. Human beings need time that is not optimized. A City that turns every meal, walk, book, and conversation into self-improvement will create another market of performance inside a civic institution. Noninstrumental time is not waste. It is part of the condition that keeps the person from becoming only a project.

Ordinary spaces are dangerous precisely because they look harmless. A dining room, library table, walking path, or sitting area can become the place where status emerges without an agenda, where people are included or frozen out, where gratitude is demanded from staff, and where informal factions form.

Ordinary conduct should not be overinterpreted, yet recurring patterns that formal sessions conceal still require attention.

These spaces need a record ethic suited to ordinary shared life. Safety, staff protection, pattern review, and later context may justify limited records, but live entertainment, personality surveillance, and social-media extraction do not. Commons succeed when people can be unglamorous without disappearing, tired without being shamed, kind without performing kindness, and corrected without spectacle turning repair into humiliation.

7.4.1 — Commons as Civic Interval

A commons is a pause in the machinery of formal formation. It lets participants, staff, mentors, and sometimes visitors occupy a shared place without every action being structured by class, deliberation, public interface, or crisis review. This pause is not absence of meaning. It is a different kind of civic meaning, the meaning of shared ordinary presence.

A participant remains bound by the Vow's rules in the commons, including the duty not to hide consequential role business. That continuing obligation does not make quiet presence, friendship, or ordinary conversation automatically recordable. Role records require a declared role purpose; separately authorized safety or other records remain governed by their own limited purposes and protections. The commons provide human intervals in which people need not produce evidence of authenticity for future public release.

Design should prevent hierarchy. If some corners become informal VIP zones, if staff occupy inferior edges, if participants

perform for visitors, or if influential mentors dominate the center, the commons will reproduce the hidden status systems the City opposes. Furniture, sightlines, access rules, and norms should support ordinary equality.

Commons also need boundaries around influence. An informal conversation can matter. A donor, adviser, journalist, or volunteer could use casual space to shape a participant outside proper channels. The solution is not to destroy casual life. The solution is to make access classes, influence logging, and staff observation proportionate and clear.

The commons should include space for quiet presence as well as conversation. A person should not be forced into constant sociability to prove openness. Introverted, neurodivergent, grieving, tired, disabled, or overloaded participants may need to be near others without performing interaction. Civic interval includes the right to be present without being consumed.

Informal influence needs rules lighter than formal deliberation and stronger than social guesswork. Friendship, admiration, irritation, and trust will grow in shared space. The concern is repeated asymmetry: the same participants included, the same critic isolated, the same mentor hovering, or donor-adjacent access becoming ordinary. Commons design should make room for human relation while giving the institution ways to notice soft capture before it becomes culture.

Staff should be visibly respected without becoming surveillance instruments. Cleaning, food service, reception, maintenance, technical support, accessibility assistance, and security shape the

felt ethics of a room. Complaint routes, pattern review, ordinary civility, and limits on retaliatory interpretation belong to commons ecology. A shared room is fair only when the people who sustain it are not hidden beneath it.

7.4.2 — Dining as Shared Life

Dining is one of the simplest and most revealing forms of shared life. People show their relation to power in how they wait, speak to food workers, handle preference, respond to scarcity, share space, and accept correction. The City should treat meals as more than nutrition and less than ritual: ordinary civic sustenance with enough structure to resist hierarchy.

A fair dining system begins with the people and systems that carry the meal. Food is grown, purchased, transported, stored, prepared, served, cleaned, composted, wasted, budgeted, and repaired through labor. Kitchen routes, heat, schedules, sourcing, waste, worker voice, and staffing levels are part of the dining room's moral architecture.

Luxury dining would distort the institution's relation to service. Meals should be nutritious, culturally respectful, accessible, and humane without resembling an elite retreat. The relevant contrast is not austerity versus pleasure. It is ordinary dignity versus a prestige environment whose comfort is subsidized by hidden labor or host inequality.

Food systems must accommodate health, disability, allergies, sensory needs, culture, religion, and ethical dietary commitments without turning difference into spectacle. Accommodation should be planned with affected people and food workers rather than

improvised at the last moment. The review must include menu design, ingredient information, cross-contact risk, fasting or observance needs, budget, staffing, and the burden created by special processes.

Shared meals can become a daily school of equality only when the institution reviews table hierarchy, service labor, dietary accommodation, food waste, complaint handling, and staff interaction without ranking personalities. The relevant evidence is operational: recurring delays, unmet needs, worker overload, exclusion, waste, and whether correction follows.

Dining should include the burden of nourishment, not only the symbolism of eating together. Food sourcing, dietary needs, allergies, religious or ethical food practices, disability access, eating disorder safeguards, staff workload, cleaning labor, waste, cost, and time all enter the dining room. A meal can become shared life, but it can also become hierarchy, stigma, deprivation, indulgence, or performance. The City should make dining modest, nourishing, inclusive, and operationally honest rather than using meals as a stage for unity.

The dining room is also a quiet test of power. Does a participant listen when a food worker explains a constraint? Does a group leave mess for someone else to absorb? Are dietary accommodations treated as nuisance? Do public-facing meals become scenes of image management while ordinary meals carry the real mood? The City does not need to turn dinner into moral scoring. It does need to recognize that public power often reveals itself in the treatment of people who serve, clean, wait, and accommodate.

The service-ecology and food/culture bias review begins with the daily chain rather than the finished plate: procurement, delivery, storage, preparation, accommodation, service, cleaning, waste, staffing, cost, and recovery. Each step identifies who decides, who works, who may be excluded, what failure looks like, and how a complaint changes the system.

Cultural inclusion is tested by design consequences, not variety on a poster. Menus, schedules, kitchens, serving practices, seating, fasting periods, ingredient information, prayer-neutral quiet, and staff capacity must be examined with affected users. An accommodation that exists only through repeated personal pleading is not yet part of the service ecology.

Workers need equal standing in this review. A menu cannot be called inclusive if it produces unsafe shifts, impossible preparation, harassment, unpaid interpretation, chronic understaffing, or pressure to conceal shortages. Worker voice, workload data, safety rights, procurement transparency, and anti-retaliation routes are part of the food system's public integrity (International Labour Organization, 1981, 1988).

The result is not a score for participants or a lifestyle ideal. It is a correction process for a shared system. When complaint patterns, waste, exclusion, staff strain, supply fragility, or cultural bias recur, the City changes the menu, schedule, staffing, contract, space, or service rule rather than asking individuals to absorb the mismatch.

7.4.3 — Libraries as Quiet Burden Relief

A library in the City is not a prestige backdrop. It is quiet burden relief and intellectual infrastructure. Public-power formation requires spaces where the participant can meet complexity slowly, where staff can retrieve materials without pressure, where citizens can access public explanations, and where silence itself becomes part of the ecology of judgment.

The library should protect depth against the speed of public life. Campaign culture rewards immediate response. Platform culture rewards reaction. Office culture often rewards the brief. A library teaches the opposite: sit with sources, compare views, follow footnotes, ask what you do not know, and resist the pleasure of premature certainty. That discipline is civic, not merely academic (Klinenberg, 2018; Aabø and Audunson, 2012).

Access must be layered. Some materials may be public. Some may be participant study materials. Some may be staff reference. Some may be protected for legal, security, clinical, or nonparticipant reasons. A library can model the City's broader record logic by making access categories clear without turning knowledge into secrecy theater.

The library can extend public learning through annotated guides, reading lists, accessible summaries, lectures, and reference support without turning participant study into a visitor attraction. Public interfaces remain distinct from quiet work areas, and materials can show how sources, disagreements, and corrections developed without displaying a learner in a difficult moment. The

result is generous access to ideas alongside a protected ecology for concentration, uncertainty, and revision.

A library succeeds when it makes slowness respectable inside a City built around public consequence. It reminds future public-power holders that knowledge is not an ornament of authority. It is one of the burdens authority must carry before acting.

A City library should be both quiet room and public-intellectual infrastructure. It should give participants access to law, history, administration, public finance, comparative politics, ethics, science literacy, biographies of institutional failure, local host-community materials, and records of rival reforms. The library should widen the menu of thought without turning learning into prestige display. It should also preserve different forms of access: physical books, digital materials, screen-reader compatibility, large print, translation pathways, assisted research, and staff who can help without becoming hidden authorities.

The library also needs a memory boundary. It is a learning environment, not the archive and not a shortcut around record controls. Public bundles, historical cases, anonymized teaching files, published critiques, and lawfully released material can support study; protected raw records, staff complaints, intimate material, and research data remain in their proper regimes. Context should become easier to reach without making restricted source material easier to take.

7.4.4 — Walking Grounds

Walking grounds protect the body from the institutional temptation to keep every important activity indoors, seated, and

verbal. Public-power formation involves cognition, but cognition lives in bodies. Walking regulates attention, stress, emotion, and conversation. A City without walking grounds will force too much burden into rooms designed for speech.

The path system should support several kinds of walking: solitary regulation, mentor conversation, participant pair discussion, staff recovery, accessible movement, and public-edge orientation. Not every path should carry the same record status. Some may be public. Some participant-only. Some staff-protected. Some designed for quiet recovery. Movement needs legible boundaries just as rooms do.

The grounds must be accessible. Walking loops should not assume a single body or pace. Mobility devices, rest points, shade, lighting, winter conditions, heat, sensory load, seating, wayfinding, and emergency access are part of the design. A path that restores only the able-bodied participant is not a fairness path.

Walking grounds succeed when movement becomes part of regulation rather than escape. They tell the participant that public-power formation is not all speech, and they tell the City that a human body must be allowed to move under burden without becoming public scenery.

Walking grounds should include seasonal and climate review. A path that works only in mild weather is not a real civic support system. Shade, drainage, snow, heat, air quality, lighting, and emergency access determine whether the loop is usable when bodies actually need it.

Walking grounds should be planned as movement infrastructure, not as pleasant leftover space between buildings. The City should know where a person can walk alone, with a mentor, with peers, with staff, with a visitor, or near the public edge, and which record or access status applies. Movement often makes difficult conversation possible, but it can also become a way to seek informal influence away from formal rooms. The grounds should allow the body to regulate without allowing public-power formation to disappear into scenic ambiguity.

Walking-ground accessibility should be judged by actual use across varied bodies and paces; a walking culture reserved in practice for the fit, fast, and unburdened would teach the opposite of civic attentiveness.

7.4.5 — Nonperformance Norms

Nonperformance norms protect ordinary life from becoming the City's most subtle theater. A participant under record may begin to curate kindness, humility, fatigue, reading, apology, friendship, and silence. Over time the person can become skilled at appearing unperformed. That is one of the hardest distortions the City must detect.

The first norm is that not every ordinary moment should be released or narrated. If the public record site rewards small moments too easily, participants will learn to make small moments for the site. Delayed release, contextual bundles, and anti-clipping rules help preserve ordinary life from immediate audience capture.

A second norm is that staff should not be used as props in authenticity. Public-power seekers often show character by how they treat staff, but staff are not instruments of participant moral display. The City should record staff treatment where role-relevant while preventing public storytelling that turns staff into evidence objects.

Nonperformance review should examine the institution's incentives rather than judge whether a participant's ordinary behavior is authentic. Daily checks can identify schedule overruns, lost recovery, and audience pressure; a material concern should trigger the bounded review described in Section 17.7.5. Remedies may include longer release delays, less public exposure, lower load, or revised evaluation practices. Review must not become daily scrutiny of sincerity.

Public-facing editors and record-site staff also have a role in nonperformance. If they select only the most moving, charming, or morally pleasing ordinary moments for public release, they will train the City toward sentimental self-display. Release curation should be audited for emotional manipulation as well as privacy and accuracy.

Nonperformance norms should be supported by release timing and institutional culture. If every ordinary interval is quickly summarized, clipped, scored, praised, attacked, or turned into public identity material, participants will learn to act for the archive even in rest. Delayed release, context labels, aggregate pattern review, and clear limits on spectacle pressure can lower that pressure. The City must distinguish being under record from

being under constant public entertainment. Without that distinction, the commons will train strategy rather than humanity.

The norm also applies to the institution itself. The City can perform compassion, perform modesty, perform accessibility, perform sustainability, and perform humility if public admiration becomes the hidden goal. Nonperformance norms should therefore be audited in both directions. Participants should be helped to live without constant image management, and the City should be prevented from using ordinary shared life as public relations. A fair commons does not ask people or buildings to look good before they are good.

7.5 — Recovery, Health, Quiet, and Reflection Zones

Recovery zones make the City's load visible enough to govern. Sleep, quiet, clinical care, sensory refuge, movement, reflection, and temporary de-loading protect capacity, improve judgment, and reduce the temptation to reward those who conceal strain. Participants, staff, families, and future decisions all benefit when early support is easier than collapse. Recovery is therefore a functional condition of answerable service, not a private luxury added after the serious work.

Recovery is a burden-placement problem. If the City does not design sleep protection, clinical interfaces, quiet rooms, reflection spaces, and crisis de-loading rooms, the burden will not disappear. It will move into insomnia, anxiety, staff overload, hidden coping, family conflict, misclassification, or sudden breakdown. A City that celebrates visible service while ignoring recovery is asking the human body to subsidize public trust.

Care spaces also protect the legitimacy of the record. A record of a person in preventable overload is not strong evidence of public-power readiness. It may be evidence of institutional failure. The City must learn to distinguish conduct under ordinary burden from conduct under excessive burden the City itself created. Recovery zones help make that distinction visible (Ulrich, 1984; Hartig et al., 2014; SAMHSA, 2014; WHO, 2018b).

These spaces must remain compatible with secular life and clearly separated from the Religion of Fairness. A participant may seek optional ritual, prayer, grief space, or spiritual reset where appropriate, but the City cannot require religious interpretation.

Reflection must be available to the nonreligious, mixed-belief, skeptical, grieving, ashamed, angry, and exhausted. A civic institution should protect meaning without possessing it.

Recovery design must also avoid hiding active public-power conduct. A quiet room cannot become a secret strategy room. A clinical interface cannot become a political channel. A reflection space cannot become unrecorded influence. Protection requires categories, logging, review, and purpose boundaries. Dignity and accountability must be held together.

The recovery ecology should also produce institutional data in careful aggregate form. If quiet rooms are always full, if sleep protections are constantly breached, if clinical de-loading increases after certain public interfaces, or if staff use crisis spaces more than expected, the City should treat that as evidence about the institution's design. The first question should not be what is wrong with the person, but what burden the City is placing.

Recovery zones carry one of the City's clearest moral admissions: visible public-power formation is heavy labor. A fair institution does not pretend that human beings can live under record, study public consequence, deliberate under scrutiny, face opposition, and prepare for office without bodily and psychological cost. It designs recovery as infrastructure because the burden is real. Sleep, clinical care, quiet, reflection, and crisis de-loading must therefore be close enough, independent enough, and ordinary enough that participants use them before collapse rather than after damage becomes public.

Recovery design also guards against a false romance of endurance. If the City begins to admire participants who need the least rest, the least care, the least quiet, or the least clinical support, it will train future public power in denial. Public power formed through denial often exports denial to the people it governs. Recovery spaces should make a different habit. They teach that a person who knows how to pause, ask for care, lower intensity, protect sleep, and return honestly may be safer with power than a person who never appears to need help.

7.5.1 — Sleep Protection Areas

Sleep protection areas treat sleep as civic infrastructure. A participant under visible public-power formation cannot be expected to carry judgment, correction, conflict, study, and public interface if the institution quietly destroys sleep. Fatigue distorts moral perception. It narrows patience, increases threat response, weakens learning, and makes performance more likely.

Sleep spaces should reduce light intrusion, sound disturbance, alert pressure, unnecessary monitoring anxiety, schedule instability, and late-night social expectation. Sleep protection is not indulgence. It is how the City prevents tomorrow's public-power formation from being carried by an injured nervous system (WHO, 2018a; Basner et al., 2014).

Sleep remains outside routine audio or video capture in the City role-record system. The institution may maintain necessary environmental, scheduling, emergency, or safety records under declared purposes, but it does not create footage of sleeping bodies to demonstrate continuity or readiness. Any exceptional

clinical recording belongs to a separately authorized care process with professional confidentiality and applicable consent requirements. The public record can explain how sleep is protected without exposing the person at rest.

Sleep protection also involves scheduling. A City that talks about sleep while filling the evening with public interface, delayed work, mentor meetings, device alerts, and early morning demands is not protecting sleep. It is aestheticizing it. Calendar design must match spatial design.

Staff also need sleep-respectful operations. Night staff, security, clinicians, maintenance workers, and emergency responders may carry the cost of participant rest. The City must design rotations, staffing, and emergency protocols so sleep protection for one group does not become hidden exhaustion for another.

A sleep protection area succeeds when the participant can rest without shame and without becoming public content. It tells the City that a person's capacity for public responsibility begins, in part, with the institution's willingness to protect the night.

The sleep-protection rule must distinguish care from surveillance. It may need evidence that the environment is functioning, alerts are restrained, and emergencies are handled. It does not need to turn the participant's rest into a nightly behavioral dataset for readiness interpretation. Sleep belongs to care before it belongs to record meaning.

Sleep protection requires design, schedule, culture, and record rules working together. A quiet room is not enough if alerts, meetings, public interface windows, late debriefs, media pressure,

or internal competition reward exhaustion. The City should define sleep windows, emergency exceptions, lighting standards, noise limits, device interruptions, recovery after night events, and protected handling of sleep-related record. If public-power formation destroys sleep and then interprets the resulting judgment errors as character, the City has shifted burden into the body and blamed the body for carrying it.

Sleep areas should also be treated as anti-spectacle zones. Sleep is not a symbol of weakness, laziness, secrecy, or withdrawal from duty. It is a condition of judgment. The City should be able to document that sleep protection exists without releasing sleep as voyeuristic material. In this domain, the public interest is served by knowing that the institution protects restoration, not by watching the most vulnerable parts of restoration.

7.5.2 — Clinical Interface Areas

Clinical interface areas protect independent care inside a record-heavy institution. The City needs clinicians because visible burden can affect sleep, mood, trauma response, stress, disability, medication, physical health, and crisis. But a clinician cannot provide real care if the participant experiences the clinical room as another public archive chamber.

The clinical interface must distinguish care record, safety signal, operational adjustment, and public release. Some information may be necessary for de-loading or safety. Much should remain protected. Clinical disclosure is not ordinary public-power evidence. Care works because people can speak before they have converted pain into public explanation.

Clinician independence is essential. A clinician cannot simultaneously serve as therapist, admissions officer, disciplinarian, public-relations adviser, political-readiness evaluator, or archive narrator without corrupting care. Safety information may need lawful routing, but the clinical role remains centered on the patient, governed by professional duties, and protected from institutional appetite for evidence.

These areas also serve staff. Staff working in the City may face emotional load, moderation exposure, conflict, burnout, and moral injury. A City that offers care only to participants while staff absorb the burden is unfair. Clinical access must be part of staff dignity as well as participant support.

Clinical interface policy should be written before the first crisis, not negotiated during one. Participants and staff should know the thresholds for confidential care, safety notification, de-loading recommendation, public status, and appeal. Ambiguity in medicine becomes fear.

Clinical interface areas must be physically and institutionally distinct from formation authority. Participants should be able to reach qualified care without wondering whether the clinician is an archive agent, mentor, evaluator, political adviser, public narrator, or loyalty officer. The rooms need independent governance, confidentiality categories, emergency exceptions, record boundaries, complaint routes, and medical and legal review. The institution may need to know that care capacity exists and safety duties were met; it does not own the therapeutic interior of the person.

The clinical interface should also protect clinicians and support staff. A clinician working near public-power formation may face pressure from participants, administrators, media, families, security, or public curiosity. The City should guard against demands for dramatic assessments, readiness pronouncements, private revelations, or public reassurance. Clinicians are not props in the City's trust narrative. Their independence is part of the trustworthiness of the City precisely because it limits what the City can use care to claim.

7.5.3 — Quiet Rooms

Quiet rooms reduce nervous-system load without requiring crisis status. The participant should not need to be breaking down before receiving relief from sound, light, conversation, or record awareness. Quiet rooms create an intermediate zone between ordinary activity and clinical care, a place where the body can lower intensity before harm escalates.

Quiet rooms must not become off-record active spaces. Their purpose is restoration, not secret meetings, donor contact, political strategy, or unlogged influence. Access logs, purpose labels, and periodic review can protect the room from becoming a hidden channel while still keeping the experience calm.

Release rules require restraint. Use of a quiet room should not become public evidence of weakness, virtue, instability, or seriousness. The public may need aggregate information about load and recovery systems. It does not need to track each moment of quiet as a character clue. The City must prevent care-seeking from becoming public signal.

Staff access should also be considered. Staff may need quiet after conflict, moderation exposure, emergency response, or intense support work. If quiet rooms are only for participants, the City may again privilege visible figures over hidden labor. Recovery infrastructure should reflect the full burden ecology.

Quiet rooms should be available before distress becomes dramatic. They should not be framed as punishment, weakness, avoidance, or special privilege. A participant, staff member, visitor, or protected contributor may need a low-stimulation space after conflict, sensory overload, grief, panic, migraine, trauma activation, or ordinary exhaustion. The room should be easy to find, culturally normalized, accessible, and governed by rules that prevent it from becoming either a hiding place for shadow meetings or a stigmatized cell for overwhelmed people.

The quiet room should be evaluated by its effect on burden distribution. If it reduces overload for the participant while leaving staff to absorb unmanaged conflict outside, the design is incomplete. If it protects staff but makes participants feel banished, the design is incomplete. If it is so public that no one uses it, or so private that it becomes operationally confusing, it is incomplete. Quiet is not absence. It is a designed condition that allows the nervous system to stop paying unnecessary costs.

7.5.4 — Reflection Spaces

Reflection spaces allow participants and staff to return to meaning without requiring a particular creed. A person under the Transparent Vow may need silence, grief, apology, prayer, meditation, secular reflection, ethical reconsideration, or a place

to sit with shame without performing confession. The City must protect this need without becoming a religious institution.

Reflection spaces should not imply a preferred faith, spiritual rank, moral purity, or institutional doctrine. They may support silence, prayer, contemplation, grief, writing, or simply being alone, but use remains voluntary and plural. Architecture can protect the option of reflection without turning the City into a religious house.

Reflection spaces can support apology, but they should not stage apology. A participant may need to prepare for repair, grieve harm, face guilt, or consider a correction. That preparation is not the same as public apology. Public apology belongs in its proper record context, with affected persons, remedy, and accountability. Reflection is not a shortcut to absolution.

Design should avoid sacred monumentality. A reflection room that feels like a shrine to the City may create subtle loyalty pressure. The room should be calm, plural, modest, and accessible. It should protect meaning without telling the participant what meaning must be.

A reflection space succeeds when it gives the person room to become more honest without making that honesty a performance. It is one of the places where the City most clearly says that record is not soul.

Reflection spaces remain separate from performance, testimony, ideology, and hidden influence. Entering one creates no expectation of public disclosure, visible piety, therapeutic narrative, or agreement with a spiritual interpretation. The room

is equally protected from donor access, charismatic mentorship, private political negotiation, and religious pressure. Its status is bounded quiet: accessible, plural, modest, purpose-limited, and governed so that conscience can deepen without becoming a channel for capture.

7.5.5 — Crisis De-Loading Rooms

Crisis de-loading rooms exist because overload will happen. A participant may face panic, grief, threat, family emergency, public humiliation, conflict, medical distress, or accumulated record strain. Care must arrive before overload becomes public disorder. De-loading rooms route acute burden toward safety, not spectacle.

Protected handling is essential because crisis material can be highly vulnerable and easily misused. Raw crisis footage, intimate distress, medical details, or family emergencies should not become public content. Public records may later include status, summary, remedies, and institutional learning where appropriate, but raw exposure is rarely justified.

The crisis room should be connected to family and nonparticipant rules. Some crises involve loved ones, dependents, intimate partners, or outside harms. The City must be able to contact and protect relevant people without making them public, and to keep the participant's crisis from becoming a gateway into household exposure.

Crisis de-loading rooms should operate under the rule of care before classification. A person in acute distress should not first become a disciplinary case, a public narrative, a readiness verdict,

or an institutional embarrassment. The immediate questions are safety, medical need, psychological support, trusted contact, removal of triggering load, and protection of others. Only after care is secure should the City decide what the event means for record, participation, pause, training, review, or exit. Sequence is an ethical safeguard.

The de-loading room should also have aftercare for the people around the crisis. Staff, peers, visitors, household members, clinicians, and witnesses may carry fear, confusion, resentment, guilt, or secondary trauma. A crisis does not end when the participant becomes calmer. The City should provide debrief, correction, support, and protected channels for those affected. Otherwise, crisis burden moves silently into the service ecology and returns later as burnout, rumor, distrust, or retaliation. Protected recovery raises the question of what the institution records, where records reside, and how materials move without exposing private life. It follows custody, classification, access, delivery, storage, correction, and disposal through accountable human owners. The service ecology must join the archive, public record site, and logistics system while keeping their permissions distinct.

7.6 — Archive, Public Record Site, and Logistics

Memory and operations require places whose boundaries can be inspected. The archive preserves custody and context; the public record site provides governed access; the operations core coordinates service under review; logistics routes move food, equipment, waste, care, and repairs; maintenance spaces keep the visible institution working. Giving these systems spatial form prevents them from dissolving into vendor dependence, spectacle portals, hidden management, or invisible labor. Background function becomes part of the City's public honesty.

Memory is not neutral once it governs public trust. Where the archive sits, how it is guarded, who may access it, how the public record site relates to it, where operators work, how supplies move, and who repairs what breaks all decide where burden goes. A City that places memory in guarded infrastructure but hides maintenance workers has understood only half its own mission.

The archive and the public-record site perform different functions and must remain separate. The archive preserves source memory under lawful custody; the public-record site provides a structured interface for civic review. Collapsing them would expose raw material, while disconnecting them would make public review weak and unverifiable. Spatial and operational design must therefore support both integrity and accessibility without confusing one with the other (ISO, 2016a, 2017; CCSDS, 2012; PREMIS Editorial Committee, 2015; W3C, 2013).

Public memory is only as fair as its dullest systems. A record-site interface can be elegant while the correction queue is

underfunded. An archive can be secure while custodial routes are exhausting. An operations dashboard can be precise while complaints disappear. The ordinary machinery of memory is where public trust either becomes durable or becomes another surface.

Archive, public record interface, operations, logistics, and maintenance are grouped here because memory and support are not separate moral universes. A public record site without supply routes will fail in the body. A logistics system without record discipline will hide labor. An operations core without review will become quiet power. A maintenance system without visibility will turn beauty into a mask. The City has to treat management, movement, repair, storage, public access, and daily upkeep as parts of one service ecology, because every one of them can either carry burden honestly or push it into the unseen.

Separation without disappearance governs the archive and logistics precinct. The raw archive is distinct from the public record site; the operations core is distinct from public narrative; logistics routes are distinct from spectacle; and maintenance evidence is distinct from worker humiliation. Each function remains visible to the people with authority to inspect it while receiving the access limits needed for dignity, security, and reliable work.

7.6.1 — Archive Location

Archive location matters because memory is power. Placement must support lawful custody, independent inspection, reliable work, and continuity through failure. Source records need

controlled access, environmental protection, provenance, backup, emergency procedures, and separation from visitor traffic. The public should understand the archive's purpose and oversight route without receiving access to protected content.

Archivists, technicians, redaction specialists, correction staff, and reviewers need humane workspaces and sufficient staffing. A secure archive can still fail if the people preserving memory work under unsustainable conditions.

Site and building review should test fire, flood, heat, power loss, unauthorized access, and other locally relevant hazards. The archive remains ordinary civic infrastructure: it preserves governed records and correction histories, not complete persons or scientific proof of the Law.

7.6.2 — Public Record Site Interface

The public record site interface is the civic face of the archive, not the archive itself. Its purpose is to let citizens, institutions, critics, journalists, and affected persons review structured public-power formation material without receiving raw exposure. Interface design determines whether memory becomes democratic context or spectacle demand.

Public usability must be taken seriously. If the site is too technical, only experts and hostile interpreters will shape public meaning. If it is too simplified, safeguards will disappear. The design must make complexity navigable without reducing it to moral scores, readiness halos, or sensational clips. The public needs help reading, not help judging too quickly.

The interface should avoid addictive design. Infinite scrolling, emotional ranking, popularity counts, dramatic thumbnails, and sexualized or humiliating framing would turn public memory into platform appetite. The City's public record site should be slower, more contextual, and more disciplined than ordinary digital culture. Civic review is not entertainment design.

Affected-person routes must be visible. If someone believes they were wrongfully exposed, mischaracterized, omitted, or harmed by a record bundle, the site should show how to seek correction or remedy. Public memory without correction is power. The interface should make repair easier to find than outrage.

A public record site interface succeeds when it lets the public see enough to evaluate public-power formation without training the public to consume the lives of participants and nearby people. It should make memory usable, not addictive.

The public record site interface should be designed as a translation layer. It receives record material that has been governed, labeled, contextualized, protected, delayed, summarized, corrected, or released through lawful rules. It is not a window into raw life. Citizens should be able to understand conduct, reasoning, influence, correction, and readiness without being invited to consume intimate material, medical detail, household spillover, or every unfinished human moment. The interface exists because public trust requires access to meaning, not because curiosity deserves access to everything.

The interface also needs public comprehension safeguards. Status labels, provenance notes, version history, correction history,

dispute markers, context statements, uncertainty labels, and access limits should be readable to nonexperts. A record site that only archivists understand will not serve democratic trust. A record site that is too simple will mislead. The City's burden is to make public memory usable without pretending that complex lives can be reduced to clean public objects.

Good public interfaces sometimes slow the reader down. A fragment should not be shareable without the context needed to understand its status; a search result may need a dispute label, correction history, or access warning; a summary may need the source record and date beside it. This friction is not obstruction when it prevents a person from being reduced to an isolated clip. The interface should make responsible interpretation easier than decontextualized circulation.

7.6.3 — Operations Core

The operations core coordinates the City's ordinary day. It schedules rooms, routes staff, manages access, tracks maintenance, supports public interface, handles emergencies, coordinates records, and monitors institutional load. That coordination is indispensable, and it concentrates practical power precisely because so many other functions depend on it.

Management decisions shape participant life. A schedule can create fatigue. A room assignment can privilege one person. A public interface slot can amplify another. A staff rotation can hide burnout. A maintenance delay can create dignity failure. If operations are treated as neutral logistics, the City will overlook one of its strongest burden-routing systems.

Reviewability gives operators room to act without turning discretion into sovereignty. Role assignments, escalation paths, access controls, decision traces, complaint routes, and after-action review should be clear enough to reconstruct consequential choices. Operators need authority to keep the City functioning, while affected people need a path to question how that authority was used.

Staff in the operations core need privacy and dignity. Their work may be role-recorded, but they are not full-life subjects. They will face stress, conflicting demands, urgent problems, and public pressure. A City that makes operators invisible or overexposes them will fail either way. Role-bound visibility is the rule.

Placement mediates the operations core's relationship to the City. Too much isolation detaches management from lived conditions; too much exposure prevents staff from working; too much symbolic centrality turns coordination into command theater. The core should remain close enough to hear the institution and modest enough not to appear as its throne.

Scheduling is power when rooms, staff, maintenance, incidents, visitors, logistics, training, archives, and public-interface time all pass through one office. Those choices can determine who is heard, what is repaired first, which work remains visible, and whose delay becomes normal. Decision logs, role boundaries, conflict disclosures, escalation rules, complaint routes, and periodic audits make that influence answerable before routine discretion hardens into hidden government.

Operational review should include the people most likely to feel management as burden. Participants will feel schedules. Staff will feel workload. Clinicians will feel boundary pressure. Visitors will feel gate rules. Host communities will feel traffic and spillover. Maintenance workers will feel deferred repair. Public users will feel interface design. An operations core becomes fairer when it can hear those burdens before they become scandal or institutional fatigue. Management is not neutral simply because it is practical.

7.6.4 — Logistics Routes

Logistics routes are the veins of the City. Food, laundry, supplies, equipment, waste, records media, medical materials, repair tools, water systems, security devices, and maintenance parts all move through them. If these routes are hidden from moral attention, the City will hide labor and burden beneath its civic surface.

Operations and logistics require a public explanation proportionate to their power. Procurement, deliveries, waste, access credentials, contractor routes, equipment custody, incident response, and maintenance schedules shape what the visible institution can actually do. Transparency here means accountable roles and reviewable processes, not live publication of security-sensitive detail.

Routes can also become shadow channels. A side door for supplies can become a door for private influence. A maintenance corridor can become unrecorded access. A delivery relationship can become vendor leverage. Anti-shadow design must include

logistics, not only public halls and office suites. Hidden power often moves through practical paths.

Staff safety and ergonomics are part of route design. Heavy loads, long distances, poor lighting, insecure corridors, noise, heat, and inadequate rest points can turn logistics into bodily injury. Public dignity is false when service movement remains painful in private space.

Logistics records should be designed to reveal burden without monitoring workers as if they were participants. Movement of supplies, access to protected areas, and vendor contact may need role records, but ordinary worker dignity requires limits on unnecessary personal tracking.

Service routes should make movement efficient, dignified, safe, and inspectable rather than conceal labor solely to preserve an attractive public surface.

The logistics system should also prevent side-channel power. Deliveries, contractor visits, vendor technicians, supply meetings, maintenance access, and operations handoffs can become routes for influence if poorly governed. The City should define who may enter, what they may access, what is logged, what remains private, and how staff can report pressure. A hidden delivery door should not become the place where public-power formation quietly meets money, media, or favor.

7.6.5 — Maintenance Visibility

Maintenance visibility prevents the City from lying through beauty. Every building decays. Every door, light, sensor, screen, drain, pipe, path, server, lock, chair, and room requires upkeep. If maintenance is hidden, deferred, underfunded, or treated as embarrassment, the City's public form will begin to conceal its real condition.

Maintenance is a City fairness problem because deferred repair moves burden forward in time. Future participants, staff, host communities, budgets, and public trust pay for today's desire to look finished. A cracked threshold, unreliable capture device, broken quiet-room ventilation, inaccessible lift, or hidden leak is therefore a governance fact. Maintenance visibility makes that burden timely enough to repair.

Maintenance reporting should be honest without becoming theatrical. The public need not receive a dramatic narrative for every repair, but it should see whether records, accessibility, safety, utilities, public interfaces, and protected zones remain functional. Upkeep often reveals institutional truth more reliably than ceremonial reports.

Maintenance workers need role dignity. They may enter sensitive areas, repair record systems, access protected rooms, and observe vulnerable conditions. Their role records should cover material access and influence, but their private lives remain protected. They should not become either invisible or treated as suspicious by default.

In the service ecology, maintenance needs a protected claim on funds. New construction, public relations, and donor-visible projects will otherwise defeat repair in every budget contest. Reserves, audit triggers, and public reporting protect the quiet systems that keep kitchens, archives, paths, lifts, care spaces, and public interfaces usable. Repair over image is a governance discipline expressed through the lived place.

Maintenance visibility joins budgets, schedules, backlogs, worker burden, safety incidents, accessibility failures, environmental cost, design defects, and restoration dates in one reviewable account. The record protects worker privacy while preventing the public-facing City from appearing whole as its support systems deteriorate. Maintenance is where ideals meet time: any promised feature has to be cleanable, repairable, staffable, fundable, adaptable, and safely retireable. Otherwise its moral beauty is being financed by hidden labor or future failure.

Maintenance visibility also protects against aesthetic deception. A building can photograph well while exhausting cleaners, wasting water, trapping heat, confusing disabled users, creating noise stress, or requiring constant specialized repair. The City should publish or preserve enough maintenance evidence to show whether beauty is being carried fairly. The test is not whether the campus remains impressive. The test is whether the ongoing cost of keeping it usable is known, shared properly, and corrected when it injures the wrong people. Backlog review should rank unresolved work by safety, accessibility, continuity, and worker burden as well as by financial cost.

An ordinary-day chain test should follow several events at once: a citizen requests a public bundle, a participant seeks correction, a protected item enters escrow, a delivery reaches the service edge, a broken component needs repair, and an auditor asks for provenance. The test asks whether people, goods, records, and authority can move through their proper routes without colliding, exposing protected material, or depending on personal favors. A system that works only when one experienced operator is present has not yet become institutional memory. Chain tests should rotate operators so continuity is demonstrated by the system rather than by one person's memory.

The same exercise needs a stop route. If the chain of custody is uncertain, a public bundle is misleading, a service path breaches protected space, a vendor blocks access, or a maintenance failure threatens preservation, the affected release or operation pauses under a named human authority. The pause receives a status label, correction owner, review clock, and public explanation appropriate to the risk. Background systems become trustworthy when their refusal to proceed is as well designed as their ordinary flow. Restart approval should identify the condition that changed and the person who verified that the affected route can safely resume.

7.7 — Landscape, Water, and the Restorative Exterior

The exterior is part of the City's working institution. Horizon, weather, movement, shade, water, vegetation, silence, and public edges let bodies recover from rooms, screens, records, and continuous interpretation. Landscape also carries drainage, cooling, biodiversity, circulation, emergency access, host connection, and maintenance. A restorative exterior therefore protects human capacity while making ecological function visible, preventing the City from becoming all interior procedure and no living world.

The restorative exterior must also answer for what it costs. Landscape can heal the participant while burdening the host ecology. Water can symbolize restoration while draining a strained watershed. Public edges can welcome citizens while exposing residents. Walking loops can regulate stress while excluding disabled bodies if poorly designed. Climate adaptation can be thoughtful or purely aesthetic. Exterior space must answer the same burden question as interior architecture.

A restorative landscape must not be purchased through ecological damage or exclusive use. Design should begin with existing habitat, water, soil, heat, species, public access, cultural meaning, maintenance labor, and climate projections. Exterior beauty is legitimate only when its burdens are disclosed and its benefits do not depend on excluding the host.

Public edges require a careful balance. Landscape cannot be used either to hide the City from the public or to make participants available for casual consumption. Edges can educate, welcome,

mark boundary, protect neighbors, and create shared civic dignity. A good edge says: this institution is here, it is bounded, it can be approached, and it does not own the surrounding place.

Climate adaptation is the final test because the City will be built in a world of heat, flood, fire, storms, water stress, migration pressure, and infrastructure strain. The exterior cannot pretend the climate is stable. It must support resilience, reduce burden, protect life, and avoid symbolic greenwashing. The land is not a backdrop for civic hope. It is a burden-bearing participant in the City's reality.

The exterior also guards against enclosure psychology. Participants and staff should be able to feel weather, season, sound, light, and horizon without feeling that the City has sealed them inside an institution. Yet the exterior must not dissolve the boundary that protects nonparticipants and records. The restorative outside is therefore not an escape from the City. It is the City learning to breathe under discipline.

The exterior also shapes public imagination before most citizens read a page of policy. Renderings of trees, plazas, water, and light can make the City look like a resort, a shrine, a corporate campus, a protected enclave, or a spectacle park if boundaries are not clear. The final design language should make welcome and limit visible together. The public edge should invite lawful inspection, criticism, and civic learning, while the land, water, paths, staff work, and climate systems remain answerable rather than decorative.

7.7.1 — Restorative Landscape

Restorative landscape gives the City a way to reduce load without medicalizing every form of recovery. Trees, shade, gardens, soil, birdsong, textured paths, seasonal change, and open view can help the body regulate after record pressure, deliberation, public interface, or conflict. This is not decorative softness. It is embodied support for public-power formation.

The landscape should be restorative for participants, staff, visitors, and sometimes the public, with different access rules for different zones. Staff should not only maintain beauty for participants. They should also have places to recover. A City that reserves restoration for visible participants while workers serve the garden from exhaustion has contradicted itself (Hartig et al., 2014; Nguyen et al., 2021).

Restorative landscape also has record implications. Outdoor spaces may include conversations, walks, informal repair, grief, or mentor interactions. Access bands, route status, and recording categories should be clear without turning the landscape into a field of anxiety. A participant should not have to choose between recovery and record confusion.

Host ecology gives landscape design its local discipline. Plant selection, water use, soil health, biodiversity, maintenance practices, and local species should respond to place. Imported luxury landscapes can externalize burden through water, labor, chemicals, heat, or replacement. A restorative exterior should improve ecological function and human use together rather than consume the host's capacity for an image.

Restorative landscape should be planned through sensory diversity rather than a single aesthetic of calm. Some people recover through open sky, some through shade, some through movement, some through stillness, some through sound, some through quiet, some through social proximity, and some through protected solitude. The landscape should provide multiple kinds of restoration without making any one body the default. A place that looks peaceful to the designer may feel exposed, inaccessible, hot, noisy, or culturally alien to the person carrying the burden.

Water design should expose both beauty and infrastructure. Supply, treatment, drainage, irrigation, stormwater, drought planning, maintenance, energy use, public-health protection, and emergency reserves belong in one account. Decorative water that hides scarcity or imposes high maintenance would contradict the restorative claim.

7.7.2 — Water Systems

Water systems carry practical, ecological, and symbolic burden. Water is needed for drinking, sanitation, kitchens, clinical care, landscape, cooling, fire safety, cleaning, and resilience. It also carries emotional meaning in a City concerned with repair and restoration. That symbolic power makes water dangerous if practical burden is hidden.

Water must be counted before it is aestheticized. A fountain, pool, garden, cooling feature, or reflective basin may appear restorative while drawing from a stressed watershed or burdening local infrastructure. The water review asks who pays, who loses access or capacity, who maintains the system, what ecological

assumptions are being made, and what happens during drought, flood, contamination, or failure.

Water design should prioritize resilience and need before display. Potable systems, greywater reuse, stormwater capture, drainage, flood protection, fire suppression, cooling, and sanitation belong ahead of ornamental effect. Exterior water features should be justified by ecological function, cooling, recovery, or public-edge dignity, not by donor spectacle.

Maintenance and safety matter. Water systems can create hazards, disease risks, repair burden, accessibility barriers, and hidden labor. A beautiful water element that staff struggle to maintain or that becomes unsafe under climate stress is not a fair design. Lifecycle review should guide ambition.

Water may communicate restoration, movement, and public life, but its design should remain practical and plural. It must first satisfy safety, conservation, maintenance, accessibility, and climate conditions. Symbolic meaning remains optional and modest. The City is a civic institution, so no fountain, garden, axis, or monument should imply spiritual purity, scientific truth, or moral rank.

Water can also become a public teaching tool when handled modestly. Clear reporting on water source, reuse, stormwater capture, drought plans, and ecological limits can help citizens see that beauty carries cost. The City should make water intelligible without turning it into a branding element.

Host routines remain prior claims on the surrounding place. School travel, care work, deliveries, worship, commerce, sleep,

and neighborhood movement continue while the City attracts attention. Lighting, sound, crowds, media, protest management, and schedules must be tested against those routines rather than treating civic interest as superior.

7.7.3 — Walking Loops

Walking loops differ from general walking grounds because they create repeatable daily regulation. A loop gives the body a predictable circuit, a way to move without deciding a route, and a place where thought can loosen. In a City of record, repetition can calm the nervous system and create rhythm without requiring performance.

Walking loops should vary in distance, grade, sensory intensity, weather exposure, and opportunities to stop, so restorative movement does not assume one body, pace, or endurance level. Accessibility review should test the full loop in ordinary and adverse conditions.

Different loops may carry different status. Some may be participant-only. Some staff-accessible. Some public-edge. Some quiet. Some suitable for mentor walks or paired repair. Different outdoor paths carry different access and record conditions. Movement under burden needs clarity.

Walking conversation need not be prohibited, but it must be proportionately governed when it becomes a route of influence. A mentor, donor, staff member, journalist, or political adviser should not be able to use an unscheduled private walk to bypass ordinary access and record rules. Purpose, role, consent, logging threshold, privacy, and later influence review should be clear

enough to preserve ordinary human conversation without creating a shadow corridor.

Changes in walking habits may offer an occasion to ask whether the City's demands need adjustment. They do not, by themselves, establish anxiety, avoidance, or performance. Any care response should begin with the person's account and relevant context, use only information collected for a declared and authorized purpose, and remain separate from admission or moral ranking. Walking should remain an available support, not a behavioral test.

Walking loops should include recovery options for staff, not only participants. A maintenance worker, clinician, educator, security worker, archive worker, or kitchen worker may also need movement, fresh air, quiet, and decompression. Paths maintained by staff should not reserve restoration entirely for participants. Staff access can be scheduled and bounded where needed, but restoration reserved entirely for visible participants would repeat a familiar civic injustice: those carrying the system receive the least room to recover from it.

Climate adaptation should be visible as maintenance and learning, not as a green halo. Shade, water management, planting, heat refuge, fire strategy, biodiversity, soil, energy, materials, and emergency access need owners, thresholds, review dates, and redesign routes. The landscape remains credible when it can admit failure and change.

7.7.4 — Public Edges

Public edges are where the City meets the world without dissolving into it. The edge may include paths, visitor approaches,

public gardens, interpretive displays, protest-adjacent spaces, host-community transitions, and visual openings. It should make the City approachable but bounded. A hidden City breeds suspicion; an overexposed City breeds spectacle.

The edge should communicate ordinary privacy protection. People outside should be able to understand that the City burdens public-power seekers, not the neighborhood. Host communities should not feel absorbed into the City's symbolic field. Public edges can mark respect for surrounding life by controlling sightlines, sound, visitor flow, and media posture.

Public educational material at the edge can explain purpose, boundaries, rights, nonparticipant protections, evidence status, and correction routes. Its design should resist participant glorification, voyeurism, sacred imagery, and simplified claims that make the first City appear inevitable. The public edge is where a complex institution either becomes legible or is reduced to myth.

Protest and criticism should be anticipated at the public edge. A fair City does not hide from dissent. It should provide lawful protest visibility, safety boundaries, access to complaint routes, and ways for criticism to be heard without harassment, doxxing, or intrusion into protected domains. The edge should protect both dissent and dignity.

Host-community use may be possible in some exterior spaces, but only with boundary clarity. Shared gardens, educational walks, public events, or civic displays can build local connection. They can also blur access and create pressure. Public-edge

programming should be carefully scoped, accessible, and reviewed for burden on residents and staff.

Public edges should make dissent ordinary enough that the City does not treat criticism as contamination. A protest path, complaint window, public learning display, host-community meeting point, or visitor route can show that the institution expects opposition. The design should protect participants and nonparticipants from harassment while allowing the public to approach the institution as a matter of civic right. A City that makes criticism physically awkward will learn to call insulation dignity. A City that ignores dignity will call exposure openness. The edge must refuse both errors.

The edge should also be legible after dark, during crowds, in bad weather, under media pressure, and during emergency. Public openness that works only on a calm tour day is not public openness. Signage, seating, shelter, lighting, transport, accessibility, security posture, translation, and staff scripts should all be tested under stress. The public edge is the first place many people will decide whether the City is answerable or merely impressive.

7.7.5 — Climate Adaptation

Climate adaptation is not an environmental chapter added to a civic book. It is a condition of buildability, health, equity, and future burden. The City will stand in a world of heat, storms, fires, floods, droughts, air-quality crises, infrastructure stress, and shifting host-community needs. A place that forms public power must be honest about the climate burden it inhabits.

Climate adaptation also affects the daily Vow. Heat can increase stress. Poor air can reduce health. Flood risk can threaten archive integrity. Smoke can alter public interface. Water limits can change landscape. Energy failure can disrupt capture systems, clinical care, and accessibility. Climate is not background. It enters the record, body, staff load, host burden, and maintenance budget.

Climate adaptation begins with local knowledge as well as technical analysis. Host residents, workers, utilities, emergency responders, Indigenous and customary communities, and long-term land users may understand heat, water, wind, flood, soil, traffic, and seasonal failure patterns that external teams cannot see from a model. Their knowledge enters design, review, drills, and post-occupancy evaluation alongside engineering and climate evidence. The site remains teachable by the land throughout its life, not only during the approval phase.

The exterior must protect life, reduce future burden, and remain honest as conditions change. Adaptation is a continuing review, not a sustainability label: landscape, utilities, emergency protocols, and exterior use must be adjustable without treating the original plan as final. Public power is formed on a planet, not in an abstract civic diagram.

Climate burdens are unequal. Disabled participants, elders, pregnant people, people with respiratory conditions, clinicians, security staff, maintenance workers, kitchen staff, visitors, and nearby residents may experience the same event very differently. The plan must identify those differences before crisis; adaptation

fails when it protects the visible center and leaves the periphery to improvise.

Each climate event should update a public learning record. Shade failure, drainage failure, weak air filtration, water overreach, or dependence on fragile systems should trigger named correction rather than reputational concealment. Trust after climate stress comes from showing what failed, who carried the burden, what changed, and what remains uncertain.

The final exterior review should be a performance walk rather than a beauty tour. Reviewers move the site at dawn, midday heat, darkness, rain, relevant smoke conditions, a crowded event, and an ordinary quiet day. They follow a wheelchair route, a maintenance route, a family visit, an emergency approach, a host-neighborhood edge, and water after a storm. The record tests shade, rest, drainage, lighting, noise, surveillance exposure, ecological strain, worker access, and the dignity of leaving. Landscape earns its place when it still works after the rendering loses its power. The analysis has shown that every visible civic room depends on less visible systems of care, food, records, movement, landscape, and labor. Infrastructure is the next test because hidden systems beneath the surface determine whether the visible City remains humane when equipment, utilities, or routines fail.

Chapter 8 — Infrastructure and Resilience

Infrastructure reveals whether the City can keep its principles under load. A power cut can interrupt record systems; a temporary repair can erase an accessible route; a service corridor can become a hidden influence path; an emergency response can protect life while changing ordinary record continuity. Chapter 8 treats each event as institutional evidence. Systems are judged by the services they preserve, the burdens they redistribute, the people they protect, and the corrections they make possible after failure.

Active-record infrastructure comes first because trust cannot rest on a mysterious capture stack. Hardware, storage, integrity monitoring, failure logging, manual fallback, access controls, emergency modes, and retirement need named owners, maintenance schedules, review routes, and status labels. Capture remains a technical service under law and human authority, never a machine judgment about the person recorded.

Service routes then expose the labor beneath public rooms. Cleaners, technicians, food workers, maintenance crews, drivers, care staff, security staff, contractors, and accessibility workers need safe circulation, usable equipment, reasonable schedules, privacy, representation, and complaint routes. Back-of-house design should support work without becoming a shadow corridor for donors, advisers, or officials.

Accessibility is treated as an integrity condition before opening. Mobility, sensory, cognitive, communication, and emergency access are not one checklist and cannot be delegated to a late compliance review. Complete journeys, real tasks, temporary closures, crowded conditions, fatigue, communication differences, and interaction with digital systems all matter.

Construction brings the institution's first labor and environmental record into being. Material extraction, contractor chains, site safety, heat, dust, carbon, waste, transport, procurement, substitutions, repairability, and future maintenance reveal whether burden honesty begins before participants arrive. A beautiful building cannot redeem an exploitative construction process.

Technical vocabulary must not become a shadow language for hidden power. A server contract, security checkpoint, material specification, evacuation route, procurement choice, or maintenance deferral is a burden decision. Experts need sufficient detail to evaluate performance and risk, while affected people need a plain-language account of purpose, owner, dependencies, protected information, failure modes, remedy, and the condition that would require pause or retirement.

Every critical system carries a service statement, accountable owner, dependency map, maintenance schedule, failure log, manual fallback, vendor-exit plan, recovery objective, correction route, and retirement condition. Standards provide disciplined vocabulary and tested practices, while local evidence shows whether the system actually serves its users. An affected person should be able to learn what failed, who owned restoration, which service returned, what remained unavailable, and what changed afterward (ISO, 2019; UNDRR, 2022; NIST, 2020c, 2024a).

Machine authority remains bounded. Capture infrastructure may record; monitoring tools may detect anomalies; Artificial Intelligence may assist with approved search, routing, or pattern review. None of those systems knows dignity, worth, readiness,

legal meaning, or the truth of a person. Human owners remain responsible for interpretation, rights decisions, correction, and shutdown.

The severity of this infrastructure belongs to a specialized, voluntary formation institution for adults who seek substantial public power. It is not a model for private households, schools, workplaces, faith communities, neighborhoods, or citizenship at large. Visible burden rises toward public power while ordinary private life remains protected.

Architects, engineers, archivists, cybersecurity reviewers, accessibility experts, emergency planners, public administrators, labor scholars, clinicians, construction professionals, disability advocates, procurement specialists, and civil-liberties readers will test different parts of the chapter. One asks whether the system works; another whether it exposes too much; another who maintains it; another what happens when it fails. The design must let those questions meet in the same record.

That expert depth still has to remain human. The reader should be able to follow a failed lift, an inaccessible detour, a dropped record stream, a worker refusing unsafe work, an evacuation under smoke, a family emergency, or a repair budget cut and see the chain of decisions that produced the burden. Technical seriousness is the ability to explain consequence, not the accumulation of jargon.

Severity without care becomes machinery. Infrastructure is not fair because it is impressive, redundant, automated, secure, expensive, or futuristic. It becomes defensible only when burdens

are placed openly, failures are reviewable, workers are not erased, users are not forced into one ideal body or mind, emergencies protect life first, and maintenance budgets tell the truth after the opening ceremony.

Ground, spatial order, inhabited zones, commons, recovery, archive interfaces, and landscape now depend on systems that can fail. Chapter 8 turns those dependencies into a public register: what service continues, what pauses, who owns restoration, which manual fallback applies, who is informed, and when the institution loses permission to operate a function. Resilience becomes specific enough to inspect and repair.

Infrastructure is not the backstage of fairness. It is fairness under load. A City that hides its systems hides the distribution of burden. A City that can disclose, limit, maintain, repair, audit, and sometimes stop its systems has begun to deserve the harder questions that follow.

8.1 — Capture Infrastructure and Continuity Systems

The capture stack begins with a dependency map rather than a device catalogue. Power, networks, clock synchronization, mounting, environmental conditions, permissions, firmware, staff procedure, storage, and repair capacity determine whether each device can perform its stated role. Mapping those links reveals single points of failure and prevents a technical gap from being misread as personal evasion. It also lets the City decide which dependencies need redundancy, manual fallback, independent verification, or retirement.

Capture governance should also distinguish technical time, institutional time, and human time. Technical time asks whether devices are synchronized. Institutional time asks when a decision, incident, repair, or notice occurred. Human time asks when an affected person could reasonably understand what happened and respond. A fair continuity system does not collapse these clocks into one machine timestamp.

Record completeness and record trustworthiness are distinct. Completeness asks whether the active period has a trace; trustworthiness asks whether that trace can be authenticated, contextualized, challenged, repaired, and lawfully used. A complete but unreliable record cannot outrank a partial record whose limits are honestly marked and whose defects are actively repaired (ISO, 2016a, 2017; CCSDS, 2012; NDSA, 2019; NIST, 2024a).

The record stack should be understood as a chain of responsibility. Capture begins the chain, but custody,

classification, correction, access, release, storage, and oversight all alter what the record can become. If one link is weak, every later claim becomes weaker. The City must therefore design capture as the first step in a governed lifecycle, not as a technical event that later systems will somehow make fair.

A serious City should test the stack in ordinary conditions and adverse conditions. Ordinary testing asks whether the system works on a normal day. Adverse testing asks what happens during power loss, network failure, public interface overload, emergency movement, protected nonvisibility, device replacement, insider misuse, cyberattack, and legal hold. The record should be trustworthy in the conditions where trust is most tempted to break.

Continuity also includes human continuity. Staff must know what to do when systems fail. Participants must know what status applies. Oversight must know when to intervene. The public must know enough to avoid rumor. A perfectly designed technical system can still fail if the people around it are confused, afraid, or untrained.

The Transparent City cannot exist on aspiration alone. If active public-power formation is to be recorded, the technical systems that create and preserve that record must be designed before the record is trusted. Capture infrastructure is not a decorative layer added to architecture. It is the City's evidentiary skeleton, and a weak skeleton will make every later public claim unstable.

Hardware is not truth. A camera sees a surface. A microphone captures sound. A sensor records a state. A timestamp marks an event. A storage system preserves data. None of these knows

meaning. None of these sees intention. None of these can determine dignity, readiness, worth, or public trust by itself. Technical capture cannot become moral authority.

Still, the hardware matters. A poorly placed device can create blind spots. An overbroad device can violate protected nonvisibility. A cheap device can fail silently. A proprietary device can give vendors too much power. A redundant device can preserve continuity. The technical design decides how much burden is placed on participants, staff, nonparticipants, reviewers, and future readers.

Continuity systems matter because the City's legitimacy depends partly on knowing when the record is complete, interrupted, restricted, delayed, compromised, or under emergency handling. In ordinary institutions, a technical failure can sometimes be treated as inconvenience. In the Transparent City, unexplained failure can become a civic crisis. A gap in record may be innocent, but if the City cannot explain it, suspicion will rush into the space.

The capture system must therefore be paired with redundancy, integrity monitoring, failure logging, emergency protocols, audit trails, and human review. Each tool protects a different kind of trust. Redundancy protects against loss. Integrity monitoring protects against tampering. Failure logging protects against rumor. Emergency protocols protect life and continuity. Human review protects the public from machine mythology.

The technical stack must answer a simple question: if this system breaks, who carries the burden? If the answer is a participant wrongfully suspected, a staff member blamed for system failure,

a nonparticipant exposed, a public record corrupted, or a future reader misled, the infrastructure is not yet fair enough.

8.1.1 — Record Hardware

Record hardware should be specified as a civic dependency rather than a device list. The City needs sensors, microphones, access logs, environmental monitors, time sources, secure edge devices, and human verification stations only where they serve the active public-power record. Each component should have a named purpose, a lawful basis, a maintenance owner, a failure notice path, and a protection rule for incidental persons. Hardware that cannot explain its burden should not be installed merely because it is available.

A hardware registry should therefore be treated as a civic artifact. Each device should have a stated purpose, physical location, activation state, responsible custodian, maintenance schedule, calibration history, access class, privacy impact, protected-zone limitation, and failure procedure. This registry need not expose security-sensitive details to the public, but it must be available to the relevant oversight bodies. Without such a registry, the City will not know whether record is being produced by governance or by accumulation.

A useful hardware plan should be written as a burden map before it is written as a device list. Each capture point should state the role it serves, the people it may touch, the protected domains nearby, the failure mode it creates, and the review route for misuse. Hardware that cannot answer those questions is not ready for a City built around visible public-power formation.

The hardware plan should also include a hardware-status taxonomy. A device can be active, degraded, disabled, under repair, in emergency fallback, or retired. Each status should carry a record consequence. If a device is degraded, public interpretation must not treat its output as ordinary capture. If it is disabled, the reason and substitute procedure must be known. If it is retired, the archive should preserve when and why that occurred.

The first rule is declared purpose. Record hardware is the visible edge of a larger moral system. Cameras, microphones, environmental sensors, access readers, timestamps, device attestations, network hardware, and storage gateways all create the first layer of active-period memory. They decide what becomes available for later review and what must be protected from review. Because of that, hardware placement is a civic decision, not merely an engineering decision.

The second rule is role and zone alignment. Hardware in a public deliberation hall serves a different purpose from hardware near clinical interfaces, residential thresholds, service routes, or emergency exits. The City's zones already carry different access bands. Hardware must respect those bands. A protected nonvisibility area cannot be designed with the same capture logic as a public record room.

The third rule is minimal sufficiency. The City needs enough hardware to preserve active-period record and continuity, but not so much that every person nearby becomes over-recorded. Minimal sufficiency does not mean weak capture. It means

capture suited to the role burden. The participant's Vow does not grant permission to collect everything about everyone else.

The fourth rule is vendor independence. Hardware should not trap the City inside one company's formats, firmware, licensing, access controls, analytics, or maintenance pipeline. If record hardware cannot be audited, replaced, migrated, or operated under public-interest governance, it has become a hidden authority. Technical convenience is not worth surrendering public memory to private dependency.

The fifth rule is maintainability. A record device that works only when new is a future failure. Cameras require cleaning, calibration, replacement, access review, security updates, and physical inspection. Microphones degrade. Readers fail. Batteries die. Mounts shift. Wiring ages. A City that does not fund the lifecycle of hardware has not funded the record. It has funded the appearance of record.

The design test for record hardware is therefore not technological abundance. It is accountable fit. The City should be able to answer, for every class of device, why it exists, what burden it prevents, what burden it creates, who may inspect its performance, what happens when it fails, and how people can challenge misuse.

8.1.2 — Redundant Storage

Redundancy should protect civic memory without multiplying exposure. A copy is not harmless because it is a backup. Every replicated record creates another location where breach, misuse, corruption, subpoena, vendor failure, or administrative drift can

occur. The storage design should therefore distinguish hot operational copies, cold preservation copies, encrypted escrow, local continuity caches, and disaster recovery repositories. Each copy should have a purpose, retention rule, access class, deletion path, and incident owner.

A storage design should be tested against four losses: loss of source, loss of status, loss of context, and loss of control. Losing the source destroys memory. Losing status makes protected material appear ordinary. Losing context makes fragments look more certain than they are. Losing control turns preservation into exposure. Redundant storage must protect all four, not merely keep files alive.

The storage-migration plan must exist before migration becomes urgent. Storage systems age, formats change, vendors disappear, encryption standards evolve, and public access tools are replaced. Migration should preserve provenance, correction history, status labels, sealing decisions, access limits, and public bundle relationships. A future reader should know not only what record survived, but how it traveled through time.

Redundant storage protects the City against a basic fragility: a single memory can be lost, corrupted, captured, or manipulated. Because active-period records carry public-power significance, storage failure cannot be treated as ordinary inconvenience. A missing record may protect hidden power, injure a participant, harm a nonparticipant, weaken public trust, or make later correction impossible.

Redundancy should not mean uncontrolled duplication. Every copy of a record creates new risk. A duplicate can be breached, misused, searched, leaked, sold, trained on, or forgotten. The City needs resilient storage, but it also needs purpose limitation, access control, encryption, provenance, retention rules, and deletion or sealing pathways where lawful. More copies without governance multiply danger.

The storage architecture must distinguish live operational storage, protected escrow storage, archival preservation, backup recovery systems, public record site bundles, and oversight-access repositories. Each has a different function. Live storage supports ongoing operations. Escrow supports delayed accountability. Archive storage preserves source memory. Public bundles support civic review. Oversight repositories support inspection. Collapsing them creates confusion and power concentration.

Redundancy also requires independent recoverability. If restoration depends on one vendor, cloud region, proprietary format, administrator group, or undocumented procedure, the record remains fragile even when copies exist. Recovery tests should prove that lawful records, status labels, audit trails, protections, and correction histories can be restored without surrendering the City's memory to a private platform or technical priesthood. A backup that cannot be independently reconstructed is only another point of dependence.

Geographic distribution may protect records from fire, flood, sabotage, and system failure, but it introduces jurisdictional risk. A record stored across borders may face different laws, access demands, surveillance exposure, vendor rules, or emergency

powers. Distributed storage does not resolve legal complexity. Legal architecture and expert review must shape where records may reside.

Redundant storage must include recovery drills. A backup that has never been restored is a hope, not a safeguard. The City should test whether records can be recovered, whether status labels survive recovery, whether protected categories remain protected, whether audit trails remain intact, and whether restored records can be distinguished from altered or partial records. Recovery without provenance can create false memory.

Redundant storage must also protect nonparticipants. A masked face, protected summary, delayed-release category, or third-party shield should not be undone because raw backup exists somewhere else. The same dignity rules that govern the public record must govern backups. A humane public surface cannot conceal dangerous backup practices.

A useful redundancy plan should also have a retirement plan. Old copies, obsolete media, duplicate repositories, and disaster-recovery snapshots can become forgotten exposure surfaces if they are not governed. Resilience is not the indefinite multiplication of copies. It is the disciplined preservation of what must remain, with lawful control over what should not spread.

8.1.3 — Integrity Monitoring

Integrity monitoring should watch the record without turning the watchers into hidden rulers. Logs, checksums, anomaly alerts, access histories, and chain-of-custody reports are useful only when they are themselves governed. The City should know who

can configure alerts, who can silence them, who can reinterpret them, who receives escalation, and how false positives are corrected. A monitoring system that cannot be challenged becomes another opaque institution inside the transparent one.

The monitoring design should separate technical anomaly from moral conclusion. A missing segment, unusual access pattern, sensor drift, corrupted timestamp, or device restart may indicate accident, maintenance, cyberattack, misuse, environmental stress, or emergency improvisation. The alert should not become accusation. It should trigger classification, preservation, notice, and review, so that the burden of uncertainty is carried by procedure rather than rumor.

The monitoring system should also track its own burden on staff. Constant alerts can create alarm fatigue, and alarm fatigue can become hidden failure. The City should review alert volume, false-positive rates, staff response time, escalation clarity, and whether monitoring produces anxiety without useful protection. Too much warning can become another form of noise.

Integrity monitoring is the City's defense against silent corruption. A record can fail by disappearing, but it can also fail by being altered, truncated, mislabeled, misdated, selectively synchronized, or detached from context. If the City cannot detect tampering and breakage, the public record becomes a surface that may look complete while hiding injury underneath.

Integrity monitoring protects provenance by asking whether devices, transmission, storage, access, classification, redaction, release, and correction remain trustworthy. It should not create an

all-seeing system above the record. The necessary output is a bounded statement about system condition, uncertainty, affected material, accountable owner, and required response.

The monitoring system must itself be logged and audited. If only technical insiders understand whether integrity alerts occurred, the City has created a hidden priesthood of infrastructure. Reviewers need interpretable summaries. Participants and affected persons need routes to challenge technical claims. Public reporting may need aggregate categories. Integrity monitoring should be legible enough to support trust without disclosing attack-sensitive details recklessly.

False positives and false negatives both create burden. A false tamper alert may cast suspicion on a participant or staff member. A missed alteration may corrupt public memory. The City must therefore treat integrity alerts as prompts for review, not automatic verdicts. Machine alerts require human audit, context, appeal, and correction. Technical certainty should be earned, not presumed.

Integrity monitoring must include protected nonvisibility. A restricted record can still be tampered with. A sealed category can still be mislabeled. A delayed-release record can still be altered before release. The fact that material is protected from public view does not remove it from integrity obligations. In some cases, protected records need stronger monitoring because fewer people can inspect them.

The deeper purpose is not technical perfection. It is public answerability under fallible systems. The City should be able to

say when a record is intact, when it is disputed, when it has been corrected, when a gap exists, when an alert was resolved, and when confidence is limited. Integrity monitoring makes memory humble enough to be trusted.

The integrity system should therefore be judged by whether it catches weak signals before they become public crises. The best alert may be the one that prevents an accusation by identifying a broken clock, a misaligned sensor, a failing storage node, or a classification error before human suspicion fills the gap with rumor.

8.1.4 — Failure Logging

A failure log preserves uncertainty instead of covering it with ticket language. It states what is known, what remains unknown, who detected the problem, which systems and records are affected, which protected people may be implicated, what interim measures are operating, and when independent review is required. Public communication then translates that state without dumping raw technical confusion or offering institutional silence. Honest uncertainty protects participants, staff, and citizens from conclusions the evidence cannot carry.

Failure logs should use a stable status language. Minor interruption, material gap, protected emergency interruption, suspected tamper event, confirmed integrity breach, lawful noncapture, inaccessible record, delayed reconstruction, and unrecoverable loss should not be improvised each time embarrassment appears. Stable labels protect the public from panic and protect affected persons from institutional vagueness.

They also allow future auditors to see whether the City is improving or merely changing words.

The failure log should record the category, time, duration, affected systems, affected records, likely cause, uncertainty level, corrective action, responsible review body, participant or nonparticipant impact, and public status where needed. This does not mean every technical detail becomes public. It means the City must preserve enough structured memory to explain what happened later without improvising a story.

Failure logging protects participants. Without it, a record gap may be interpreted as evasion or misconduct. A participant under the Vow should not carry suspicion created by the institution's technical failure. The City must be able to distinguish participant responsibility from system responsibility. That distinction is one of the fairest uses of infrastructure documentation.

Failure logging also protects the public. If every gap is explained away informally, public trust decays. Citizens need to know that the City can name categories of interruption, correct them, and preserve failure memory. A public that is asked to trust a full-record institution has the right to know how the institution handles broken record conditions.

Failure logging protects staff as well. In many institutions, system failure becomes worker blame because worker blame is easier than infrastructure honesty. A maintenance worker, operator, archivist, or security staff member should not become the scapegoat for underfunding, poor design, vendor dependency, or

inadequate training. Logs should identify system causes, not only human names.

The log must also avoid punitive excess. If every small failure becomes a public scandal, staff may hide issues and participants may panic. Failure logging should classify severity. Some failures require internal correction. Some require affected-person notice. Some require public status. Some require shutdown review. Proportional disclosure protects both trust and dignity.

A failure log is a burden-placement instrument. It prevents uncertainty from falling on the wrong person. It prevents the institution from hiding behind complexity. It prevents technical failure from becoming moral accusation without review. A City with honest failure logs may be less shiny, but it is more fair.

Failure logs also protect the City from institutional pride. A public institution may prefer to describe failure as anomaly, but repeated anomalies are pattern. The log should make repetition visible enough that leadership cannot hide drift behind the language of incident response.

8.1.5 — Emergency Capture Protocols

During an emergency, ordinary capture may need to change to protect life, dignity, or response. The City may route people through unusual paths, suspend public feeds, switch to restricted capture, rely on manual logs, or preserve a protected summary until the scene is safe. Each deviation is a temporary integrity measure with a recorded reason, status, authority, and later review, not permission for secret active life.

The protocol identifies the threshold at which care, evacuation, or immediate safety outranks ordinary recording procedure. Crossing that threshold still creates a minimal status record, names the responsible authority, protects affected people, and requires later reconstruction. Emergency may make perfect documentation impossible; it does not erase the fact that normal controls were suspended.

The emergency protocol should have a rehearsed break-glass structure. Break-glass access means a narrow, logged, time-limited departure from ordinary access or capture procedure for immediate life, safety, or system-continuity reasons. It should require identity, reason, scope, duration, later review, and affected-person assessment. It should never become a standing convenience for senior officials, security teams, technical administrators, or public-relations pressure.

Emergency capture must also account for emotional and cognitive aftermath. A person who has just survived a medical event, threat, fire, evacuation, or family emergency may not be able to understand record-status notices immediately. The City should provide delayed explanation, advocate support where appropriate, and an appeal route after stabilization. Record honesty is not achieved by handing a frightened person a policy paragraph while the body is still recovering.

Crises arrive faster than ideal record conditions. Medical emergencies, fires, evacuations, violent threats, cyber disruption, severe weather, family crises, infrastructure failures, and security incidents can interrupt ordinary capture. The City protects life first, preserves the most reliable trace conditions allow, and closes

the emergency route before it becomes a general tunnel out of accountability.

The first emergency rule is hierarchy: life, safety, and immediate care outrank record formalities. No participant, staff member, visitor, child, or nonparticipant should be endangered because someone is trying to preserve a perfect record. The purpose of record is to serve public burden and later review. It is not more sacred than life.

The second rule is after-action accounting. Once immediate danger passes, the City must classify what happened, what was captured, what was not captured, who had emergency access, which records are delayed or protected, what needs notice, and whether the interruption reveals a system weakness. Emergency memory must not disappear simply because the emergency was real.

The third rule is nonparticipant protection. Emergencies often bring outsiders into the City: paramedics, firefighters, police, family members, neighbors, public officials, contractors, and bystanders. Their presence in a crisis does not make them participants in the Vow. Emergency capture must protect incidental persons while preserving the public-power relevance of the event where lawful.

The fourth rule is abuse detection. Emergency protocols can be manipulated. A person may claim emergency to avoid record. Staff may classify ordinary difficulty as crisis. Security may expand exceptions. Vendors may hide outages. The City must therefore audit emergency use patterns. Too many emergencies

around the same person, route, device, room, or category may reveal drift.

The protocol should be rehearsed with the people who will use it, not merely written by those who govern it. Clinicians, security staff, archive staff, disabled users, maintenance workers, public interface workers, and outside responders should test whether the rule can be carried under pressure. A protocol that only works in calm language is not an emergency protocol.

A failover drill should end with a restoration test, not merely confirmation that backup systems activated. The City should identify records created under emergency rules, permissions that changed, data delayed or lost, people affected, notices issued, and reconciliations still open. Successful recovery means the system returns to a trustworthy state and accounts for the exceptional period.

8.2 — Service Routes and Maintenance Labor

Service routes distribute labor, bodily strain, time pressure, safety, and access to sensitive spaces. A maintenance corridor that is narrow, hidden, poorly ventilated, poorly lit, or difficult to evacuate has assigned the burden of public beauty to workers who will rarely appear in the institution's story. The service ecology is therefore designed and audited with the same seriousness as the public face. Worker observation, task trials, ergonomic review, rest access, and complaint routes make that seriousness measurable.

Service routes also need anti-influence governance. Food delivery, repairs, technical support, cleaning, medical supply, archive movement, and emergency equipment all require access. Access can become influence if it permits unlogged contact, private message passing, informal favors, donor privileges, or hidden proximity to participants. The City should protect service workers from being used as shadow intermediaries and protect participants from unreviewed channels disguised as logistics.

A staff-burden register should run beside the participant record without exposing staff private life. It can track staffing ratios, recurring overload, unsafe routes, maintenance backlog, emotional labor, injury patterns, complaint categories, turnover, and unresolved hidden-cost warnings. Visible public-power formation is not honest when participant burden is counted precisely while worker burden remains anecdotal (International Labour Organization, 1981, 1988; NIOSH, 1997).

One of the simplest ways to evaluate a public institution is to ask whether its most praised spaces depend on the least protected people. The City must answer that question before anyone can admire its public halls. If the ordinary labor of the City is invisible, underpaid, unsafe, unrecorded where influence matters, or overrecorded where privacy matters, the City's visible mission is unstable.

The service ecology should be treated as a system of dignity, not as a logistical inconvenience. Routes, uniforms if any, staff entrances, break rooms, tool storage, device access, cleaning protocols, maintenance windows, and staff complaint channels all teach participants what kind of public power the City is forming.

A service-route map must remain visible to governance even where it is not public. This map should identify the paths by which food, waste, cleaning, maintenance, supplies, devices, records media, medical support, and emergency equipment move. It should also identify which routes intersect with participant spaces, protected domains, public spaces, and staff-only domains. A route that no one reviews is an architectural shadow.

Service labor should be included in the City's cost and dignity calculations. The question is not only how many workers are needed, but how much repeated burden each worker carries, whether the work exposes them to records, whether the work creates access to sensitive areas, whether the work is physically safe, and whether the worker has a complaint route. Hidden labor is not hidden because it is unimportant. It is often hidden because institutions are embarrassed to count it.

Every public institution has a backstage. Food, waste, linens, equipment, servers, cleaning, ramps, devices, filters, and doors move through it, and workers keep each system usable. A City that claims to reveal hidden power cannot hide the people, routes, schedules, and risks that make its own public face possible.

Service routes are often designed for invisibility. That invisibility can be useful for operations, but it can also hide worker burden, informal access, unreviewed movement, staff exhaustion, and unequal dignity. The City must distinguish operational discretion from moral disappearance. A route can be private to protect work without being unaccountable.

Maintenance labor is the recurring evidence that infrastructure is not a one-time achievement. A record system needs upkeep. A building needs repair. Accessibility features need inspection. Emergency systems need testing. Landscape needs care. Cybersecurity needs updates. The City will either budget for this labor honestly or push hidden burden into staff and future failure.

Service labor reveals whether the City treats its moral purpose as shared work or as a cost to be minimized until failure occurs. A City that underpays, understaffs, over-records, overworks, or silences service workers has shifted burden downward. Its public-power formation may look noble, but its infrastructure will tell a different story.

Service routes also affect record integrity. A hidden service corridor can become a side channel for influence if it permits unlogged access to participants, office suites, protected zones, or archive systems. The City must design service movement to

protect worker dignity while preventing service circulation from becoming informal power circulation.

Service routes and maintenance are civic architecture. It asks not only whether the City works, but who must work to make it work, under what conditions, with what privacy, what visibility, what safety, what complaint rights, and what protection from being made background.

8.2.1 — Service Route Dignity

Service routes should be judged by the same dignity standards as public halls. A corridor used by cleaners, technicians, food staff, waste handlers, medical support, security, and delivery workers should not be narrow, poorly lit, overheated, confusing, unsafe, or hidden from institutional memory. If the City's visible rooms are humane while its service routes are degrading, the architecture has merely moved burden out of sight.

A dignified service route should be legible to those who use it. Workers should not have to rely on informal lore, unsafe shortcuts, or senior-staff permission to move through the City. The route should communicate purpose, safety, emergency exit, protected boundaries, and escalation options. Confusion in a service route is not just inefficiency. It is a condition that increases injury, delay, resentment, and shadow discretion.

Service-route dignity lies between invisibility and exposure. Workers deserve privacy, safety, adequate space, usable equipment, and freedom from unnecessary public observation. At the same time, the institution must recognize the routes, schedules, hazards, and authority conditions under which their

work is performed. The objective is reviewable treatment, not public display of laborers.

Service route design should include adequate width, clear signage, safe surfaces, ergonomic movement, climate control, lighting, rest access, emergency egress, and separation from public spectacle. These are practical details, but in the City practical details are moral facts. A worker injured by a bad route carries a burden the institution chose to ignore.

Service routes must also avoid becoming privilege routes. If influential participants, donors, visitors, officials, or staff use service paths to avoid ordinary record conditions or public interface boundaries, the route has become a shadow channel. Worker spaces should not be used as informal political corridors. The City must protect the route's service purpose.

Service route dignity should be audited. Workers should have complaint routes, anonymous reporting where needed, and participation in route review. A blueprint may look rational to architects while exhausting the people who use it fifty times a day. The burden expert is often the person carrying the burden. The City must listen there.

The City's service routes will teach participants whether they notice the people who sustain public life. A participant who treats service workers as invisible has revealed something about power. But the worker should not have to become a test object. Dignity must be protected first, and evidence about participant conduct must be gathered without exploiting the staff member's vulnerability.

The simplest way to test a service route is to ask whether a respected public guest would be allowed to see it without embarrassment. If the answer is no, the City should ask whether the route has been designed to hide the people who carry its daily life. Backstage dignity is often the first casualty of beautiful civic design.

8.2.2 — Maintenance Staffing

Maintenance staffing is civic capacity that has to exist before opening. Record hardware, lifts, water systems, accessibility devices, emergency equipment, kitchens, landscape, communications, lighting, security tools, and archive environments all depend on skilled people, workable shifts, training time, spare capacity, and safe callout. The staffing plan records skill mix, coverage, on-call limits, recovery, succession risk, contractor dependence, and trigger points for narrowing service. Deferred hiring becomes visible as a continuity and safety decision rather than an invisible economy.

Maintenance staffing should be calculated from real systems, not from image budgets. The number of cameras, doors, ramps, lifts, filters, rooms, records, kitchens, vehicles, medical interfaces, public interfaces, water systems, and security devices creates recurring work. If the City counts the capital cost but undercounts the human maintenance load, it has already shifted burden into future burnout and deferred failure.

The staffing model must count recurring labor. Record devices need calibration; doors need adjustment; secure rooms need inspection; public interfaces need uptime; heating, cooling, water,

air quality, and electrical systems need monitoring; accessibility systems need maintenance; emergency systems need drills; and landscape and drainage need care. None of this occurs by civic magic.

Understaffing moves burden into delay, breakdown, overwork, and hidden risk. A small staff may keep the public-facing campus functional for a while, but only by skipping inspections, postponing repairs, working overtime, accepting unsafe shortcuts, or allowing minor failures to compound. A balanced budget cannot be achieved by spending the bodies of maintenance workers.

Staffing should be tied to system complexity. A simple, maintainable design may require fewer specialized staff. A highly technical design may require more staff, more vendors, more training, more cybersecurity, and more redundancy. If the City chooses complexity, it must fund the labor complexity creates. Elegant systems that hide their operating burden fail the test.

Maintenance staffing also requires role clarity. Workers need authority to take systems offline when safety requires it, report deferred maintenance, challenge symbolic spending that crowds out repair, and escalate risk without retaliation. If maintenance staff can see failure but cannot speak, the City has blinded itself. Technical truth often enters institutions through the person asked to fix what leaders hoped would not break.

Training matters because maintenance in the City is not ordinary facilities work alone. Workers may touch protected zones, record hardware, emergency systems, public interface infrastructure, and

accessibility features. They need role-record boundaries, privacy rules, nonparticipant protections, cybersecurity awareness, and dignity protocols. Maintenance labor sits close to sensitive life.

Maintenance staffing must be planned before scale. Expansion without technicians, cleaners, operators, accessibility support, spare coverage, supervision, and protected training time is borrowing from the future. Staffing sufficiency belongs in pilot review, continued-operation review, and public maintenance reporting. When upkeep cannot keep pace, growth pauses before the workload is transferred to workers or users.

Maintenance staffing should also include institutional memory. Workers who know why a system was designed a certain way can detect failure earlier than a contractor reading a manual for the first time. The City should protect that knowledge through documentation, training, respectful retention, and succession, rather than letting maintenance wisdom vanish with turnover.

8.2.3 — Safety and Ergonomics

Safety and ergonomics are not merely workplace compliance matters. They are part of whether the City tells the truth about the bodies that keep it alive. Lifting, reaching, kneeling, repetitive inspection, night repair, confined-space work, heat exposure, chemical handling, ladder use, electrical work, and response to alarms all distribute burden through human bodies. A design that makes maintenance heroic has already failed the ordinary ethics of infrastructure.

Ergonomic review should include the actual tasks of the City, not generic office posture. A record technician may need safe access

to ceiling devices. A custodian may need service rooms close enough to avoid exhausting routes. A clinician may need unobstructed emergency movement. A landscape worker may need shade, water, and equipment storage. A security staffer may need a station that permits calm observation rather than constant vigilance strain. Each task should be designed as a visible duty rather than an invisible sacrifice.

An ergonomic review should include the invisible repetitions of work. A single lift may seem harmless. A thousand lifts become injury. One awkward reach may seem minor. A daily route with awkward reaches becomes occupational burden. The City should evaluate repetition, not only dramatic hazards, because hidden labor often injures slowly.

Safety review should also include emotional ergonomics. Some roles place workers at repeated points of conflict: complaint intake, moderation, security screening, archive correction, public interface, and emergency response. The City should design rotation, supervision, rest, and escalation so that emotional friction does not become a private tax paid by staff.

Safety and ergonomics are not worker comfort after core mission. They are part of the core mission because the City is built to prevent hidden burden. A route that requires repeated lifting without assistance, a mechanical room that forces awkward posture, a cleaning process that exposes workers to chemicals, or a monitoring station that creates eye strain is a burden placed on workers for the sake of institutional appearance.

Work design must begin with bodies that tire, bend, age, differ, recover, and sometimes become injured. Ergonomic assessment belongs in early design, not after workers begin reporting pain. Carts, lifts, adjustable stations, anti-fatigue surfaces, proper lighting, hearing protection, ventilation, tool access, and safe storage are infrastructure ethics.

Safety also includes psychosocial burden. Maintenance and service workers may operate in tense spaces, near participants under stress, around media pressure, during protests, inside emergency conditions, or while handling sensitive records or protected areas. Safety must include protection from harassment, retaliation, public exposure, and role confusion. A worker should not have to choose between finishing a task and protecting their dignity.

Safety data must remain a protection tool rather than a surveillance file. Injury reports, near misses, equipment faults, overload indicators, and hazard observations should be collected to improve work, staffing, training, and design. They should not become punitive productivity measures, public reputation signals, or evidence of a worker's character. Purpose limits, access controls, anti-retaliation rules, retention schedules, and worker review are part of the safety system itself.

Ergonomics interacts with record design. If a device requires constant manual correction, someone carries that burden. If a public record site has repeated technical glitches, staff absorb frustration. If a door system misclassifies access, security and maintenance workers carry conflict. The City must evaluate

systems by the labor they require when they fail, not only by how they function in demonstration.

A safe City should also empower workers to stop unsafe work. If a maintenance task risks injury, record breach, nonparticipant exposure, or unsafe public access, the worker should have a clear escalation path. A culture that treats delay as failure will hide danger. A culture that treats safe stoppage as integrity will repair problems before they injure people.

A safety system is especially strong when it notices the injuries that do not become headlines. Repetitive strain, chronic stress, near misses, awkward lifts, poor ventilation, and constant alert fatigue may never look dramatic, yet they reveal where the institution is spending bodies quietly. The City must learn to count quiet harm.

8.2.4 — Operational Transparency

The object of operational transparency is the support system, not the worker's private day. Public reporting can show staffing levels, backlog classes, major maintenance failures, response times, safety incidents, vendor dependence, repair deferrals, and budget pressure. Gossip, raw footage of labor, and personal humiliation add no accountability and would recreate the exposure the City is supposed to direct toward consequential power.

Different audiences require different operational views. The public needs intelligible status and consequence. Oversight needs fuller logs and supporting records. Staff need work-order detail and safe internal communication. Protected people need notice

when their spaces or records are affected. Security-sensitive information may require lawful shielding. Transparency is therefore a set of purpose-matched views rather than one indiscriminate window.

Operational transparency makes support systems reviewable without turning every worker into a public exhibit. The City should be able to explain how food, cleaning, maintenance, logistics, records, devices, utilities, security, and emergency readiness function. It should not ask the public to trust a seamless surface. Seamlessness is often the aesthetic of hidden labor.

A public operations account should name staffing categories, maintenance schedules, major dependencies, service-route principles, vendor roles, outage classes, safety review, and the status of significant repairs. Sensitive details can remain protected, but the institution must still show that it counts the people and systems beneath its visible surface.

Operational dashboards must be handled carefully. A dashboard can reveal maintenance backlog, service delays, system uptime, accessibility repairs, and complaint categories. It can also create false precision or expose staff to blame. The City should report operation at the right level: useful for governance, meaningful to the public, protective of workers, and humble about what a metric can show.

Transparency should include failure categories. Planned maintenance, emergency repairs, accessibility outages, record device downtime, service route closures, and vendor incidents should have status language. Hidden operations fail twice: first

technically, then publicly when people learn the institution concealed the failure. Honest status language reduces rumor.

Operational transparency works through role-bounded explanation. A repair report identifies the affected service, status, delay, owner, interim protection, and next review without publishing a worker's identity by default, exposing a security-sensitive route, or revealing a protected zone. The public receives enough information to judge the institution while operational and personal details remain under their proper controls.

A City that makes operations visible teaches a larger civic lesson. Every public institution rests on systems people rarely see. If public-power seekers learn to see these systems, they may later govern less theatrically. They may understand that policy is not only announcement. It is the repair of the hidden structures that carry public burden.

Operational transparency fails when citizens need administrative fluency to understand it. The City should explain service burdens, dependencies, delays, and correction routes in clear language while reserving technical or security-sensitive detail for the appropriate reviewers. Jargon cannot become a new wall behind which practical power disappears.

8.2.5 — Staff Privacy Boundaries

Staff privacy boundaries require more than a statement that staff are not participants. Service workers may appear incidentally in participant records, emergency logs, access systems, complaint files, maintenance tickets, and public-record explanations. The City should define when staff identity is necessary, when a role

label is sufficient, when masking is required, and how workers can object to unnecessary exposure.

These boundaries should also apply to contractors and temporary workers. A person repairing a network switch, installing a ramp, delivering medical equipment, cleaning after a crisis, or inspecting a fire system should not lose ordinary privacy because they crossed a City threshold. Contract language, badges, orientation, access logs, and incident procedures should all make clear that support work does not equal the Transparent Vow.

A role-record principle should govern infrastructure work. A worker's actions may need logging where they affect records, access, safety, maintenance, protected zones, or participant contact. That purpose-limited record does not authorize a full-life dossier. Staff privacy, complaint routes, labor representation, and access to correction remain part of operational integrity.

Staff privacy also protects the integrity of reporting. Workers will not report hazards, harassment, influence attempts, technical weaknesses, or record defects if every report risks unnecessary exposure of their private life. A City that wants honest maintenance intelligence must make it safe to speak. Privacy is not the enemy of accountability here. It is part of the path by which hidden burden becomes visible without sacrificing the person who names it.

Staff privacy boundaries are necessary because the Transparent Vow belongs to participants, not to every person who works in the City. Staff operate inside a high-record environment. They may influence participants, access systems, repair devices,

support care, moderate records, and protect safety. That creates role accountability. It does not create full-life exposure.

A staff role record should capture material conduct inside the role: access events, advice given where relevant, work logs, safety incidents, complaints, system interventions, conflicts of interest, and decisions that affect participants or records. It should not capture off-duty life, private beliefs, unrelated relationships, medical details, or ordinary domestic conduct. Staff are not auxiliary participants by employment.

The boundary protects labor dignity. Without it, the City may make working there too costly for anyone who values ordinary privacy. The result would be either staffing failure or a workforce selected for unusual tolerance of exposure. Neither is fair. A City cannot sustain itself by recruiting workers into burdens they did not choose. Clear role limits also widen the pool of skilled workers willing to serve without surrendering ordinary private life.

Staff consent should be meaningful and role-specific. Employment terms must clearly state what role records exist, what is logged, what can be reviewed, what is public, what is protected, and how staff may challenge misuse. A worker should not discover the scope of role visibility only after a record dispute occurs. Notice before burden applies to staff as well as participants. That notice should be renewed whenever technology or job design materially changes what the institution can observe. Renewal should identify any new sensor, access log, or review authority before the change takes effect.

The boundary should be revisited when roles change. A worker promoted into a sensitive archive role, a maintenance contractor given recurring protected-zone access, or a moderator assigned to public interface review may need a different role record. Changing duty should change record status through notice and consent, not through invisible expansion. A short transition record should identify the new duty, changed visibility, review date, and route to challenge the change. If the worker refuses the changed burden, reassignment or exit should remain available without retaliation.

8.3 — Accessibility, Disability, and Sensory Inclusion

Accessibility is institutional truth expressed through movement, communication, comprehension, and independent use. It shows whether the City designed for varied bodies, senses, cognition, language, stamina, and technology access or imagined one ideal civic user. Access provided only after a request, through escorted exception, humiliating detour, or staff availability is dependency rather than inclusion. The built and digital environment should make ordinary participation possible without requiring a person to disclose more than the function demands.

Disability expertise must enter early enough to shape the building, not late enough to decorate a failure. Mobility, sensory, cognitive, communication, psychiatric, chronic illness, fatigue, pain, neurodivergence, aging, temporary injury, pregnancy, and trauma-related needs all affect how a person carries the City. The integrity question is not whether every desire is met. It is whether varied bodies and minds are treated as part of the design population from the beginning.

Accessibility also protects public interpretation. If only certain bodies can move easily through the City, the public receives a distorted picture of who appears calm, articulate, punctual, steady, or resilient. Exclusion can masquerade as character evidence. Access failure therefore risks converting design bias into public-power judgment (United Nations, 2006; ISO, 2021a; Steinfeld and Maisel, 2012; Hamraie, 2017; World Health Organization, 2022c; W3C, 2023).

Accessibility in the City must also protect the people who inspect the City. A critic, affected person, journalist, host-community member, disabled visitor, or family member must be able to use the public interface and complaint pathways without needing insider help. Otherwise the City becomes readable only by those already positioned to understand it.

The accessibility program must distinguish accommodation from redesign. Accommodation helps a person navigate a system built without them in mind. Redesign changes the system so fewer people need special permission to use it. The City will need both, but its ambition should be redesign wherever predictable burden can be removed.

Accessibility begins in the real design rather than after it. It is evidence of whether the City understands human beings. A public-power formation institution that assumes an ideal body or ideal mind has already narrowed the public it claims to serve. The question is not how unusual users can be fitted into the City, but whether human variation was a first condition of design.

Disability access is often treated as compliance. Compliance matters, but compliance is a floor. The City's burden is deeper because it asks people to live, work, visit, protest, review records, access care, move through emergencies, and understand public information inside an unusual civic environment. A ramp is not enough if the record site is cognitively hostile, the emergency alarms overwhelm neurodivergent users, and public interface tools exclude people who process information differently.

Sensory inclusion matters because the City will be a high-load environment. Participants under record, staff under pressure, visitors under uncertainty, critics under tension, and vulnerable persons in crisis may all experience light, sound, crowd density, signage, waiting, alarms, screens, texture, and spatial complexity as burden. Sensory design is not softness. It is load governance.

Accessibility also protects public legitimacy. A City that can be understood only by the highly educated, navigated only by the able-bodied, tolerated only by low-sensitivity nervous systems, or used only by people with digital fluency will reproduce elite access. Public trust cannot be accessible only to the already empowered.

Universal design belongs before opening, but accessibility audit must continue after use. People reveal burdens designers did not predict. A hallway that looks accessible on paper may fail under crowd conditions. A record site may pass a checklist while confusing nonexperts. A quiet room may be too far from where overload occurs. Continuous audit lets lived burden correct designed confidence.

The City's accessibility ethic is simple: no person should carry extra avoidable burden because the institution imagined too narrow a human being. Where unavoidable burden remains, it should be named, reduced, supported, reviewed, and treated as part of the City's responsibility.

8.3.1 — Universal Design Baseline

Universal design begins before recruitment. When access appears only after a disabled participant arrives, the institution has shifted

the work of imagination onto the person already carrying the barrier. The baseline should expect variation in mobility, hearing, vision, cognition, speech, stamina, sensory processing, neurodivergence, chronic illness, trauma history, and temporary impairment. Human variation enters the plan as ordinary reality, not as an exception request.

The baseline should include governance, not only features. Someone must have authority to stop an opening, delay a public event, revise a route, change signage, add quiet capacity, repair an assistive system, or require independent review when access fails. Accessibility is not the presence of ramps and captions alone. It is a living power to correct the built environment when the environment begins to exclude.

Accessibility belongs inside ordinary operations. A meeting is not fully scheduled until its access conditions are known. A route is not complete until varied movement, communication, cognition, and sensory needs have been considered. A public record bundle is not ready until comprehension and assistive-technology use have been tested. Access becomes a measure of ordinary quality rather than a favor granted after difficulty appears.

The baseline also protects ordinary citizens. Public visitors may not know the City's terms, may be elderly, disabled, grieving, angry, confused, overburdened, or unfamiliar with public institutions. A City designed only for trained insiders will make the public feel incompetent. A fair public institution should not make people feel small simply because they need the building to explain itself.

A universal design baseline means accessibility is built into the City's first grammar. It is not a special route, secondary entrance, hidden service lift, afterthought caption, later translation, or exception process. The baseline asks how varied bodies and minds move, understand, rest, communicate, and exit from the beginning of design.

The baseline should apply across the whole City: residences, classrooms, deliberative halls, commons, dining spaces, libraries, walking grounds, archive interfaces, public record sites, service routes, clinical areas, emergency paths, and public edges. A person should not become included in one domain and excluded in the next. Accessibility that disappears at thresholds is not accessibility. It is intermittent permission.

Use-case testing turns the universal-design baseline into lived evidence. Reviewers should follow a wheelchair user through a fire evacuation, a blind visitor through the public record site, a neurodivergent participant from public interface to sensory refuge, a person with low literacy through consent, and a staff member with chronic pain along a full service route. Each journey reveals thresholds that a checklist can miss.

Universal design must not become a claim of perfection. No design anticipates every body or context. The baseline should include feedback routes, accessibility complaint pathways, expert audit, participant and staff review, and public usability testing. The City is fairer when it admits access is a continuing obligation rather than a completed achievement.

In a City that forms public power, universal design also educates. Participants learn that accessibility is not charity. It is burden placement. They learn that public systems fail when they design for a fictional average person. They learn that governance is partly the art of noticing who must work harder because a system imagined them too late.

Mobility access must survive temporary conditions. Construction hoarding, repairs, deliveries, crowds, security incidents, weather, wet surfaces, broken lifts, and event furniture often defeat routes that appear accessible on drawings. Every temporary change needs an accessible alternative, clear notice, and a person responsible for restoring the route.

8.3.2 — Mobility Access

Mobility access should be measured against the ordinary rhythm of City life. It is not enough that a wheelchair user can enter a building once. The question is whether a person can reach residence, learning space, dining, deliberation, public interface, care, evacuation, reflection, archive access, complaint routes, visitor areas, and emergency assistance without being segregated, delayed, exhausted, or marked as an exception.

Route equality should be treated qualitatively. A path may be technically accessible while still being humiliating if it sends disabled users through service corridors, hidden entrances, long detours, locked lifts, or staff-dependent passages. The City should review distance, slope, weather exposure, resting points, door hardware, elevator redundancy, tactile surfaces, seating, signage,

emergency refuge, and the social meaning of the path. Access that works only by apology is not access.

Mobility access should include redundancy because a single accessible route is a single point of exclusion. If the only lift fails, the only ramp is blocked, the only low-gradient path floods, or the only accessible vehicle is unavailable, access has been narrowed to optimism. The City should plan alternate routes, maintenance priority, emergency evacuation, rest points, seating intervals, and clear notice when a route is temporarily unavailable.

Paths must be continuous. It is not enough to make the entrance accessible if deliberation halls, dining rooms, protected zones, service areas, bathrooms, bedrooms, archive interfaces, public record site spaces, and emergency exits are unevenly available. The City's moral claim is weakened whenever a person can enter but cannot fully participate.

Vertical-access redundancy must remain usable during evacuation and maintenance outages, not only during ordinary operation; emergency plans should be tested with the bodies and assistance needs the City actually serves.

Mobility access also affects record boundaries. If an accessible route forces a person through a more visible area than others use, the City has created unequal exposure. If the only accessible route passes through staff zones or protected areas, it creates role confusion. If mobility assistance requires excessive staff involvement, it may create privacy loss. Access routes must preserve dignity and record status.

Outdoor mobility deserves attention. Walking grounds, restorative exterior, public edges, paths to protest areas, host-community interface, and emergency assembly points must be usable across weather, terrain, light, and fatigue conditions. A beautiful landscape that excludes disabled bodies is not restorative. It is an aesthetic burden placed on others.

Maintenance determines whether mobility access remains real. Slopes settle, doors become heavy, surfaces crack, automatic openers fail, tactile guides wear, and snow, heat, rain, or debris can make a route unusable. These failures need inspection, reporting, and prompt repair as governance matters. Deferred access repair is exclusion in slow motion.

Mobility access should be tested under ordinary and stressed conditions. A route that works on a quiet afternoon may fail during public interface, emergency drill, media presence, rain, heat, crowding, or device outage. The City must test access under the conditions in which burden actually appears.

8.3.3 — Cognitive Access

Cognitive access begins with the premise that civic seriousness should not require deciphering a maze. Participants, visitors, staff, inspectors, critics, families, disabled users, and stressed people should be able to understand where they are, what rules apply, where to get help, how to leave, and how to contest a problem. Confusing infrastructure transfers burden to memory, confidence, language skill, and prior institutional comfort.

The cognitive-access plan should use redundant cues for comprehension: plain-language signs, icons where useful, maps

that do not disclose protected routes, staff wayfinding points, orientation rehearsals, digital supports, quiet waiting places, and crisis instructions that can be understood under pressure. Cognitive access also requires restraint. Too many alerts, screens, warnings, options, and labels can become their own form of exclusion. Legibility is achieved when necessary information arrives in the right amount, at the right moment, with a route to human help.

Cognitive access requires reducing avoidable mystery across signs, maps, consent terms, record-status notices, complaint routes, emergency instructions, wayfinding, queues, archives, and digital interfaces. These systems should be understandable without elite literacy, institutional confidence, or insider vocabulary. When people must decode a maze before they can object or seek help, burden has moved to those least able to carry it.

Plain language is structural access. It should preserve precise distinctions without condescension: capture differs from release; protected nonvisibility differs from hidden active life; a role record differs from a full-life record; an Artificial Intelligence summary differs from judgment; and operational evidence differs from validation. These distinctions belong in signs, consent materials, status labels, emergency instructions, and complaint routes, not only in specialist documents.

Memory, attention, stress, trauma, language difference, and neurodivergence all affect comprehension. A person in crisis may not process instructions well. A visitor may misunderstand record status. A staff member under time pressure may miss a step. The

City should design repeated cues, confirmations, summaries, and review steps to reduce preventable misunderstanding.

Cognitive access protects agency. Consent terms must be understandable before agreement; status labels must let public readers distinguish fact, allegation, correction, and uncertainty; and appeal routes must remain usable by a person under stress. Readability testing, alternative formats, supported decision-making, translation, teach-back, and independent assistance prevent complexity from becoming a gatekeeper.

The deepest test is explanatory: can a person describe the City back in ordinary language? If participants, staff, visitors, and citizens cannot describe what burden is being placed on whom, the City is not yet legible. Fair systems must also be understandable to those asked to trust them.

Cognitive access is also an anti-capture safeguard. When rules are hard to understand, insiders gain power. Those who know the system can navigate rights, complaints, records, and access more easily than those who do not. Clear design reduces the authority of insiders over everyone else.

8.3.4 — Sensory Access

Sensory access begins in ordinary operation rather than in a refuge offered after overload. Light flicker, glare, echo, alarms, mechanical hum, crowd density, scent, temperature, screen brightness, visible capture equipment, and abrupt transitions are mapped by intensity, duration, predictability, control, and recovery. User-adjustable features and low-stimulation alternatives are integrated where function permits. People should

be able to name and reduce avoidable load before distress becomes the only evidence the institution recognizes.

Because the City is an active-record institution, sensory access also includes the felt presence of capture. Some participants may tolerate a deliberative hall but not a room where recording devices are visually aggressive. Some visitors may be able to engage a public interface only if seating, lighting, wait time, and noise are moderated. Sensory inclusion should therefore pair technical accommodation with psychological legibility: people should know what is recording, why it is there, what is shielded, and where relief is available.

Sensory design must not equate seriousness with harshness. Constant brightness, echoing halls, hard surfaces, surveillance-like glare, abrupt alarms, dense signage, and visually busy public interfaces may create unnecessary burden. A severe civic purpose does not require severe sensory conditions. Human-scale authority can be calm.

Sensory refuge is an accessibility route. The practical test is whether a person can identify, reach, use, and leave a lower-stimulation space without stigma, delay, or loss of the service they came to receive.

Alarms and emergency systems require particular care. They must be noticeable, accessible, and effective across hearing, vision, cognition, and mobility differences, but they should not produce avoidable panic or sensory injury. Redundant signals, visual alerts, tactile cues, plain instructions, and staff support can protect safety without relying on one overwhelming stimulus.

Public record interfaces also carry sensory burden. A screen full of dense status labels, flashing alerts, auto-playing media, or complex navigation can exclude users and intensify misreading. The public should be able to review record bundles without being manipulated by dramatic presentation or defeated by cognitive and sensory overload.

Sensory access must include staff. Service workers, moderators, archivists, operators, security staff, clinicians, and maintenance workers may spend long hours in spaces participants use briefly. Noise, lighting, screen exposure, and repetitive alerts can become occupational harm. The City cannot make an accessible front and an exhausting back.

The City's sensory ethic is modest: reduce avoidable load, preserve dignity, support recovery, and make intense environments intentional rather than accidental. Public power should be formed in a place that teaches steadiness, not constant activation.

Sensory access should not be framed as making the City less serious. A calm environment can support rigorous judgment better than an overstimulating one. The City should learn that steadiness, silence, warmth, adjustability, and refuge are not retreats from public burden. They are conditions under which burden can be carried without distortion.

8.3.5 — Accessibility Audit

An accessibility audit needs authority before opening and throughout operation. Disabled reviewers and users, accessibility professionals, emergency planners, staff representatives, and

clinicians where relevant should test the institution under ordinary and stressed conditions. Routes, devices, software, staffing, events, and crisis modes change; a one-time checklist cannot certify them indefinitely.

Testing should combine walk-throughs with real tasks: entering a building, reaching care, using the record interface, understanding consent, submitting a complaint, and evacuating. Reviewers should test crowding, lift or screen failure, noise, fatigue, distress, and conflicting demands. A route or form that works during a demonstration may fail under the conditions in which it is needed.

Each material finding should have a responsible office, funded remedy, deadline, interim accommodation, retest, and appeal route. Immediate hazards trigger pause or closure; significant barriers receive funded deadlines; recurring failures require redesign or governance review; and less urgent defects remain on a dated repair schedule. Public summaries should report progress without exposing personal information. Accessibility is a condition of legitimate civic burden, and the authority to secure repair is part of the audit's credibility (Steinfeld and Maisel, 2012; Hamraie, 2017).

Audit data should protect people. Accessibility complaints may reveal disability, medical condition, cognitive profile, trauma history, or family need. Access requests cannot become public labels. The audit should count burden without exposing the person who named it. This is especially important in a record-rich institution. Aggregate reporting can reveal recurring access failures without turning individual accommodation needs into public identifiers. Complaint and accommodation data should

also be checked for missing voices, because silence may reflect an inaccessible reporting route rather than absence of burden.

Accessibility review recurs after construction, occupancy, public-interface launch, major technology change, emergency drills, renovation, and before any renewal of operating status. Access is a living condition shaped by wear, crowding, staffing, software, temporary closures, and changing users. The review cycle should include disabled users and workers with authority to challenge the official account of usability. Recurring review should compare promised accessibility with actual task completion across changing conditions and user groups. Findings should be assigned to named owners so repeated barriers cannot disappear between audit cycles.

The strongest accessibility audit is allowed to slow the project. If an access failure is serious enough to prevent dignified use, the opening, activation, expansion, or public interface should pause. Accessibility that cannot stop momentum is advisory, not governing. Accessible operation depends on what the City is made from and how construction distributes risk. The relevant standard is lifecycle responsibility. Construction review must examine provenance, worker safety, durability, repairability, toxicity, embodied carbon, energy, waste, local capacity, and disassembly. Opening-day finish matters less than what workers, users, hosts, budgets, and ecosystems carry across the building's life. A pause caused by an access failure should remain visible until the barrier is repaired and independently retested. A failed retest should keep the affected function paused rather than convert urgency into an exception.

8.4 — Construction and Materials

Construction creates the City's first public record before any participant arrives. Land disturbance, procurement, worker conditions, material extraction, transport, energy, carbon, waste, biodiversity, and host disruption all belong to the project's civic account. Whole-life assessment follows those burdens through manufacture, construction, use, maintenance, adaptation, disassembly, and reuse. A beautiful campus is worthy of its purpose only when its making can withstand labor, environmental, cost, and community scrutiny (ISO, 2006a, 2006b; RICS, 2023; UNEP and GlobalABC, 2026).

Construction discipline aims at traceable compromise rather than purity. No major building can be made without supply chains, permits, cost pressure, delays, and imperfect information. The ethical task is to identify burdens, reduce what can be reduced, justify what remains, protect workers, avoid prestige waste, and preserve repair and replacement routes. A claim of innocence would hide more than it explains.

The build record should remain available after opening so safety incidents, accessibility changes, vendor dependencies, and budget revisions do not disappear from later evaluation (International Labour Organization, 1988).

The construction phase should also be treated as a public teaching moment. A City that explains why it chose durable repairable materials, why it rejected prestige finishes, why it slowed work for safety, or why it changed a supplier after review teaches the

public that fairness is not only the finished form. It is the method of making.

Construction choices require a future-maintenance review. A system that appears affordable at purchase may create proprietary dependence, expensive repair, hazardous disposal, difficult access, or long shutdowns later. Opening-day savings are false when they create future hidden burden.

Construction is the City's first conduct. Before a participant enters, before the Vow is spoken, before the archive opens, the City has already acted upon land, workers, materials, water, energy, roads, vendors, local residents, and future maintenance. A fair City cannot begin by hiding the burden of its own birth.

The act of building tests whether the City believes its own standard. It would be a contradiction to create a public-power formation institution through exploited labor, opaque procurement, reckless extraction, wasteful materials, dangerous working conditions, or symbolic spending that crowds out function. The building process must be part of the record of the City's seriousness.

Materials carry histories. They are extracted, manufactured, transported, installed, maintained, repaired, and discarded. Each step places burden on workers, ecosystems, communities, energy systems, and future budgets. Material choice is a public ethics question.

Construction labor carries direct human burden. Workers face risk, weather, schedules, machinery, dust, chemicals, repetitive strain, subcontracting pressure, wage conditions, and sometimes

unsafe acceleration. If the City protects future participants while tolerating dangerous construction labor, it has not moved burden fairly. It has moved burden earlier and out of sight.

Carbon, energy, waste, and lifecycle review matter because the City should not repair one public burden by worsening another. A building designed to make power more fair cannot ignore climate and ecological burden. Environmental cost is not an abstract future concern. It returns as heat, flood, fire, water strain, public health burden, energy cost, and infrastructure fragility.

Construction transparency protects the public from being asked to admire a finished object without knowing what it cost others. Transparency does not mean publishing every security-sensitive detail. It means major choices, standards, burden reviews, labor protections, environmental considerations, procurement principles, and repair implications should be reviewable. The City's first public memory begins before occupancy.

8.4.1 — Material Source Burden

Material source review should look beyond price and appearance. Stone, timber, steel, concrete, glass, electronics, batteries, wiring, insulation, finishes, furniture, and sensor components arrive through mines, forests, factories, ports, trucks, warehouses, and labor regimes. The City does not need to solve global supply chains inside this chapter, but it should refuse willful ignorance. A material that makes the City beautiful while hiding extraction abuse, forced labor risk, toxic exposure, or ecological harm carries an unacknowledged burden into the walls.

Material source review should include provenance, labor conditions, ecological impact, durability, repairability, replacement availability, transport burden, local effects, and dependence on unstable or coercive suppliers. The City does not need a moral fantasy in which every material is pure. It needs a source record honest enough that future readers can see what was chosen, why, what alternatives existed, and what burdens were accepted.

The review should also distinguish symbolic materials from functional materials. Prestige stone, rare finishes, dramatic glass, imported timber, or technologically fashionable components can carry unnecessary burden if they serve image more than function. Durable, repairable, locally maintainable materials may be less spectacular and more fair. The City's beauty should come from integrity of burden, not from expensive surfaces that future workers must protect.

Material sourcing should include a refusal category. Some materials may be too exploitative, too fragile, too energy-intensive, too difficult to repair, or too symbolically extravagant for the City's purpose. The ability to say no matters because public projects often justify questionable materials by claiming that beauty, durability, or donor preference requires them. Refusal is part of material governance.

The materials standard must distinguish necessity from prestige. A resilient door, safe glass, fire-rated assembly, accessible surface, or secure server component may be necessary. A rare finish chosen to signal importance may not be. The public should

not be asked to confuse expensive material expression with moral seriousness.

Material-source review follows extraction, manufacture, transport, installation, use, repair, and disposal. Price, appearance, and prestige cannot reveal labor risk, carbon, toxicity, biodiversity loss, supply-chain concentration, repairability, or waste. Procurement should show the tradeoffs rather than converting one favorable label into moral innocence.

Procurement should add responsible sourcing and climate suitability to the functional-material test, so locally maintainable choices do not hide extraction, labor, or environmental burden.

Material source review must also consider technical materials. Sensors, batteries, servers, access devices, storage hardware, networking components, and security systems carry mining, manufacturing, e-waste, labor, and vendor-dependence burdens. The City cannot treat digital infrastructure as weightless. Digital memory has a physical body.

Material source burden becomes a teaching object as well. Public-power seekers formed in the City should understand that every public building hides supply chains. If they learn to see the materials under their feet, they may later govern infrastructure with less illusion. The building itself becomes a lesson in consequence.

Material review should include replacement horizons. A source that appears acceptable for first purchase may become burdensome if replacement requires rare parts, proprietary contracts, long shipping routes, or hazardous disposal. The City

should ask not only where the material comes from, but what it will demand from the future.

8.4.2 — Labor in Construction

Construction labor is the City's first public test. Before any participant carries a Transparent Vow, workers carry heat, height, dust, deadlines, injury risk, commute burden, wage pressure, subcontracting complexity, and project uncertainty. The public should not be asked to admire a building produced through rushed work, unpaid time, unsafe sequencing, weak grievance routes, or retaliation against workers who slow the schedule for safety (International Labour Organization, 2022b).

Construction transparency should include worker voice. Public summaries need not expose individual workers, but they should show safety performance, wage compliance, subcontractor accountability, change-order pressure, injury response, rest conditions, language access, training, accommodation, and complaint outcomes. If the City cannot build itself while respecting workers, it has not yet earned the right to teach public power about burden.

The construction plan must prevent a host-community extraction event. Local workers may benefit from jobs, but they may also carry rent pressure, traffic, noise, displacement, or public-service strain. Apprenticeship, local procurement, fair bidding, traffic planning, worker transport, community notice, and complaint routes should be treated as construction ethics. The host place is not a blank surface for the project's ideals.

Labor in construction is the first human test of the City's moral claim. Workers prepare the site, pour foundations, frame structures, install systems, build ramps, wire record infrastructure, place pipes, carry materials, finish rooms, test devices, and correct defects. Before the City asks participants to accept visible burden, it must ask whether its own builders are protected from hidden burden.

Worker safety is the first requirement. The City should demand safety planning, training, protective equipment, hazard reporting, stop-work authority, accident review, and fair scheduling. A rushed build may satisfy donors or public expectations, but schedule pressure that increases injury risk is an unfair transfer of burden. Construction momentum is not a moral excuse.

Construction labor intersects with immigration status, local employment, union conditions, apprenticeships, housing, transport, and regional labor demand. Vulnerability cannot become an administrative convenience. The project should disclose recruitment, employment entities, wage and hour rules, accommodation, safety representation, complaint routes, and the effect of its hiring on essential local services.

Labor transparency should be meaningful without exposing individual workers unnecessarily. Public reporting can include safety categories, contractor standards, wage compliance summaries, incident categories, correction actions, and labor complaint routes. Workers should have protected channels to report harm without fear of losing work or immigration security where applicable. Protection must be real, not ceremonial.

The build process should also teach participants and future readers that public institutions are built by labor, not by vision alone. A City that remembers its builders becomes less likely to treat staff as background later. A City that forgets its construction workers will probably forget its maintenance workers too.

The City's construction labor rule can be stated plainly: no public-power formation institution should begin by placing hidden danger on the people building it. The worksite is not outside the City's civic obligations. It is the first place that lens must look.

Construction labor also shapes public trust because workers become the first witnesses to whether the City believes its own language. If the people building the City experience fear, wage abuse, unsafe pressure, or disregard, that testimony will matter more than an opening speech. Labor dignity begins the City's credibility.

8.4.3 — Carbon and Energy Load

Carbon and energy review should make the City's construction burden as visible as its operating burden; efficiency after opening cannot erase the emissions embedded in what was built (UNEP and GlobalABC, 2026).

Resilience changes energy ethics. Backup power, distributed generation, storage, passive survivability, load shedding, cooling, and critical-system priorities all carry costs and external effects. The review should identify which functions must persist, for whom, for how long, with what fuel or storage, and under whose authority, rather than treating maximum continuity as an unquestioned good.

The energy-continuity plan must address failure in layers: brief interruption, extended outage, extreme heat or cold, cyber-linked utility failure, fuel or grid disruption, and regional disaster. Each layer should state what continues, what narrows, what pauses, what is protected, and what public status applies. Energy resilience is not simply having backup power. It is knowing which duties survive under scarcity.

Carbon and energy load connect the City to the wider material world. A campus with record systems, climate control, storage, public interfaces, security, kitchens, residences, laboratories, archives, and maintenance systems will use energy. It will also embody energy in construction materials. If this burden is ignored, the City will appear morally clean only because its ecological cost is carried elsewhere.

The first distinction is between operational energy and embodied energy. Operational energy is used after the City opens: heating, cooling, lighting, computing, ventilation, storage, water systems, transportation, security, and daily use. Embodied energy is carried in materials, manufacturing, transport, construction, and replacement. Both matter. A building can be efficient in operation but heavy in embodied carbon. A low-carbon material can fail early and create replacement burden.

The energy system must be evaluated through reliability, resilience, carbon, cost, and dignity. Energy systems must support record continuity, medical safety, accessibility devices, emergency routes, food storage, climate refuge, and public interfaces. Energy failure is not only inconvenience. It can

endanger people, interrupt records, disable access, and create public confusion.

Renewable energy, storage, microgrid capacity, passive design, efficient systems, thermal resilience, and demand management may all matter, but none should be treated as a slogan. A system that looks green but is unreliable under heat, storm, fire, cyberattack, or maintenance constraint may fail the City's actual burden. Energy design must be tested under stress, not only described under ideal conditions.

Computing energy must be counted. Archive storage, redundancy, search, security monitoring, Artificial Intelligence assistance, rendering, public record access, backups, and cybersecurity all use power and hardware. Digital civic memory is not immaterial. The City should avoid pretending that technical elegance has no environmental weight.

Energy reporting should be public enough to support trust. The City can report usage categories, resilience status, emergency capacity, efficiency improvements, maintenance problems, and carbon-reduction efforts without creating security vulnerability. Hidden energy burden will eventually become public cost, whether through bills, emissions, outages, or host-community strain.

The City is not required to solve climate by itself. It cannot ignore the environmental burden it creates while claiming civic virtue. A City that counts power must also count power in the electrical sense.

Energy review should include prioritization under constraint. During shortage, outage, emergency, or climate stress, the City should know which loads preserve life, dignity, access, record continuity, and care, and which loads can be reduced. A fair energy system has a moral order, not only a technical one.

8.4.4 — Waste and Lifecycle Review

Waste review should begin at design, not demolition. Systems chosen for ease of launch may become future burdens when replacement parts are proprietary, batteries are hard to recycle, sensors become obsolete, finishes fail early, or renovation creates hazardous waste. Lifecycle review should ask how components are repaired, repurposed, disassembled, recycled, safely disposed of, or avoided altogether.

Lifecycle review must guard against novelty waste. A prestige project is tempted by custom fixtures, experimental surfaces, branded interiors, one-off interfaces, and display technologies that are difficult to maintain. Replicability requires a different beauty: components that can be understood, repaired, sourced, upgraded, and retired without making future workers pay for today's symbolism. Lifecycle review is humility made material.

Lifecycle review should begin at design selection. A component that is cheap to install but impossible to repair will become future burden. A finish that looks pristine but requires toxic cleaning will shift burden to staff and environment. A proprietary system that cannot be serviced without vendor monopoly will become governance risk. Waste is not only what goes into a dumpster. It

is also the long-term consequence of choices made to look efficient at the beginning.

A materials-and-systems passport should accompany every major component. Such a passport can record source, installation date, expected service life, replacement route, repair instructions, warranty, recycling or disposal path, known risks, and responsible custodian. The passport is not a public spectacle. It is a memory tool that keeps maintenance from depending on informal knowledge, vendor leverage, or institutional amnesia.

Waste begins in construction. Offcuts, packaging, demolition debris, soil movement, broken materials, temporary structures, and procurement errors can create large early burdens. The City should design for waste reduction, reuse, recycling, safe disposal, and transparency. Waste is not only a cost. It is evidence of how carefully the project understood its own material consequences.

Lifecycle review should examine durability, repairability, modular replacement, parts availability, hazardous disposal, vendor dependence, shutdown time, future maintenance skill, and total cost rather than purchase price alone. The review should be written from the perspective of the future maintenance worker, host resident, budget officer, disabled user, and critic who will inherit today's choice. A cheap or proprietary system that fails early or cannot be repaired locally may create greater burden than a more durable alternative.

Lifecycle review also protects host communities from delayed burden. Waste does not vanish because it leaves the campus. Disposal routes, demolition plans, electronic waste, and

hazardous materials may affect other places and workers. The City's burden review should follow waste far enough to avoid exporting harm under the name of cleanliness.

8.4.5 — Materials and Construction Transparency

Construction transparency governs decisions without turning workers into content. Public reporting can show contractor selection logic, beneficial ownership, major change orders, cost escalation, material substitutions, land and utility effects, safety performance, delay causes, community impacts, grievance status, and remedy. Individual workers retain privacy and freedom from harassment, and cameras are not used to create a civic spectacle out of labor. The public receives enough information to follow power, money, risk, and correction through the build.

Transparency must also protect security and persons. A public construction record should not expose vulnerabilities, worker private details, protected security layouts, or sensitive technical schematics. The fair approach is status transparency with protected detail handling: enough public knowledge to make burdens reviewable, enough shielding to keep the City from teaching saboteurs or exposing workers.

Construction transparency also protects against donor monumentality. If major design changes follow donor preference, naming ambition, prestige pressure, or symbolic extravagance, the record should reveal that. A City built to resist hidden influence cannot allow aesthetic power to be bought silently. Funding and design choices must be reviewable together.

Host communities need specific construction transparency. They should know expected disruption, traffic, noise, utility changes, public service load, safety measures, complaint routes, mitigation commitments, and schedule changes. Public communication should not treat neighbors as obstacles to the project's future. They are people already carrying present burden.

Transparency must include correction. Construction will deviate from plan. Some deviations are harmless or necessary. Others reveal poor planning, vendor pressure, budget shifts, labor risk, or environmental problem. A transparent City should not report only milestones. It should report meaningful changes, why they happened, and what burden they created or reduced.

A transparent construction record will help future Cities avoid both imitation and ignorance. Later builders should be able to learn what cost too much, what failed early, what overburdened workers, what materials performed well, what procurement rules mattered, and what host-community effects were underestimated.

8.5 — Emergency Systems and Continuity of Care

Emergency planning begins with the endangered person. Who is trapped, overloaded, unable to hear an alarm, unable to use stairs, dependent on medication, separated from a child or caregiver, carrying protected material, or uncertain where to go? Those questions organize routes, refuge, staffing, communication, transport, clinical handoff, accessible alerts, and family contact. Record rules then support later accountability without delaying rescue, care, evacuation, or stabilization.

Continuity of care carries the same dignity boundaries into crisis. Responders minimize exposure, preserve accessible evacuation and communication, protect disabled users and nonparticipants, separate record gaps from suspicion, and keep human safety decisions under accountable human authority. Emergency modes may alter routes and documentation, but they do not suspend bodily dignity, complaint, later review, or the duty to end temporary exceptions.

Emergency systems should distinguish immediate command from lasting authority. Crisis may require temporary direction, rapid access changes, and protective nonrelease, but each exceptional power needs a trigger, owner, scope, clock, log, and return condition. After the emergency, ordinary governance resumes through review, correction, remedy, and public or protected explanation (UNDRR, 2015; ISO, 2018c, 2019; FEMA, 2021; WHO, 2019b).

Emergency planning should be rehearsed under mixed conditions because real emergencies rarely respect department boundaries.

A medical event may occur during a public interface. A fire alarm may occur while protected material is being reviewed. A security incident may coincide with disability-access needs. A family emergency may occur during active deliberation. Planning must cross the same boundaries that crisis crosses.

Crisis communication should tell people what is happening, what remains protected, what is unknown, what action is required, what service has changed, and how to seek help. Silence creates rumor and fear; premature certainty creates later distrust. Accessible, multilingual, non-digital, and role-specific channels keep people oriented while facts develop.

Emergencies expose the real hierarchy of an institution. When a person collapses, a fire starts, a threat appears, a child is in danger, a system is breached, or a storm interrupts power, the City's values become operational. If the City hesitates between preserving a perfect record and protecting life, it must choose life. If it uses crisis to hide power, it must be corrected. If it ignores families and nonparticipants, it has failed its boundary.

Emergency systems hold two truths together. Care, safety, and life outrank routine record formalities. Emergency also cannot become a permanent hidden channel for active public-power conduct. The City therefore uses proportionate exception rules, minimum necessary capture, human authorization, after-action reconciliation, and independent review once immediate danger passes.

Continuity of care includes medical routes, clinical handoff, emergency responders, accessibility needs, medication, mental-

health crisis, family notification, dependent protection, staff safety, evacuation, and recovery. It also includes restoring ordinary record systems, explaining exceptions, and repairing systems after the immediate danger passes. Emergency response is not complete when the alarm stops.

Security incidents require restraint because dissent, confusion, protest, and threat are not the same condition. The City protects participants, staff, records, visitors, families, and hosts through graded response, de-escalation, accessible communication, lawful coordination, and documented escalation criteria. Security serves civic life when it narrows danger without converting the place into a fortress.

Family emergencies create special tension because the participant remains human under the Vow. Illness, death, child safety, dependent crisis, partner crisis, and urgent household need can require rapid action and protected handling. The City must allow care without turning emergency into a secret active-life zone. Family dignity and record continuity must both be governed.

Emergency design remains incomplete until recovery is planned. The City should identify who was harmed, which records or services failed, what support and explanation are owed, which repairs must precede reopening, and what system changes follow. Continuity after crisis means more than speed. It means returning to safe, accessible, reviewable operation without hiding the exceptional period.

8.5.1 — Medical Emergency Routes

Medical routes should be planned with clinical time in mind. A person in respiratory distress, cardiac crisis, seizure, severe allergic reaction, psychiatric emergency, pregnancy complication, injury, or acute overload cannot wait for the institution to reconcile record formalities. Routes must be direct, known, accessible, clear of spectacle, coordinated with local emergency services, and able to shift into protected handling immediately.

The medical-emergency protocol must separate transport from public drama. A public-power participant does not become public content while being carried to care. Medical emergency records should preserve necessary facts for integrity, later review, and continuity while shielding clinical detail, bystanders, family members, and responders unless lawful review requires more. The first duty is life and care. The record follows with discipline after the person is safe.

Medical emergency routes should be clear to staff and responders without turning the whole City into a hospital corridor. The route should identify who calls, who escorts, where responders enter, what information is shared, what is shielded, how incidental persons are protected, and how the record status changes during care. The route should be rehearsed enough that compassion does not depend on improvisation.

Medical records created during emergency should remain governed by health privacy, consent where possible, clinical independence, and later record-status review. The fact that an

emergency happens inside the City does not make intimate health information automatically public-power evidence. Some facts may matter to the City's safety and continuity review; many details belong in protected care records or restricted summaries.

Medical routing should preserve dignity without creating a general shadow corridor. Where possible, a person in crisis should reach care away from public spectacle. The route needs emergency status, restricted access, minimal necessary logging, and after-action review so that a care path does not later become a convenient channel for hidden influence.

Routes must be physically clear, accessible, redundant, and known. Emergency responders should be able to reach residences, classrooms, deliberative halls, protected zones, staff areas, archives, public interfaces, service routes, and exterior spaces without confusion. A medical route that exists only in a plan but fails under actual movement is not a route. It is a diagram.

Clinical handoff requires clear role boundaries. Emergency responders, clinicians, security, operators, archive staff, and participant-support staff may all become involved. Each role should know what information is necessary for care, what is protected, what must be logged, what may be delayed, and who reviews the emergency record afterward. Confusion can create both danger and overexposure.

Medical routes should include accessibility and communication needs. A person may be Deaf, blind, mobility-impaired, cognitively overloaded, nonverbal, in panic, medicated, injured, or unable to explain history. The City should prepare emergency

communication tools, accessible evacuation aids, medication information handling, and support persons where lawful. The emergency should not assume ideal communication.

After medical emergencies, the City should review timing, route function, dignity protection, staff coordination, record impact, nonparticipant exposure, and recovery support. The goal is not blame by default. The goal is to learn whether the City's infrastructure protected life before image, and whether answerability was restored afterward.

Medical emergency design should include privacy after the event. A person who has been carried through a public route, assisted by responders, or removed from an active space may face rumor even if no public record is released. The City should prevent gossip from becoming unofficial publication.

8.5.2 — Fire and Evacuation Systems

Fire and evacuation design should account for the City's unusual population and record conditions. Participants, visitors, disabled persons, staff, contractors, children or dependents in shielded zones, public-interface users, archive workers, and emergency responders may all move differently during alarm. A single evacuation diagram cannot carry this burden. The City needs drills, refuge areas, redundant alarms, tactile and visual signals, smoke control, clear assembly rules, protected-person procedures, and routes that do not reveal private household or care spaces unnecessarily.

Evacuation should also be tested under degraded conditions. Elevators may fail, smoke may block a preferred route,

communications may be noisy, doors may malfunction, a protest or media crowd may be outside, weather may make assembly unsafe, and record systems may lose power. The City should rehearse these combinations because fairness under emergency is not a poster on a wall. It is whether the most vulnerable person can leave without being forgotten.

Evacuation drills must remain distinct from spectacle. Drills should be serious, scheduled and unscheduled within reason, trauma-aware, and publicly reviewable at the status level. They should not be used to humiliate participants, test panic for entertainment, expose protected persons, or create dramatic footage for public trust. Safety drills are for protection and improvement, not civic theater.

Fire and evacuation systems are basic safety, but in the City basic safety is also a public trust condition. A civic institution that cannot move people out of danger cannot ask anyone to carry extraordinary public burden. Evacuation must be designed for participants, staff, visitors, children, dependents, disabled people, critics, media, vendors, emergency responders, and people in protected zones.

The evacuation system must respect differentiated spaces. A public hall, residential wing, clinical interface, archive facility, service route, protected nonvisibility area, and record hardware room may each require different procedures. The City cannot rely on a single generic evacuation plan. It needs zone-specific planning that still remains understandable under stress.

Record continuity during fire must be secondary to life but not abandoned without logging. If systems shut down, if emergency capture changes, if protected zones are opened, if public exits are rerouted, or if data rooms are sealed, the City should record status where possible and reconstruct later. Emergency conditions should be lawful and explainable, not chaotic and forgotten.

Fire drills should include staff, participants, visitors where appropriate, accessibility scenarios, archive protection, nonparticipant shielding, and public interface confusion. A drill that only tests ideal conditions teaches false confidence. The City should rehearse hard cases: night evacuation, communication failure, blocked route, mobility support, simultaneous public event, and system outage.

Fire and evacuation systems are an institutional humility test. The City may speak about public memory and future power, but fire asks a simpler question: can people leave safely? If the answer is uncertain, no higher civic claim is ready.

Evacuation review should include return. After people leave a building, they need reunification, medication access, communication, accessible shelter, record status, and emotional stabilization. Evacuation is not complete when the body exits the door. It is complete when care and continuity have been restored.

8.5.3 — Security Incident Response

Security incident response should protect life and rights without importing carceral instinct. A threat, intrusion, harassment campaign, sabotage attempt, doxxing incident, violent protest, insider misuse, or cyber-physical attack may require rapid action.

But the response should remain bounded by roles, review, de-escalation, evidence preservation, nonparticipant protection, and later explanation. Fear should not become a standing government inside the City.

The response architecture should distinguish kinds of threat. A confused visitor, angry critic, organized harassment group, armed intruder, compromised vendor credential, falsified media asset, insider data misuse, and environmental hazard require different tools. Treating all disturbance as security danger makes the City brittle and punitive. Treating all danger as misunderstanding makes it reckless. The fair route is classification, proportional response, protected recording, outside review, and remedy for anyone harmed by the response itself.

Security incidents should also be reviewed for infrastructure causes. A hostile contact may reveal a gate failure. A panic may reveal sensory overload. A confrontation may reveal poor wayfinding. A breach may reveal vendor weakness. A pattern of escalation may reveal staff understaffing or unclear authority. Incident response is not complete when the person is removed. It is complete only when the City learns what design burden helped create or worsen the event.

Incident response should include a rights-after-action review. After the immediate risk is contained, reviewers should ask whether anyone was wrongly excluded, over-searched, over-recorded, exposed, silenced, injured, threatened, misclassified, or denied a complaint route. A secure City that cannot review its own security conduct has allowed safety to become unanswerable power.

Security response begins with proportionality. Conflict may be ordinary, criticism may be legitimate, protest may be lawful, and a confused visitor may need orientation rather than force. Threat assessment should use declared criteria, trained human judgment, de-escalation, accessibility, review, and clear escalation routes. The City protects people best when it can distinguish danger from democratic friction.

De-escalation should be a core capability. Staff must know how to reduce harm without humiliating people, escalating confusion, or using force as the first language of authority. Security presence should protect human beings and records without teaching participants that power speaks through intimidation. A City that forms future public leaders should model safety without dominance.

Record handling during security incidents requires careful design. Some material may need delayed release to prevent copycat harm, protect victims, preserve investigation, or shield security vulnerabilities. Yet delayed release must be logged, reviewed, and time-bound where lawful. Security cannot become a permanent category of opacity.

Cyber-physical incidents require coordination across technical and human systems. A door system may fail because of cyberattack. A record device may be disabled during intrusion. A public interface may be flooded by bots during a protest. Security response must include operations, cybersecurity, archive integrity, public communication, and care. Siloed response will miss combined attacks.

After a security incident, the City should conduct review that asks not only whether the threat was stopped, but where burden was placed. Were critics wrongly treated as threats? Were participants overexposed? Were staff protected? Were nonparticipants harmed? Did emergency opacity return to record? Did the public receive enough explanation? Safety is not complete until those questions are answered.

Security review should include the possibility that the City itself escalated the incident. Confusing signage, excessive screening, inaccessible instructions, dismissive staff, poor queue design, or public-interface frustration can turn tension into conflict. A fair response asks what the institution contributed before it asks only what the individual did.

8.5.4 — Family Emergency Protocols

Family emergency protocols should prevent the Vow from becoming abandonment. A participant may be responsible for a child, partner, elder, disabled dependent, relative in crisis, or household matter that cannot be postponed because the active record is inconvenient. The City should define how family emergencies are noticed, shielded, verified, supported, transported, and reviewed without turning dependent life into public material.

The protocol should also protect participants from moral coercion. A participant should not be subtly punished for caring for a dependent, responding to a family emergency, or requesting pause under lawful conditions. Public-power formation cannot teach responsibility while making care look like weakness. The

City should record role-relevant continuity decisions without converting private family crisis into public content.

Family emergency protocols recognize that a participant under the Vow remains embedded in human bonds. A child may become ill. A parent may die. A partner may face danger. A dependent may need urgent care. A household may experience crisis. The City cannot treat these events as distractions from public-power formation. They are part of the life from which public power must not sever the person.

The protocol must protect family dignity. A family emergency does not make family members public material. A child's crisis, a partner's medical condition, a custody emergency, or an elder's decline should not become part of the participant's public narrative by default. The City may need to explain continuity interruptions. It does not need to expose collateral persons.

The protocol must also prevent family emergency from becoming hidden active public-power conduct. A participant should be able to leave, pause, communicate, receive support, and attend to urgent need under clear status. If the emergency creates record gaps, those gaps should be labeled and reviewed. Care and accountability must both be preserved.

Staff must be trained to respond humanely. A family emergency is not only logistics. It may involve grief, panic, guilt, legal complexity, medical uncertainty, and public attention. Staff should know how to route care, protect privacy, support travel, manage record status, and prevent media intrusion. The City's human quality will be tested here.

Public explanation should be minimal and truthful where needed. If a participant misses a public interface or active formation event because of family emergency, the City may provide a status statement without details. The public's right to continuity does not include the right to intimate family facts. Status clarity prevents rumor while protecting dignity.

Family emergency protocols make the City more humane and more trustworthy. They show that the Vow is not possession. They also show that care can be handled without hidden exception. A City that knows how to respond to family crisis has understood that public power must remain connected to ordinary humanity.

Family emergency planning should also protect the family from becoming a test of the participant's loyalty to the City. The participant should not be praised for neglecting ordinary love, nor shamed for needing to respond. Public-power formation must not train people to demonstrate seriousness by becoming less human.

8.5.5 — Continuity After Crisis

Recovery is not a return to the old normal. Fire, breach, injury, outage, flood, death, illness, or attack may require changed schedules, record rules, counseling, accessibility review, staff recovery, host repair, or independent investigation. Resumption must follow evidence that safe conditions have been restored.

The recovery protocol should define operational states such as fully active, partially active, paused, restricted, externally supervised, under repair, under inquiry, or closed to new participants. Each state must have concrete consequences for

records, rights, staff workload, public interface, host burden, and the next review. Continuity is honest when the institution can say that the old rhythm is not yet safe to resume and can show what evidence would change that status.

Crisis recovery joins human, technical, and institutional repair. Review should examine people, records, access, staff, communication, host effects, and trust before ordinary operations resume. Reopening is justified when the conditions that produced harm have been corrected or bounded, not when the institution simply wishes to appear strong.

After-action review uses tiered access because honesty and protection are both forms of accuracy. Clinicians, security reviewers, legal authorities, affected persons, technical auditors, and the public may need different records. Some material can be released promptly, some after investigation or delay, and some remains protected because disclosure would expose a person without public-power relevance. A public summary still states what happened, what failed, what service changed, who reviews it, and which repair or remedy follows.

After-crisis review must account for burdens that did not exist before the event. A breach may produce lasting fear; an evacuation may expose accessibility failures; a public incident may trigger harassment; a medical event may create family vulnerability. Restoration is not always a return to the old state. Some crises change the burden map and require continuing support, shielding, or redesign.

The first task is recovery. Before ordinary operations resume, the City should check immediate care needs, accessible accommodation, staff rest, family shielding, and continuing risks. Response becomes learning only when this after-period belongs to the emergency system. Record gaps, trauma, public confusion, and technical or accessibility failures need named owners, deadlines, remedies, and independent review.

The second task is record reconstruction. What happened? What was captured? What was interrupted? What status labels apply? What remains protected? What requires delayed release? What must be corrected? Who needs access? Who needs notice? What should never be public? The reconstruction should be careful enough to support trust and restrained enough to protect dignity.

The third task is responsibility classification. Was the crisis caused by participant conduct, system failure, staff error, vendor failure, design weakness, external attack, unforeseeable event, or some combination? Classification matters because wrong classification misplaces burden. Blaming an individual for system failure is unfair. Hiding misconduct behind system language is also unfair.

The fourth task is public communication. Some crises require public explanation because they affect public trust, active record status, participant readiness, nonparticipant harm, safety, or future operations. Public explanation should state category, status, corrective action, and limits. It should not expose protected persons to satisfy curiosity.

Public communication also requires post-crisis review. Silence can feed rumor, while excessive detail can expose people, security, or care. The City should identify which messages clarified, confused, revealed too much, or protected institutional image more than affected people. Emergency readiness cannot compensate for years of neglected inspection, delayed replacement, and invisible worker overload. The design makes maintenance the final test of spatial honesty. Budgets, repair clocks, deferred work, outage logs, asset condition, accessibility failures, contractor dependence, and closure thresholds must remain legible over time.

8.6 — Maintenance as Institutional Honesty

Maintenance is the chapter's deepest test because it begins after novelty fades. Buildings age, software loses support, climate conditions change, skilled workers leave, budgets tighten, and public attention moves elsewhere. The maintenance regime reveals whether the City can preserve safety, accessibility, record integrity, care, and dignity through ordinary years rather than only during opening. Continuing service without borrowing risk from workers, hosts, future users, or future budgets is the institution's most durable form of honesty.

The maintenance regime is a standing account of burden. Every deferred repair places cost, risk, delay, or indignity on someone later. Every hidden defect asks users to trust a surface the institution knows is weakened. Public maintenance reporting, protected technical detail, staff authority, budget floors, and stop-work rules make deterioration visible early enough for action.

Maintenance is continued authorization in daily form. A City may pass an opening review and still degrade through neglected access equipment, outdated cybersecurity, underfunded staff, leaking roofs, deferred climate adaptation, or inaccessible public interfaces. Core functions remain authorized only while their service, safety, rights, record, and care conditions continue to hold (ISO, 2019; Vanier, 2001; Wireman, 2004).

Maintenance also protects the City from mythology. A mythic institution wants to appear complete. A maintained institution admits that every building and system requires inspection, repair, renewal, and replacement. Visible upkeep is not embarrassment.

It is evidence that the City remains a human institution willing to correct its material promises.

The maintenance question should follow every new idea. Who will maintain it? What will it cost to repair? What happens when it fails? Who is burdened during failure? How will failure be reported? What must be paused until it is fixed? If these questions cannot be answered, the idea is not ready for the City.

Maintenance should be classified by duty: safety maintenance, accessibility maintenance, record-integrity maintenance, dignity maintenance, staff-workflow maintenance, public-interface maintenance, environmental maintenance, and aesthetic maintenance. Aesthetic maintenance matters, but it should not outrank the duties that protect life, rights, staff, nonparticipants, and record integrity. Classification prevents beauty from quietly winning every budget contest.

Maintenance vocabulary must distinguish repair, renewal, replacement, upgrade, and redesign. Repair restores function. Renewal extends life. Replacement substitutes a failing component. Upgrade changes capacity. Redesign admits the old system was not good enough. These distinctions matter because institutions often call redesign a repair to avoid admitting a deeper flaw, or call an image upgrade a necessity to win funding. Maintenance language should not become camouflage.

Maintenance tells the truth about whether the City intends to last. Opening ceremonies are brief, architecture photographs age slowly, and public attention moves elsewhere. What remains is repair: worn thresholds, pumps, roofs, lifts, networks, kitchens,

quiet rooms, records systems, alarms, paths, and worker tools. An institution becomes credible when those ordinary systems receive attention before prestige projects.

Maintenance is civic truth because deferred repair places burden somewhere. It may fall on a disabled visitor whose route no longer works, a participant whose record is disrupted, a maintenance worker asked to improvise unsafely, a host utility carrying extra load, or a future budget forced into emergency replacement. Naming the bearer changes maintenance from backstage expense into public responsibility.

Maintenance also reveals institutional priorities. A City that spends on image while repair backlogs grow has chosen appearance over function. A City that hides deterioration to protect reputation has falsified its own public memory. Budget reports, condition assessments, worker testimony, outage logs, and user complaints should therefore meet in one reviewable maintenance picture.

The trust bargain includes a public maintenance account. Citizens and participants should see whether records, accessibility, emergency systems, service routes, and repair budgets remain sound. Reports should distinguish routine work, rights-affecting defects, urgent hazards, overdue items, and conditions requiring restriction or pause.

Maintenance review should affect continued standing. When core systems cannot meet minimum service, accessibility, safety, record, care, or worker-protection conditions, the City pauses expansion, slows admissions, narrows operations, funds repair, or

closes the affected function. The review gate converts maintenance from aspiration into a decision rule.

Maintenance as institutional honesty gathers the chapter into time. Capture hardware, storage, service routes, accessibility, emergency systems, materials, and construction choices all require upkeep. The City earns continuity by showing what is sound, what is degrading, what is under repair, who owns restoration, and what must stop until the promise can be kept.

8.6.1 — Repair Over Image

Repair over image requires visible imperfection. Scaffolding, temporary routes, closed rooms, maintenance notices, patched surfaces, and equipment replacement should not be hidden merely because they disturb the public image. A building that explains repair teaches that institutions remain worthy only while they care for what has worn down.

The danger is not only cosmetic. Image protection can delay safety work, accessibility fixes, cybersecurity upgrades, archive environment repairs, staff station improvements, and utility replacement. The City should treat any decision to postpone functional repair for ceremonial, donor, media, or visual reasons as a governance event. If beauty competes with duty, duty wins.

This discipline also corrects leadership incentives. Openings, expansions, ceremonies, and new programs produce visible credit; repairs usually prevent events that never become news. Budgets and governance review should therefore make renewal, backlog reduction, accessibility repair, incident learning, and

maintenance leadership visible. Expansion while systems decay is not ambition. It is a transfer of burden into the future.

Repair before image is simple to state and hard to honor. When visible improvement competes with work protecting function, dignity, accessibility, safety, or record integrity, repair normally comes first. Decoration becomes evasion when an institution cannot maintain its obligations.

This priority must govern budgets, donors, operating review, and public reporting. Visible additions wait while critical accessibility, safety, record, utility, care, or emergency defects remain unresolved. New programs may proceed only when they do not consume resources needed to restore essential systems.

Staff often become the hidden patch when maintenance is delayed. They explain failures, improvise workarounds, absorb frustration, redirect people, and sometimes accept physical risk. Deferred repair is transferred labor, not merely postponed spending.

Repair priorities teach participants what public duty means. Image-first choices reward surfaces; pausing a visible event to restore access or record integrity shows duty outranking spectacle. The institution should explain the burden reduced and the obligation served.

Some repairs correct breakage; others correct a mistaken assumption. A civic institution built to learn should be able to say that a beautiful choice placed burden badly and has therefore been changed. Redesign is not an embarrassment when it records the reason, affected people, cost, and result.

8.6.2 — Public Maintenance Reporting

A useful maintenance report is readable without becoming sensational. It should show which systems function, which failures affect rights, what is under repair, who owns the work, what temporary controls exist, and which defects require restriction, pause, or independent review. Its purpose is intelligibility, not drama.

The reporting language should avoid both triumph and panic. A perfect-looking report is suspicious because real infrastructure ages. A chaotic report can damage trust by making every scratch look like collapse. The City needs status categories that show function, impairment, remedy, delay, and unresolved risk. The goal is not to dramatize upkeep. The goal is to prevent the slow conversion of hidden deterioration into hidden power.

Public reporting should be clear enough to inform trust and restrained enough to avoid operational exposure. Citizens may need to know whether core systems are in good standing, under repair, conditionally approved, paused, or externally reviewed. They do not need every security-sensitive detail or protected-person incident. Maintenance reporting should be a status language, not a dump of raw facility data.

The report should also tell a story over time. A single defect matters, but patterns matter more. Are outages becoming more frequent? Are accessibility repairs delayed more than public-interface repairs? Are staff complaints increasing? Are vendors recurring sources of failure? Are emergency drills improving? A

maintenance report that cannot reveal trend is a public relations sheet, not an accountability instrument.

Public upkeep becomes reviewable without exposing every technical detail or security vulnerability. Citizens, participants, staff, auditors, and host communities need a structured view of whether burden-carrying systems are healthy, degraded, or dependent on temporary workarounds. Hidden condition is unsupported trust.

The report should include categories such as record infrastructure status, accessibility repairs, emergency systems, service route safety, maintenance backlog, vendor incidents, utility resilience, archive integrity, public interface uptime, and significant deferred maintenance. The level of detail should be enough to support accountability without creating avoidable risk.

Reporting should distinguish severity. A minor scheduled repair is not a crisis. A failed emergency system is. A temporary accessibility workaround is different from long-term exclusion. A record device under maintenance is different from unexplained capture failure. Status language helps prevent both panic and minimization.

Credible maintenance reporting needs time status. Each material issue should be classified as immediate repair, scheduled repair, monitored condition, redesign, vendor dispute, funding decision, external review, or operating-status concern, with a named next date. This prevents defects from dissolving into vague intention.

Maintenance reports should also indicate whether temporary workarounds are creating burden. A temporary route may require

extra staff time, exclude some users, reduce privacy, or increase confusion. Workarounds are sometimes necessary, but they should not disappear from the burden review simply because they are temporary.

8.6.3 — Deferred Maintenance Risk

Postponement can masquerade as prudence. A delayed roof repair, software update, sensor replacement, accessibility retrofit, generator test, staff hire, drainage improvement, or archive climate upgrade may look economical until the cost returns as injury, breach, outage, exclusion, exhaustion, host damage, or public confusion. Deferral is therefore a transfer of burden into the future, not a neutral pause in spending.

Deferral therefore carries a public clock. When a repair is postponed, the record states the reason, decision owner, accepted risk, affected services and people, interim protection, next review, and trigger that converts delay into a mandatory pause or violation. Waiting may sometimes be proportionate, but the institution must keep the carrier and consequence of that wait visible (ISO, 2019; NIST, 2020c; Vanier, 2001).

Risk begins before visible failure. A server near end of life, a roof with a known weakness, an elevator with recurring faults, a ramp that ices seasonally, a cooling system without reserve, a contractor backlog, or a postponed access repair already changes the institution's safety and reliability. Waiting for injury is not fiscal restraint; it is a decision to make someone else encounter the accumulated cost.

A deferred repair converts a present decision into future cost, staff labor, safety exposure, access failure, record instability, public mistrust, and sometimes human injury. The delay may protect an opening date, avoid an unpopular closure, preserve an image, or improve the current budget. None of those benefits cancels the obligation being carried forward.

Classification follows the duty at stake. A delay affecting safety, accessibility, record integrity, protected nonvisibility, staff conditions, emergency readiness, public interface, host burden, or lifecycle cost is more than a facilities matter. The record should identify which duty is impaired, who bears the interim risk, and which trigger converts postponement into pause, closure, or violation.

Material decline also changes public interpretation. A failing record site can look like concealment. Unreliable protection systems can destroy participant trust. Broken access features can drive disabled users away. Deteriorating service routes can tell workers that their safety matters less than the public facade. Maintenance condition therefore communicates institutional values even before a formal report is read.

Critical deferral changes the City's operating standing. It may require slower admissions, narrower public interface, restricted record operations, closure of affected spaces, outside supervision, or a halt to expansion. Continued growth while essential systems decay would make appearance more important than duty and should trigger a public explanation.

The moral pattern is simple: present avoidance cannot be financed by silent claims on future people. A polished surface does not justify transferring repair, risk, and disruption to workers, hosts, participants, or successors who never chose the delay.

Repeated deferral reveals governance culture. When leaders postpone repairs that protect rights, access, records, or safety, they teach the institution that visible success outranks durable function. The problem is mechanical, fiscal, and moral because the same habit shapes what the City notices before harm.

8.6.4 — Budget Protection for Maintenance

Success is the moment when maintenance funding becomes most vulnerable. Attention and donor enthusiasm pull toward expansion, public spaces, beautiful additions, ceremonies, media systems, and new programs, while pumps, cables, drains, backups, ramps, staff tools, software patches, fire systems, and replacement parts remain unseen. A protected reserve keeps the foundation of every visible promise from losing to novelty.

The budget should treat depreciation, replacement, and retirement as ordinary stewardship. Hardware ages, buildings settle, software loses support, materials wear, emergency equipment expires, accessibility standards evolve, climate loads change, and security threats adapt. Some systems can be repaired; others should be withdrawn before failure. A budget that funds only launch has already assigned future correction to later workers, participants, hosts, or taxpayers without their consent.

A protected maintenance reserve keeps upkeep from losing every contest against newness. Programs, buildings, public interfaces,

technology, events, and donor-recognized features may feel more exciting than inspection and repair. Without a durable claim on resources, the City will slowly turn moral architecture into appearance management.

Protected budgets should cover routine inspection, emergency repair, accessibility upkeep, archive infrastructure, cybersecurity updates, device replacement, service route safety, staff equipment, environmental systems, water systems, emergency systems, and lifecycle replacement. The budget should not treat maintenance as a leftover after symbolic priorities are funded.

Reserve design matters because failure is uneven. Some years will require more repair. A storm, cyber incident, device recall, building defect, or accessibility redesign may create sudden cost. If maintenance has no reserve, the City may be tempted to delay or conceal. A reserve gives the institution refusal capacity against neglect.

Maintenance finance is transparent at the level needed for governance and public trust. Citizens can see whether funding matches system complexity, which backlogs are growing, what reserves protect critical failures, and whether temporary workarounds are becoming permanent burdens. Worker privacy and sensitive security details remain protected. Replication is withheld when the City cannot explain the condition of the systems it expects others to copy.

Maintenance equity becomes visible in what fails first. Underfunding often reaches ramps, lifts, staff routes, service spaces, assistive systems, and less public-facing areas before it

reaches the polished facade. Protected budgets prevent neglect from building an internal class structure into the City's physical condition.

The reserve must survive leadership change. A new administration, donor cycle, controversy, or expansion plan should not be able to drain repair funding without a recorded justification, affected-system review, and independent challenge. Governance rules strong enough to outlast enthusiasm keep future leaders from spending the City's reliability as though it were spare cash.

8.6.5 — Maintenance Review Gate

The maintenance review gate should be difficult to evade. Leadership should not be able to route around it by calling a failure temporary, cosmetic, donor-funded, politically inconvenient, or not yet public. If infrastructure failure touches record integrity, safety, accessibility, worker health, emergency response, host burden, or protected-person rights, the gate should have authority to require correction before expansion continues.

The gate should review record infrastructure, emergency readiness, accessibility systems, service routes, staff workload, public interface stability, protected nonvisibility systems, archive integrity, vendor support, cybersecurity maintenance, water and energy resilience, and host-community spillover. A single defect may require repair; a pattern across categories may require narrowing, pause, or decertification.

The gate should operate through both scheduled review and trigger review. Scheduled review prevents slow neglect from

disappearing into ordinary time. Trigger review begins when repeated outages, access failures, safety incidents, staff injury clusters, unresolved complaints, vendor nonperformance, cyber warnings, emergency drill failures, or host-community concerns show that burden is moving faster than the institution is admitting.

The maintenance gate must accept protected input from workers and affected users rather than depend only on leadership reports.

The maintenance gate needs graduated consequences. Depending on severity, it may require a repair plan, deadline, budget correction, outside audit, vendor replacement, public status label, admissions pause, narrowed public interface, temporary closure, leadership review, suspension of an affected function, or loss of formal standing. Proportionality matters, but consequence must remain possible.

The gate also governs symbolic activity. Critical maintenance failure can delay ceremonies, tours, expansion announcements, donor events, major public releases, or replication claims when those activities consume resources or create a false picture of institutional condition. A gate that cannot interrupt prestige is only advice.

Public summaries should communicate gate outcomes without exposing protected details. Citizens need to know whether the City is in good maintenance standing, under conditional repair, externally supervised, pausing expansion, restricting an affected service, or facing suspension. Raw security vulnerabilities, worker medical information, protected records, and family circumstances remain outside that explanation.

The service, maintenance, and continuity register turns the Chapter's scattered obligations into one operational record. For each critical system it identifies the accountable human owner, external dependencies, minimum service level, maintenance interval, known vulnerabilities, manual fallback, affected groups, unresolved backlog, restoration priority, and next review date.

A register entry distinguishes ordinary degradation from a continuity event. It records what continues, what narrows, what pauses, who must be notified, which protected rights remain nonnegotiable, and what evidence is needed before normal operation resumes. That structure prevents emergency improvisation from disguising a change in institutional authority.

Cyber and physical continuity belong in the same dependency view without being collapsed. A server outage may disable record access, lifts may fail during a power event, a water interruption may close care or food systems, and a staff shortage may render a technically intact system unusable. Recovery plans therefore need both technical redundancy and human capacity (ISO, 2019; NIST, 2024a; WHO, 2019b). A recovery exercise should test whether a backup system still works when the staff normally operating it are unavailable.

Workers and affected users must be able to amend the register. Maintenance staff, disabled users, clinicians, archive custodians, emergency responders, participants, and host representatives often detect a failing dependency before leadership sees it in aggregate reports. Their route into the register needs protection from retaliation and a visible disposition. A rejected maintenance

report should remain traceable to its disposition when a later outage tests the earlier decision.

The register also carries stop authority. When minimum service, care continuity, accessibility, record integrity, worker safety, or lawful public explanation cannot be sustained, admissions, expansion, public events, or affected operations pause. Resilience is credible only when the institution can name what it cannot safely continue (UNDRR, 2015; WHO, 2019b). Restart approval should identify any temporary workaround that remains in service and the obligation to replace it.

Part III — Rights, Records, and Openness

In a protected room beside the public archive, a participant and a nonparticipant sit across from an independent reviewer. Between them lies a record authentic in origin and harmful in public effect. The participant challenges its label; the nonparticipant challenges being visible at all. The reviewer preserves the source, stops further circulation, opens care and appeal, and names the next responsible act. That scene governs Part III. Transparency is measured not by volume released, but by whether a powerful memory system can separate public responsibility from protected life, repair error without erasing history, and return the burden of correction to the institution that created the harm.

The first two Parts have given the City a civic type and a physical form. Part III gives those commitments a memory system. The institution now has to show how rights, custody, access, correction, time, and public interpretation can make visible responsibility usable without turning ordinary human vulnerability into public property. This is the movement from architecture to answerability: the City becomes more open by becoming more exact about what may be known, by whom, for which purpose, and under whose continuing review.

Rights come before records, not as a limit added after openness but as the condition that makes openness legitimate. A powerful archive earns trust only when participants and nearby people can invoke due process, counsel, care, complaint, appeal, remedy, privacy, and exit against the institution itself. Record power becomes civic value when it remains subordinate to human standing and review (Nissenbaum, 2010; International Council on Archives, 2011; European Union, 2016).

Part III asks a concrete institutional question: where does the burden of public memory land? A record can move burden toward the person who seeks public power, or away from that person and onto a child, partner, staff member, clinician, visitor, critic, or host community. It can preserve accountability, or preserve an injury. It can help citizens judge, or teach them to confuse exposure with truth. The fairness of record design therefore depends less on how much is kept than on who carries each stage, who can object, and what repair follows.

Accordingly, the Part opens with the people who can be helped or harmed before it opens the archive. Participant rights, protected nonvisibility, child and dependent protection, third-party standing, professional independence, complaint, appeal, remedy, and care define the operating floor. The sequence teaches a durable civic rule: the record exists to make public responsibility answerable, while the person remains more than any record that can be made about them.

Protected nonvisibility is the design that lets a person receive care, counsel, intimate support, grief space, worship, crisis response, and bodily protection without creating a hidden channel for active public-power conduct. It is neither raw exposure nor an off-record civic life. It is purpose-bound handling, declared transition, restricted access, review, and later reconciliation. The achievement is a City capable of preserving the Vow while protecting the human conditions that make responsible service possible.

Household protection is where the City proves that chosen civic burden does not spread by proximity. A participant may accept

the Transparent Vow; children, partners, dependents, and other household members retain independent standing, privacy, care, and refusal. The child noninheritance rule carries this boundary through rooms, schedules, records, media, and public artifacts. Its practical test is simple: the institution must make public power more answerable without making a family more public.

Third-party standing extends that achievement beyond the participant. Visitors, bystanders, protesters, journalists, professional helpers, contractors, emergency responders, staff, and local residents may enter the City's record field for limited reasons. Their proximity creates obligations for the institution, not a presumption of consent. A mature record system can preserve the role-relevant event, shield collateral persons, receive their challenge, and repair wrongful exposure without forcing them to become public in order to be heard.

With that rights floor in place, the Part turns to two different institutions of memory. The official archive preserves governed source records with custody, provenance, access rules, status, and correction. The public record site publishes structured civic objects that ordinary readers can inspect and contest. Journalism, machine assistance, and public discussion then interpret those objects without becoming the archive's owner. This separation makes public memory plural, traceable, and corrigible rather than raw or monopolized.

The record lifecycle is the Part's central technical grammar. Capture, custody, access, release, interpretation, research, Artificial Intelligence training, reuse, retention, sealing, deletion, and correction are separate decisions rather than one expanding

permission. Each transition needs a stated purpose, authority, affected-person route, review clock, destination, and remedy. Making those gates visible allows the City to preserve useful memory while preventing an initially lawful record from silently becoming every later kind of institutional resource.

Time gives record governance its discipline. Some evidence remains durable because it protects public memory, affected persons, and institutional learning; other exposure should narrow, seal, expire, or return for review as public relevance changes. Retention, delayed release, escrow, deletion, sealing, periodic review, and posthumous handling therefore answer one question at different stages: what continuing purpose justifies carrying this material now, and who can challenge that answer?

The perimeter gives these distinctions a physical and social form. Citizens, critics, experts, journalists, protesters, vendors, relatives, and emergency responders can approach through routes designed for their purposes, while households, staff spaces, archives, care rooms, and nonparticipants remain protected. Openness here means legible access, reasons, challenge, and correction. The edge succeeds when a newcomer can tell what is public, what is protected, who owns the decision, and how that decision can be reviewed. The City has reached the threshold where visibility must become rights-governed memory. The design begins with the people who carry the consequences of record power: participants, children, dependents, families, staff, professionals, visitors, and incidental contacts.

Chapter 9 — Rights, Privacy, and Protected Life

A participant enters a protected consultation room carrying a printed extract from the public record site. The extract is authentic, yet it is wrong in the way that matters most: an interim classification has been cropped away from its status label, a clinical pause has been mistaken for misconduct, and a family member has been drawn into the public story without consent. The first institutional question cannot be how to defend the archive. It must be how to stop the harm, preserve the source, hear the affected people, and place the burden of repair on the institution that created the exposure. Rights begin at precisely this point, when a record is real enough to injure and incomplete enough to deceive.

Rights come before records because a visible civic burden is legitimate only while the person under it remains able to act against the institution. The participant accepts a narrow active-period record for a public purpose; the City accepts the heavier reciprocal duty to provide due process, independent counsel, care, complaint, appeal, correction, remedy, and exit. This exchange turns answerability into a governed relationship rather than institutional possession.

Rights keep visible burden attached to the role that accepted it instead of letting the institution push costs toward people with less power to refuse. They govern capture, access, shielding, release, challenge, remedy, and exit from the beginning. A right becomes usable only when the holder, duty bearer, triggering event, response clock, review body, interim protection, and remedy are identifiable. Anything less may express a value, but it does not yet give a harmed person a route through the institution.

Rights, privacy, and protected life sit at the threshold between built form and public memory. The City's rooms, cameras, access bands, records, and interfaces can make hidden formation visible, but their civic value depends on disciplined use. A lawful archive preserves conduct and context without claiming a person's inner truth. Oversight inspects authority rather than browsing lives. Machine assistance helps people find governed material while human beings retain judgment, dignity, and control over consequences (United Nations, 1966; UN Human Rights Committee, 2007; Tyler, 2006).

Due process, counsel, complaint, humane care, and exit are the working mechanisms of the rights floor. Notice gives the person a knowable decision; counsel creates independent help; complaint makes harm reportable; care protects health before interpretation; appeal subjects the first decision to review; remedy returns burden toward the institution; exit prevents the Vow from becoming possession. Together they make rights usable at the moment institutional power is most likely to feel inevitable.

A usable rights system can be followed from standing and notice through immediate protection, lawful evidence access, independent assistance, reasons, review, remedy, implementation, and verification. Jurisdiction-specific law remains controlling, so the City does not create enforceable doctrine by description. Its design contribution is to expose the whole route clearly enough that participants, families, staff, professionals, reviewers, and the public can identify the next responsible actor at every stage (Tyler, 2006; OHCHR, 2024).

Protected nonvisibility gives the City a positive capacity: it can preserve health care, legal advice, intimacy, modesty, grief, worship, crisis response, and safety without abandoning the Transparent Vow. The mechanism is stage-specific handling. Source custody remains lawful; access narrows; public release may become a protected summary or wait; active public-power conduct cannot hide inside the category; and each transition remains reviewable. Dignity and answerability are carried together rather than traded against one another.

Children, dependents, partners, and households require a protection that travels through the entire system. The participant chooses the Vow; connected people retain their own standing, privacy, care, and refusal. The child noninheritance rule therefore shapes rooms, capture zones, metadata, visitor routes, public bundles, machine search, media access, and remedy. The City may learn how public service affects a household, but it may not turn the household into supporting evidence about the participant.

Collateral protection begins before release. It shapes room layout, camera range, appointment metadata, visitor badges, captions, staff logs, machine search, public tours, donor materials, emergency notices, and later historical interpretation. A blurred face may remain identifiable through school, timing, voice, or association; an unnamed partner may still be exposed by context. The City therefore treats inference control as part of architecture and workflow, not as a final redaction task.

Third-party rights make the City answerable to people who enter its record field for limited reasons. A visitor, bystander, professional helper, staff member, protester, journalist, vendor,

emergency responder, or host resident can be captured, associated, or inferred without choosing participant status. Each needs a route to notice, challenge, shielding, correction, and proportionate remedy that does not require further publicity. Proximity creates an institutional duty to classify purpose correctly and minimize collateral burden.

Professional interfaces let the City receive care, counsel, review, conscience support, and emergency help while preserving the relationship that makes each service trustworthy. Medical, legal, clinical, pastoral, and emergency roles carry different duties, records, authorities, and complaint routes. Purpose limits, separate custody, credential verification, restricted release, professional independence, and a logged return to active-role handling protect both competent service and the City's anti-shadow purpose.

Care before evidence establishes the order of response when a person is unsafe, ill, exposed, overwhelmed, or threatened. Relief, stabilization, shelter, counsel, and protection begin immediately while source material is preserved in ways compatible with those needs. Classification, investigation, and public explanation then proceed under their own clocks. This order makes the City more reliable, not less evidentiary, because it prevents avoidable harm from becoming the price of institutional certainty.

The chapter gives the reader protection routes before the machinery of memory. A participant or affected person should be able to find the decision owner, immediate safeguard, counsel or advocate, complaint channel, review body, available remedy, implementation owner, and closure evidence without becoming a

procedural expert. Those elements belong in one coherent rights pathway that preserves the person behind the case.

Rights and protected life give the City the capacity to carry severe public accountability humanely. They make correction possible before scandal, care possible before classification, and refusal possible before institutional loyalty hardens. Once these pathways are concrete, the archive can become a public good rather than a stronger claimant on the person.

9.1 — Participant Rights Under Visible Burden

A rights regime becomes credible when a person can find the rule, understand the allegation or decision, obtain independent assistance, answer the record, receive reasons, seek review, and obtain an effective remedy. Those elements recur across fair-hearing, administrative-justice, and procedural-justice traditions, although their legal force varies by jurisdiction. In the City they must become operational pathways: timely notice, counsel outside institutional command, complaint intake that does not require public exposure, and an appeal body able to change the result. Voice, neutrality, respectful treatment, and trustworthy motives affect perceived legitimacy, but perception cannot replace authority, evidence, or remedy (United Nations, 1966; UN Human Rights Committee, 2007; Tyler, 2006).

The participant under the Transparent Vow is not an object of the City. They are a person carrying a chosen role burden for a public purpose. This distinction must govern the entire rights structure. The City may ask for full active-period record while active, but it may not convert visibility into possession. The participant remains entitled to process, help, complaint, care, and exit because the Vow is only fair when the person under it remains legally and humanly protected.

Before activation, the rights floor should be visible, usable, and explainable in ordinary language. A participant needs to know who may impose each consequence, where independent counsel and complaint begin, how emergency pause and care operate, which body hears appeal, what happens to the record, and what

leaving changes. A right that disappears under stress is weaker than its written form suggests. The City therefore treats rights as civic infrastructure: mapped, staffed, timed, accessible, and capable of changing an outcome.

The operational standard is a rights, complaint, appeal, and remedy route attached to every active participant and available, where relevant, to affected persons. The route names the right holder, triggering event, responsible authority, interim protection, response clock, counsel channel, complaint intake, appeal body, remedy options, public-notice rule, anti-retaliation protection, and independent reviewer. It also records accessible format, translation, disability accommodation, emergency pause, exit consequence, and effect on record status. This is not a score or profile; it is a navigable map of institutional duties that keeps protection usable under stress (European Union, 2016; Committee on the Rights of the Child, 2021; World Medical Association, 2024).

Visible burden creates new forms of vulnerability. A participant may be misread by the public, misclassified by staff, harmed by a record error, exposed through technical failure, pressured by institutional pride, or treated as a symbol rather than a person. The more visible a person's role becomes, the more dangerous arbitrary institutional action becomes. A private wrong may injure a person privately. A public wrong inside the City may follow them through record, interpretation, campaign, office, or ordinary life after exit.

Rights under visible burden therefore do more than protect the individual. They protect the public meaning of the City. A record

produced under arbitrary conditions is not trustworthy. A confession produced under pressure is not civic evidence. A complaint system that silences participants turns the archive into curated authority. A care system that waits for interpretation before giving help turns evidence into cruelty. A Vow without exit begins to resemble custody.

The rights floor begins with the protections closest to the active participant. Due process protects against arbitrary sanction. Counsel access preserves independent legal help. Complaint rights allow harm to be named before it becomes scandal or collapse. Humane care places health before interpretation. Exit rights keep participation from becoming possession. Together they form the rights floor beneath the full active record (Tyler, 2006; Mashaw, 2006; European Union, 2016).

The rights floor makes consequence legitimate rather than impossible. Misconduct, concealment, role violation, harm, breach, and manipulation may require investigation and proportionate response, but the route must remain knowable and contestable. As the potential burden grows, notice, evidence access, independent assistance, reasons, review, and remedy must become more exact. Civic purpose strengthens the demand for procedural discipline; it never substitutes for it.

The operative standard makes this section simple in principle and difficult in practice. Burden should move upward toward public-power seekers, but it must not crush the person who carries it. Participant rights are the mechanisms by which upward burden remains bounded, lawful, humane, and reviewable. Without them, visible formation becomes domination by another name.

9.1.1 — Due Process

Due process also protects against the special danger of public acceleration. In ordinary institutions, an error may remain inside a file or administrative chain. In the Transparent City, an error can become a public label, a released bundle, a search result, or a lasting interpretive frame. The process must therefore slow the City at the point where visibility would otherwise make a first judgment travel faster than fairness (United Nations, 1966; UN Human Rights Committee, 2007; Tyler, 2006).

Due process is the participant's first protection against the City mistaking institutional confidence for truth. A visible record environment can make a charge, classification, or interpretation feel unusually persuasive. Once something is recorded, people may treat it as self-explanatory. Due process interrupts that temptation. It requires notice, reasons, evidence, response, review, proportionate action, and a route beyond the first decision.

The Transparent City will face many decisions that can harm a participant: status changes, record labels, sanctions, pauses, restrictions, release decisions, role pathway changes, public explanations, removal, and post-exit classifications. None of these should be made through informal mood, reputation management, staff resentment, public pressure, donor concern, media pressure, or algorithmic flagging. The participant must know what is being alleged or decided, what evidence is being used, what standard applies, and how to respond.

Due process also protects the interpretation of the archive. An accurate recording can document an unfair procedure; procedural unfairness does not automatically make the recording false. But a punishment recorded without the charge, response, or appeal can mislead the public about what the evidence establishes. An uncontested label can likewise turn an institutional interpretation into apparent fact. Record integrity therefore requires accurate source material, visible procedural context, and a route to challenge the conclusions attached to it.

Institutional legitimacy requires the City to distinguish emergency action from final determination. In an urgent safety situation, temporary restriction may be necessary before full review. But emergency status must be labeled, limited, logged, and reviewed after the danger passes. Emergency action is not a shortcut to permanent classification. The participant should not carry a lasting public mark from a temporary safety response unless the response survives later process.

Due process is real only when it works for the person who is tired, frightened, disabled, pressed for time, or unfamiliar with institutional language. Plain-language notice, translation, accessible formats, counsel or advocacy, readable standards, non-digital routes, and sufficient response time turn procedure into protection. Testing should use stressed users rather than ideal readers. Understanding a decision about one's own record or participation cannot depend on elite legal fluency.

Finally, due process protects the City from itself. Institutions under public pressure often want speed, certainty, and reputational control. Due process slows the City down at the

moment speed becomes dangerous. It says the record may be strong, but the person still answers before a reviewable rule. It says the City may be serious, but seriousness does not outrank fairness. It is one of the ways the City remains answerable rather than merely powerful.

Due process also needs a burden placement note. Each consequential decision should identify who carries the cost if the decision is wrong: the participant, the public, the staff, a family member, a third party, the archive, or the host community. This does not require a formal equation. It requires disciplined attention to the fact that procedural shortcuts always place cost somewhere.

Provisional measures require particular care. Temporary restriction, emergency masking, delayed release, or temporary suspension may be necessary before full review, but provisional status should not become permanent by administrative fatigue. A clock, a reviewer, a reason, and a return path should accompany every provisional action.

A credible rights system should also maintain a due-process map for public-facing actions. If a status label changes, if a record bundle is delayed, if a participant is restricted, or if a public explanation names a category of concern, the map should show the authority, the evidence class, the reviewer, the appeal route, the temporary safeguards, and the person or class carrying the risk of error. This map is not public in every detail, but the discipline behind it must be auditable.

A second due-process safeguard is role separation. The person who initiates a sanction should not be the sole interpreter of the evidence, the sole custodian of the record, the sole communicator to the public, and the sole reviewer of the participant's objection. Separate roles slow institutional certainty just enough to protect truth. The City should prefer a slower process that can be trusted over a fast process that leaves the participant carrying the burden of doubt.

A rights-invocation card should accompany every consequential participant decision. It identifies the action under review, the claimed authority, the information relied upon, temporary protections, the deadline for reasons, the counsel route, complaint and appeal bodies, remedies each body can order, and the person responsible for implementation. The card is neither verdict nor waiver. It is a portable route from notice to action, written for the moment when stress makes institutional vocabulary hardest to use (Tyler, 2006; Mashaw, 2006; European Union, 2016).

9.1.2 — Counsel Access

Counsel access should be designed as an ordinary expectation, not as a sign that the participant has become adversarial. If legal help is treated as suspicious, participants will avoid it until problems become severe. A healthy City normalizes independent advice before activation, during disputes, around release challenges, and at exit. The presence of counsel shows that the Vow is bounded by law rather than powered by trust alone.

Counsel access preserves the participant's ability to stand before the City as a rights-bearing person rather than as material inside

an institutional process. The City's record system will create legal questions from the first day of active participation. Release decisions, protected nonvisibility, complaints, sanctions, staff conflicts, family boundaries, employment implications, office pathways, emergency exceptions, and post-exit status may all require independent legal interpretation.

The participant should not have to rely on the City's explanation of the City. Even a well-intentioned institution will tend to describe its rules in a way that preserves its own operation. Counsel gives the participant a second language, a confidential adviser, and a route to challenge terms, procedures, sanctions, releases, and harms. Legal help is not hostility to the City. It is part of making the Vow lawful.

Counsel access protects the participant from the institution's interpretive advantage. The City may record that a protected legal interface occurred when status or continuity requires it, but that fact does not create access to privileged content. Confidential consultation lets a person ask questions, preserve rights, and challenge the City's own account without converting every legal concern into formation material. The occurrence record, content boundary, access rule, and review route should therefore remain distinct.

Yet counsel access must not become a hidden active public-power channel. The City may need rules distinguishing legal consultation from political strategy, donor contact, campaign planning, or unrecorded public-power conduct. The legal interface should have role status, logging of occurrence where appropriate, privileged content protection, and review

mechanisms for abuse claims. The goal is neither exposure nor blind immunity. The goal is lawful boundary.

Counsel access also matters for nonparticipants. A partner, family member, staff member, visitor, or wrongfully exposed person may need independent legal help in relation to the participant's record. The City should not design counsel only for the active participant. If the record system harms someone outside the Vow, that person must be able to understand their rights and seek remedy without being forced into the City's narrative of itself.

The burden-placement framework makes counsel access a burden-placement safeguard. Without counsel, the cost of complexity falls on the participant or affected person. With counsel, some of that cost moves back toward the institution and the legal system that must justify its actions. A City that fears counsel reveals that it wants trust without challenge. A City that welcomes counsel shows that it expects to be corrected.

Counsel access should be financially and practically reachable. A right to counsel that assumes private wealth, calm time, perfect literacy, or freedom from institutional dependency is not calibrated to the burden of the Vow. The City should therefore plan independent funding, language access, disability access, urgent consultation, and counsel choice rules before the first participant activates. Otherwise legal help becomes another privilege hidden inside a public ideal.

Institutional practice should also protect counsel access from social stigma. Orientation should present counsel as a normal companion of serious civic burden, not as a defensive weapon

used by the guilty. If participants believe that asking for counsel marks them as evasive, the formal right will shrink in practice. The City's fairness test treats stigma as a burden-transfer device; counsel stigma pushes legal complexity back onto the person least able to carry it alone.

9.1.3 — Complaint Rights

Complaint rights also create a counterweight to admiration. When a City is seen as historic, people may hesitate to name harm because they fear damaging something important. That hesitation is itself a warning sign. The complaint system must teach participants, staff, families, visitors, and affected persons that protecting the City means correcting it, not shielding it from uncomfortable testimony.

Complaint rights make harm speakable before harm becomes collapse. The City will create many kinds of possible injury: overexposure, misclassification, staff misconduct, participant misconduct, technical failure, retaliation, unsafe conditions, disability exclusion, discriminatory treatment, intimate-record mishandling, family burden, public-interface abuse, and institutional pressure to continue when pause is needed. A participant must have a route to name harm without needing to make it public first.

A complaint right is not simply a mailbox. It is a structure of trust. The participant must know where to complain, what happens after complaint, who receives it, whether it is confidential, when it becomes reviewable, how retaliation is prevented, how emergency relief is triggered, how appeal works, and what

remedies are possible. A vague promise that complaints will be heard is not enough for an institution that holds full active-period records.

Complaint rights protect the City's truth. Staff and leadership may miss patterns that participants experience directly. Repeated small humiliations, subtle pressure, overwork, unclear status labels, disrespectful staff contact, or daily design failure may not appear in audits unless people can complain safely. Complaint systems let the City learn from the people closest to the burden.

A visible complaint channel needs protection from public retaliation. Inside an institution built around records, a complaint can be misread as weakness, disloyalty, instability, or image damage before its substance is heard. Complaint status therefore remains separate from character judgment unless a fair process later establishes genuine relevance. The route succeeds when reporting harm does not create a second harm through exposure, punishment, or informal exclusion.

Complaint systems must include independent review. If the same operator who created the harm controls the complaint, the complaint is not a safeguard. Ombuds independence, appeal beyond operations, external inspection for serious categories, and public reporting of aggregate complaint patterns can prevent complaint routes from becoming symbolic. A complaint system that never embarrasses the City is probably not working.

Complaint rights prevent hidden burden from accumulating inside the very institution designed to reveal burden. They turn injury into information, information into review, review into

remedy, and remedy into institutional learning. A City without complaint rights is not a transparent institution. It is merely an institution that records participants while concealing itself.

Complaint rights may require representative complaint. A child, dependent adult, medically fragile person, intimidated partner, or wrongfully exposed bystander may not be able to complain directly. The City should allow lawful representatives, advocates, or protected intermediaries where appropriate so the most vulnerable people are not excluded from recourse by the vulnerability that requires protection.

Operational practice should track complaint patterns as evidence about itself. A single complaint may reveal an individual injury. Repeated complaints in the same category may reveal architectural, staffing, technical, or cultural failure. Complaint data must not become public ranking of complainants, but aggregated burden patterns should inform governance, audit, and repair.

A complaint route should include low-intensity, confidential, urgent, formal, and external pathways. Not every harm begins as a lawsuit-level event. Some begin as a pattern, a tone, an unexplained label, a repeated access denial, a staff conflict, or a sense that a protected category is being treated as suspicious. If the City hears only fully formed accusations, it will miss the early signals that prevent larger injury.

Complaint rights also require protection against informal retaliation. Retaliation is not only dismissal or punishment. It can appear as colder staff treatment, slowed support, social exclusion,

unfavorable interpretation, subtle pressure, leaked tone, or narrative framing that marks the complainant as unstable. The City must treat these softer forms of retaliation as recordable institutional risks, because hidden retaliation teaches everyone else to stay silent.

9.1.4 — Humane Care

Humane care should also be budgeted, staffed, and routinized rather than left to heroic improvisation. A care promise without clinicians, sleep protections, accessible spaces, referral pathways, de-loading authority, and emergency protocols is only language. The City must make care materially available in the same way it makes record materially available. Otherwise the record will be stronger than the body expected to carry it.

Humane care means the participant's health, safety, and dignity come before interpretive use of the record. A visible burden institution will constantly be tempted to ask what an event means. Is distress evidence of misfit? Is anger evidence of danger? Is exhaustion evidence of weakness? Is withdrawal evidence of concealment? Humane care interrupts premature interpretation. It asks first what the person needs.

Care before interpretation does not erase accountability. A participant who harms someone may still face consequence. A participant who conceals active public-power conduct may still require review. But immediate care, safety, medical attention, clinical response, de-loading, sleep protection, and crisis handling should not wait until the institution has decided what the event

says about readiness. The body should not be made to wait for the archive.

Humane care also protects the quality of evidence. A person under untreated distress, pain, sleep deprivation, panic, or medical instability may behave in ways that are real but not self-explanatory. If the City uses such moments without care context, it will mislead the public and harm the person. Care records, protected summaries, clinical independence, and context labels can help distinguish conduct, condition, response, and institutional burden.

Humane care must avoid two opposite failures. The first is neglect disguised as rigor, where the institution treats visible public-power formation as a license to ignore suffering. The second is care disguised as control, where health language is used to manage dissent, suppress complaint, or delay exit. Humane care must remain independent enough to protect the person and transparent enough in status to prevent hidden domination.

Care should include ordinary preventive structures, not only crisis response. Sleep, nutrition, accessibility, disability support, quiet spaces, trauma-aware design, medical interfaces, clinical referral, de-loading pathways, and support for changed circumstances all belong to humane care. A City that waits for breakdown before caring has misunderstood the burden it creates.

This fairness discipline treats humane care as an obligation generated by the City's own design. If the institution asks people to carry visible burden for public-power formation, it also owes them the means to remain human under that burden. Care is not

softness added to severity. It is the condition under which severity can be morally considered at all.

Humane care should be separated from reputation management. When a participant is injured, overwhelmed, threatened, ill, grieving, or destabilized, care should not depend on how the incident will look to the public record. The care team's first loyalty is the person's safety and dignity within lawful bounds. Public explanation can wait until protection is in place. A City that treats care as public optics will teach participants to hide distress.

Care should be available even when responsibility is disputed. A participant harmed during a record failure, interpersonal conflict, medical crisis, or public misinterpretation should not have to prove institutional fault before receiving stabilization. The City may later determine cause, consequence, and liability. Relief in the urgent moment is not an admission of blame. It is the human floor that keeps investigation from becoming another burden.

9.1.5 — Exit Rights

Exit rights also preserve public honesty about readiness. A participant who leaves may be showing prudence, not failure. The City should help the public distinguish voluntary exit, pause, removal, exhaustion, changed circumstance, misconduct, and ordinary redirection. Without that distinction, public interpretation will turn every departure into rumor. Clear exit categories protect the participant, the City, and the public record (Mashaw, 2006; Bovens, 2007).

Exit rights keep the Transparent Vow from becoming possession. A person who cannot leave is not carrying a voluntary burden. They are being held. The City may have rules for active participation, record status, support terms, public explanation, and post-exit boundaries, but it must preserve real departure. The possibility of exit is part of the moral structure of entry.

Exit rights protect consent over time. A person may enter sincerely and later discover that the burden is unsafe, misfit, damaging to dependents, medically untenable, psychologically too heavy, legally complicated, or no longer aligned with role purpose. Changed circumstances should not require secret exception. The City should provide lawful pause, withdrawal review, early exit, post-exit support, and future privacy boundaries. Honest exit is better than false continuity.

Exit rights also protect the institution's credibility. If participants remain because leaving would be shameful, financially devastating, publicly humiliating, or practically impossible, the record will no longer show voluntary burden. It will show endurance under constraint. That undermines public trust. A City that traps participants in order to preserve its own image becomes one of the false forms it claims to reject.

Exit is not the same as erasure. Records created during active participation may remain according to lawful retention, release, sealing, time review, and public-power relevance. The participant cannot simply erase all public-power formation record because they leave. But future ordinary life should not remain under active record by default. The active Vow has an active period. After that period, the person moves toward a different status.

Exit is voluntary only when continuity survives departure. If participation has changed housing, health care, debt relief, dependent support, employment, security exposure, or public reputation, the City owes a planned transition. Bounded severance, care continuity, practical assistance, and clear record handling complete obligations created by the institution without owning the former participant.

The operative standard makes exit a form of truth. It reveals whether the City wants voluntary answerability or institutional possession. It protects the person from becoming trapped by a beautiful purpose. It protects the City from lying about consent. It protects the public from mistaking continued participation for continued readiness. Exit is not failure by default. Sometimes exit is the most honest burden placement available.

The exit packet carries a dignity statement beyond the gate. It identifies what remains recorded or protected, which proceedings remain open, which interpretations lack support, and which judgments the City has never made. Departure is a transition, not evidence of cowardice, betrayal, unfitness, or moral failure. Unfinished participation never becomes institutional ownership of a life story.

Exit patterns should be audited for coercion without becoming a scoreboard. Rare departure despite visible distress may indicate that leaving is too costly; clustering after complaints may expose retaliation or a failed pathway; fear of future public interpretation may reveal weak post-exit boundaries. The institution should review timing, support requests, unresolved complaints, and post-exit harms with small-number privacy. Such evidence cannot

rank participants, but it can reveal whether the door is real or merely announced.

A credible exit right should be rehearsed before it is needed. Orientation can include a private exit simulation in which a participant asks what happens to housing, care, dependent support, security exposure, public labels, unfinished complaints, and future access to records. The exercise is not theatrical. It reveals whether staff give consistent answers, whether forms are intelligible, whether independent advice is available, and whether a person can leave without first persuading the institution that leaving is wise. A right that becomes legible only during crisis is not yet a dependable right.

Portability matters after departure. The participant should receive a plain-language exit packet identifying continuing services, record status, unresolved proceedings, correction and reply routes, emergency contacts, data restrictions, and the date of the next time review. Nothing in that packet should function as a character certificate. Its purpose is continuity and protection, not a favorable or unfavorable civic grade. The City should also monitor whether former participants face blacklisting, retaliatory disclosure, or informal pressure to remain publicly loyal after ordinary participation has ended (European Union, 2016; OHCHR, 2024).

9.2 — Protected Nonvisibility Categories

Contextual integrity offers the clearest account of protected nonvisibility. Information may be appropriate for a clinician, lawyer, emergency responder, or trusted care provider while remaining inappropriate for a public record bundle, newsroom, search tool, or training dataset. A sound design therefore specifies the actors, purposes, information types, transmission principles, retention period, and review route for each protected category. Data-protection principles such as purpose limitation, minimization, accuracy, storage limitation, and security offer useful design analogues, while professional confidentiality supplies stronger domain-specific duties. The result is not an off-record life for active public-power conduct; it is a disciplined refusal to make dignity-bearing contexts interchangeable (Nissenbaum, 2010; European Union, 2016; World Medical Association, 2022).

Protected nonvisibility does not retreat from the Transparent Vow. It is the lawful and humane way the Vow avoids becoming exposure without fairness. The active participant has no authorized off-record active public-power formation life while active. Yet a human being under record still requires protected handling in health, counsel, bodily dignity, grief, worship, crisis, and safety. These categories do not defeat the Vow. They prevent the Vow from becoming degradation.

A sound protected-nonvisibility regime operates as a ladder of handling rather than one box marked hidden. Material may be fully shielded, available only to restricted reviewers, represented

by protected summary, delayed before release, or included in an ordinary public bundle after legal, ethical, and affected-person review. These categories should be rehearsed and taught before controversy begins so protection does not become either a loophole for hidden power or an appetite for raw exposure.

No protected-nonvisibility regime is credible when the people who benefit from disclosure administer it as a favor. The institution needs declared categories, independent review, emergency use rules, expiry or renewal, audit, and a route for the protected person to challenge either too much shielding or too little. Otherwise privacy becomes discretionary power, and discretionary power tends to follow institutional convenience.

This distinction will be one of the most scrutinized parts of the City. Critics will ask whether protected categories are loopholes. Supporters may ask whether they weaken transparency. Participants may fear they are too narrow. Families and professionals may fear they are too broad. The answer cannot be a slogan. The City needs category definitions, access limits, delayed release rules, protected summaries, review trails, expert review, appeal, and remedy for misuse.

Protected nonvisibility serves dignity, lawful process, care, counsel, third-party rights, immediate safety, and vulnerable states. It does not create a general shelter for operators, donors, staff, officials, or participants to hide active public-power conduct. When sensitive material also contains role-relevant meaning, the City should preserve the governed source, restrict raw access, and publish the narrowest accurate status or protected

summary that permits accountability without exposing the protected domain.

The categories in this section are not exhaustive for all future law or practice, but they establish the City's moral grammar. Health and clinical care require treatment trust. Legal counsel requires due process. Intimacy and modesty require bodily dignity. Grief and worship protect vulnerable states and conscience. Crisis and safety prioritize immediate protection. Each category creates a different kind of shielding and a different kind of abuse risk (Nissenbaum, 2010; European Union, 2016).

The relevant burden test is whether protection moves burden to the right place. If protection hides misconduct, burden moves onto the public. If exposure humiliates or endangers a person, burden moves onto the vulnerable. The City must place the burden on governed review rather than on either raw exposure or blind trust. Protected nonvisibility is the discipline that makes that possible.

9.2.1 — Health and Clinical Care

Health protection includes the ordinary, unheroic work of keeping a body livable. Medication refills, disability accommodation, menstrual health, chronic pain, allergy management, mobility support, nutrition, and sleep conditions may never become dramatic public events, yet they determine whether visible service can continue without needless harm. A City designed only for spectacular crisis would miss the daily body that carries every public role (Nissenbaum, 2010; European Union, 2016).

Health and clinical care require protected handling because care depends on trust. A participant living under full active-period record may still need medical treatment, psychological support, medication management, disability care, trauma response, sleep care, reproductive health care, emergency intervention, and ordinary clinical privacy. If those contexts become public material by default, participants will avoid care or perform care, and the City will produce worse evidence and more harm.

Institutional policy should distinguish the existence of a protected health interface from the content of that interface. It may be necessary to log that a health appointment occurred, that a load adjustment followed, that an emergency status was activated, or that a public-facing schedule changed. It does not follow that clinical details become public record. The public can be informed about role-relevant status without consuming treatment content.

Health material can be public-power relevant in limited ways. A severe health condition may affect active participation, role pathway, load capacity, safety, or office readiness. A pattern of untreated impairment may require pause. A clinical crisis may explain a continuity break. But relevance should not erase dignity. The City needs protected summaries, clinical independence, category review, and participant response before public meaning is attached to health events.

Health protection works only when its boundary is specific. Weak protection turns illness and treatment into public spectacle; an overbroad category can be misused to conceal meetings, influence, strategy, or misconduct. The City should define the clinical purpose, protected content, minimal occurrence status,

authorized recipients, emergency exceptions, and review route before the interface is used. Care space remains protected, while active public-power conduct retains its ordinary record duties.

Clinical professionals need enough independence to treat honestly and enough accountability to operate inside a public-power formation institution. Their primary duty is care, not archive production, and they should not become unreviewable gatekeepers over participation. Law, professional ethics, consent, and City protocol should specify the limited safety or status information that may leave the clinical interface, who receives it, and how the person can challenge misuse.

Health protection prevents the burden of public-power formation from becoming bodily consumption. The participant should not have to choose between care and dignity, between treatment and future public humiliation, or between honesty and health. A City that cannot protect care cannot sustain visible burden humanely.

Health information moves only as far as its purpose requires. A public status board may need to show a health-related pause without naming a diagnosis; a load review may need functional limits without receiving the narrative of treatment. The governing questions precede every transfer: what decision requires this fact, which recipient needs it, how long does that need last, and what narrower form would suffice? Minimum-necessary handling makes care compatible with accountable public formation.

Return-to-participation decisions should be framed as capacity and support judgments, not moral rehabilitation. A participant returning from illness, crisis, or clinical care should not be asked

to perform gratitude, courage, or redemption for the record. The relevant question is whether the burden can now be carried safely under lawful supports.

Health and clinical protection also applies to staff and collateral persons. A staff member overwhelmed by moderation burden, a partner affected by exposure, or a bystander injured by a City incident may need care outside the participant record. The City should not reserve clinical dignity for the person at the center of public attention.

Health shielding should include metadata discipline. Even a protected clinical conversation can reveal too much if appointment timing, location, specialist category, medication logistics, crisis frequency, or staff routing becomes publicly inferable. The City should design health nonvisibility against inference as well as direct release. Dignity is not protected if the raw note is sealed while the surrounding pattern exposes the person anyway.

The health category should be strong enough to protect ordinary care, not only dramatic crisis. Chronic illness, disability management, reproductive health, medication adjustment, sleep intervention, therapy referral, pain treatment, fatigue, and preventive care all shape a participant's capacity to carry visible burden. If the City protects only emergencies, it will miss the quieter medical load that determines whether the Vow is humane.

9.2.2 — Legal Counsel

The legal counsel category should be especially clear at the boundary between personal legal advice and official legal duty. A

participant moving toward office may interact with personal counsel, campaign counsel, public-office counsel, ethics counsel, and institutional counsel. These roles are not interchangeable. The City must prevent confusion over whom counsel represents, what is privileged, what belongs to public office, and what remains a personal rights interface.

Legal counsel belongs in protected nonvisibility because due process collapses if the participant cannot speak with counsel confidentially. The City's record environment will generate disputes about rights, status, release, family exposure, staff conduct, sanction, exit, and public meaning. Counsel must be able to hear the participant's questions, fears, admissions, and objections without becoming raw public material.

The existence of legal consultation may sometimes need a status record. The City may need to know that a counsel interface occurred, that release was delayed for legal review, that an appeal was filed, or that a protected process is underway. But protected status is not content access. The legal interface protects the participant's ability to challenge the City itself. If the institution controls the legal conversation, the challenge becomes symbolic.

Legal counsel also protects nonparticipants. Partners, household members, staff, visitors, professionals, and wrongfully exposed persons may need legal advice regarding City records. Their legal interfaces should not be swallowed by the participant's Vow. A person harmed by the City should not have to surrender more privacy in order to seek help. The remedy path must not become a new exposure path.

The loophole risk is real. Legal counsel labels can be misused to shield public-power conduct. A participant might try to route political strategy, donor communication, or unofficial meetings through privileged channels. The City must therefore set category limits, occurrence logs where lawful, counsel identity handling, privilege review processes, and abuse review. Privilege should protect legal advice, not become a magical exemption from the Vow.

Legal counsel protection begins with jurisdictional humility. The City can require protected access to counsel, respect privilege and confidentiality where law provides them, log only the occurrence status needed for continuity, and preserve an independent complaint route. It cannot manufacture one privilege rule for every legal order. Local counsel and competent authority determine the legal details, while the City preserves the institutional design principle that advice must remain usable against the institution itself.

Legal counsel keeps burden from becoming unanswerable. The City asks participants to accept unusual visibility. It must also give them unusual clarity about how to challenge, appeal, interpret, and refuse unlawful overreach. Legal counsel is not a gap in transparency. It is a condition of lawful transparency.

Legal-counsel protection should include privilege review before any disputed release, summary, or access event. The City should not decide alone that a legal interaction contains public-power material. Independent legal review, minimum necessary status logging, and a challenge route should govern boundary disputes.

The result is not secrecy drift. It is a lawful distinction between counsel as protection and conduct as public-power formation.

The legal-counsel category should protect prospective counsel as well as retained counsel. A person may need to ask whether they need representation, whether a conflict exists, or whether a family member should have separate counsel. If preliminary inquiry is exposed, the participant may avoid legal help until the situation hardens. The boundary should therefore protect legal consultation at the moment uncertainty begins.

9.2.3 — Intimacy and Modesty

Intimacy protection resists moralized interpretation. Conventional relationships do not establish stability, unconventional relationships do not establish danger, and sexual history is not a proxy for public fitness. Modesty rules protect the body from humiliation while preserving lawful review of coercion, dependency, leverage, conflicts of interest, and misconduct when those matters bear directly on public-power formation. The distinction keeps relevant accountability visible without converting private difference into civic evidence.

Intimacy and modesty require protection because bodily dignity cannot be treated as public evidence by default. A participant's relationships, dependencies, coercion risks, conflicts of interest, or abuse claims may sometimes matter for public-power formation. That limited relevance does not make intimate life public property. The City must separate relationship relevance from voyeurism with unusual care.

Modesty protection is not prudishness. It is dignity architecture. Bodies are vulnerable to humiliation, eroticized interpretation, platform abuse, revenge circulation, political weaponization, and false moral inference. A City that exposes bodily material too easily will train the public to consume persons under the language of accountability. That would be a moral failure, not a transparency achievement.

Protected handling may include restricted review, delayed release, shielded access, access logs, summary substitution, third-party masking, partner consent review, and expert review. The public may need to know that a power imbalance was reviewed, that a relationship created dependency, that a complaint was made, or that a conflict was resolved. The public rarely needs raw intimate detail to understand public-power relevance.

The loophole risk is also real. Intimacy categories can be used to hide coercion, exploitation, secret leverage, partner pressure, or misconduct. The City must not shield abuse in the name of modesty. The solution is not exposure by default. The solution is expert review, protected evidence handling, affected-person rights, coercion screening, and public summaries where civic relevance requires explanation without raw harm.

A nonparticipant partner or collateral person retains independent control over body, image, data, intimate history, and public identity. Review of a participant's conduct does not transfer the Vow to anyone nearby. Consent for a limited use must be specific, renewable where circumstances change, and revocable where law and safety permit; refusal should not reduce the person's standing

or access to care. The record design should make the third party's route visible without requiring further exposure.

Institutional fairness depends on whether public interest is being separated from public appetite. Intimacy and modesty protections keep the City from converting civic relevance into sexual spectacle. They also prevent secrecy from covering abuse. The City must be strong enough to review power in intimate contexts and restrained enough not to make intimacy a public offering.

A clear relevance threshold governs intimate material. Before viewing, summarizing, retaining for public meaning, or releasing any intimate content, reviewers identify the precise public-power question it answers, the authority for review, the people placed at risk, and the least exposing form that can carry the necessary meaning. Curiosity, moralism, embarrassment, and audience appetite do not satisfy that threshold. Material that cannot meet it remains protected.

Summary substitution is especially important in this domain. A lawful reviewer may need to know that a conflict of interest, coercive dependency, or consent violation was found. The public may need a status label or limited finding. The public almost never needs raw sexual detail. The difference protects both dignity and civic meaning.

A defensible implementation must also guard against retrospective sexual moralism. A relationship that violates a reader's expectations is not automatically evidence of unfitness. A conventional relationship is not automatically evidence of virtue. The record should evaluate power, coercion, dependency,

law, and public consequence, not impose one private morality as a readiness test.

The line between civic relevance and public appetite must remain unmistakable. Coercion, corruption, conflicts of interest, abuse, bribery, and misuse of role may warrant disciplined review. Bodies, desire, embarrassment, sexual health, modesty, private affection, and vulnerability do not become public interests merely because audiences are curious. Every later artifact, summary, tour, clip, or search interface should preserve the distinction so intimate shielding cannot be diluted by presentation.

The modesty category should be designed for bodily realities that institutions often mishandle: bathing, dressing, medical devices, menstruation, pregnancy, lactation, disability assistance, toileting, sexual health, gendered vulnerability, age-related change, and recovery from trauma. These realities may occur in the active period, but they are not civic evidence by default. A City that cannot protect the body cannot be trusted with public-power formation.

9.2.4 — Grief and Worship

Grief and worship protections should also guard against compelled meaning. A participant should not be expected to explain every loss in public language, turn every apology into a lesson, or translate every sacred or secular practice into civic usefulness. Some forms of human return are needed precisely because they are not public instruments. The City should protect that space without allowing it to hide public-power conduct.

Grief and worship are vulnerable states. A participant may grieve a death, loss, betrayal, family crisis, public harm, personal failure, or moral injury. A participant may pray, meditate, sit in silence, speak with clergy, practice within another religion, reject religion, or use optional practices associated with the Religion of Fairness outside the City only where boundaries are clear. These moments may occur under active record conditions, but they require protected handling.

Grief is care material before it is record material. Tears do not establish virtue, silence does not establish depth, and a public apology does not require raw footage of mourning. Where accountability needs a status, sequence, or protected summary, the record can carry that limited function without consuming the vulnerable state itself. The City demonstrates seriousness by protecting grief from civic theater while preserving the public facts that genuinely matter.

Conscience protection gives participants room for faith, secular commitment, mixed-belief life, doubt, silence, or no religious practice. Religion of Fairness participation, prayer, ritual, and sacred language remain optional, and none serves as evidence of readiness, loyalty, or moral depth. A protected pastoral or spiritual interface should preserve the person's chosen meaning while keeping active public-power conduct outside the protected category. The City supports freedom of conscience by declining to grade it.

The loophole risk is that grief or worship categories could be used to hide public-power conduct. A protected worship room cannot become an unrecorded donor channel. A pastoral interface cannot

become a political strategy room. The City must define the scope of protected spiritual and grief contexts, log occurrence where lawful and appropriate, protect content, and review abuse claims through careful category rules.

Clergy or pastoral support should be optional and plural. The City should not assume one tradition, one language of meaning, or one response to suffering. Professional or recognized support may include clergy, chaplains, spiritual caregivers, secular grief counselors, or other qualified helpers depending on law and context. The boundary is not between religion and nonreligion. The boundary is between protected vulnerable meaning and hidden public-power conduct.

The grief category also protects mourning for people outside public significance. A participant may grieve a parent, child, friend, colleague, pet, country, lost relationship, lost health, lost faith, or lost future. The public may be interested in how grief affects public readiness, but that interest can often be met through protected summary or status handling. The raw interior of grief is not a public resource.

9.2.5 — Crisis and Safety

Crisis rules earn value before a crisis occurs. Participants, clinicians, staff, security personnel, and emergency responders should know who leads, what information travels, how care overrides ordinary workflow, which records are created, and when after-action review begins. Drills, role separation, accessible communication, and recovery practice make the pathway usable under fear. The aim is not to dramatize

breakdown, but to ensure that relief and protection are already organized when ordinary record procedures must yield (World Medical Association, 2022; Solove, 2008).

Crisis and safety require immediate protection because danger does not wait for interpretive process. A participant, staff member, family member, visitor, or bystander may face medical crisis, self-harm risk, violence, threat, stalking, fire, evacuation, panic, acute psychological distress, security incident, or family emergency. In such moments, the City's first obligation is safety and care, not public meaning.

Crisis protection does not abolish record. It changes priority. The City may need emergency logs, limited capture, delayed access, protected status labels, after-action review, and public explanation where needed. But the emergency response should not be governed by the archive's appetite. Life, safety, de-escalation, medical care, and immediate protection come first. Record continuity follows under lawful emergency protocols.

Safety categories must be protected because public exposure can worsen danger. Stalking risk, domestic violence risk, targeted harassment, location exposure, emergency movement, and threat response may require delayed release or restricted access. A public that wants immediate information may need to wait. Public interest does not automatically outrank safety of persons who did not create the danger.

Emergency protection needs a visible end as well as a rapid beginning. A valid crisis category should state its trigger, decision owner, immediate scope, time limit, oversight notice, renewal

standard, after-action disclosure, and route for challenging misuse. Those controls let the City act quickly for safety while preventing emergency language from becoming a permanent nonpublication channel. Review should begin as soon as the danger permits, with care and protected life still intact.

Crisis care must avoid punishment. A participant in breakdown, medical distress, panic, grief crisis, or acute overload should not be treated first as evidence of unfitness or misconduct. Care before classification applies with special force here. Later review may still ask what the crisis means for participation, load, readiness, or safety. But the immediate response should protect the person and others from harm.

Crisis and safety shielding should have a later-review discipline. Emergency protection may require immediate masking, restricted access, security routing, or temporary information suppression. Those actions should be reviewed after the danger has passed, not to punish urgency, but to ensure that emergency categories did not become permanent darkness. The City protects life first, then restores record integrity without exposing the person to fresh harm.

Safety shielding should include threat modeling for vulnerable associates. A participant may become a vector through which enemies, obsessive supporters, journalists, or political opponents seek family members, former partners, clinicians, staff, or witnesses. Crisis handling must look outward as well as inward. The burden of protection belongs to the City once the City's visibility has increased the danger.

Crisis documentation should be divided by function. A clinical record carries symptoms, treatment, medication, and professional judgment; a safety log carries immediate threat, location, protective action, and operational consequence; a public notice may need only to state that ordinary participation has paused and review is pending. Separate custody, access, correction, and retention rules let each audience receive what it needs without merging medical vulnerability into public explanation (World Medical Association, 2024; European Union, 2016).

Reentry begins with restored agency, not with the institution's calendar. After an acute event, independent review considers the person's wishes, the contribution of City load, changed conditions, required support, protected record status, and the narrow public explanation actually owed. Return, redirection, extended pause, and exit remain legitimate outcomes. The central achievement is a choice made under safer conditions, without punishing vulnerability or turning crisis into a permanent public identity. Protection is credible only when the category, decision owner, review clock, appeal route, and limits on downstream use remain explicit.

9.3 — Children, Dependents, and Families

Children and dependents cannot be treated as extensions of a participant's consent. Their developmental position, reliance on adults, changing capacities, and limited ability to leave household exposure create a distinct protection problem. The child-noninheritance rule must therefore operate across capture, metadata, release, search, media, visitor access, and machine processing, not merely at publication. International child-rights and privacy frameworks do not supply a ready-made City code, but they make the burden clear: best interests, evolving capacities, participation rights, family integrity, and protection from exploitative data practices require independent representation (United Nations, 1989; Committee on the Rights of the Child, 2021; United Nations, 1966).

The Transparent Vow is chosen by the participant. It is not chosen by the participant's child, dependent adult, spouse, partner, parent, sibling, roommate, caregiver, or household member. This section begins with that fact because every family rule in the City depends on it. Public-power formation may affect families, but effect is not consent. Proximity is not participation. Love is not waiver. Dependency is not exposure (United Nations, 1989; Committee on the Rights of the Child, 2021).

The family shield must appear in orientation, record design, visitor rules, spatial boundaries, media policy, public summaries, and exit planning. It cannot live only in this chapter as a promise. A child's image, a partner's crisis, an elder's care need, a custody dispute, or a dependent's disability can enter the City's

operational awareness without becoming public material. The design test is whether a family member can be protected without being made invisible to care.

Awareness and exposure are different institutional acts. The City may need to know that a child exists, that a dependent requires support, that a partner needs an appeal route, or that a household faces a safety risk. None of those facts belongs in public view by default. A protected status stub, private support plan, family-law referral, safety flag, or affected-person route can carry the operational need while leaving the underlying life private. Citizens may be told that shielding rules exist without being given the lives those rules protect.

Family life cannot serve as borrowed evidence of public trust. Supporters may seek images of warmth, critics may hunt household moments for hypocrisy, and media may treat intimacy as proof. The public facts that matter are institutional: household burden, adequacy of support, complaints, safeguards, remedies, and role-relevant conduct. A family scene enters public memory only through a separate lawful and person-centered process, never because it makes the project easier to admire, attack, or market.

Children hold the strongest claim against inherited visibility. They cannot consent to an adult's public-power burden, and their development, school life, peer relations, safety, future identity, and freedom from symbolic use deserve protection at every stage. The City should design capture zones, visitor routes, metadata, summaries, search, tours, and media practice around the child shield. Accountability is strengthened, not weakened, when the

institution proves it can keep adult power visible without turning childhood into evidence.

Dependents and vulnerable household members need protection matched to their actual reliance on the participant and the City. An elder, disabled adult, ill family member, dependent partner, or person receiving care may face changed transport, housing, medical continuity, schedules, security, or caregiving load. The institution should identify those burdens, fund reasonable support, provide an independent advocate or complaint route where needed, and preserve private life. Need is a reason for care, not a license for narrative exposure.

Partners and household members require their own notice, consent boundaries, complaint routes, privacy protections, and remedies because the participant's role can change their daily life. Location, schedule, public attention, security risk, household logistics, support terms, and media interest may all reach them. The City should document institutional duties and burden without treating the partner as an accessory to public trust or placing the household in the archive by default.

Some family questions must return immediately to competent law and professional practice. Custody, guardianship, dependent care, domestic violence, reproductive health, medical privacy, parental rights, and household safety cannot be settled by internal custom. The City can establish a protective design floor, preserve emergency routes, and provide independent support; jurisdiction-specific authority determines enforceable duties and remedies. That division protects families from institutional improvisation while keeping the City's own burdens visible.

9.3.1 — Child Noninheritance Rule

Indirect exposure belongs inside the child-noninheritance rule. A child may be identifiable without being named when a record reveals school, schedule, neighborhood, health details, family conflict, belongings, or repeated contextual clues. Shielding therefore requires inference review, not merely name removal. The standard is whether peers, media, commercial actors, or hostile observers could reasonably reconstruct the child's identity or circumstances (United Nations, 1989; Committee on the Rights of the Child, 2021).

The child noninheritance rule is a bright operational rule: no child becomes a participant because an adult lives, works, visits, receives support, or seeks public power through the City. The adult's chosen record burden stops at the child. Every system that touches family life should implement the same result through capture exclusions, access limits, masking, delayed release, complaint, correction, and artifact review rather than relying on a general promise of privacy.

This rule protects more than privacy. It protects development, safety, peer relations, school life, future identity, and the child's right not to be made into public material before they can understand the stakes. A child who is exposed as part of a civic experiment may carry that exposure for life. The City must not create public memory around children in order to make public power more knowable.

Operational practice should prohibit using children as proof. A child's image, voice, routine, school context, distress, affection,

or relationship with a participant should not be displayed to establish that the City is humane, intergenerational, successful, or safe. Any exceptional handling requires a separate lawful and child-centered process, a compelling purpose, minimal exposure, independent review, and a clear withdrawal or expiry route. Shielding remains the default.

Child data requires strict protection. Names, images, locations, school details, medical facts, family dynamics, digital traces, and incidental appearances should be masked, excluded, summarized, or restricted according to child-safety rules. The City should assume that public release can spread beyond its control. Platform circulation, screenshots, archives, hostile commentary, and future search create risks that cannot be undone easily.

The rule also protects children from symbolic labor inside the institution. A child should not be asked to perform pride, forgiveness, support, sacrifice, normalcy, or loyalty for a participant or for the City. Their behavior cannot be interpreted as a readiness signal or moral verdict on the adult. Children remain persons with their own developing identities, relationships, and futures, not instruments for public-power meaning.

Child noninheritance prevents burden from moving downward to the least powerful. If the City cannot stop the adult's role burden from reaching children, then the City has failed the most basic direction of fairness. Public power must carry more burden. Children must carry less.

Public artifacts require the same child shield as the archive. Brochures, tours, documentaries, dashboards, social clips, fundraising pages, architectural renderings, and case studies can create permanent exposure even when the source record is protected. Artifact review should test identifiability, inference, future search, emotional pressure, and promotional use before release. A project cannot claim child protection while using childhood to soften resistance or raise support.

Child protection also requires future-risk thinking. Information that seems harmless at age four may become harmful at age fourteen or twenty-four. The City should assume that public memory travels across time in ways childhood cannot consent to. Time review, masking, and nonrelease should therefore be stricter for children than for ordinary adult collateral persons.

The public rule should be memorable enough to govern under pressure: no child becomes transparent because an adult seeks public power. That sentence does not replace the detailed controls, but it gives families, journalists, donors, designers, staff, and reviewers a common test for proposed capture or release. Any exception should face child-centered legal authority, documented necessity, independent review, and the least exposing feasible form.

Child noninheritance should appear in procurement, tour design, media agreements, donor materials, record-site prototypes, training, and incident review, not only in privacy policy. Vendors and partners should be contractually unable to reuse child-related material, build profiles, or retain incidental capture outside the authorized purpose. Audits should verify actual absence,

masking, deletion, and correction. Sometimes the most truthful public representation of the child shield is a deliberate blank where promotional culture expects a face.

The rule also protects adult memory of childhood. A child who grew up near a participant should not spend adulthood searchable as a prop in someone else's civic narrative. Childhood material should remain shielded, time-reviewed, or summarized only under exceptional lawful standards. The City must imagine the future adult who may one day ask why an institution preserved or released their childhood in service of another person's public ambition.

9.3.2 — Dependent Protection

Dependent protection also requires attention to the dignity of receiving care. A dependent person should not be described publicly as a burden in a way that reduces them to a cost of the participant's service. The City may need to count care obligations, but its language must preserve the dependent's personhood. Care is not merely a complication to public ambition. It is part of the moral reality the City must respect.

Dependent protection extends the same principle to vulnerable people whose lives may be connected to the participant by care, financial support, disability, age, illness, legal dependency, or household need. A dependent adult may require care. An elder may need support. A disabled family member may rely on routine and privacy. A medically vulnerable person may be affected by participant schedules and public attention. None of this makes them public material.

Dependent burden must be counted without turning dependents into record subjects. Care obligations can affect entry, pause, residence, travel, office service, and the practical ability to remain under the Vow. That burden belongs in planning because ignoring it would make consent fictional. The dependent's diagnosis, school, routine, legal status, or family history does not therefore become public material. Minimum necessary information, protected summaries, restricted access, and independent review let support follow the burden without exporting the person.

Dependent protection spans financial, logistical, medical, relational, and emotional realities. When participation creates care gaps, transport burdens, housing instability, disrupted treatment, or caregiver strain, those effects belong inside the City's decision rather than being dismissed as private inconvenience. The response may be added support, a lighter schedule, delayed activation, a different pathway, or refusal of entry when the burden cannot be carried safely. Honest formation counts the life that surrounds the participant.

The abuse risk is that dependency can become leverage. A participant may be pressured by family, caregivers, funders, or the City itself through dependent needs. The City must review whether support is being used to control the participant or whether the dependent is being used to manipulate public image. Dependent protection includes protection from becoming a pressure point in the participant's formation.

Dependent persons should have complaint routes where appropriate. Some may not be able to complain easily because of age, disability, illness, language, power imbalance, or dependence

on the participant. The City may need advocates, guardianship-sensitive protocols, professional review, or affected-person routes that do not expose the dependent to public record. Remedy must be accessible even when the harmed person is not the loudest person in the room.

Dependent protection asks who pays when public-power formation rearranges care. If the answer is a dependent person who never consented, the design is wrong. The City can ask participants to carry burden. It cannot make vulnerable dependents quietly subsidize that burden with lost care, lost privacy, or lost safety.

The operative procedure should distinguish care visibility from dependent visibility. The public may need to know that the institution has counted care burden. It does not need to know the dependent person's diagnosis, finances, household conflict, or private history. The burden can be acknowledged without exposing the person who receives care.

Dependent protection should also watch for indirect coercion. A participant may feel unable to complain, pause, or exit if doing so would jeopardize dependent support. Support terms must therefore be designed so dependents are not used, even unintentionally, as pressure points keeping the participant inside the Vow.

Dependent protection should recognize that dependency is not only childhood. Disability, illness, aging, financial reliance, immigration vulnerability, language dependence, trauma, and caregiving arrangements can all place a person near the

participant's burden without giving meaningful consent to exposure. The City should treat dependency as a shield-triggering condition, not as a narrative detail for public understanding.

Dependent protection should include substitute support when the participant's visible burden disrupts care. A dependent may lose attention, routine, privacy, transport, financial stability, emotional calm, or safety because the participant is carrying the Vow. The City should not merely promise not to expose the dependent. It should ask what practical support prevents the participant's chosen burden from becoming the dependent's hidden cost.

9.3.3 — Partner Rights

Partner rights should also include protection from public expectation. A partner may be pressured by audiences to appear loyal, forgiving, supportive, patriotic, spiritual, or proud. The City must not make partner performance part of participant credibility. A partner may choose silence, distance, complaint, or private support. Those choices should not be converted into readiness evidence without careful, lawful, and narrow review.

Partner rights recognize that spouses, partners, and intimate household companions may be deeply affected by the participant's Vow without accepting the same role. A partner may share space, care duties, finances, emotional history, parenting, public attention, and security risk. The City must not treat the partner as either invisible or automatically public. Both errors would be unjust.

The first partner right is consent boundary. A partner's relationship with the participant does not automatically consent

to public record release, intimate exposure, relational interpretation, or public use of household context. A partner may choose certain forms of participation, support, consultation, or public statement, but those choices must be specific, revocable where possible, and protected from coercion. The participant's Vow does not authorize the City to own the partner's story.

The second partner right is complaint. A partner may be harmed by the participant, by the City, by public attention, by record misuse, by staff conduct, by security failures, or by family burden. The partner needs a route to name harm without being forced into public exposure. A household complaint route must be designed for collateral persons, not merely for participants.

The third partner right is dignity in interpretation. Relationships are complex. A disagreement, silence, separation, reconciliation, or emotional moment should not automatically become public evidence of character. The City must avoid turning partner presence or absence into readiness signals without careful review. Romantic life should not become a stage for the participant's public meaning.

The fourth partner right is safety. If there is coercion, abuse, stalking, domination, retaliation, or unsafe household dynamics, the City must put safety before reconciliation and before image. Partner rights are not only privacy rights. They include protection from harm and access to qualified support. The City must not use family unity language to pressure a person into unsafe repair.

Partner rights prevent the Vow from annexing intimate association. Public-power formation can legitimately examine

influence and dependency where relevant, but it cannot consume the partner as evidence. The partner remains a person with rights, not a mirror in which the participant proves readiness.

Partner rights should include independent counsel or advocacy where the partner's interests diverge from the participant's interests. A partner may support the Vow and still be harmed by it. They may need privacy, safety planning, family-law advice, intimacy shielding, employment protection, or a route to object to release. Love does not waive rights. Proximity does not erase a separate person.

Partners also need protection from narrative fusion. Public audiences often treat a spouse or partner as evidence of character, stability, hypocrisy, loyalty, or contradiction. The City should resist that appetite. A partner can be relevant where conflicts, coercion, care duties, financial leverage, or public role influence exist. A partner is not automatically a character exhibit for the participant's public story.

9.3.4 — Household Complaint Route

The route should also accommodate people who are not comfortable using the City's own language. A household member may not speak in terms of record burden, nonvisibility, or public-power formation. They may simply say the schedule is breaking care, the media attention is frightening a child, or the participant has changed under pressure. Intake must translate lived harm into institutional categories without dismissing ordinary language as imprecision.

A household complaint route gives people around the participant a way to report harm created by the City's burden. Household members may experience disruption, pressure, exposure risk, security concern, care burden, financial dependency, emotional strain, media attention, or conflict over the participant's role. If the only complaint route belongs to the participant, the City will miss harms carried by those who did not choose the Vow.

The route must be accessible to varied households. A household may include partners, children, elders, relatives, chosen family, roommates, caregivers, dependents, or separated co-parents. Some people may need confidential intake. Some may need advocates. Some may require translation or disability access. Some may fear retaliation from the participant or from the institution. The complaint route must be designed for unequal power.

A household complaint begins as a route to relief, not as a new public object. Intake protects the reporting person, classifies the concern, provides immediate assistance where needed, and reviews any role-relevant implications through the proper authority. Public explanation appears only when public trust genuinely requires it and in the least exposing form. The person who reports harm should not have to become visible in order for the institution to become answerable.

The route must distinguish discomfort from harm, and harm from public-power relevance. Some household disruptions may be expected and manageable. Some may require support. Some may show that participation should pause. Some may reveal misconduct. Some may belong to family-law or domestic-

violence systems beyond the City's competence. Category review prevents the City from treating every domestic difficulty as evidence or ignoring serious danger as private.

The household complaint route should include remedies. Possible remedies include schedule adjustment, shielding, support services, temporary pause, referral, legal review, care planning, public correction, compensation where appropriate, and participant-status review. A complaint route without remedy becomes a listening ritual. The City needs repair capacity.

The household complaint route should be usable without forcing a family member into public conflict. Many household harms are difficult to name because the person fears damaging the participant, the City, a child, or their own safety. The route should allow confidential intake, safety screening, protected advocacy, emergency shielding, and independent review. If the only route is public accusation, many harms will remain hidden.

The route should also allow household members to ask for clarification before harm becomes acute. A partner may need to know what will be recorded. A dependent may need to know where to go during a crisis. A caregiver may need to object to schedule design. A child advocate may need to raise a shielding concern. Early questions should be welcomed because they prevent the household from carrying uncertainty in silence.

9.3.5 — Family-Law Boundary

The family-law boundary also protects against the City being used as reputational leverage. A participant should not be able to say that City status proves parental fitness, nor should an

opponent be able to say that active burden proves family unfitness. Family-law systems must judge family matters through lawful standards. City records may inform only where properly requested, protected, contextualized, and legally relevant (United Nations, 1966; European Court of Human Rights, 2026).

The family-law boundary protects the City from overclaiming in domains where law, care, custody, guardianship, safety, and private rights are already complex. The City may shape public-power formation, but it does not become family court, child welfare system, custody authority, domestic-violence court, medical decision-maker, or general household regulator. It must know when to defer.

Custody disputes require special humility. A participant's record may become relevant in a custody context, but the City should not decide custody. A child's welfare, parental rights, privacy, safety, and legal process belong to proper legal structures. The City may provide records under lawful process, protected summaries where appropriate, and expert guidance about its own systems. It should not convert its civic judgments into family-law conclusions.

Domestic safety requires similar boundaries. If there is violence, coercive control, stalking, abuse, or danger, the City must route safety before institutional image. But it must do so through qualified systems. The City should not pressure mediation, apology, or household repair where safety is at risk. Safety before reconciliation is a rule of fairness, not a preference.

Medical and reproductive issues intersect with family law as well. Pregnancy, reproductive health, medical decision-making,

disability support, dependent care, guardianship, and parentage may require legal and clinical expertise. The City cannot improvise these rules because the participant is under the Vow. It must defer to qualified review while preserving its own nonexposure and record-stage disciplines.

The family-law boundary also protects the City from becoming a tool in private disputes. A partner, relative, or adversary may seek to weaponize City records. The City must have lawful access rules, affected-person protections, redaction, category review, and court-response protocols. Public-power accountability should not become a new weapon for domestic conflict.

Institutional practice should also protect legal humility in public explanation. When a family-law matter affects participant status, the public may need a limited status note, but the City should not narrate custody, domestic conflict, reproductive health, or family vulnerability as if it were competent to settle those matters in public prose.

Private disputes create a predictable misuse route. A participant, partner, former partner, relative, employer, or critic may try to convert City material into leverage in custody, divorce, inheritance, immigration, employment, or reputation conflict. Family-law boundaries should require lawful process, relevance, minimum necessary transfer, notice where permitted, protective review, and a later disposition rule. Public-power records should not become a casually searchable arsenal for conflicts the City does not own. A request log should preserve the question actually asked so a later reviewer can identify when a narrow inquiry expanded into an unrelated search.

When a family-law dispute touches a City record, the safest default is a bounded legal hold rather than immediate release or deletion. The hold preserves relevant material, freezes discretionary dissemination, identifies the lawful custodian, and routes the issue to qualified counsel or a competent authority. It should not give either private party a new strategic advantage. Every hold needs a reason, scope, review date, affected-person notice where lawful, and a rule for what happens when jurisdictions conflict or proceedings end. The custodian should distinguish preservation from permission to inspect, preventing the existence of a hold from becoming an informal grant of access.

The family-law interface should use minimum necessary exchange. A court, guardian, child-protection authority, clinician, or counsel may need a specific record for a specific purpose, but that need does not justify exporting an entire participant archive or household history. The request, legal basis, selected material, redactions, objections, transfer method, recipient duties, and later disposition should be recorded. This keeps the City from becoming an informal discovery warehouse and protects children and dependents whose lives would otherwise travel into disputes they did not choose (United Nations, 1989; Committee on the Rights of the Child, 2021). That protection extends beyond the household itself, because visitors, clinicians, educators, neighbors, and incidental contacts retain rights that cannot be waived by the participant. Recording the recipient's acknowledgment completes the handoff and gives affected people a named destination for any later correction.

9.4 — Third-Party Rights and Incidental Contact

Incidental contact creates institutional duties rather than implied consent. A visitor, neighbor, delivery worker, protester, clinician, cleaner, journalist, or passerby may enter the City's sensory or digital field for a limited reason. Camera range, microphone range, access logs, biometric tools, captions, searchable metadata, and reuse should therefore be purpose-mapped before collection. Minimization, rapid masking, notice where feasible, an affected-person challenge route, correction, and remedy must travel together because harm can arise through aggregation, secondary use, distorted context, or exclusion from the decision even when no single datum appears intimate (Solove, 2008; Nissenbaum, 2010; European Union, 2016).

The Transparent City creates a record field around active public-power formation. That field will inevitably touch people who did not choose it. A visitor may enter for a meeting. A bystander may appear at a public edge. A clinician, lawyer, clergy member, journalist, vendor, emergency responder, critic, protester, or staff member may interact with the City for a limited purpose. Incidental contact is unavoidable. Inherited exposure is not.

Third-party protection requires affected-person standing. A person wrongfully captured, mislabeled, exposed, summarized, quoted, indexed, or associated with a participant must have a route to be heard without first becoming more public. Standing should not depend on fame, litigation capacity, media attention, or personal access to City leadership. The City's own record

power creates the need for a collateral-person remedy architecture.

A collateral-person matrix should ask five questions. Did the person consent to the setting? Did they consent to capture? Did they consent to release? Do they have a protected role or vulnerability? What remedy exists if the answer was misunderstood? These questions are simple enough for public explanation and strong enough to guide system design. They prevent the City from letting a person's accidental nearness become an unchosen civic burden.

Third-party rights protect the moral boundary between active participants and everyone else. The participant accepts the Vow. The third party does not. The City must therefore design masking, access limits, notice, role records, protected summaries, consent rules, and remedy for wrongful exposure. Without these protections, the City would become a gravity well, pulling ordinary people into public record by proximity (European Union, 2016; Ohm, 2010).

Third-party protection also protects public trust. A City that harms bystanders will lose legitimacy quickly and rightly. Citizens will not trust an institution that can capture them by accident and release them by procedure. Professionals will not serve if their work becomes public material. Staff will not stay if role records become full-life records. Critics will not approach if dissent makes them searchable. The City must make participation status visible and nonparticipation status protected.

The record system must therefore distinguish several categories: visitor, bystander, professional, staff, vendor, emergency responder, protester, journalist, family member, affected person, and ordinary public contact. These categories may overlap. The City must still prevent the collapse of all categories into one record subject. Purpose matters. Role matters. Consent matters. Public-power relevance matters.

Remedy for wrongful exposure completes the structure. Even strong systems fail. A face may appear. A name may be released. A summary may identify someone by context. A clip may circulate. A staff role may be overdisclosed. A protester may be misclassified. A professional interaction may become searchable. The City must have repair routes before harm occurs, not after public scandal forces improvisation.

The operative design should be judged by whether a person who did not choose public-power burden is nevertheless made to carry it. Third-party rights answer no. They allow the City to remain open, staffed, professional, and public-facing without converting every person near it into material for the archive.

9.4.1 — Visitor Protection

Visitor protection also requires a culture of restraint among participants and staff. A visitor should not be treated as useful content because they are interesting, emotional, critical, famous, ordinary, or inconvenient. The City should train people inside the institution to recognize the difference between a person entering a public interface and a person becoming part of the public record.

That distinction should be social as well as technical (Solove, 2008; Nissenbaum, 2010).

Visitor protection begins with role-limited entry. A visitor enters the City for a defined purpose: meeting, tour, inspection, expert review, media access, family contact, public interface, service delivery, or event participation. That defined purpose should determine the record conditions that apply. A visitor should know before entering what may be captured, what may be released, what will be masked, and what remedy exists for error.

Visitors are not participants. They may be recorded for security, access, context, or public-power relevance, but their ordinary life is not under the Vow. The City should avoid treating visitor appearance as implied consent to public use. Notice must be clear, but notice alone is not enough. The design should minimize unnecessary visitor capture and restrict release unless public-power relevance is strong and lawful.

Visitor protection is also public-interface protection. Citizens, critics, journalists, and experts must be able to approach the City without surrendering ordinary privacy. If every visit becomes a public identity event, the City will deter honest criticism and ordinary civic contact. The public edge should make entry conditions legible without turning every visitor into a searchable person.

Visitor categories may differ. A family visitor requires stronger shielding. A public tour visitor may accept limited visibility. An inspector may enter under oversight rules. A journalist may document under media protocols. A vendor may enter under

operational logs. The City should not use one visitor rule for all purposes. Role-limited entry must be precise enough to prevent both confusion and overexposure.

Visitor protection should include challenge and correction. If a visitor is released improperly, misidentified, clipped, or described inaccurately, they need a route for correction, masking, takedown request where possible, public correction, and remedy. The City cannot promise that no error will occur. It can promise that error is not ignored.

The gate should do most of the explanatory work. Before entry, a visitor can see whether the next space is captured, public, protected, media-accessible, or staff-only; what record state applies; how to ask for accommodation; and how to leave or withdraw permission within lawful limits. Role-specific notice reduces the need for technical knowledge. The environment carries the burden of preventing accidental exposure rather than placing that burden on the person least familiar with the City.

Unequal power changes what visitor consent means. A student, intern, low-wage worker, local resident, translator, contractor, critic, or participant's guest may sign while feeling unable to refuse. The design therefore pairs notice with a real alternative, a human contact, nonretaliation, and a route to withdraw or challenge. Practical voluntariness is tested from the position of the visitor most likely to experience status pressure, not from the confidence of the institution presenting the form.

9.4.2 — Bystander Protection

Bystander protection must anticipate modern search and inference. A partial face, gait, vehicle, location pattern, workplace uniform, school emblem, voice, or combination of small clues may identify someone after obvious details are masked. Review therefore tests contextual inference, not merely direct identifiers, before release. Protection also follows derivatives so a masked source is not defeated by an unmasked thumbnail, transcript, caption, or search result.

Bystander protection handles the person who appears without intending to enter the City's record at all. A bystander may be near the perimeter, on a public street, in a host community, at a protest, in a service area, at an emergency scene, in a public interface, or incidentally present during travel. Their appearance may be captured, but capture should not become public release without strong justification.

Bystander protection should assume that a person may discover capture only after release or inference. Face, voice, location, clothing, timing, association, metadata, and unusual context can identify someone even when a name is absent. The City therefore needs visible notices where feasible, retrospective lookup and challenge routes, rapid protective action, and non-digital assistance for people who cannot navigate the record site. Unknown capture is a predictable design condition, not an exceptional accident.

Masking should be the default where bystander identity is not public-power relevant. Face blurring, voice alteration, metadata

reduction, delayed review, protected summaries, and context control may be needed. Bystander protection should not be limited to visual image. A person can be exposed by a license plate, address, route, timestamp, social context, or repeated presence.

Bystander appearance can sometimes be relevant. A protest, public disturbance, emergency, harm event, or public interaction may require some record of bystander context. Even then, the City should ask what level of detail is necessary. Public relevance should be narrow. The fact that someone is present near public power does not make their identity public property.

Bystander remedy must be practical. A person who discovers wrongful exposure should be able to contact the City, identify the record, request masking or correction, receive a response, and obtain remedy where harm occurred. The City should not require expensive legal action before correcting obvious bystander exposure. Practical repair is part of dignity.

Bystander protection prevents the record field from expanding into ordinary public life. The City's burden is aimed at public-power formation, not at the people who happen to pass near it. A bystander should not pay for public accountability with their own unintended visibility.

Bystander protection should include environmental bystanders. A local resident whose home appears in a perimeter video, a worker visible in a service route, or a protester captured near a public interface may be identifiable through setting as much as through

face. The City must treat place, association, and routine as possible identifiers.

Protection should not depend on bystanders discovering that they appeared. The City applies protective defaults before release, tests likely derivatives, and offers a rapid correction route if exposure occurs. Remedy remains essential, but prevention places the burden where it belongs: on the institution that captures and publishes, not on the person who never chose visibility.

Incidental appearance should trigger minimization rather than become free context. Cameras, microphones, logs, maps, summaries, and machine search can turn a passing moment into a durable association. The system should exclude unnecessary capture, mask or restrict what remains, separate temporary safety use from public release, and preserve a correction or deletion route where lawful. A bystander is not a public exhibit merely because the institution's sensor encountered them.

Bystander review should also consider group exposure. A street, school, clinic, protest line, religious gathering, workplace, or host-community event can be exposed even when individual names are masked. Context can identify people. The City should therefore review background, location, timing, local uniqueness, and social inference before treating bystander protection as complete. Privacy can fail through pattern even when faces disappear.

9.4.3 — Professional Protection

Professional protection also supports recruitment of competent helpers. Skilled professionals will avoid the City if their work

becomes politicized, clipped, or exposed beyond role. The City should make clear that professional participation is bounded, respected, and correctable. Otherwise the institution will attract only those willing to perform publicly, which would weaken care, counsel, emergency response, and expert review.

Professional protection shields people who enter the City under a professional duty: doctors, lawyers, clinicians, clergy, pastoral caregivers, disability specialists, interpreters, emergency responders, auditors, inspectors, technical experts, social workers, and others whose role requires trust or expertise. Their professional presence supports the City. It should not make them public material by default.

Professional relationships carry distinct duties that make the service possible. A doctor's presence is not public evidence, a lawyer's consultation is not a civic event, clinical care is not a readiness spectacle, and pastoral support is not ritual theater. The City should define the professional purpose, protected content, minimal status record, custody owner, emergency exception, complaint route, and return point to ordinary active-role recording before the interface begins.

The institutional design may still need professional occurrence logs, role status, conflict checks, access records, and public explanation of institutional process. The challenge is to protect content while preserving accountability around role. For example, the public may need to know that an independent clinical review occurred, but not what a participant disclosed in therapy. The public may need to know that legal review delayed release, but not privileged strategy.

Professional protection must also prevent role misuse. A professional label cannot become a disguise for donor access, political strategy, personal favoritism, hidden meetings, or unrecorded public-power conduct. The City must define professional scope, require credential or role verification where appropriate, log role entry, and review abuse claims. Protection is for professional purpose, not for status immunity.

Professionals themselves need remedy. A doctor, lawyer, clinician, clergy member, expert, or responder may be misrepresented by the City, exposed by record release, pressured by participants, targeted by media, or burdened by public interpretation. Professional protection should include correction routes, masking, security support where needed, and complaint access. The professional does not become an accessory to the participant's public story.

Professional protection keeps the City dependent on expertise without consuming expertise. Care, counsel, review, and emergency response can enter the City only if professional roles remain trustworthy. The public benefits from those roles precisely because the City does not turn them into spectacle.

Professional protection should include role-stub discipline. The City may sometimes log that a medical professional, lawyer, clinician, clergy member, interpreter, mediator, or emergency responder was present for a protected purpose. The stub should identify enough to preserve continuity and prevent false secrecy, but not enough to expose protected content, imply wrongdoing, or turn the professional into part of the public story.

Professional independence should be evaluated as a service-quality condition: visibility pressure that changes care, counsel, interpretation, or emergency judgment degrades the professional function itself.

9.4.4 — Staff Protection

Staff protection belongs in the job description, not in a policy discovered after injury. A prospective worker should know that employment is not consent to full-life exposure and that only material role influence enters the governed record. Recruitment, scheduling, complaint, support, and exit terms should make that boundary visible from the first contact. The institution earns labor legitimacy when a person can understand the cost of the role before depending on it.

Staff protection is necessary because staff work inside the City without accepting the participant's full-life record burden. Staff may teach, treat, mentor, archive, moderate, maintain, secure, cook, clean, operate, translate, inspect, repair, or manage systems. Their work may be role-recorded because staff influence matters. Their private lives should not be exposed because staff are not active participants in the Transparent Vow.

Staff remain third parties to the participant's Vow. This chapter therefore limits incidental staff capture to role-relevant conduct and protected remedy; Chapter 21 supplies the fuller staff-record architecture.

Staff are vulnerable to two opposite harms. If staff influence is invisible, hidden power returns through support labor. If staff are overexposed, the City moves participant burden downward into

workers. Staff protection therefore requires role-bound visibility: enough record to preserve accountability, enough privacy to preserve dignity. This balance is not optional. It is one of the City's most important labor safeguards.

Staff protection also includes consent, notice, complaint rights, labor standards, anti-retaliation, and data limits. Staff should know what their role record captures, who may access it, how long it is retained, how it may be corrected, and how misuse is remedied. Employment should not become accidental entry into a quasi-transparent life.

Emotional and moderation burden requires the same seriousness as physical workload. Archivists, moderators, clinicians, security staff, complaint handlers, and public-interface teams may encounter distressing material, conflict, harassment, and pressure to absorb institutional anxiety. Protection therefore includes rotation, staffing ratios, debriefing, clinical support, protected refusal, safety review, and a route to report hidden cost. Participant dignity cannot be financed through invisible staff exhaustion.

Public anger can turn a role-bound worker into an accidental symbol of institutional failure. A complaint, outage, correction, gate decision, archive error, security event, or care breakdown may justify scrutiny of the work performed, but it does not justify doxxing, scapegoating, family exposure, or unmanaged public blame. Role accountability should remain attached to the act, authority, evidence, and remedy. Staff are accountable workers, not sacrificial surfaces for public trust.

Collective voice is essential when individual complaint is too risky. A worker may fear naming unsafe load, record misuse, retaliation, or role-boundary drift alone. Protected committees, union routes where lawful, ombuds access, and collective pattern reporting can reveal conditions that isolated cases conceal. Staff voice does not obstruct transparency. It shows where the institution has moved its own burden out of sight.

9.4.5 — Remedy for Wrongful Exposure

Wrongful exposure remedy should include an anti-blame rule for the harmed person. A person whose information is released should not be told they should have avoided the City, avoided complaint, avoided visiting, avoided a relationship, or anticipated the institution's error. The burden of repair belongs to the system that exposed them. Blaming the exposed person would invert the governing standard (European Union, 2016; Ohm, 2010).

Remedy for wrongful exposure is the test of whether shielding is real. A policy that says people should not be exposed is not enough. The City must be prepared for mistaken release, improper access, faulty masking, metadata leakage, misclassification, public clipping, machine summary error, staff overdisclosure, vendor breach, and inferential exposure. Wrongful exposure is not only possible. It is predictable.

The first remedy is notice. A person harmed by exposure should not discover the harm only through public circulation where avoidable. The City should notify affected persons when a significant exposure occurs, explain what happened, identify what record or release is involved, name the immediate protective

steps, and provide a route for response. Notice must be timely, clear, and accessible.

The second remedy is correction or shielding. Depending on the harm, the City may need to mask identity, remove improper material where possible, correct public labels, replace raw release with protected summary, seal material, add context, restrict access, challenge platform circulation, or issue a public correction. Digital spread cannot always be undone, but difficulty is not an excuse for inaction.

The third remedy is accountability. The City should identify whether wrongful exposure resulted from human error, system failure, vendor breach, policy weakness, malicious action, unclear category rules, or insufficient review. Repair without cause analysis invites repetition. Cause analysis should not become scapegoating. It should place burden accurately so future harm is reduced.

The fourth remedy may include compensation, support, security assistance, legal assistance, clinical support, or other concrete relief. Exposure can produce reputational injury, safety risk, emotional distress, financial harm, professional harm, family harm, and platform harassment. Apology alone may not be enough. The remedy should match the burden created.

Remedy should include downstream correction where possible. If a wrongful release has been copied into a civic platform, media interpretation, machine summary, or public discussion forum connected to the City, the correction should travel as far as the

City can lawfully carry it. A correction hidden on a back page may not reach the place where the harm now lives.

A serious record system budgets for repair before harm occurs. Wrongful exposure may require legal help, temporary relocation, counseling, digital-security support, employment repair, family protection, or emergency care. An exposure-injury reserve should have transparent funding, independent authorization, rapid access, audit, and anti-retaliation controls. If the City cannot finance foreseeable remedies without bargaining with the harmed person, it is not ready to operate the exposure system that created the risk.

Wrongful-exposure remedy should include speed because exposure multiplies with time. Search indexing, reposting, machine summarization, harassment, employment effects, and family consequences may begin before formal findings conclude. Temporary shielding, status notices, takedown efforts, emergency assistance, and protected explanation may be needed while the full review proceeds. Remedy delayed until certainty may become remedy denied.

The remedy route should distinguish exposure levels. A private internal misrouting, a restricted reviewer mistake, a public bundle error, a media amplification, a machine-summary hallucination, and a viral screenshot do not create the same burden. Each requires different speed, technical response, legal review, human support, and public explanation. A mature City does not call all exposure incidents by one name.

9.5 — Professional Interfaces

Professional interfaces are not generic private rooms; they are relationships governed by specialized duties. Legal counsel requires independence and confidentiality sufficient for candid advice. Medical and clinical care require privacy, informed consent, continuity, and freedom from institutional retaliation. Pastoral or spiritual care requires voluntary access without converting belief into a civic qualification or record category. Emergency interfaces may temporarily prioritize life and safety while preserving later audit of exceptional access. The City should therefore maintain interface-specific protocols, credential checks, separate records, purpose limits, and independent complaint routes. The professional remains accountable to law and ethics, but is not deputized into the City's publicity system (United Nations, 1990a; World Medical Association, 2022; World Medical Association, 2024).

Professional interfaces are the City's protected channels of care, counsel, review, conscience, and emergency response. They are necessary because the City cannot ask a participant to live under visible burden while denying the professional relationships that make such burden lawful and humane. A participant needs medical care. They need legal counsel. They may need clinical support. They may need clergy, pastoral, or secular conscience support. They may need emergency help. Each interface carries its own rules.

Professional interfaces should be routed by purpose. The City must know when a protected role is active, who may verify the

boundary, what minimal operational status may be logged, and what content remains outside ordinary record appetite. This is not a blanket secrecy privilege for public-power formation. It is a disciplined distinction between care, counsel, conscience, emergency protection, and active civic conduct.

Each professional interface needs a minimal-status rule. The record may show that a protected interface existed, that a professional role was active, that an emergency exception occurred, or that a review is pending. It should not disclose content merely because the City values transparency. This minimal-status rule preserves both accountability and the professional function. It lets the City know enough to prevent hidden influence without teaching professionals and participants that every protected exchange is public property.

Each professional interface receives a narrow charter. Medical care does not become a strategy room, legal counsel a donor route, clinical support a performance, pastoral care a religious qualification, or emergency access an all-purpose exception. The charter identifies who may enter, what is protected, which minimal status may leave, how misuse is reported, and when ordinary record rules resume. Precision makes professional help more available because its boundaries are known before pressure arrives.

Professional interfaces also require role respect. The doctor is not an archive agent. The lawyer is not a public-relations function. The clinician is not an evaluator for institutional image. The clergy or pastoral caregiver is not a recruiter for the Religion of Fairness. The emergency responder is not a transparency

administrator. Each professional role serves a purpose that can be corrupted if absorbed into the City's hunger for meaning or control.

That safeguard has a counter-risk: professional interfaces exist inside a public-power formation institution. Some occurrence records, status labels, timing notes, emergency logs, or protected summaries may be necessary. The City may need to know that an interface occurred and what operational consequence followed. It does not thereby own the protected content. The difference between occurrence, status, and content must be designed before use.

Professional interfaces should be reviewable at the category level. The City may need expert review of whether a category is being used properly, whether access is too broad, whether records are over-retained, whether staff are misusing professional labels, or whether participants are hiding public-power conduct behind professional categories. The review should protect professional content while testing institutional integrity.

The burden-placement framework treats professional interfaces as burden-routing systems. They move some burden from the participant into specialized care, law, conscience, or emergency response. They move some burden from the public into professional judgment. They also create risks of secrecy and dependency. This section asks how each interface can remain both protected and answerable (World Medical Association, 2024; World Medical Association, 2022).

9.5.1 — Medical Interface

Disability and chronic illness belong inside ordinary medical design rather than at the edge of an imagined ideal participant. Ongoing treatment, fluctuating capacity, fatigue, pain, sensory need, mobility support, or medication can coexist with serious public-role formation when accommodation is real and role fit is honest. The medical interface should distinguish supportable variation from unsafe load instead of treating complexity as either disqualification or irrelevance (United Nations, 2006; World Medical Association, 2022).

Bodily care remains private even inside a severe public institution. An active participant may need medication management, urgent treatment, disability support, reproductive care, chronic-illness management, sleep treatment, injury response, or specialist consultation. The public burden concerns preparation for power. It does not turn the body into an exhibit or make ordinary treatment a public event.

Treatment trust depends on clinicians being able to ask, examine, diagnose, document, and advise without assuming that raw medical content will be released. Fear of exposure can produce delayed care, concealed symptoms, performed wellness, and avoidable harm. A protected clinical record, narrow status notice, and independent boundary review allow care to proceed while still preventing health categories from becoming a route for hidden active-role conduct.

The institutional design may still need medical status information for operational purposes. A participant's load may need

adjustment. A public schedule may change. A protected nonvisibility period may be activated. An emergency continuity break may need classification. The public may need a bounded explanation where role status changes. The medical interface should support such status handling without turning treatment into public narrative.

Medical independence protects both care and institutional truth. Operators should not medicalize dissent, exhaustion, or criticism to conceal poor design, and clinicians should not be pressured to justify participation decisions already made elsewhere. The clinician owns treatment judgment within professional and legal limits; the City owns workload, environment, safety, and program decisions. A visible referral, complaint, and conflict route keeps those responsibilities from being quietly exchanged.

The same medical boundary protects people who never accepted the Vow. Family members, visitors, staff, contractors, and bystanders may require care on site. Their treatment belongs in the relevant clinical or incident system, not in the participant archive, except for the minimum information needed for lawful safety review. An emergency near the City is not automatically City content.

The applicable principle is simple: the body is not sacrificed to the record. Public-role formation may be demanding, but treatment remains treatment. Status information can establish that participation paused, that safety review occurred, or that a protected category applies without revealing diagnosis or intimate detail. Medical dignity and public accountability meet through separation, not through raw disclosure.

Clinical independence also needs protection from narrative pressure. A clinician should not alter care because an intervention looks politically weak, publicly dramatic, useful to the archive, or inconvenient to the institution. Conflicts, professional conduct, and safety can be reviewed, but treatment decisions remain governed by health, autonomy, dignity, and lawful standards of care. Otherwise the participant learns to perform wellness instead of seeking help.

Medical interface policy should also include ordinary accessibility. A participant may need sign language interpretation, mobility assistance, neurodivergent accommodations, trauma-informed care, translation, medication management, or assistive technology during care. These supports should not create extra public traces simply because they are visible in logistics. Accessibility is part of health dignity, not an exception to be explained.

9.5.2 — Legal Interface

Public trust can be served without exposing protected legal content. The record site may state that a release is under legal review, an appeal is pending, a privilege question has been resolved, or an injunction governs access. Those labels prevent empty silence from becoming rumor while preserving counsel and due process. The public needs the status of the process, not the substance of protected advice.

The legal interface organizes counsel, privilege review, dispute handling, and lawful challenge inside the institution. Its design should answer where consultation occurs, how the occurrence is

logged, what content remains protected, who may see a status label, and who reviews a contested boundary. Counsel access is not complete until those operational questions have owners.

Physical and procedural distinction prevents false expectations. Participants, staff, nonparticipants, and affected persons must know when they are entering a protected legal consultation, an ordinary administrative conversation, or a recorded public-power process. Misclassification can destroy privilege, trust, and the integrity of the Vow. Clear notices, separate custody, and independent review make the boundary usable rather than ceremonial.

Legal privilege is jurisdiction-dependent and must be handled with humility. The City can state that counsel communications require protection and expert review, but it cannot make every legal question universal. Different jurisdictions may define privilege, public records, official duties, government attorney roles, and disclosure obligations differently. The City should build a legal interface that can adapt to actual law rather than pretending its own architecture is law.

Contestability requires counsel on every side of a consequential record decision. Participants may challenge classification, release, sanctions, exit terms, or public explanation. Nonparticipants may challenge exposure. Staff may seek help with labor, retaliation, or privacy injury. A legal route reserved for the central participant would reproduce the very hierarchy the rights system is meant to correct.

The interface also needs abuse review. If legal consultation spaces are repeatedly used for unexplained delays, strategic concealment, donor influence, political coordination, or nonlegal meetings, the City must investigate without violating protected content. Occurrence patterns, role verification, and independent privilege review can help. The point is not to weaken counsel. It is to protect counsel from being used as camouflage.

Lawful humility is the point of the interface. The City records public-role formation, but it is not its own court and cannot define privilege by convenience. Protected consultation lets external law and adversarial challenge enter the institution, restrain it, and correct it. A record system becomes safer when it has a door through which lawful opposition can pass.

Adversarial posture must not be treated as disloyalty. A participant may oppose the institution over a release, support denial, admission outcome, role condition, sanction, or record injury. Staff and affected persons may do the same. Counsel is real only when legal challenge can alter the process without triggering retaliation or an adverse character inference.

Legal interface rules should extend to affected nonparticipants. A child advocate, partner, staff member, visitor, or wrongfully exposed person may need legal help against or outside the participant's interests. The City should not route all legal meaning through the participant merely because the participant accepted the Vow. Rights become real when collateral persons can receive counsel without being absorbed into the participant's record.

9.5.3 — Clinical Interface

Clinical support also protects against therapeutic coercion. The City does not require confession, vulnerability performance, emotional disclosure, or psychological framing as proof of formation. Therapy may support health and agency, but it never becomes a loyalty ritual or readiness theater. The clinical interface serves the person; it does not extract inner life for civic meaning.

The clinical interface separates therapy, mental health care, trauma support, psychological assessment, crisis stabilization, and emotional recovery from record appetite. The City will create load. That load must be cared for. But if clinical care is treated as another source of public meaning, participants will learn to perform wellness or hide distress. Neither outcome serves public trust.

Clinical independence is the first requirement. A clinician should not be primarily an operator, disciplinarian, public interpreter, readiness certifier, or archive agent. The clinician's role is care, assessment where appropriate, safety, referral, and treatment within ethical and legal boundaries. The City may need status information for load adjustment or safety planning, but it should not turn clinical content into public record material by default.

Clinical care should be usable without stigma and separate from moral ranking. Seeking therapy may show responsible self-care, while acute instability, coercion, severe overload, or safety risk can still affect participation under a distinct role-assessment process. The City should separate treatment records from status

decisions, require the minimum necessary bridge information, give the participant notice and review rights, and make clear which professional owns each judgment. Care and readiness inform one another without collapsing into the same record.

The interface should include consent boundaries, protected notes, category labels, crisis exceptions, independent referral options, and review rules for mandatory reporting where law requires it. Participants should know what is protected, what may be shared for safety, what may affect status, and what will not become public. Uncertainty about clinical confidentiality can itself become a burden.

Clinical care should also be accessible to staff and sometimes affected persons. Moderators, archivists, security staff, clinicians themselves, and complaint handlers may carry serious emotional load. Staff care must not be ignored because the public story focuses on participants. The City should not create a hierarchy in which participants receive care and support labor absorbs harm quietly.

The clinical interface makes visible burden survivable without turning suffering into evidence. It says distress should be cared for before it is interpreted. It says a person under record remains a person with interior vulnerability. It says the City's moral claim depends partly on whether those vulnerabilities are protected rather than displayed.

Clinical language cannot become a defense against criticism. Resistance to a decision, challenge to staff, or complaint about record burden is not clinical instability merely because the

institution finds it inconvenient. Any clinical concern requires ordinary professional standards, independence, and a care purpose. Diagnosis, referral, and protected health information remain outside reputation management.

The opposite danger also matters: the City must not underuse clinical care out of fear that care will seem like weakness. A humane City should normalize support before crisis. The strongest public-power formation will often come from participants who learn when to seek help, not from participants who perform invulnerability until they break.

The clinical interface should include clear separation between therapy, capacity review, risk assessment, mentorship, and public evaluation. These roles may all involve psychological language, but they are not the same. Therapy serves care. Capacity review serves informed participation. Risk assessment serves safety. Mentorship serves formation. Public evaluation serves civic review. If the City merges them, participants will not know when they are being helped and when they are being assessed.

Clinical interface design should also prevent therapeutic dependency on the institution. If the City provides clinicians, mentors, and care structures, participants may begin to rely on the City as the container of self-understanding. Independent referral, outside consultation, exit continuity, and protected choice keep care from becoming institutional possession. The goal is support, not a clinical annex of civic identity.

9.5.4 — Clergy or Pastoral Interface

The same interface should protect nonreligious conscience through silence, ethical conversation, philosophical reflection, and grief support without requiring ritual or doctrine.

The clergy or pastoral interface allows optional spiritual, pastoral, or conscience support without making the City religious. The Transparent City is a civic public-power formation institution. It cannot require participation in the Religion of Fairness, prayer, ritual, confession, spiritual status, or religious language. Yet some participants may need religious counsel, pastoral care, secular chaplaincy, grief support, moral conversation, or conscience guidance. The City must allow such support under clear limits.

The pastoral interface is plural, optional, and noncoercive. A participant may belong to an established religion, follow the optional spiritual path described in The Religion of Fairness, live secularly, hold mixed beliefs, remain skeptical, or decline spiritual support entirely. None of these positions carries readiness weight. The interface exists to support conscience and meaning without classifying the person.

Content protection matters. Pastoral or spiritual care often involves grief, guilt, confession, moral doubt, family pain, fear, shame, and hope. These are not public artifacts by default. The City may need to log occurrence, status, or operational consequence, but it should not consume content. A participant should not have to choose between conscience support and public exposure.

Pastoral protection can become a loophole if scope is vague. A protected spiritual-care category could otherwise shelter faction building, recruiting, hidden political coordination, or off-record public-power work. Optional use, plural provision, nonrecruitment, minimum status logging, protected content, and independent abuse review keep care available without creating a sovereignty channel. The safeguard protects both conscience and civic accountability.

Support providers should follow the same purpose, confidentiality, safeguarding, complaint, and anti-recruitment rules.

Pastoral protection should not weaken safeguarding. Clergy or pastoral care may be confidential within lawful and ethical limits, but abuse, coercion, imminent danger, child risk, or institutional manipulation cannot be hidden behind sacred language. The City must respect conscience while refusing spiritual secrecy as a shelter for harm. Freedom of conscience includes protection from religious misuse.

9.5.5 — Emergency Interface

Emergency dignity continues after immediate danger has passed. A person carried out by paramedics, evacuated during panic, protected from threat, or involved in a family emergency does not become a permanent symbol of fragility. After-action status separates what the public needs to know from what belongs to care, safety, and protected recovery. Emergency memory should document institutional conduct, not brand the person who needed help (World Medical Association, 2024; O'Neill, 2002a).

The emergency interface governs urgent access when ordinary procedure cannot safely operate. Medical crisis, fire, violence, self-harm risk, severe weather, cyberattack, evacuation, family emergency, or public disturbance may require rapid action across protected thresholds. Predeclared authority, minimum necessary capture, later classification, and affected-person protection allow responders to move quickly without converting urgency into permanent unreviewed power.

Authority should be legible before the alarm sounds. The protocol identifies who may enter, who may override an ordinary threshold, what can be captured, what is delayed, who receives notice, how family and accessibility needs are handled, and who classifies the event afterward. Fear is a poor author of institutional boundaries. The decisions most vulnerable to panic belong in the plan.

Emergency responders are not participants. Paramedics, firefighters, police, crisis clinicians, security specialists, public officials, or family emergency contacts may enter the City for urgent purpose. Their presence does not place them under the Vow. Their identities, actions, and communications may need documentation for safety and accountability, but they require role-limited handling and shielding from unnecessary public exposure.

Care and immediate safety lead during the event. A perfect record is not worth a delayed evacuation, an exposed victim, or a child placed at greater risk. Once the danger has passed, the institution can classify gaps, review access, repair the record, and explain

what lawfully belongs in public view. The sequence is life first, evidence second, interpretation later.

Abuse controls follow. Emergency categories can be manipulated to hide misconduct, bypass access rules, or expand security authority. The City needs triggers, time limits, oversight notice, after-action review, and pattern audit. A repeated emergency is not bad luck until review confirms it; it may be a system signal.

Two failures must be prevented: reckless exposure during danger and permanent secrecy afterward. The emergency route permits speed while preserving a path back to reasons, audit, correction, and remedy. Urgency may suspend a step; it never erases the duty to account once accounting becomes safe.

Public communication belongs in emergency protocols. Silence may breed rumor, while excessive disclosure may expose protected people or compromise safety. A short status statement, review clock, and later explanation can protect trust better than panic disclosure or opacity.

Rehearsal tests whether the written rule survives pressure. Dry runs should bring together care, security, accessibility, record operations, legal review, family contact, and public communication. The exercise is not theater. It should reveal who waits for permission, which protected categories disappear, where information bottlenecks form, and whether care truly outranks archive formalities. Each drill should convert at least one coordination failure into a dated corrective action with a named owner.

A narrow emergency log preserves speed without amnesia. Responders need immediate access to reduce danger; later review needs the actor, authority, protected material accessed, and repair. That record preserves answerability without forcing the crisis itself into public spectacle. The log should also record when emergency permissions end so temporary access cannot survive by administrative inertia.

Role cards, access classes, privacy flags, translation, family contact, disability accommodation, and debriefing should be rehearsed together. Institutions reproduce under crisis what they practiced in calm conditions. If dignity is absent from rehearsal, convenience will write the real protocol. A later replay should test whether the correction still works with a different team and different communication conditions.

9.6 — Care Before Evidence, Complaint, Appeal, and Remedy

Care before evidence sets the order of response without erasing the record. Immediate safety, clinical stabilization, shelter, legal access, and protection from retaliation begin first; evidence is preserved in ways compatible with those needs. Assisted intake, several reporting channels, accessible and non-digital routes, interim relief, independent investigation, reasoned outcomes, appeal, and enforceable remedy prevent the harmed person from having to become archivist, advocate, and procedural expert while in crisis. Public explanation follows only when public trust or third-party safety requires it and should reveal institutional responsibility without disclosing protected life for dramatic effect (World Medical Association, 2024; United Nations, 1966; UN Human Rights Committee, 2004).

The rights structure remains abstract until harm has a sequence. This section establishes that sequence. When a person is hurt, endangered, exposed, misclassified, or overwhelmed, the first duty is relief. Classification, investigation, interpretation, public explanation, and institutional defense come later. The City must not ask the injured person to wait for meaning before receiving care (Tyler, 2006; Bovens, 2007; OHCHR, 2024).

The remedy architecture begins with a no-wrong-door principle. A harmed person need not decide whether the event is a privacy violation, care failure, technical breach, professional-boundary issue, child-shielding failure, or public-summary error before relief begins. The first contact receives the person, opens

immediate protection, preserves relevant evidence, and routes the category to the proper authority. Administrative classification follows care rather than delaying it. That sequence turns care before evidence into a usable institutional practice.

The rights, complaint, appeal, and remedy route should be written as a living sequence, not a poster. Intake receives the harm without requiring perfect classification. Triage protects the person and preserves evidence. Category review assigns the proper legal, clinical, privacy, employment, family, or record process. Appeal reaches a body capable of changing the first decision. Remedy moves burden back toward the source of harm through correction, shielding, restoration, compensation where lawful, service repair, discipline, or public notice. At each step, the City names who acts, by when, what interim protection applies, what happens after silence, and how retaliation is detected.

Care before evidence does not weaken truth. It protects the conditions under which truth can be gathered fairly. A person in crisis may need medical help. A child may need shielding. A nonparticipant may need masking. A staff member may need protection from retaliation. A participant may need de-loading. These actions can occur before the City has completed full adjudication. Relief is not a final verdict. It is the first burden placement.

Complaint intake makes harm reportable. Without intake, the City learns only from visible failure or public scandal. Appeal pathway prevents the first decision from becoming institutional sovereignty. Remedy types identify the forms repair may take. Public explanation where needed preserves trust without turning

affected persons into public material. Together these tools convert rights from principles into an operating system.

The rights floor requires the institution to design this sequence for different people, not only for participants. Staff, family members, children through guardians or advocates, partners, visitors, professionals, bystanders, host-community members, and affected public persons may all need routes. A City that gives participants rights but leaves collateral persons without remedy has not solved the burden problem. It has only protected the central role.

Reputation defense creates a second danger. Institutions often respond to harm by asking how the event will look. The City must ask what burden has been created, who carries it, and what relief is owed. Public trust grows when institutions repair honestly, not when they preserve image smoothly. A fair City should fear unremedied harm more than embarrassment.

The final principle is proportional public explanation. Some harms require public explanation because public trust, record integrity, or affected persons demand it. Some explanations would create more harm if too much detail is released. The City must explain category, responsibility, remedy, and reform where needed while protecting vulnerable people. Truth and restraint must be held together.

9.6.1 — Relief Before Classification

Frontline authority must permit immediate protective action. Staff should not wait for senior approval before shielding a child, pausing a harmful release, summoning care, or protecting a

complainant from retaliation. Provisional powers can be narrow, time-limited, logged, and audited afterward. Fast protection and later review are compatible when the authority is designed in advance (World Medical Association, 2024; National Commission, 1979).

Relief before classification means reducing active harm before deciding the final meaning of the event. A participant collapses, a child is exposed, a staff member reports retaliation, a visitor is misidentified, a partner reports coercion, or a technical error releases protected material. The first response is to stabilize, shield, pause, preserve options, and make the route safe enough for later testimony.

This principle is especially important because the City is a record institution. Record institutions tend to classify quickly. They ask what category an event belongs to, who is responsible, what label applies, and how the public will read it. Classification matters, but premature classification can delay care, distort interpretation, and pressure the injured person to supply evidence while still unsafe. Relief creates space for later fairness.

Relief can take many forms: medical care, de-loading, temporary shielding, emergency masking, safe housing, security support, protected status, access suspension, public-release hold, counseling referral, child protection, technical containment, staff reassignment, or pause. Relief should be proportionate and time-limited where appropriate. It is not a final finding. It is the humane first response to possible harm.

Protective action should never be presented as proof of misconduct, weakness, concealment, or guilt. De-loading, shielding, delayed release, and emergency pause are provisional status events. Clear labels should state what is known, what remains under review, and what protection is active without inviting the public to fill the gap with accusation. Care loses its safety value when seeking it creates an adverse public inference.

The sequence also restrains institutional self-protection. Operators may want to classify first because classification controls the story; participants may want immediate explanation to defend themselves; media may demand a conclusion before the facts are safe. The institution must be able to say: protection now, classification next, public explanation only when lawful and responsible.

A no-wrong-door rule completes the protection. Someone seeking help should not be rejected because they used the privacy route for a care issue, the staff route for a record injury, or the safety route for retaliation. Internal routing can correct categories after stabilization. The person should not have to diagnose the institution before the institution agrees to protect them.

A credible rights system should record relief separately from adjudication. Stabilizing someone does not mean the complaint is proven. Providing shelter does not decide liability. Masking a record temporarily does not concede permanent nonrelease. This separation protects both the harmed person and the process. It allows the City to help immediately without turning care into a premature verdict.

9.6.2 — Participant Complaint Intake

Complaint intake should also preserve the right to imperfect reporting. People often report harm before they can describe it in the institution's categories. A City that rejects incomplete complaints will hear mainly from people who are already confident, fluent, and safe. Intake should allow partial reports, follow-up, assistance, translation, and supported clarification. Accuracy can improve after safety is established.

Complaint intake is the front door of institutional correction. It must be easy to find, accessible, safe, confidential where needed, and capable of triage. A complaint may concern overexposure, rights violation, staff conduct, participant conduct, technical breach, family burden, child risk, discrimination, accessibility failure, public-interface abuse, or host-community harm. The intake system should not make people prove the whole case before it accepts the report.

The first intake duty is listening without premature defense. A person reporting harm may be distressed, unclear, incomplete, angry, afraid, ashamed, or unsure which rule applies. Intake should gather enough information to protect and route the complaint without turning the first contact into cross-examination. The City can investigate later. It should not make intake itself a barrier.

The second duty is safety screening. Some complaints require immediate action: danger, retaliation risk, child exposure, intimate-record harm, medical emergency, staff threat, doxxing, public harassment, or technical breach. Intake should identify

urgent cases and trigger relief before ordinary review. A complaint system that treats all harms as paperwork will fail the people most at risk.

The third duty is role classification. Is the complainant a participant, staff member, nonparticipant, visitor, professional, family member, host-community member, affected person, or public user? Different roles require different protections and remedies. But classification should serve the person, not exclude them. A complaint should not be rejected merely because the person does not fit an easy category.

The fourth duty is anti-retaliation. People will not complain if they fear punishment, public exposure, loss of access, staff hostility, participant anger, family pressure, donor influence, or institutional blame. Intake must explain retaliation protections and route high-risk complaints to independent review where needed. The City's willingness to hear complaint is measured by how it protects complainants afterward.

Complaint intake should preserve narrative dignity. A harmed person should not have to retell the same event to multiple offices, perform distress to be believed, provide unnecessary intimate detail, or accept a public label before help begins. Intake should gather what is needed, protect what is vulnerable, and allow supplement later. The burden of internal classification belongs to the City.

Intake should also support anonymous or protected preliminary reporting where lawful. Some harms can be named safely only in stages. A person may need to ask whether something is

reportable, whether they are at risk, or whether naming themselves will expose others. Preliminary reporting should not be a loophole for false accusation, but neither should formal identity disclosure be the price of early protection.

Complaint intake needs a visible clock. The record distinguishes immediate protection, evidence preservation, acknowledgment, initial classification, independent assignment, interim reasons, expected decision date, and any extension. Missed deadlines escalate automatically rather than forcing the complainant to begin again. Where delay itself creates danger, an ombuds or independent reviewer can order temporary protection, restore access, pause publication, preserve housing or care, or separate parties while the merits remain open. Timeliness changes outcomes: a remedy arriving after exposure, retaliation, or forced exit may be legally available and humanly useless (Bovens, 2007; OHCHR, 2024; European Union, 2016).

9.6.3 — Participant Appeal Pathway

The appeal pathway should include protection against exhaustion. A person should not need endless time, money, technical literacy, legal sophistication, or emotional stamina to challenge the City. Appeals should be serious but not punishing. The institution already holds power over records, access, and interpretation. It should not add procedural fatigue as another burden on the person seeking review.

An appeal pathway prevents first decisions from becoming final authority merely because the institution made them. A release decision may be wrong. A complaint may be dismissed

incorrectly. A protected category may be misapplied. A participant may be sanctioned unfairly. A staff member may be denied remedy. A nonparticipant may be told exposure was acceptable when it was not. Appeal keeps the City from becoming trapped inside its first interpretation.

Appeal must be more than a repetition of the same review by the same people. If operations made the first decision, appeal should reach a more independent body. If the archive office classified a record, appeal should involve review beyond the archive office. If staff hierarchy handled a complaint, appeal should have a route outside that hierarchy. Independence protects appeal from becoming ceremonial.

The appeal pathway should be accessible and understandable. A person should know the deadline, required information, available assistance, interim protections, standard of review, possible outcomes, and whether public status changes during appeal. If appeal is procedurally obscure, it will serve the literate, resourced, and confident more than the vulnerable. That would reproduce unfairness inside the rights system.

Appeal should preserve interim protection where needed. If a release is challenged, release may need to pause. If retaliation is alleged, the complainant may need protection. If a child or nonparticipant is at risk, shielding should remain while review occurs. An appeal that allows harm to continue during review may become meaningless by the time it succeeds.

Appeal should also preserve record integrity. The record should show when a decision was appealed, what status applied, what

changed, and why. But the appeal record must not expose protected details unnecessarily. Public correction can be important, but appeal should not become another disclosure event. Status labels can preserve contestability without consuming the person.

Appeal places burden on the institution to justify itself twice where necessary. It refuses the idea that governance is fair because it is confident. Appeal makes the City corrigible, and corrigibility is one of the City's deepest moral claims.

The appeal pathway should be independent enough to correct institutional self-protection. It should include timelines, reasons, record access where lawful, protected advocacy, escalation, interim relief, and meta-review when patterns emerge. Appeal should not be framed as disruption. It is one of the ways the City learns whether its first decision moved burden fairly.

Appeal outcomes should become institutional learning without becoming public rank. Aggregate reversals, delayed decisions, repeated categories, and differential access can reveal where the City is failing. The learning should be public enough to show accountability and protected enough to avoid exposing participants or complainants. The appeal system is both remedy and mirror.

9.6.4 — Remedy Types

Remedy should repair the person's burden and the system that made it possible. Individual relief may require shielding, correction, compensation, care, restored access, or a protected apology; structural relief may require policy change, staff action, vendor replacement, workflow redesign, training, audit, or public reporting. Closing one case while leaving the mechanism intact protects the institution more than the next affected person. Every remedy decision should name both tracks and verify implementation.

Remedy types name what repair may require. The City should not treat apology as the only remedy, nor should it assume that money alone repairs harm. Different harms require different responses: correction, compensation, shielding, apology, access restriction, release withdrawal where possible, public clarification, medical care, counseling, legal support, staff discipline, technical repair, policy change, training, pause, or decertification review. The remedy should match the burden created.

Correction addresses false or misleading record. A mislabeled record, inaccurate summary, missing context, improper inference, wrong identity, or outdated release may need correction. Correction should be visible enough to repair public memory. It should not hide the fact that an error occurred if public reliance has already happened. Silent edits protect the institution more than the harmed person.

Compensation may be necessary where wrongful exposure, data injury, lost work, relocation, medical cost, security risk, or

reputational harm creates material burden. Compensation should not be treated as hush money. It should be bounded, documented, audited, and paired with structural repair where the harm reveals system failure. Paying a person while leaving the cause unchanged is not full remedy.

Shielding remedies include masking, redaction, sealing, delayed release, protected summary, search restriction, access limitation, and takedown attempts where appropriate. Shielding is especially important for children, nonparticipants, intimate material, medical material, legal content, and bystanders. The City must know how to reduce future exposure after a mistake, even if it cannot erase all past circulation.

Apology has a place when it is specific, accountable, and not used as a substitute for repair. A proper apology names the wrong, the harmed party where safe, the responsibility, the remedy, and the prevention change. It should not demand forgiveness. It should not force public reconciliation. It should not turn the harmed person into a supporting actor in the City's redemption story.

Remedy types prevent harm from being absorbed into narrative. A City committed to fairness must repair in the form the burden actually takes. Record harm, bodily harm, financial harm, family harm, professional harm, public meaning harm, and dignity harm are not the same. Remedy must be plural because burden is plural.

Remedy should include restoration of agency. A person harmed by the City may need more than correction of a record. They may need a voice in how the correction is phrased, whether their name appears, whether a summary is used, how future access is limited,

and what support is offered. Agency is part of repair because exposure injury often includes loss of control over one's own story.

Remedy is not an institutional favor. It is the transfer of burden back toward the source of the wrong through correction, protection, restoration, compensation where lawful, changed practice, or another effective response. Calling remedy kindness can hide responsibility and turn enforceable repair into gratitude. The language of repair should reveal who caused the burden, who owes action, and how completion will be verified.

Some remedies will need expert review before implementation. A public clarification may affect litigation. A compensation plan may affect employment. A shielding order may affect child safety. A record correction may affect public trust. Remedy design should be humane, but it should also be technically and legally competent.

Where harm involves vendor conduct, child safety, or a legal duty, the remedy must include the appropriate specialist response rather than rely on a general apology or training measure.

Remedy types should also include prevention orders. After harm, the City may need to change access rights, retrain staff, redesign a workflow, alter a record label, remove a vendor, repair a space, revise media rules, or pause a practice. Compensation without prevention leaves future burden in place. A fair remedy asks not only what was lost, but what must never again be carried in the same way.

9.6.5 — Public Explanation Where Needed

Public explanation should also be tested for hostile reuse. A statement meant to preserve trust can accidentally expose a person by implication, confirm rumors, invite harassment, or create a searchable label that outlives the event. Before release, the City should ask how the explanation may be clipped, misunderstood, indexed, or weaponized. Explanation is a public artifact and must be governed as one (UN Human Rights Committee, 2004; Bovens, 2007).

Public explanation where needed preserves trust without making every harm public content. Some events require public explanation because the public record has changed, a release was wrong, a participant status is affected, a systemic failure occurred, a safety incident matters, or public trust depends on knowing what the City did. Other events require privacy because explanation would expose a child, nonparticipant, medical context, intimate material, legal content, or vulnerable person. The City must distinguish these cases.

A useful public explanation names the event category, immediate protections, record status, review owner, remedy or correction, and structural change where one follows. It gives the public enough to understand institutional responsibility without satisfying curiosity beyond public need. Protected people remain unidentified unless identification is lawful and necessary. Precise language replaces euphemism, and the explanation links to the correction route and next review.

Public explanation is most valuable when silence would force

people to guess about a wrongful exposure, archive breach, continuity failure, participant sanction, public correction, staff misconduct with public relevance, or host-community harm. The explanation should state the event category, current status, protective action, review owner, correction or remedy, and next update without exposing protected people. Trust grows when the institution carries the burden of clarity and restraint together, rather than choosing secrecy or spectacle.

Public explanation cannot be managed as reputation defense. It distinguishes preliminary status from final finding, states uncertainty that remains, protects affected-person privacy, and gives the next review date where possible. The institution may explain what it knows and what it has done without claiming flawless handling. Credibility grows when the statement exposes the work still owed.

Public explanations are themselves governed records. When early information changes, the City updates the statement, preserves version history, links the correction log, and enables reply where appropriate. The earlier error is not silently overwritten. Public-facing honesty requires the same provenance and correction discipline demanded of every other bundle.

Operational design should also track public explanations as part of failure memory. If the same categories recur, the issue is systemic. If explanations become formulaic, public trust will erode. If explanations protect leadership while blaming lower staff, hidden hierarchy may be returning. Public explanation should itself be audited.

Public explanation should be written for the affected person as well as for the public. The City should ask whether the statement protects the person's dignity, avoids unnecessary identifiers, preserves correction, names institutional responsibility where appropriate, and reduces rumor without feeding appetite. A good explanation carries the burden of trust repair without making the harmed person pay for it again.

When a matter remains open, public explanation should end with a review point. The City should say what it knows, what remains protected or uncertain, when it will update, and who owns the next decision. Trust grows when uncertainty is governed rather than polished away.

Chapter 10 — Archive and Public Record Site

A member of the public opens a participant record bundle and sees three different accounts of the same event: the source recording, the participant's contextual statement, and a later finding that changed the official classification. Beside them sits a machine summary that omits the correction because its index was stale. Nothing here can be solved by saying that the archive is complete. The question is whether each layer declares what it is, whether provenance remains visible, whether disputes travel with the record, and whether the interface makes correction easier to find than the original error.

Public memory is civic infrastructure. It can give citizens a durable basis for judging the formation of future power, give affected people a route to correction, and give the institution a record of what it learned. Its value depends on design. Memory that is too thin recreates rumor and campaign mythology; memory that is raw converts public responsibility into searchable exposure. The chapter builds the governed middle: trustworthy source custody, usable public interfaces, visible status, correction, and plural interpretation.

The preceding chapter established the rights floor. This chapter shows how memory can operate inside it. The public needs records that are authentic, contextual, current in status, challengeable, and accessible. Participants and collateral persons need shielding, notice, reply, and remedy. Archivists and oversight bodies need source integrity and custody. No single object can perform all of those jobs, so the chapter separates the archive, public record site, public bundle, newsroom, civic platform, and machine summary.

The official archive and the participant record site are complementary but noninterchangeable. The archive holds governed source memory under lawful purpose, custody, access, preservation, and correction duties. The record site publishes selected, structured, status-labeled material for civic use. Keeping them separate prevents raw source exposure on one side and inaccessible institutional possession on the other. It also lets each object carry a review standard suited to its public role.

A public bundle is a governed release form, not the archive and not the person. It gathers role-relevant material for a declared question, preserves provenance and status, shows dispute and correction, identifies protected absences, and expires or returns to review when its purpose changes. The bundle may help citizens judge conduct and preparation for public authority. It cannot settle character, worth, loyalty, destiny, or the meaning of an entire life.

Public memory changes who carries uncertainty. In ordinary political life, citizens guess, journalists reconstruct what was never designed to be knowable, whistleblowers risk retaliation, opponents exploit thin official records, and families become collateral material when private conduct bursts into public conflict. The City moves part of that burden upstream by creating a governed record. It succeeds only if the new archive does not transfer uncertainty and exposure onto participants, nonparticipants, staff, or hosts least able to contest it.

An archive serves fairness when it carries the burden of being interpretable and correctable. It preserves source context, labels uncertainty, separates custody from release, records who changed what, allows affected people to challenge public meaning, and

makes its own failures visible. Citizens should be able to ask what kind of object they are seeing, which authority released it, what remains disputed or protected, and where a correction or deeper review can be found.

For that reason, the chapter refuses metaphors that turn the archive into a soul, conscience, perfect mirror, or final truth. Those images grant moral authority to a custody system. The City's archive can be durable, technically sophisticated, and publicly consequential while remaining modest about what it knows. It remembers role-relevant conduct, decisions, context, status, disputes, and correction. Human motive and identity remain open to judgment rather than captured as institutional fact.

The public interface is therefore part of the ethics of interpretation. Labels, timelines, bundles, search, summaries, and visual hierarchy determine what readers notice first and what they may mistake for settled. Accessible design should bring status, context, disagreement, correction, and source routes into the main reading path rather than hiding them behind expert controls. The interface succeeds when ordinary readers can use evidence without being pushed toward a score or character verdict.

Integrity joins technical controls to institutional responsibility. Authenticity requires provenance, custody logs, tamper detection, durable identifiers, and independent verification. Trust also requires separation of duties, incident response, public status, correction, and recovery when integrity cannot be established. A forged clip, silent edit, stale machine index, broken timestamp, or vendor migration becomes governable only when the system

records both the failure and the route back to reliable public memory.

Public memory attracts competing pressures. Participants may seek favorable context; critics may prefer damaging fragments; journalists may need speed; citizens may need simplicity; vendors may prefer scalable automation; machine systems may smooth uncertainty into confident prose. The architecture answers by making provenance, status, correction, and limits travel with every official derivative. No audience receives authority merely because its demand is urgent or popular.

Procedure is the constructive middle between raw release and institutional silence. Source material can remain in custody while the public receives a governed bundle, protected summary, release note, correction history, or explanation of lawful absence. The decision must identify purpose, affected people, reviewer, status, expiry, and remedy. Slower release is justified only when it protects a named interest and remains visible to challenge, not when delay protects institutional image.

The chapter makes this architecture inspectable by requiring each record state to identify its public purpose, source and custody evidence, visible status, affected-person route, release or interpretation owner, correction duty, and review clock. A complete archive is never a complete person. The point is to keep public claims traceable to governed source memory and to carry corrections through every official derivative (International Council on Archives, 2012; ISO, 2016a; W3C, 2013).

The record site is built for citizens with different bodies, languages, attention capacities, levels of civic education, disabilities, and histories of institutional trust. Accessibility is not a decorative layer over complex data. Plain labels, stable navigation, screen-reader order, captions, contrast, non-digital assistance, language access, and layered depth determine whether the public can examine the record without depending on a new class of interpreters.

The record site must respect citizens as judges rather than clients of the institution. It can arrange memory so source, status, dispute, correction, and context are legible, but it cannot dictate the conclusion. A public bundle may show growth, avoidance, correction, repeated harm, or unresolved disagreement. What those facts mean for office, trust, or politics remains a lawful civic judgment made by people, not an automatic institutional score.

Journalism performs a different public function. It investigates, interprets, questions, synthesizes, criticizes, and sometimes discovers what official memory missed. The record site supplies auditable, status-labeled source material; the newsroom remains free to challenge its selection, framing, and omissions. Keeping the two distinct prevents official memory from becoming propaganda and journalism from becoming an extension of the archive.

Machine assistance can improve navigation, translation, retrieval, comparison, and access to correction history, but it remains one interpretive tool among several. Every official machine summary needs visible source links, status propagation, uncertainty, human review, challenge, versioning, and withdrawal. It may help a

reader find governed material; it cannot assign readiness, trust, character, virtue, or worth, and it cannot collapse contradictory records into an official personality narrative (Council of Europe, 2024; NIST, 2023a; European Union, 2024).

The public record site also carries duties to nonparticipants whose lives appear by proximity. Children, families, staff, visitors, clinicians, lawyers, clergy, bystanders, protesters, and host residents may be necessary to understand a public event without becoming proper subjects of a public profile. Masking, role labeling, protected summaries, delayed release, search limits, correction, and affected-person access allow civic meaning to survive while collateral identity remains protected.

Correction is a continuing duty of public memory. If a record is inaccurate, mislabeled, missing context, misleadingly clipped, or wrongly attached to a person, the remedy must be visible enough to repair public understanding. Quiet correction is sometimes necessary to protect a person from further exposure, but silent alteration of public memory is dangerous. The City must be able to say: this is what changed, why it changed, who authorized the change, what remains disputed, and how the affected person may reply.

Right of reply is not a privilege granted to favored participants. It is a structural protection against archive-as-fate. A participant, staff member, family member, visitor, or other affected person may need to add context, challenge classification, explain chronology, identify missing information, or dispute the meaning attached to a public bundle. The reply should not become a

propaganda channel, but neither should official memory be allowed to speak as if no one inside it can answer.

The chapter establishes a plural architecture of public memory for the procedures that follow. The archive preserves governed sources; the record site presents versioned civic objects; journalists and independent reviewers interpret; lawful authorities compel or restrain; affected people contest; auditors inspect; citizens judge. Each role gains value because none owns the whole chain. By separating custody, publication, interpretation, correction, and authority, the City can make formation answerable without converting evidence into fate or one institution into a memory sovereign.

10.1 — Archive as Lawful Public Memory

An archive earns public trust by preserving evidence of decisions and actions without claiming possession of the people represented in them. Records-management standards emphasize authenticity, reliability, integrity, usability, provenance, and controlled disposition; archival ethics adds access, accountability, and respect for rights. Those principles support a City archive that preserves source records, authority trails, corrections, and context while refusing the metaphysical language of a complete person. The archive can establish what was captured, by whom, under what rule, with what changes, and with what contest. It cannot establish the total meaning of a life, infer private worth, or convert a partial institutional record into a civic soul (International Council on Archives, 2011; ISO, 2016a; ISO, 2017).

The archive is the City's governed source memory. It preserves active public-power formation under declared custody, provenance, category, context, access, and review rules so later storytelling cannot replace the underlying record. It remains distinct from the public record site, newsroom, platform feed, research dataset, and Artificial Intelligence training reservoir. Those later uses may receive authorized derivatives, but they do not inherit the archive's full contents or authority merely because the source exists.

Calling the archive lawful public memory does not mean every record is publicly released. It means the memory exists for a public-power purpose and is governed by public-facing duties. Some records may remain restricted. Some may be summarized.

Some may be delayed. Some may be sealed. Some may become public. The archive holds the deeper source memory so that the public record site can show what is relevant without pretending that all memory should be exposed.

The archive carries two duties at once. It resists forgetting where forgetting would let power escape burden, and it resists possession where possession would turn a person into material. A fair archive preserves enough to make public-power formation answerable while refusing to treat the record as personhood, destiny, or ownership.

A trustworthy archive must therefore be written, designed, and governed as a public trust rather than an institutional asset. It holds memories that can affect campaigns, offices, reputations, families, staff, host communities, and future historians. That kind of memory requires more than storage; it requires a philosophy of custody.

A lawful archive must also be emotionally modest. It should not be described as the heart, conscience, or soul of the City. Those metaphors make memory too sacred and too total. The archive is an instrument of public burden, not the spiritual center of a civic order.

10.1.1 — Source Record Function

The source record function begins with a plain distinction: the archive is where original institutional memory is preserved, while public-facing material is only a governed output. The archive contains the source layer from which later bundles, summaries, corrections, disputes, and audit trails are derived. If that source

layer is weak, every public interpretation built on it becomes fragile (International Council on Archives, 2011; ISO, 2016a).

Source memory matters because public power is often defended through later narrative. A decision may be described differently after criticism. A relationship may be minimized after exposure. A staff influence may disappear once a public figure speaks alone. A draft may be replaced by a polished account of how the conclusion supposedly emerged. The archive prevents later narration from becoming the only memory.

The source record is not a license for indiscriminate use. Its function is preservation under purpose. The City records active public-power formation because that formation may later affect citizens, office, campaign, staff, public trust, and institutional review. The record exists to prevent disappearance, not to feed curiosity. Source status creates responsibility, not a public claim on exposure.

Every source record should carry enough basic information to make future interpretation possible: time, place, role, access band, record origin, participant status, nonparticipant presence, protection category where applicable, and the authority under which the record was captured. Without this basic context, memory decays into artifact. A file without context can become as misleading as no file at all.

The source record function also supports correction. If the public record site releases a bundle, and that bundle is later challenged, the archive must allow the City to return to source records, classify the issue, restore context, and correct the public layer.

Public memory that cannot return to source is vulnerable to rumor, institutional denial, and machine summary error.

The archive therefore serves the public by not being fully public. Its deeper memory allows the public interface to remain structured and humane. A good archive makes public review stronger by refusing to collapse source, release, interpretation, and spectacle into one stream.

The source function also gives the City a way to separate memory from theater during controversy. When a public argument erupts, the question should not be which fragment is loudest, which side is most skilled at clipping, or which interpretation travels fastest. The question should be whether a governed source record exists, what status it carries, and what public interface can responsibly show.

Source memory should also be designed for lawful humility after the participant leaves. A public-power formation record may remain relevant, but the person is no longer under active formation burden. The source layer must preserve what public accountability requires while allowing post-exit privacy and time review to have real meaning.

A source record also needs a release lineage. When a later public bundle, protected summary, research extract, or correction notice draws from the archive, the public-facing item should be traceable back to the source layer without exposing protected contents. This lets reviewers ask whether the public object faithfully represents the original record, whether relevant context was omitted, and

whether the release form shifted burden onto someone who was not supposed to carry it.

The source function should therefore include both technical preservation and civic intelligibility. It is not enough to keep files alive on a server if their meaning cannot be reconstructed. The record must preserve enough surrounding information to show why it was captured, who had authority, what category it entered, what protections attached, and what later public uses were allowed or denied.

This architecture also prevents memory laundering. If an institution can transform source records into polished public objects without preserving the path between them, it can make selective disclosure look like transparency. The source layer must therefore keep the roughness of origin alive under governance, even when the public interface receives only a structured and protected form.

10.1.2 — Conduct, Not Soul

The archive records conduct, context, role, decision, interaction, and correction. It does not record the soul. This distinction must remain visible throughout the City because public memory can easily acquire false metaphysical authority. A record may be accurate and still not contain the full meaning of a human being.

Conduct can matter greatly. How a participant treats staff, responds to criticism, handles delay, manages a conflict, asks for help, hides a pressure, credits an adviser, or revises a position may be public-power relevant. The archive preserves such conduct because public authority is shaped by repeated patterns. But

conduct is not consciousness. It does not give the City direct access to motive, destiny, worth, or inner life.

This distinction protects participants from record totalism. A participant may be angry on a given day without anger becoming identity. A draft may be immature without proving incapacity. A silence may be meaningful, or it may be fatigue, grief, fear, or misunderstanding. The archive can preserve the event. Interpretation must remain humble.

The distinction also protects the public from false certainty. Citizens may understandably want records to settle character. They may want the archive to say who is trustworthy and who is not. But that desire is dangerous. The public record can inform judgment. It cannot replace judgment. The City must teach readers that records are evidence under context, not final moral equations.

Artificial Intelligence can help locate duplicates, detect anomalies, support accessibility, cluster governed records, summarize sequences, and surface contradictions for human review. Those are retrieval and quality-control functions, not personality judgment. Every use discloses inputs, limits, model version, uncertainty, human owner, and challenge route. Machine assistance earns value by making records more usable while remaining unable to assign worth, readiness, inner truth, or civic rank.

The boundary between conduct and soul should appear in public education materials attached to the record site. Readers should be reminded that visible action can be relevant and still incomplete.

A civic record can support judgment, caution, or trust, but it should not feed the fantasy that a person has been fully known.

This also protects apology and growth. If the archive is treated as soul, a past failure may become permanent identity. If it is treated as conduct under time, correction and future change remain intelligible. Public memory should make accountability possible without freezing every human being at their worst or most flattering moment.

A credible record system should therefore avoid language that turns the archive into moral essence. Terms such as true self, revealed nature, or proof of character should be treated as public-risk language. The safer vocabulary is conduct, pattern, context, correction, limitation, and public-power relevance.

The conduct boundary should also shape search. A public interface that lets users search for humiliation, private language, medical vulnerability, intimate detail, or emotional collapse teaches the public to treat a person as extractable material. Search should be oriented around public-power questions: decisions, roles, reasons, influence, correction, readiness, office relevance, and institutional response.

This is one reason the archive must resist character thumbnails. A profile that says calm, unstable, loyal, deceptive, or virtuous can sound efficient, but it invites moral compression. The City can show records, patterns, corrections, disputes, and role-relevant evidence. It cannot replace public judgment with a label that pretends to see the interior person.

Archival practice should teach readers that incompleteness is not evasion. A conduct record can be serious, relevant, and still partial. That humility is not a weakness in public memory; it is a protection against the appetite to finish a human being through documents. The record has authority only within its scope.

10.1.3 — Lawful Custody

Lawful custody begins with a custody map. The City must know which office may create a record, which office may preserve it, which office may classify it, which office may correct it, which office may authorize public release, and which office may hear an appeal when custody is challenged. A record without a custody map is not public memory; it is an object waiting to be captured by whoever can move fastest.

Custody also requires separation of functions. The same person or office should not control capture, classification, public release, correction, and audit. When those powers collapse, memory becomes institutionally convenient. The burden then moves onto participants, nonparticipants, journalists, and citizens who must guess whether a record was handled for truth or for reputation defense.

A lawful archive must be able to confess custody failure. Unauthorized access, orphaned copies, missing logs, broken permissions, unreviewed exports, and unexplained gaps should become status events, not rumors. The first remedy is containment; the second is notice to affected persons; the third is correction of the public layer where the failure has changed public meaning; the fourth is governance review of why custody failed.

A record this powerful cannot float. Lawful custody means the archive is held under defined authority, duty, access rules, audit, remedy, and review. It is not the property of a founder, donor, platform, vendor, staff office, political faction, or public crowd. Whoever holds the archive holds a form of power, so custody must be constrained before the archive becomes impressive.

Custody assigns responsibility for preserving, inspecting, correcting, releasing, sealing, summarizing, transferring, and retiring records. A complete custody rule names the legal or institutional owner, authorized roles, separation of duties, access logging, handoff procedure, incident response, vendor exit, and independent review. With those elements visible, participants can challenge misuse, the public can test authenticity, nonparticipants can seek shielding, staff can respect role boundaries, and auditors know where accountability resides.

Lawful public memory requires the City to treat custody as layered. Operational staff may manage systems. Archivists may preserve memory. Oversight bodies may audit access and classification. Affected persons may have correction pathways. Legal authorities may control categories requiring privilege or protection. Technical vendors may host or support infrastructure only under strict audit and exit rights. No layer should own the whole archive by convenience.

Lawful custody also means jurisdictional humility. Privacy law, public-records law, evidentiary rules, labor law, disability law, professional confidentiality, child protection, family law, and constitutional standards all shape what custody may mean in a real place. The City can define the moral need for custody, but

legal enforceability belongs to lawful institutions and expert review.

Custody should produce visible accountability without exposing protected contents. Public reports can show access counts, correction categories, breach incidents, delayed-release categories, audit findings, and unresolved issues without revealing vulnerable material. Transparency about custody is not the same as exposure of records. The public needs to know the archive is governed.

Custody should include emergency rules before emergency arrives. A breach, court order, public crisis, death, transfer, decertification, or shutdown can create pressure to improvise. Improvisation around source memory is dangerous. The custodian should know in advance who can freeze access, who can authorize urgent review, who can notify affected persons, and who can speak publicly.

Custody must also include rules for transfer and closure. If a City is suspended, decertified, merged, dissolved, or moved, the archive cannot be abandoned to convenience. A lawful transfer plan should preserve rights, correction, access, protection categories, and public memory continuity.

The custodian should be answerable to affected persons as well as public reviewers. Participants and nonparticipants need to know how to ask who accessed their records, what status a record carries, and what remedy exists for misuse. Custody without person-facing recourse is only institutional control.

The custody framework should include a plain public map of responsibilities. A citizen should be able to understand, at least in outline, who preserves source records, who reviews access, who handles correction, who responds to breach, who audits, and who can be appealed to when the archive harms someone.

Custody also needs a breach posture. If protected material is wrongly accessed or exposed, the institution must know who is notified, who is shielded, who investigates, what public statement is lawful, how further spread is contained, and how the correction record is attached. A custody system that only governs normal days is not yet trustworthy.

Lawful custody also requires succession planning. The archive cannot depend on the memory or moral seriousness of a founding generation. If staff change, vendors fail, institutions reorganize, or a City is decertified, custody duties must continue under a predeclared transfer authority. Public memory cannot be left to personality.

Custody must be legible to participants before the Vow becomes active. A person cannot meaningfully accept record burden without knowing who holds the record, which bodies can see it, which categories are protected, what happens after exit, and where to challenge misuse. Consent without custody clarity becomes a decorative form of pressure.

10.1.4 — Public-Power Relevance

Public-power relevance is the archive's limiting principle. Records are preserved because active formation for consequential public roles affects people beyond the participant, not because

every human trace is interesting. Each retained or released item therefore names the role connection it serves. Where relevance is weak and exposure risk high, the archive narrows, summarizes, shields, delays, or declines release.

A useful operating test is not a formal equation, but it can guide judgment: civic relevance must be weighed with lawful authority, context, correction route, and exposure risk. A record becomes more eligible for public interface when it helps citizens understand public-power formation and when it can be released with context and remedy. A record becomes less eligible when it mainly satisfies curiosity or harms nonparticipants without clear public-power value.

Public-power relevance includes conduct that bears on office readiness, staff dignity, influence, dependency, correction capacity, record continuity, public reasoning, crisis conduct, conflict response, or use of support. It may include sensitive material only when power relevance is strong and protection standards are met. It does not include ordinary private detail merely because the participant is under the Vow.

The relevance test protects nonparticipants. A visitor's incidental appearance may be relevant to record integrity but not to public release. A family detail may matter for support planning but not for civic display. A professional interaction may require logging without publicizing the professional. Relevance is not a net that catches everyone near the participant.

Relevance review should be repeated across time. A record that is too sensitive for immediate public release may become

appropriate for protected summary later. A record that looked important during scandal may prove minor after context is restored. The City must allow relevance to be reviewed without converting review into erasure.

The relevance test also guards against flattering overrelease. Public institutions often release positive material eagerly and negative material slowly. The City must not use relevance to display virtue while shielding difficulty. Relevance should apply to burden, not institutional advantage.

Relevance review should include public harm review. Some material may be relevant but still too harmful for raw release. In those cases the question becomes what form of public knowledge can carry the civic meaning with the least unnecessary exposure. That is where protected summaries, delayed release, and restricted access become part of fairness.

Fame does not strengthen a weak relevance claim. Later public attention may increase curiosity, commercial value, or political pressure, but it does not by itself increase civic need. The archive applies the same role-based threshold when the participant is obscure and when the world is watching.

A practical memory-burden test can discipline relevance review. The reviewer should ask what public-power question the record answers, what lawful authority supports preservation or release, what status label belongs to it, what context is necessary, who may be burdened by exposure, what challenge route exists, and what narrower form can carry the civic meaning. A record that

cannot pass that test may still belong in protected custody, but it does not belong in public release.

The relevance standard also prevents the archive from becoming a campaign weapon. Positive records should not be elevated merely because they flatter a participant, and negative records should not be elevated merely because they attract attention. Fairness requires symmetry: the same rule must govern praise, criticism, scandal, rehabilitation, and silence.

Public-power relevance also requires attention to time. A fact may be relevant during active formation, less relevant after role change, relevant again during an office campaign, and then eligible only for historical review. The archive should not freeze relevance at the most dramatic moment. Time review protects both accountability and dignity.

10.1.5 — Anti-Myth Function

Public power is constantly compressed into story, and the archive must resist both heroic and hostile simplification. A participant can be cast as reformer, manipulator, martyr, prodigy, failure, or proof of a new politics long before the underlying sequence is read. Campaigns, critics, donors, media, volunteers, and supporters all contribute because memorable characters travel faster than governed context (ISO, 2017; International Council on Archives, 2012).

Sequence is the first defense. Drafts, warnings, advice, hesitation, correction, later learning, and changed conditions show formation as a process rather than a single revealing scene. A speech looks

different when the reader can see the options that preceded it and the repair that followed it.

Flattering myth can be as confining as scandal. Public praise may pressure a participant to remain transparent, tireless, wounded, brilliant, or unusually fair even when that persona no longer fits reality or safe capacity. Ordinary records of uncertainty, rest, error, and modest work make it harder for admiration to become a role the person is forced to perform.

Scandal myth works in the opposite direction. One fragment can define a person, erase a correction, or turn an unresolved dispute into final character. The archive cannot prevent every misuse, but structured context, visible status, and a usable correction route give the public something sturdier than the fragment.

A trustworthy archive must also refuse its own mythology. It is a governed source of records and context, not an omniscient witness that defeats all other accounts. Its authority grows when it displays provenance, uncertainty, contest, and correction, including reasons to distrust an item that it itself preserves.

That restraint is a democratic service. Citizens receive an object better than persona or rumor without being told that the object contains the whole person. Public memory becomes more useful when interpretation remains visibly necessary.

Institutional legend belongs under the same discipline. The City may be tempted to remember itself as the first institution that solved hidden power. Staff warnings, host objections, failed designs, abandoned practices, correction costs, and public

misunderstandings should remain searchable enough to interrupt that self-portrait.

The opposite legend, that difficulty proves only cruelty or failure, is also incomplete. A serious record can show when the institution narrowed, paused, repaired, or relinquished authority. Learning should remain visible after both praise and outrage have moved on.

Readers should be taught to prefer recoverable sequence over a satisfying arc. Hostile and flattering myths both ask for premature certainty. The record site should reward questions such as what changed, who objected, which status applies, and what remains unresolved.

Founder, participant, and institutional origin stories require particular caution. Fame creates pressure to turn first events into destiny, disagreement into betrayal, and correction into proof of exceptional virtue. The archive should be more austere than that appetite and preserve the details that glamour omits.

Search design can expose myth-making in real time. If queries for scandal, heroism, or personality dominate while role decisions, correction, staff influence, and maintenance remain hard to retrieve, the interface is feeding simplification. Periodic search and placement audits should compare public attention with the civic purposes the archive claims to serve.

Contradiction should not be edited away. A participant may show courage and vanity, patience and evasion, growth and relapse, sound judgment and fatigue. Mixed evidence is not a defect in memory. It is one reason history is more trustworthy than legend.

An anti-myth audit can sample featured material, search defaults, recommendation logic, headlines, public bundles, and omissions. The question is not whether positive and negative items appear in equal numbers. It is whether selection rules let routine burden, unresolved complaint, institutional failure, and later correction remain findable beside the dramatic scene.

Routine is one of the archive's strongest anti-theatrical materials. Waiting, fatigue, maintenance, staff interaction, ordinary study, unsuccessful meetings, and uneventful repair reveal the texture that dramatic highlights remove. Public judgment benefits from knowing how the institution behaves when nobody expects a defining moment. Search audits should sample routine, low-attention material as well as headline events so dramatic records do not define the institution by default.

The outcome is not a storyless archive. Human beings will continue to interpret, remember, and argue. The design asks only that official memory preserve enough provenance, sequence, contradiction, and repair that no favored story can honestly present itself as the whole record. The archive is governed source memory, and its credibility depends on letting the public reach usable evidence without stripping away status, provenance, correction, or context. Public access should illuminate public-power formation without converting custody into ownership of the person. The archive's landing and ranking logic should make ordinary sequence discoverable instead of rewarding only the most memorable events.

10.2 — Participant Record Site as Public Interface

The public record site should be designed as an interface for inspection rather than a stream of exposure. Users need layered context, stable definitions, accessible navigation, provenance cues, visible disputes, correction histories, and plain explanations of role status. Accessibility is not an optional visual treatment: keyboard operation, semantic structure, readable contrast, captions, text alternatives, and cognitive clarity determine who can inspect power. Public access also requires restraint. Search, bulk download, automated scraping, and decontextualized clipping can transform legitimate transparency into targeting or spectacle. The interface should therefore support meaningful access while governing high-risk extraction and preserving the distinction between official source, interpretation, and machine assistance (International Council on Archives, 2012; UN Human Rights Committee, 2011; W3C, 2023).

The participant record site is where public memory becomes usable. It is not the archive itself. It is the public-facing interface that translates source memory into structured civic review material. Its task is to help citizens understand public-power formation without forcing them into raw record exposure or leaving them dependent on campaign narrative, rumor, partisan framing, or machine summary.

The public interface is built for democratic interpretation rather than voyeurism. It helps readers find source, status, sequence, context, correction, role pathway, dispute, and limitations without inviting them to browse a human life as entertainment. Its

measure of success is better judgment with less needless exposure. Accessibility and restraint therefore serve the same civic purpose.

Interface design is civic ethics. The way records are bundled, layered, explained, disputed, corrected, and made accessible will shape how the City is understood. If the site is confusing, fragments will dominate. If it is too polished, it will look like propaganda. If it is too raw, it will become spectacle. A fair interface teaches readers how to look.

The public interface is also where the City teaches its audience what kind of looking is fair. A public record site can train citizens toward patience, context, correction, and role-specific judgment, or it can train them toward browsing and quick condemnation. Interface design is civic pedagogy.

The interface should also anticipate unequal public attention. Some participants will draw fascination; others may be ignored. Some issues will become symbolic; others will be technically important but publicly quiet. The site must organize memory by civic relevance, not by popularity or drama.

10.2.1 — Record Bundle Purpose

A record bundle is a structured public review object. It gathers related material around a civic purpose rather than dumping all available records into public view. A bundle may concern a role pathway, a decision sequence, a correction history, an office-readiness claim, a staff influence pattern, or a public explanation record. Its purpose is to make public review possible without making exposure indiscriminate (UN Human Rights Committee,

2011; W3C, 2023).

The bundle protects citizens from fragment overload. Raw records can overwhelm. When people are overwhelmed, they rely on clips, headlines, partisan interpreters, or emotionally vivid fragments. A bundle gives structure so the public can see what kind of record is being presented, why it matters, what its limits are, what is disputed, and what should not be inferred.

The bundle also protects participants and nonparticipants from being converted into spectacle. A public-facing bundle can exclude protected material, substitute summaries where appropriate, mask third parties, and provide release notes. It lets the City say, this material has public-power relevance, and this other material remains protected or restricted. That distinction is impossible in a raw dump.

Record bundles should never become marketing packets. A bundle that selects only flattering evidence becomes campaign material. A bundle that selects only damaging evidence becomes punishment. The City must define bundle categories, inclusion rules, dispute rules, and auditability so that public review remains credible. The public should be able to ask why a bundle contains what it contains.

A strong bundle also includes limits. It should tell readers when a record is partial, when context is missing, when a dispute remains unresolved, when legal review is pending, when sensitive content has been summarized, and when material should not be treated as final. Limits are not weakness. They are how public memory resists false certainty.

Bundle purpose also supports audit. An auditor can ask whether a bundle's contents match its stated purpose, whether protected material was unnecessarily included, whether damaging context was omitted, and whether a reader would understand the limits. Public bundles should be designed to be tested, not merely read.

The same rule needs a limiting condition: the bundle should preserve a path back to source status. If a reader wants deeper review, the record site should show what source categories support the bundle and what protections limit further access. Structure should not become opacity.

A bundle should also protect against the tyranny of the exceptional moment. It should place dramatic events beside ordinary patterns, correction history, and role context so that the public does not confuse the loudest record with the most representative one.

A record bundle is a public object with a burden budget. It should contain enough material to let citizens understand a participant's public-power formation, but not so much that readers are invited to wander through a life. Bundle design should therefore start with purpose, not abundance: what question does this bundle help answer, and why is this form the least harmful adequate form?

Good bundle design also makes absence visible without making absence suspicious. If material is delayed, sealed, redacted, or summarized, the bundle should say so through lawful labels. That does not give the public everything it wants, but it prevents silence from becoming a rumor factory and prevents protection from looking like favoritism.

Bundles should also disclose their assembly logic. A citizen should know whether a bundle is chronological, role-based, event-based, correction-based, readiness-based, or institutional-failure based. Assembly logic matters because order creates meaning. The same records can produce a different public burden if they are arranged as a scandal trail, a redemption arc, or an administrative record.

10.2.2 — Context Layers

Context layers are the record site's defense against fragment-based judgment. Every public item should carry enough surrounding information to prevent the reader from treating a draft as a decision, a simulation as office conduct, a delay as concealment, a protected summary as raw evidence, or a disputed item as settled. Context is not a favor to the participant. It is a duty to the public.

The first layer is status. Readers need to know whether material is source-derived, summarized, corrected, disputed, delayed, sealed, protected, time-reviewed, provisional, or final within a defined category. Status does not decide interpretation, but it gives interpretation a floor. Without status, every record appears equally authoritative, and that is false.

The second layer is temporal context. A comment made at the beginning of formation may mean something different after months of correction. A decision revised after opposition carries a different meaning from a decision never challenged. A record without sequence can make growth look like contradiction or

make stubbornness look like consistency. Time is part of meaning.

The third layer is role context. Public-power relevance depends on what role is being formed, what pathway the participant is in, what duties were at stake, and what kind of burden the record addresses. A behavior relevant to executive crisis readiness may not have the same relevance for a local deliberative role. Context layers prevent universal overreading.

Context layers teach the public to read slowly. The City will fail if it gives people more records while training them to interpret less carefully. A fair public record site should make quick certainty harder, not easier.

Context layers should also protect against false equivalence. Not every record in a bundle has equal weight. A final decision, a rejected draft, a simulation response, a staff warning, and a participant reflection may all belong in the same sequence, but they should not appear as identical evidence. The site must help readers understand weight without dictating conclusion.

Good context design also helps the reader see absence responsibly. If a source is protected, unavailable, delayed, or under review, the public should not be left to imagine the worst. A visible status category can reduce speculation while preserving the underlying protection.

Context layers should be designed for machine readability as well as human readability. If summaries, search tools, accessibility tools, and translation systems rely on the site, they must receive

status and context metadata so that assistance does not strip away the very safeguards the public needs.

Context layers should be layered rather than forced into one explanation. A reader may need chronological context, role context, legal status, protection status, correction status, participant reply, affected-person note, and institutional interpretation. The interface should let these layers travel together without making any one layer erase the others.

Context also protects against the tyranny of the clip. A fifteen-second exchange may be real and still misleading. The interface should show whether the clip comes from a larger deliberation, whether a correction followed, whether a staff concern existed, whether protected material was withheld, and whether the item is disputed. Context does not excuse conduct. It lets conduct be judged under truth rather than appetite.

The strongest context layers should be portable. If a record is quoted by the record site, referenced by a newsroom, summarized by a machine, or linked from a civic platform, the core status and correction context should travel with it where possible. Context that stays only on the first page becomes fragile in a public world built for clipping.

10.2.3 — Role Pathway Display

The public record site should identify the role pathway because readiness is never abstract. Local office, legislative work, executive responsibility, diplomacy, administrative leadership, adjudicative roles, and technical public service impose different burdens and call for different evidence. The interface should show

the pathway without pretending that the pathway authorizes office.

A single ladder of seriousness would distort both people and records. It would imply that every participant is moving toward the same authority and that more visible material means greater civic stature. Role context prevents that ranking error by connecting evidence to jurisdiction, scale, function, and consequence rather than to prestige.

A useful pathway card can name the prospective role family, its public duties, relevant formation domains, evidence categories, protected absences, unresolved questions, review date, and limits on transfer. Budget literacy does not demonstrate diplomatic judgment. Crisis simulation in one domain does not become universal leadership evidence.

The card should make the City's nonclaim equally visible. Formation history, correction practice, staff treatment, public reasoning, and role-relevant conduct may inform judgment. They do not create legal eligibility, guarantee competence, direct a party, bind an appointing authority, or command public trust.

Pathways can change without becoming moral narratives. Redirection may reflect better fit, delay may protect health or family, narrowing may show honest judgment, and departure may be prudent. The interface should record the administrative change and reason category without turning it into a story of ascent or failure.

This role-specific display improves interpretation precisely because it limits interpretation. It tells the reader which burdens

the evidence addresses and which questions remain outside the record. Humility is built into the interface rather than added as a warning paragraph.

Administrative labels need precise definitions. Accepted, active, paused, delayed, redirected, withdrawn, completed, returned, and under review describe process states attached to a role pathway. They are not reputational grades and should not be ordered visually from lower to higher human value.

External authorities remain external. Voters, law, election administrators, parties, legislatures, appointing bodies, professional regulators, and courts retain their own responsibilities. A pathway page should reveal those handoffs so the City record cannot be mistaken for a parallel credentialing state.

Visual grammar matters. Branching routes, parallel domains, review points, and exits communicate role specificity better than a staircase, pyramid, badge sequence, or rising score. The diagram should show obligations and limits, not a journey from ordinary life toward superior civic virtue.

Role fit must remain narrower than deserving power. A participant may be suited to one function and not another, delayed by load, redirected to a non-elective role, or finished with City participation altogether. None of those outcomes authorizes a judgment about the person's worth, trustworthiness, or entitlement to office.

Institutional failure must appear on the same page as participant evidence. A missing record may result from denied opportunity,

inaccessible design, technical loss, staff shortage, protected status, unresolved complaint, or role irrelevance. The interface should not silently assign every absence to the person under review.

Different pathways produce different densities of evidence. A crisis-oriented track may contain repeated simulations; a legislative track may contain extensive drafting and coalition work; a technical track may emphasize systems analysis. Those differences cannot be compared as moral seriousness or quantity of virtue.

Transfer across roles should therefore be rebuttable rather than automatic. Evidence may remain relevant after a pathway change, but the public interface should state why, under what limit, and which new questions remain unanswered. The volume of archived material must never create an aura of universal readiness.

A well-designed pathway display leaves the reader oriented but not instructed whom to admire. It gives process state, role context, evidence boundaries, current disputes, and the next review point. Democratic judgment remains with the lawful public and institutions that own it.

10.2.4 — Dispute and Correction Visibility

A public record site that hides disputes is not transparent. It is polished. Dispute and correction visibility means the reader can see when a participant contests a record, when a nonparticipant challenges exposure, when the institution corrects classification,

when context is restored, and when a public summary has changed. Contestability is part of public memory.

Dispute visibility protects the participant from institutional finality. If a record is inaccurate, incomplete, misleading, or wrongly classified, the participant needs a route to challenge it. That route should not be hidden in administrative files. The public interface should show that a challenge exists and, where appropriate, how it was resolved or remains pending.

Correction visibility protects nonparticipants and affected persons. A visitor, staff member, family member, professional, protester, or bystander may be wrongly exposed, misidentified, or included in a public bundle in a misleading way. They need correction routes, and the public needs to know that collateral people are not trapped by the City's memory.

Dispute visibility also protects the public from false confidence. A record without a dispute label can look settled when it is not. A correction hidden at the bottom of a page can allow the original error to dominate. The site should make correction status visible enough that readers cannot innocently rely on obsolete or challenged material.

Dispute visibility needs proportion. A challenge should be findable without converting every disagreement into spectacle. Protected categories, nonparticipant rights, legal review, or safety may justify delayed or summarized explanation. The public entitlement is to know that the record is contestable, what status applies, who owns review, and whether the result changed the

operative object. Visible contestability is different from raw exposure.

Dispute visibility also discourages the public from treating disagreement with the record as dishonesty. Sometimes a participant disputes a record because they are evading responsibility. Sometimes they dispute it because the record is wrong or incomplete. The site should make the existence of dispute visible without prejudging motive.

Public correction design should be simple enough to be found under stress. A harmed person should not need to navigate a maze of archive offices, legal categories, and technical forms to seek repair. A visible correction pathway is part of accessibility, not only governance.

The public record site should not bury disputes in separate administrative pages. If a record is disputed, the dispute status should travel with the record. Public memory becomes unfair when corrections and disputes are technically available but practically invisible.

Dispute visibility should be designed to prevent both concealment and pile-on. The public should know that a record is challenged, corrected, appealed, or under category review, but the interface should not turn every dispute into a spectacle page. The status of contestation is public; the vulnerable details that make contestation painful may still remain protected.

A useful public example is a bundle in which a deliberation clip appears to show evasion. A later correction may reveal that a protected legal consultation constrained what could be said. The

correction should not erase the clip, but it should travel with it, restore context, and mark the institutional lesson: public memory is not trustworthy unless it can change in the open.

Correction visibility should be designed for proportional attention. Some disputes require a small label, some require a prominent correction, some require withdrawal of a public object, and some require a public institutional explanation. Too little correction hides harm; too much correction can create new harm.

10.2.5 — Accessibility for Nonexperts

The interface should offer more than one path into the same memory. Some readers will need a chronological path, some will need an issue path, some will need an office-readiness path, some will need a correction path, and some will need a plain-language overview before they can approach source-linked material. They prevent one interface design from deciding who gets to understand power (International Council on Archives, 2012; Bertot et al., 2010).

Accessibility includes protection from manipulative design. The record site should not use autoplay, trending lists, dramatic thumbnails, outrage prompts, emotional ranking, or endless scroll to hold attention. A civic record site should help readers stop, compare, verify, and leave with a bounded judgment.

Nonexpert access also includes civic intermediary access. Journalists, teachers, advocacy groups, researchers, and local forums may need structured public materials to explain City records to wider audiences. Public materials should keep the same

status labels, correction notices, release notes, and protection limits wherever they travel.

Plain-language explanations matter. Terms such as archive, protected summary, delayed release, disputed status, chain of custody, role pathway, nonparticipant masking, and Artificial Intelligence summary should be defined where they appear. A citizen should not need technical training to know whether a public bundle is final, disputed, partial, or protected.

Disability accessibility is equally central. Captions, screen-reader compatibility, plain text alternatives, high-contrast options, navigable structure, language assistance, and cognitive-load design are not favors. If public record is part of democratic judgment, then access is part of fairness.

Nonexpert accessibility also requires interpretive pacing. It should help readers move from overview to detail, from context to source, from claim to dispute, from release to correction. Usability can be ethical or manipulative.

Accessibility for nonexperts does not mean the City should hide complexity. The right design gives readers layered entry: summaries, context labels, deeper records, correction logs, provenance views, and expert notes where needed. The reader can go deeper without being forced into raw chaos.

The public interface should explain what it is before asking the reader to trust it. A short charter can identify the official source of record status, the distinction between source and interpretation, the correction and reply routes, the accessibility options, and the

current version. Orientation is not promotional copy. It is part of informed public use.

Search should reveal status before relevance ranking can hide it. A disputed, corrected, protected, obsolete, or delayed item should carry that condition into search results, exports, and machine-assisted retrieval. Otherwise the interface trains the public to read speed as authority and recency as truth.

Accessibility for nonexperts must include cognitive accessibility, language accessibility, disability access, and media-literacy support. The City should not demand expert decoding from the public before it grants them public memory.

Nonexpert accessibility includes education against certainty rituals: isolated lines as proof, volume as virtue, protection as corruption, or private material as the price of curiosity. A trustworthy record site teaches judgment, not only access.

Test accessibility through tasks with readers of varied literacy, language, disability, device, and time: can they find status, corrections, versions, protected summaries, and appeals? Usability evidence should trigger redesign, not blame.

Emotional accessibility matters too. Severity, legal language, moral drama, and constant warning may overwhelm readers and drive them to irresponsible simplifiers. Calm layering, dignified pacing, and routes to deeper detail sustain attention without mistaking simplicity for truth.

A bounded usability report should show whether people can find status, source, dispute, correction, protection, and appeal without undue effort or steering. A usable record site still depends on

confidence in the material beneath it. Record integrity turns on provenance, custody logs, tamper detection, deepfake resistance, and independent audit. First-time users should be able to distinguish source, current status, dispute, correction, and appeal without specialist guidance.

10.3 — Provenance, Chain of Custody, and Tamper Resistance

Provenance makes evidentiary trust inspectable. A record should carry its source, capture time, role context, custody events, transformations, redactions, releases, corrections, responsible authority, and known limits. Tamper-evident logs, cryptographic checks, write controls, independent replication, and anomaly review help only when human investigators can understand what the system recorded and what it missed. Content credentials can document origin and modification, but an authentic asset may still be incomplete or misleading; technical verification therefore belongs beside context review, affected-person challenge, and correction (W3C, 2013; ISO/IEC, 2012; C2PA, 2026).

If the City matters, its records will be attacked. Some attacks will be crude: deletion, forgery, leaks, and unauthorized access. Some will be subtle: clipping, mislabeling, metadata manipulation, selective release, deepfake media, unverifiable summaries, and confusion about which version is official. A public memory system that cannot defend provenance cannot defend public trust.

Provenance and chain of custody are not only technical disciplines. They are civic disciplines. They allow citizens, participants, nonparticipants, reviewers, and institutions to know whether a record is what it claims to be, whether it has changed, who handled it, and what authority governs it. Without that trust, the archive becomes one more contested story.

Tamper resistance must be built before crisis. Once a record is publicly disputed, the public needs more than reassurance. It

needs visible integrity systems, audit trails, independent review, and breach communication rules. This section treats record integrity as part of the City's duty to the people whose lives will be interpreted through its memory (W3C, 2013; ISO, 2017; ISO/IEC, 2012).

Attacks on memory will often be political, technical, moral, and emotional at once. A fabricated record can injure a participant; a successful attack on a genuine record can deprive the public of evidence; a breach can expose nonparticipants who never chose visibility. Integrity response must account for all three harms rather than protecting only institutional continuity.

Integrity systems should also be legible during calm periods, not only after breach. If the public learns provenance and custody rules only during scandal, those rules may feel defensive. The record site should normalize integrity education before trust is tested.

10.3.1 — Provenance Metadata

Provenance metadata is ethical information before it is technical information. It should identify the source system, time of capture, authorized role context, processing history, custody events, protection category, release authority, and known limitations. The point is not to satisfy a database. The point is to let a later reader ask whether a record is the same object, under the same authority, carrying the same limits that it carried when it was first preserved (W3C, 2013; ISO/IEC, 2012).

Some provenance metadata will itself be protected. Exact locations, device identifiers, security routes, medical context,

family identifiers, witness names, and staff identifiers can expose people if released casually. The public interface should disclose enough provenance to support trust while preserving details whose exposure would create new harm. Metadata is not automatically public simply because it proves authenticity.

Good provenance records uncertainty. If a sensor failed, if a human note was entered later, if a translation was used, if a protected category changed release form, or if a timestamp was reconstructed from secondary logs, the record should say so. Confidence that hides uncertainty is worse than uncertainty made visible. The City should teach the public to trust honest limits more than polished certainty.

Provenance metadata records the origin and authority of a record. It should identify when the record was created, what system created it, what role context applied, which access band governed it, whether nonparticipants were present, whether protected categories were flagged, and what custody chain began at capture. This information makes later interpretation possible.

Without provenance, a record becomes a floating object. A clip may be real but removed from context. A document may be authentic but no longer current. A summary may accurately quote source records but omit status. Provenance does not settle meaning, but it prevents the first layer of confusion: where did this come from and under what authority does it exist.

Provenance must also distinguish record types. A raw capture, a protected summary, an official release note, a correction log, a dispute label, a public bundle, a newsroom interpretation, and an

Artificial Intelligence summary should never appear as the same kind of item. Each has different authority. Metadata must carry that difference.

The governing record design should also record the relationship between source and public output. If a public bundle derives from source records, the public interface should be able to say that it derives from governed source records without exposing protected source content. This allows citizens to trust that public material is not invented while preserving lawful shielding.

Provenance metadata can become invasive if overcollected. The City should capture what is needed for authenticity, status, context, and review, not every possible trace because storage is cheap. Metadata itself can expose protected patterns, locations, contacts, or vulnerable persons. Provenance must be governed with the same care as content.

Provenance metadata should include human-readable forms as well as technical forms. Auditors may need detailed logs, but citizens need basic confidence: official source, status, date, category, and release authority. If integrity is only visible to specialists, public trust will depend on a new technical priesthood.

A further requirement is to guard against provenance laundering. A document can be given official-looking metadata after weak capture, poor custody, or questionable classification. Metadata is only as trustworthy as the process that creates it. Provenance systems themselves need audit, not reverence.

Provenance should also carry relation to release. If a record appears in a public bundle, the site should know which source

record and which custody path support it. This makes it possible to audit not only the record but the act of public presentation.

Provenance metadata should include origin, capture method, capture authority, time source, device or system identity where lawful, classification history, access events, transformation events, release decision, and correction lineage. Not every item can expose all metadata publicly, but every item should be internally auditable. The metadata is the record's memory of its own burden.

Institutional memory should treat missing metadata as a status condition, not as an invisible defect. If a record lacks reliable time, source, custody, or transformation history, that uncertainty must travel with the record. A public object with uncertain provenance may still matter, but it should never wear the costume of certainty.

Provenance metadata should be resilient against vendor change. A record system that preserves source information only inside a proprietary platform can lose intelligibility when a vendor fails, contracts end, or formats change. The City should require exportable, documented, durable metadata because public memory cannot depend on a vendor's lifespan.

Provenance needs a visible gap protocol. Device-clock drift, lost metadata, altered vendor exports, invalid signatures, and uncertain origin are not silently normalized into certainty. Each gap receives a status, bounded explanation, investigator, preservation action, and rule for whether the item may support public release. Later restoration preserves the history of

uncertainty rather than overwriting it. Provenance is strongest when unknowns are represented as carefully as known facts (W3C, 2013; ISO, 2017; NARA, 2023).

10.3.2 — Chain-of-Custody Logs

Chain-of-custody logs record who handled a record, what changed, what authority allowed the action, and what status resulted. In ordinary life, chain of custody may sound like evidence law. In the City, it becomes a moral guardrail because public memory can be harmed by quiet handling as much as by false content.

A custody log should track capture, transfer, classification, access, redaction, summary, release, correction, sealing, export, audit, and breach response. It should identify role, not expose private staff life. It should make material handling reviewable without turning every worker into a public subject. The goal is accountability for record actions, not staff surveillance.

Chain of custody protects participants from secret editing. If a record changes, the change should be traceable. If a classification shifts, the reason should be recorded. If a release is delayed, the status should have a review clock. If an item is corrected, the prior status should not vanish without history. The participant should not live under a record that can be quietly rewritten.

Any defensible record system has to protect custody logs themselves. They may contain sensitive staff actions, nonparticipant references, security details, legal review, and protected categories. Public summaries of custody may be

appropriate where raw custody data is not. The principle is auditability, not universal exposure.

A chain-of-custody log should make improper access visible. If someone browses records outside their role, retrieves sensitive material without purpose, or exports data beyond authority, the log should create evidence of that misuse. Privacy is not protected only by secrecy; it is protected by accountable access.

Custody logs also help explain errors without turning errors into conspiracies. A migration failure, mistaken classification, or delayed correction may be serious, but it is different from deliberate tampering. Logs let the City distinguish negligence, misconduct, system failure, and lawful handling.

The custody system should include access reason codes. It is not enough to know that someone opened a record; the system should identify the purpose category where feasible. Oversight review can then detect browsing disguised as work or repeated access patterns without public purpose.

Chain of custody should also cover public exports. Once a public bundle is downloaded, cited, or shared, the City cannot control every use, but it can provide stable identifiers, release notes, and version checks that let responsible users verify currency.

Chain-of-custody logs should record access without turning access logs into new instruments of retaliation. Staff, auditors, legal reviewers, affected-person reviewers, and technical responders may need access for legitimate reasons. The log should make misuse discoverable while protecting lawful work from harassment or political exposure.

Custody logs also need human-readable summaries. A cryptographic trail may satisfy technical reviewers, but citizens and affected persons need to know, in plain language, whether a record was created under authority, preserved without unexplained gaps, accessed by proper roles, transformed under review, and released or withheld with a reason.

Custody logs also protect the public from institutional memory control. A record site that silently removes, replaces, or reorders material can shape interpretation while appearing neutral. Chain-of-custody records make that shaping visible to auditors and, where lawful, to the public through bounded summaries.

The chain of custody should also protect against quiet over-access by insiders. The gravest abuse may not be a dramatic hack but a slow culture of curiosity, favoritism, informal browsing, or political whispering. Logs, role separation, sampling audits, and meaningful sanctions make internal misuse harder to normalize.

10.3.3 — Tamper Alerts

Tamper alerts are the City's early warning system for manipulated memory. They should detect or flag unexpected edits, missing files, altered metadata, unauthorized access, hash mismatch, suspicious export, inconsistent timestamps, abnormal query patterns, or attempts to bypass classification. A record system without tamper alerting asks people to discover manipulation too late.

The alert system must distinguish suspicion from conclusion. A tamper alert is not proof of wrongdoing. It is a call for review. Technical systems can misread normal maintenance, migration,

lawful correction, or format changes. The City must avoid panic while refusing complacency. Alerts should trigger classification, investigation, and status labeling where needed.

Public communication around tamper alerts requires care. Some alerts may not need public notice. Others may affect released material, participant rights, nonparticipant protection, or public trust. The City should define categories: internal technical review, oversight notice, affected-person notice, public status alert, and breach communication. Silence cannot be the default where public memory is compromised.

Tamper alerts also help protect against internal misuse. Not all threats come from outside attackers. Staff, contractors, vendors, participants, administrators, or authorized users may misuse access. Alerting should be designed around role boundaries so unusual behavior becomes visible without making ordinary work impossible.

An alert system can itself become oppressive if it creates constant suspicion or unreviewable automated accusation. Human audit, appeal, and bias review matter. The system should notice anomalies. It should not govern people. Technical alerting must remain subordinate to accountable review.

Detection is useful only if response has been rehearsed. Staff need a practiced sequence for freezing affected objects, preserving evidence, notifying oversight and affected persons, publishing a bounded status notice, restoring service, and reviewing the failure. An alert without assigned authority simply tells the institution that harm is occurring.

The alert architecture should also protect against alert fatigue. Too many low-value alerts can train staff to ignore warnings. The City should classify severity, route intelligently, and review false positives. A warning system that nobody trusts will fail when it is most needed.

Tamper alert governance should include remedies for people harmed by suspected manipulation. If a false or compromised record becomes public, affected persons may need temporary status notes, context restoration, public warning, and later correction even before the full investigation ends.

Tamper alerts should have severity levels. A checksum mismatch, metadata conflict, missing segment, unauthorized access, suspicious export, unexplained deletion attempt, or public forgery does not carry the same meaning. The response should be proportionate, but every category should have a defined route so staff do not improvise under pressure.

A tamper alert also creates communication burden. The City should not conceal integrity concerns until it can speak perfectly, but it should not release panic either. The public may need a temporary label such as integrity review pending, while affected persons may need immediate notice and protection before the public receives detail.

Tamper response should include human care. If an altered record exposes a private detail, defames a participant, endangers a nonparticipant, or destabilizes a family, the first response cannot be merely technical restoration. Notice, shielding, support, public

clarification, and harm mitigation belong inside the integrity protocol because the record is attached to persons.

10.3.4 — Deepfake Resistance

Archival practice should assume that synthetic media will be used against it. A false clip of a participant, a fabricated private scene, a generated voice note, a forged deliberation exchange, or a manipulated staff instruction could travel faster than the archive can explain. Deepfake resistance is not a public-relations feature. It is a burden-control system for everyone whose public meaning can be stolen by fabricated evidence.

The response should have stages. A suspect item should be quarantined from official reuse, matched against source records, checked against custody logs, compared with independent technical indicators, routed to human review, and given a public status label when public harm is likely. The City should not promise instant truth. It should promise a visible process that prevents forged memory from moving unchecked through public life.

No detector should become the judge. Machine detection, cryptographic signatures, watermark checks, metadata comparison, witness review, and source record reconciliation each answer different questions. A detector can miss a strong forgery or suspect a real recording. The City should combine technical evidence with custody evidence and human accountability, then explain the confidence level without turning confidence into a final verdict about the person.

Deepfake resistance protects both people and public judgment. Fabricated audio, video, images, or text can injure participants, nonparticipants, elections, and institutional legitimacy; false denials can also discredit authentic records. The City therefore combines provenance, capture security, independent verification, rapid challenge, public status labels, and correction. Synthetic-media readiness begins before the first convincing attack, not after it (C2PA, 2026; NIST, 2024c).

Resistance begins with authentication. Source records should carry provenance, capture signatures, custody logs, integrity checks, and controlled release pathways. Public users should be able to distinguish official record-site material from external clips, commentary, reposts, altered media, and unofficial compilations. The record site should not assume that the public can identify manipulation unaided.

Deepfake resistance also requires public education. Citizens should understand that a viral clip is not the same as an official record bundle, that a machine-generated transcript may be wrong, that a dramatic excerpt may be authentic but misleading, and that official confirmation may take time. The City must not train the public to believe everything that looks like evidence.

Deepfake defense also protects the City from overcorrection. In a synthetic media environment, people may dismiss real records as fake. A participant caught in misconduct may claim fabrication. A public official may deny authentic evidence. Independent audit, custody trails, and fast but careful verification help prevent the collapse of trust into universal suspicion.

The public record site should avoid training citizens to rely on visual realism. It should teach verification habits: official source, status, provenance, version, release note, and correction log. Public memory becomes stronger when citizens learn to ask how a record is verified, not merely whether it feels convincing.

Deepfake resistance must include nonparticipant protection. A fabricated clip may involve a family member, staff member, visitor, critic, or child. The response should not treat the participant's reputation as the only harm. Synthetic media can injure anyone pulled into the City's symbolic field.

A further requirement is to prepare public statements that avoid overclaim. During verification, it may not yet know whether a media item is false, altered, authentic, or context-stripped. A careful status statement can reduce panic without pretending certainty before review is complete.

Synthetic attacks are likely to target emotion before technical scrutiny catches up. Fabricated intimacy, invented insults, false staff abuse, or simulated crisis behavior can feel more revealing than ordinary evidence. Defense therefore combines provenance, source verification, rapid status notices, public education, and a correction route that addresses both the artifact and the narrative pressure it creates.

Deepfake resistance cannot rely on one tool or one vendor. It should combine provenance markers, cryptographic signatures where appropriate, watermark and manifest review where available, chain-of-custody analysis, human review, adversarial testing, source comparison, and public education about

uncertainty. No technical marker should be advertised as magical proof.

The deeper danger is not only that fake material will be believed. It is also that real material will be dismissed as fake. A City record system must therefore protect authenticity in both directions: it must expose forged records and defend genuine records from bad-faith denial. Tamper resistance is a public-trust function, not merely a file-integrity function.

Deepfake education should also protect the public from cynicism. If every record is treated as potentially fake without a process for verification, accountability collapses into disbelief. The City should neither promise perfect detection nor surrender to distrust. It should give the public a route: status label, provenance check, integrity review, human audit, correction path.

10.3.5 — Independent Audit

Independent audit makes record integrity more than internal assurance. The City cannot simply say its records are authentic, its classifications fair, its corrections complete, and its releases lawful. Institutions tend to trust themselves too much. The archive must be open to external inspection under rules that protect sensitive material while testing the system seriously (C2PA, 2026; Chesney and Citron, 2019).

An independent audit should examine provenance systems, custody logs, tamper alerts, access patterns, classification decisions, protected summaries, release notes, correction handling, vendor dependence, Artificial Intelligence assistance, and breach response. It should not merely check whether

procedures exist. It should test whether procedures work under stress.

Public audit summaries are necessary, but they must be carefully designed. The public needs to know categories of findings, severity, remedies, unresolved concerns, and repeated failures. The public does not need protected raw records, vulnerable names, security details that increase risk, or intimate material. Audit transparency must be informative without becoming exposure.

Independent audit should include adversarial testing. Red teams can attempt to manipulate records, abuse search, infer protected facts, exploit metadata, pressure release categories, or test public-interface confusion. A memory system that has not been attacked in rehearsal may fail in public crisis.

Independent audit is the archive's humility mechanism. It admits that public memory held by an institution is too powerful to be trusted merely because the institution says it serves fairness.

Independent audit should include user-experience testing because public misunderstanding can be an integrity failure. If ordinary readers consistently misread status labels, protected summaries, or version histories, the system is not working even if the underlying records are accurate. Audit should test the public interface as well as the back-end archive.

Independent audit should be scheduled and triggered. Regular audits create baseline accountability; incident-triggered audits respond to breach, controversy, unusual access, public confusion, or repeated correction. Both are needed because some failures are

routine drift and others are acute crisis.

The audit process should include participant and nonparticipant experience. A technically sound archive can still feel impossible to challenge. If people harmed by records cannot find correction routes, the system is not functioning as fair public memory.

Independent audit should be routine, adversarial, and public enough to matter. A yearly ceremonial audit is not sufficient for an archive that can shape public trust. Auditors should be able to test access controls, sampling integrity, release labels, correction linkage, breach response, vendor dependence, and the treatment of unfavorable institutional records.

Audit results should themselves carry status labels. Some findings can be public, some may require protected summaries, and some may need delayed release to prevent security exposure or further harm. The rule is not maximum disclosure. The rule is reviewable truth under lawful protection.

Independent auditors should be protected from institutional retaliation and from becoming celebrities of distrust. Their independence depends on appointment rules, funding security, access authority, conflict disclosure, rotation, appeal routes, and public reporting duties. Audit should be strong enough to find failure and restrained enough not to become a rival power center.

A mature audit program uses blind test records and controlled canary events. Auditors can introduce a harmless synthetic record with known provenance, correction, access, and expiry properties, then test whether every system preserves them. They can also verify that unauthorized browsing, delayed correction,

broken version links, or vendor-side copying produces a detectable signal. These tests do not guarantee every real record is safe; they show whether controls detect the failures they claim to govern (ISO, 2016a; NIST, 2020a).

Findings need remediation clocks. A critical custody failure may require immediate suspension of release. A recurrent labeling defect may require a temporary warning across every affected bundle. A vendor weakness may require access reduction, migration, or termination. The audit record should identify owner, deadline, interim protection, verification method, and consequence for nonclosure. Repeated findings should escalate rather than restart as if they were new. Otherwise the audit becomes a ritual that documents the same injury while the institution learns only how to describe it.

Independent auditors also need access to the dependency chain beyond the City's direct servers. Cloud storage, transcription, translation, content credentials, search indexes, backup media, and security tools may each hold part of the record's integrity. Contractual claims are not enough. Audit rights, evidence preservation, incident notice, subcontractor visibility, exit assistance, and data-return or destruction proof should travel through the vendor chain. An archive cannot call its custody independent if its most consequential dependencies are contractually opaque.

10.4 — Public Bundles, Status Labels, and Versioning

A public bundle should be a governed publication object, not a raw data dump. Each bundle needs a declared purpose, inclusion rule, protected-category review, status labels, version identifier, release date, change log, and expiration or review condition. Labels such as allegation, participant statement, verified event, disputed classification, interim restriction, final decision, correction, and withdrawn item must remain distinct. Version history should allow a reader to see what changed without preserving every harmful error in perpetually prominent form. Records standards and public-sector version practices support this layered approach, but the City must add a hostile-crop test: any detachable label or screenshot should retain enough status information to resist a false impression (ISO, 2016a; ISO, 2017; International Council on Archives, 2012).

Public records become dangerous when they appear without status. A document, clip, summary, transcript, or timeline can look complete even when it is partial, disputed, corrected, delayed, protected, draft, simulation-based, or time-limited. Public bundles, status labels, and versioning are the record site's grammar. They tell readers how to read before they decide what to think.

Presentation is part of truthfulness. A record can be authentic and still misleading if released in the wrong category. A summary can be accurate and still harmful if its limits are not visible. A corrected item can continue to injure if the correction is buried.

Public memory requires not only records, but records that explain their own status.

A credible record system should make public records usable without making them too smooth. Overly polished public bundles may feel like propaganda. Raw material may become spectacle. Status labels and version histories create a middle path: structured enough to guide, transparent enough to challenge, humble enough to correct.

The public layer should therefore feel more like a carefully governed civic library than a platform feed. It should help people understand what is before them, why it is there, and how it has changed, without using urgency, novelty, or spectacle to keep attention.

The relevant architecture should also allow public readers to move from general to specific without losing orientation. A citizen may begin with a short overview, open a bundle, inspect status labels, read release notes, and then follow correction history. Each step should make the next step clear.

10.4.1 — Public Bundle Categories

Public bundles are purpose-built views of governed records. A decision bundle may gather drafts, briefings, objections, revisions, final explanation, and later correction; a correction bundle may show error, response, remedy, and updated status; a role-pathway bundle may show relevant education, deliberation, staff treatment, public interface, and limits. Each category should answer a defined public question with declared sources, status,

omissions, and expiry, and should keep unrelated material separate (ISO, 2016a; ISO, 2017).

Public bundle categories should include exclusion logic. A category must say not only what is included, but what is excluded and why. Protected nonvisibility, child protection, professional confidentiality, nonparticipant masking, legal review, security delay, and intimate-record shielding may all shape the bundle. Exclusion logic protects the vulnerable and prevents suspicion that absence always means concealment.

Well-designed public bundle categories help the City say: this is the kind of record you are seeing, this is why it matters, this is what it does not show, and this is where correction or dispute may live.

Bundle categories should be stable enough for comparison across participants and flexible enough for unusual cases. If every participant receives a different category structure, public judgment becomes difficult. If categories are rigid, they may force complex situations into misleading forms. The City needs standard categories with room for explained exception.

A bundle category should also indicate the intended reader. Some bundles may be for general citizens, some for affected persons, some for institutional reviewers, and some for oversight summaries. Public-facing design improves when it knows whose burden of understanding it is trying to reduce.

Public bundle categories should be listed in a glossary or public guide so users can learn the record site's grammar. A citizen

should not have to infer category meaning from repeated exposure. The interface should teach its own structure.

Bundle categories should be reviewed after major public misunderstandings. If a category consistently invites wrong inference, the problem may not be the public alone. The City may need to rename, restructure, or split the category so its purpose becomes clearer.

The category list should prevent an all-purpose participant file. Role readiness, event context, correction, incident response, office interface, support-and-load summaries, and institutional failure each require different source rules and audiences. A single universal bundle would erase those distinctions and invite readers to interpret administrative convenience as a portrait of the person.

Bundle categories also reduce public rank. The site should not imply that the largest bundle means the most serious person, or that the cleanest bundle means the best person. A bundle is a release form for a civic question. It is not a medal, a sentence, or a certificate of worth.

Bundle categories should be defined before political pressure arises. Categories invented during controversy can appear defensive and may be selected strategically. Predeclared categories support consistent release, clearer public understanding, and audit of whether the City is grouping records to protect itself.

Bundle categories should remain revisable through public and expert review. As the City learns, new release forms may be needed, and old categories may create hidden bias. Revision

should happen through logged governance, not quiet interface redesign. The category system itself is part of public memory and should be treated as a public object.

10.4.2 — Status Labels

A status label earns its place only when it changes handling. A disputed record must route readers to the challenge; a corrected record must reveal the correction; a delayed record must name the authority and review date; a protected or sealed record must explain its category without disclosing the protected content. A label that informs nobody's conduct is decoration, not governance.

Labels describe the state of a record, never the worth of a person. Protection, delay, appeal, dispute, or sealing must not become a quiet mark of guilt, weakness, or unreliability. Wording, symbols, placement, and release notes should all reinforce that the status belongs to the object and its handling. Public memory becomes a stigma machine when record-state language is allowed to migrate into human judgment.

The vocabulary should be finite enough to learn and precise enough to govern. Current, disputed, corrected, superseded, delayed, sealed, protected, summarized, draft, simulation, unverified, under review, subject to appeal, and released with limitations are not interchangeable. Each term should answer a practical question about how the item may be read, reused, challenged, or withheld. Without that grammar, readers will mistake visibility for certainty.

Corrected must remain visible rather than disappear into a silent edit. The current object should show that a prior version existed, what changed, when the change occurred, and whether the correction altered public meaning. The earlier version may remain preserved for audit under proper access controls. Correction is not an embarrassment to hide; it is evidence that the memory system can answer its own errors.

Delayed, sealed, and protected states demand category-level explanation. The public may reasonably suspect concealment when material is withheld, while vulnerable people may be harmed if the explanation itself reveals too much. A lawful interface can identify child protection, legal counsel, clinical care, intimacy, nonparticipant masking, security risk, family-law review, or active appeal without exposing the underlying content. The explanation should be sufficient for review, not sufficient for reconstruction.

A status label should work for an ordinary reader and for an auditor. Each label needs a plain definition, responsible authority, start time, review path, expiry or transition rule, and consequence for misuse. Technical precision without usability hides the route from the affected person; friendly wording without testable criteria hides it from oversight. The best label makes the next lawful action easier to identify while limiting the moral inferences a reader is invited to draw.

Status must travel with the record at the point of use. Labels belong beside excerpts, summaries, downloads, transcripts, and derivative public artifacts, not only in a legend that few readers open. Where an official object can be copied or shared, the City

should provide copy-stable identifiers and context so the status is less likely to disappear during circulation. Detached content is one of the principal routes by which accurate records become misleading evidence.

Too many labels can defeat the system as surely as too few. If every item carries a thicket of warnings, readers will stop distinguishing consequential states from routine ones. The taxonomy should be small, teachable, and governed by thresholds that can be audited. Status inflation is a design failure because it turns caution into noise.

Accessibility cannot depend on color alone. Text, symbols, contrast, screen-reader order, plain language, and cognitive load all shape whether a label is usable. The interface should be tested with people who rely on different sensory, linguistic, and cognitive pathways. A status system that only its designers can decode is not public infrastructure.

Changes in status belong to the history of the object. When a record moves from disputed to corrected, delayed to released, or public to sealed, the transition should retain its date, authority, reason, and review trail. Hidden relabeling can rewrite memory without appearing to alter the record. A visible status history makes reclassification answerable.

Label governance must resist pressure from every direction. A powerful participant may seek rapid removal of disputed; critics may want a damaging status retained after review; the institution may prefer ambiguity that protects itself. Independent criteria, conflict rules, and appeal prevent the vocabulary from becoming

a tool of influence. The label should follow the evidence and authority, not the strongest audience.

Official derivatives need the same status discipline as source pages. A machine summary, accessible transcript, media packet, educational excerpt, or downloadable bundle should carry the relevant dispute, correction, protection, appeal, and review state. The official interface cannot claim integrity at the source while distributing unlabeled derivatives. Propagation is part of labeling.

Status grammar protects evidence from moral theater. Corrected names a record action, not exoneration; disputed names an active challenge, not falsity; sealed names access, not scandal; protected names handling, not guilt. Record sites, journalists, machine summaries, and City staff use these distinctions consistently so procedural states do not harden into character verdicts.

Every status label requires a named owner and a review horizon. Without ownership, correction becomes nobody's task; without a horizon, temporary caution hardens into permanent suspicion. The interface should distinguish current, pending, historical, appealed, expired, and scheduled-for-review states because time is part of a record's meaning, not metadata beside it.

Layered labeling solves the tension between brevity and precision. The reader first sees a short plain-language status, then a concise explanation, then a deeper route to authority, history, and review. A long legal note can conceal meaning through complexity, while a badge can conceal it through oversimplification. The layered form keeps public use quick without making expert scrutiny impossible.

10.4.3 — Version History

Version history prevents silent editing. The public record site will evolve because records are corrected, disputes are resolved, release statuses change, protected summaries are updated, and context is restored. Without visible version history, the City can quietly reshape public memory while appearing stable. That cannot be allowed.

A version history should show meaningful changes: added context, correction, redaction, protected-summary replacement, dispute resolution, release after delay, sealing, unsealing, category reclassification, and altered status labels. The public should not need forensic skill to know that a public bundle has changed.

Version history also protects the City from false accusations. If a public item changes for a lawful reason, the version log can explain that reason. If a protected category required masking, the log can show that masking occurred under review. If a dispute was resolved, the log can show the path. Transparency about change builds trust.

The system should distinguish minor technical changes from meaning-changing changes. Formatting fixes, accessibility improvements, typographical corrections, and file migrations should not overwhelm the public log, but meaningful edits must be visible. The City should define thresholds for public notice so version history is neither empty nor unusable.

Version history must not expose protected material through the back door. If a redaction is corrected, the log should not reveal

what the redaction protects. If a nonparticipant name is removed, the log can state that a nonparticipant protection correction occurred without naming the person. Version history itself needs shielding rules.

Version history must protect readers who encounter official material outside the record site. Every public object should carry a stable identifier, current-version check, status date, and visible route back to the authoritative source. When a meaning-changing update occurs, the City should notify known syndication partners and affected people where appropriate. The objective is not perfect control of circulation, which is impossible, but a public path by which reliance can be corrected.

Version history can also protect legitimate learning. A participant or institution should not be punished for correcting an inaccurate public item if the correction is visible and explained. The public should learn to see correction as integrity rather than proof that the whole record is unreliable.

Institutional learning becomes visible when the log connects a corrected object to the process change that followed. A misleading label may lead to a new review trigger; a masking failure may change capture zones; a stale machine index may create a propagation check. The version history should distinguish repair of the individual object from repair of the system so the public can see whether the same burden is likely to recur.

A meaning-changing version entry states the prior state, new state, date, authorizing role, reason, effect on public

interpretation, downstream artifacts, and next review. Technical corrections remain in a compact maintenance layer. This two-level log keeps administrative detail from burying civic change while preserving the provenance needed by auditors, journalists, courts, scholars, affected people, and later stewards.

Versioning should also preserve withdrawn errors. When a public bundle is corrected, the prior public state should not vanish as if it never existed. A visible correction trail teaches institutional honesty and allows harmed persons, journalists, critics, and later reviewers to see not only the current record but the path by which the City repaired memory.

Version history should preserve stable citations. Scholars, journalists, courts, oversight bodies, affected persons, and citizens may need to cite the exact state they reviewed. Version-specific reference must remain possible without creating confusing duplication or allowing an obsolete state to masquerade as current.

Version history should include machine-generated outputs where they affect public interpretation. If a summary, translation, transcript, caption, search result, or recommendation changes, the public-facing meaning may change even if the source record does not. Versioning must follow the public object, not only the source file.

10.4.4 — Protected Public-Bundle Summaries

A protected summary is a governed public object. It should identify the public question answered, protection category, release authority, level of generality, creation date, version,

correction owner, and review date. It should remain linked to source custody without exposing protected content. If source material can be released safely with context, institutional convenience is not a reason to substitute a summary.

Different domains require different forms. Clinical care may permit a functional statement without diagnosis; legal counsel, a process statement without privileged advice; family or child protection, a status statement without identity; and security, a bounded risk statement without operational detail. Category experts should help determine the least revealing form that still communicates the role-relevant fact. For example, a scheduling change may be explained without naming the underlying medical condition. The summary must distinguish what it establishes from what remains unavailable and must not invite readers to infer hidden wrongdoing or certainty.

Writers should be trained in these limits and reviewed independently of public-relations incentives. Review must work in both directions: an affected person may challenge excessive disclosure or mischaracterization, while authorized public oversight may challenge concealment of role-relevant conduct or flattering ambiguity. The answer is a reviewable decision, not automatic raw disclosure.

Available remedies include correction, narrowing, replacement, withdrawal, and a stronger release note. A changed summary should retain a version history where this can be done safely. Scheduled review, new information, legal resolution, or material public misunderstanding should prompt reconsideration. The

more a summary substitutes for source material, the clearer its authority, limits, and challenge route must be.

10.4.5 — Release Notes

Release notes explain why material appears, why it appears in a particular form, and why other material may be withheld, delayed, summarized, sealed, or corrected. They are the public record site's act of accountability around release itself. A record site without release notes asks the public to infer too much from presence and absence (International Council on Archives, 2012; NARA, 2023).

A release note should identify the bundle category, public-power relevance, source authority, status labels, protection categories where applicable, dispute status, version relation, and correction route. It should also state major limits: what the release does not show, what should not be inferred, and whether further review is pending. This kind of note slows misinterpretation.

Release notes are especially important when material is controversial. If a damaging item is released, the note should explain public-power relevance without theatrical language. If a flattering item is released, the note should avoid promotional tone. If material is delayed, the note should explain the category and review clock where lawful. If content is summarized, the note should state the limits of the summary.

Release notes should also identify review pathways. A reader, participant, affected person, or oversight body should know how to challenge classification, report wrongful exposure, ask for context restoration, or find the correction log. A release note

should not only explain the release; it should open the route to contest it.

In high-risk releases, the note may need to name public harm protections. If material could be clipped, sexualized, used to identify a child, trigger harassment, or expose a nonparticipant, the release note should indicate safeguards and public-use limits. Civic release must anticipate misuse.

Public exports should carry a portable provenance stub containing source, version, release status, correction state, and a stable route back to the governed record. The stub should remain usable when the file is detached from the original site.

Release notes should explain enough of the release decision to prevent suspicion without giving away what protection requires withholding. They should state the public-power question, the release form, the protection category if any, the review authority, the status label, and the correction route. A reader should know why the item appears in this form rather than another. The note should also identify whether the release is complete, partial, provisional, or superseded so later readers can interpret its status correctly.

Release notes also help prevent momentum release. Public pressure may demand immediate publication during scandal, campaign conflict, or institutional crisis. A release note forces the City to show the route by which material became public. The note is a small constitutional habit inside the record interface. During high-pressure periods, that discipline gives staff a governed alternative to both premature release and unexplained silence.

Release notes can help build institutional memory for future reform. When release decisions are logged consistently, auditors can detect patterns: overrelease in scandal, underrelease near favored participants, recurring delays in certain categories, or confusion around nonparticipant protection. A release note is therefore both explanation and data for accountability. Over time, those patterns can show whether policy, staffing, or interface design needs correction rather than leaving each release decision isolated.

10.5 — Correction, Right of Reply, and Context Integrity

Correction is not a hidden administrative repair. When an official public interface has carried an error, the corrected record should identify what changed, when, why, and under whose authority, while avoiding unnecessary repetition of the original harm. Participants and nonparticipants require different access routes but equal seriousness. A right of reply can preserve contested interpretation without forcing the archive to declare all claims equally supported. Context restoration may require linking a clipped item to the longer sequence, restoring omitted documents, or explaining a later reversal. Data-protection law, records practice, and journalistic ethics converge on a practical insight: accuracy is a continuing duty rather than a one-time publication event (European Union, 2016; ISO, 2016a; Society of Professional Journalists, 2014).

Public memory will make mistakes. Records may be inaccurate, incomplete, misleading, misclassified, overexposed, underexplained, decontextualized, or harmful in ways the City did not foresee. If the record site cannot correct itself, it will become a new source of injustice. Correction is not a weakness in memory. It is one of memory's rights obligations.

Participants, nonparticipants, affected persons, staff, and host-community members need a route for repairing official public memory when it harms them. A corrected archive is more credible than one that performs infallibility; a visible correction log is

more honest than silent replacement; and a bounded reply can preserve human context when official categories are too narrow.

Context integrity is also part of correction. A record may be technically accurate and publicly misleading because it has been clipped, separated from sequence, stripped of status, or framed by a false narrative. The City must be able to restore context without becoming a speech police force. It must maintain official memory while recognizing that public interpretation happens beyond its walls.

Correction also shows whether the City can accept burden when the institution itself has caused harm. It is easy to praise correction in participants. It is harder to correct the record when the City's own release, summary, label, or interface design created the injury.

The correction architecture should also be kind to time. Old errors may continue to shape new readings; old corrections may be forgotten; old public fragments may circulate outside the site. The City must think of correction as ongoing stewardship, not a single administrative act.

10.5.1 — Participant Correction

A participant correction begins with a specific object and alleged defect. The request identifies factual error, missing source, status mistake, misclassification, incomplete sequence, wrongful release, or material omission. General dissatisfaction with public judgment is not enough, but the route should help a person translate harm into a reviewable claim (European Union, 2016; ISO, 2016a).

The intake body acknowledges the request, preserves the challenged version, applies any necessary interim label, and assigns a clock. Urgent exposure, safety, or identity errors may require provisional shielding before full review. The visible status should say that review is active without treating the complaint as proof.

Access to the relevant source or a protected review pathway is essential. A person cannot challenge an object they are forbidden to understand. Where third-party rights limit disclosure, counsel or an independent reviewer can examine the protected material and explain the basis sufficiently for contest.

The decision should distinguish source error from interpretation. A wrong date, attribution, status, or category may require correction. An accurate but incomplete item may require context restoration. A contested conclusion may require a reply or dispute label. Different defects need different remedies.

When public material changes, the interface should show that a correction occurred, what kind of defect was repaired, and whether the change alters earlier interpretation. The notice should avoid repeating protected content or humiliating the participant. Silent editing hides institutional error; theatrical correction creates another spectacle.

Using the route should never count against the participant as noncooperation, evasiveness, or poor transparency. A lawful challenge is part of governed record, not a breach of the Vow. Anti-retaliation review should examine later admissions, support,

status, staff treatment, and public communication for adverse inference.

Some errors are errors of missing context rather than false source. A dated addendum, linked reply, restored sequence, or corrected status may preserve the original record while preventing the public from reading it as complete. Alteration is not always the most truthful remedy.

Correction access must not depend on confidence, legal literacy, money, or public influence. Plain-language help, translation, disability access, representative assistance, and funded independent advice can prevent the process from becoming a privilege of the articulate.

Disagreement remains distinct from correction. A participant may reject a lawful public interpretation even when the source is accurate. The archive should correct defects, while the reply route preserves disciplined disagreement without falsely declaring all claims equally supported.

The decision record should name the defect category, evidence reviewed, authority, reasons, remedy, propagation duties, appeal route, and implementation owner. That structure lets later auditors see whether similar harms receive similar treatment and whether correction changes practice rather than merely adding a note.

The route cannot become reputation management. Accurate public-power records do not disappear simply because they are uncomfortable. Correction protects truth and dignity by repairing defects, restoring context, and preserving reply, not by turning the archive into a personal brand office.

Correction rights must remain usable when social stamina is lowest. A person may be ill, exhausted, legally constrained, politically attacked, or afraid that complaint will magnify the record. Assisted filing, confidential intake, representation, and time-limited interim protection keep the route open when burden is highest.

Repair must follow every governed derivative. Public bundles, exports, machine summaries, newsroom feeds, cached pages, accessibility versions, translations, research extracts, and graphics should receive a tracked update or an unresolved-status notice. Some copies cannot be recalled, but replacement identifiers, redirects, notices to known recipients, and a propagation log show whether public memory was actually repaired (European Union, 2016; International Council on Archives, 2012; C2PA, 2026).

10.5.2 — Nonparticipant Correction

Nonparticipant correction may carry the greater moral urgency because the person never accepted the Transparent Vow. Visitors, bystanders, family members, staff, professionals, protesters, host-community residents, and incidental contacts can enter public memory through proximity alone. If the City exposes or misrepresents them, they must be able to seek repair without becoming public subjects in the process. The route begins from their independent standing, not from the participant's permission.

A usable nonparticipant pathway should cover wrongful exposure, identity error, masking, removal where appropriate, protected-summary revision, context correction, and remedy for

harm. Intake must be understandable without knowledge of City bureaucracy and available through accessible, trauma-aware, privacy-preserving channels. Urgent cases require interim protection before the merits are finally decided. The process should reduce exposure while it evaluates exposure.

Correction by a nonparticipant is not disloyalty to the institution. It is evidence about whether the City is keeping its burden where it belongs. When public-power visibility spills onto people who did not choose it, the repair route is part of the design's core purpose, not a public-relations concession. Defensive treatment of the complainant would repeat the original injury.

Some claims will expose a genuine conflict between public relevance and private harm. A person's presence may matter to understanding public-power formation even when raw identification would be disproportionate. Masking, pseudonymization, delayed release, protected summaries, affected-person access, or category-level description can preserve public meaning without preserving every identifying detail. Correction should therefore consider alternative forms, not only publication or deletion.

The complaint itself needs protection. A person asking to be removed from wrongful exposure should not become more visible because they objected, and staff should not treat the request as evidence of guilt or hostility. Complaint data require separate custody, limited access, anti-retaliation safeguards, and a clear destruction or retention rule. The remedy route must not multiply the burden it was created to reduce.

High-risk exposure requires an emergency route. A wrongly exposed child, clinician, partner, victim, protester, or bystander may need immediate masking, temporary takedown, search suppression, safety support, or platform notice before ordinary review is complete. Interim action should be logged, narrowly scoped, and capable of being revised as facts change, but speed is part of dignity when delay extends harm.

Repeated collateral harms should trigger redesign rather than an endless sequence of individual cases. If the same camera angle, release template, bundle category, or machine summary repeatedly exposes nonparticipants, the pattern belongs in an institutional failure review. Correction data should therefore feed architecture, training, vendor, and policy changes. A route that repairs people one by one while preserving the cause is incomplete.

Notice is necessary where it is feasible and safe. People cannot challenge exposure they do not know exists, yet notice itself may reveal sensitive circumstances or create danger. The City should define when affected persons are notified before release, immediately after release, or through a protected intermediary. The decision and its reason should be reviewable.

Removal alone may not repair the harm. Depending on the case, remedy can include public correction, apology, compensation, takedown assistance, security support, restored access, future masking, or an audit of the process that caused the exposure. The response should match the injury rather than default to the easiest technical change. A vanished file does not automatically restore reputation, safety, or trust.

The burden of using the correction system should itself be measured. Time, cost, number of steps, need for counsel, emotional load, repeat disclosure, and delay before public repair all reveal whether the route is practically available. A pathway can exist on paper while exhausting the people it is supposed to protect. Usability is part of remedy quality.

Collateral persons should not receive weaker correction rights merely because they stand outside the participant system. Their lack of consent is the reason for stronger care, not lesser standing. The process should recognize visitors, children, partners, professionals, staff, critics, and bystanders as independent affected persons. The City does not own their route through the participant.

Low-burden intake is essential. A person harmed by incidental exposure should not need to master institutional architecture, hire counsel, or make a public statement before receiving help. Plain forms, assisted intake, translation, disability access, confidential channels, and a single accountable case owner place the design burden on the institution that created the record environment. Complexity cannot become a gatekeeper.

Representation must be available when direct participation is unsafe or impossible. Children, dependents, incapacitated people, elders, patients, clients, and people under threat may need a guardian, counsel, advocate, privacy ombuds, or trusted intermediary to act. The representative's authority and limits should be recorded, and the affected person's own voice should be preserved where possible. Protection should not require vulnerability to perform itself in public.

10.5.3 — Record-Site Right of Reply

A right of reply is not a second campaign page. It is bounded by relevance, privacy, nonharassment, and the same protection rules that govern the record. A participant may explain context, remorse, disagreement, or changed understanding, but may not use reply to attack witnesses, staff, professionals, nonparticipants, or critics. The route adds accountable context; it does not license retaliation.

Staff and nonparticipants may need the same route. A public bundle can misdescribe a visitor, misframe a staff action, or imply household consent that never existed. The interface should therefore recognize affected-person replies rather than make the visible participant the sole human voice beside the record. Public memory becomes distorted when everyone else appears only through institutional description.

Every reply needs an explicit status. Readers should know whether it was submitted by a participant, affected person, or staff member; whether it was reviewed for protection; which facts remain disputed; and whether correction or appeal is pending. The source record and the reply should remain linked without either pretending to erase the other. Context integrity comes from relation, not replacement.

The route lets a participant or affected person add a contextual response to public memory. It does not overwrite source records, certify the response as true, or annul a lawful finding. Its function is narrower and still important: a person described by official

memory receives a visible, governed way to speak. The interface should make both the value and the limit of that speech clear.

Records can establish conduct without exhausting experience, pressure, interpretation, later learning, or contested meaning. A participant may explain an error; a nonparticipant may describe harm; a staff member may correct an implication; a critic may answer an institutional characterization. Without reply, the record site risks freezing people inside the language of the organization that recorded them. Contestability restores a measure of human authorship.

A visible label should identify the reply as contextual response rather than source record or official verification. It should name the speaker's role, the record addressed, date, review status, and any live dispute. That grammar protects the speaker from having the response misrepresented as an admission, and it protects the public from mistaking assertion for adjudication. Status belongs at the point of reading.

The route should not force every response into a repentance story. A reply may apologize, correct a fact, dispute interpretation, describe harm, explain later learning, or simply preserve disagreement. The institution should resist the dramatic convenience of treating accountability as a single arc from offense to redemption. Public memory needs room for unresolved but disciplined human complexity.

Official language can be accurate and still fail to express the lived consequence of a decision. A person harmed by a record may need to state what a formal correction cannot capture, provided

the response remains relevant and protective of others. The route should permit human language without converting injury into spectacle. Procedural dignity includes the ability to speak in one's own register.

Popularity cannot determine access to reply. A disliked participant, an unpopular protester, a low-status staff member, or a nonparticipant without a public platform retains the same route. Rights are most necessary when the crowd is least inclined to grant them. The interface should therefore insulate reply decisions from audience approval and institutional prestige.

Not every response should carry the same visibility as the original record. A public reply may be appropriate in one case; a protected response, affected-person note, or summary-level correction may be safer in another. The speaker should receive a reasoned choice among formats where law and protection permit. Flexibility serves dignity only when status and audience remain clear.

Bounded replies can teach readers how accountable memory works. The public sees that an official record may coexist with challenge, explanation, and unresolved disagreement. That lesson is more demanding than a single authoritative story, but it is closer to democratic judgment. Public education is a consequence of the route, not a reason to expose the speaker further.

A governed reply is more than a comment box. It is attached to a specific record, dated, source-labeled, protected against collateral disclosure, moderated for abuse, and reviewable if the institution limits or rejects it. The relationship between record and reply should persist across versions and official derivatives. Context

should not disappear when the object is downloaded or summarized.

Public memory is rarely complete at first release. A person may need to identify what was omitted, what changed later, which constraint shaped the event, or why a public interpretation is unfair. The route does not guarantee agreement; it guarantees that official memory is not the only permitted account of its own limits. Contested memory is often more honest than clean silence.

The boundary matters as much as the right. Replies cannot become campaign messaging, harassment, disclosure of protected material, defamation, or evasion of responsibility. Review should address relevance, collateral-person safety, protected categories, and public purpose without turning the institution into an editor of acceptable viewpoints. A reply may be uncomfortable and still legitimate.

Power inequality determines whether reply is real. The institution has staff and an official interface; the public has attention; the person seeking reply may have neither money nor endurance. The route should attach assistance and a deadline to the disputed object so success does not depend on winning a media contest. A lawful response must remain available even when the speaker is unpopular.

10.5.4 — Context Restoration

Context restoration repairs an official public object when status, sequence, provenance, correction, or protected meaning has been stripped away. It does not give the City ownership of every outside interpretation. The institution may restore what its own

governed record can establish, while criticism and independent judgment remain free. The distinction between correction and image defense should be visible in the trigger and review.

A simulation clip presented as ordinary conduct, a draft presented as final, an old version circulated without its correction, or a protected summary described as proof of concealment can all produce false public meaning. The response should reconnect the fragment to its status, sequence, provenance, and later record. Restoration succeeds when a reader can verify the missing context rather than merely trust an institutional denial. The repaired path should be as easy to find as the fragment.

Speed matters when distortion is spreading. Clips, headlines, platform posts, and machine summaries can establish a durable frame within hours, while a slow correction arrives after the audience has moved on. High-risk cases therefore need a rapid, provisional context notice that can later be confirmed, revised, or withdrawn. Urgency does not justify certainty; it justifies a visible review state.

The institution cannot call every harsh interpretation a context failure. Critics may draw severe conclusions from accurate records and remain within legitimate public judgment. Restoration should be limited to identifiable problems such as wrong provenance, missing status, false sequence, omitted correction, category confusion, or a misleading official derivative. A process that protects institutional comfort would become propaganda by procedure.

Restoration should connect the disputed object to the relevant public bundle, release note, correction log, and reply. That route lets readers move from a fragment back to governed memory without requiring the City to police every conversation. The aim is not to silence interpretation. It is to ensure that accurate context remains available and technically linkable.

External circulation should shape the design from the beginning. A restoration object needs a stable identifier, plain-language status, accessible format, and a short explanation that can travel across platforms without revealing protected material. Responsible intermediaries should be able to verify currency quickly. Context that is technically correct but impossible to reuse will lose to the misleading fragment.

Repeated distortion is evidence about release design. If the same kind of bundle is routinely misread, the problem may lie in sequencing, labels, headlines, excerpts, or missing context rather than in public carelessness. Restoration data should feed future templates and training. Repair after the fact is necessary, but the better result is fewer predictable misreadings.

People who request context repair may face accusations that they are hiding the truth. Anti-retaliation and confidentiality safeguards are therefore especially important for nonparticipants, staff, family members, and other people with little public power. The route should protect good-faith requests while preserving the public's ability to inspect the resulting decision. Seeking accurate context cannot become a new exposure event.

Public artifacts should carry enough context at first release to reduce emergency repair. Short videos, diagrams, captions, guide pages, and summaries need source, status, date, scope, and correction routes proportionate to their reach. High-compression formats deserve more discipline, not less, because they detach easily. A small caption can prevent a large interpretive error.

The duty remains tied to public-power relevance. The City is not responsible for correcting every rumor about personality or private life, and it should not enlarge its record simply to answer gossip. Restoration applies when an official record, official release, or public-power claim is materially misframed in a way the governed interface can responsibly clarify. The boundary protects both public memory and private life.

A practical trigger is material risk of misleading interpretation caused by missing record, status, sequence, provenance, or correction. The institution need not prove that every reader was deceived, but it should identify the public object, the omitted context, the likely consequence, and the authority for intervention. The trigger and decision should be logged so restoration cannot become discretionary reputation management.

Repair may require adding sequence, linking a later correction, changing a headline, revising a machine summary, attaching a role-pathway note, masking a collateral person, or elevating an affected-person response. The chosen action should address the public object that created the misunderstanding. Telling readers to be more careful is not a substitute for repairing a misleading official interface.

Correction remains reachable after release. Old records can reappear years later after original labels fall away. The City cannot control every recirculation, but it can keep the official version current, preserve correction history, issue durable clarifications, and notify known derivatives when renewed use creates foreseeable harm. Time review governs context as well as retention.

10.5.5 — Public Correction Log

A public correction log makes repair visible as part of record integrity. It records material corrections, resolved disputes, status changes, bundle revisions, protected-summary updates, and context restorations that alter public meaning. Silent editing asks readers to trust a changing surface; a visible log makes fallibility answerable (Society of Professional Journalists, 2014; Kovach and Rosenstiel, 2021).

Searchability needs protective limits. Readers should be able to see what changed without using the log to reconstruct protected content, identify collateral persons, or browse vulnerability. Category-level search, controlled detail, and affected-person review can support oversight without creating a new exposure index.

Correction categories should distinguish institutional error, participant or nonparticipant request, legal update, technical fix, version migration, and context restoration. A typographical repair is not wrongful exposure, and a disputed interpretation is not false provenance. The category shapes public meaning, remedy, and later audit.

Where public harm occurred, the log should show remedy status in proportionate terms. It may record protection, reclassification, withdrawal of a compromised bundle, or redesign of a safeguard without exposing protected detail. A corrected record can still leave the injured person without repair.

The log turns institutional error into public responsibility by showing whether the City can identify, explain, repair, and learn from failure.

The log is an institutional memory tool, not a shame archive. Entries stay plain and specific, organized around consequence and repair rather than humiliation or scandal ranking.

Correction patterns can become network-level failure memory. Repeated problems with labels, masking, release notes, protected summaries, or machine outputs should be shared only after de-identification and separation of local facts from general design lessons.

Timeliness belongs in the audit because an accurate correction can arrive after harm has completed its public life. The log records detection, protection, decision, propagation, and completion, and repeated delay escalates.

Plain language should show what changed, why, under whose authority, and whether repair changed the institution.

Official artifacts share the correction system. Videos, tours, summaries, machine outputs, and release labels remain answerable when they misstate roles or expose people. Machine-readable correction links should travel with superseded official

objects so later systems can discover that the earlier version changed.

Correction burden includes delay, repeated disclosure, and every derivative that carried the error. Review must reach search, summaries, artifacts, and outside recipients so the injured person does not carry the institution's coordination failure. Correction changes public memory without erasing history. Public interpretation must keep source custody distinct from the record site, newsroom, civic platform, and machine summary. The log should distinguish derivatives that confirmed correction from destinations that remain unreachable, keeping incomplete repair visible.

10.6 — Record Site, Newsroom, and Machine-Assisted Summary

The archive, record site, newsroom, civic platform, and machine summary perform distinct epistemic jobs. The archive preserves governed source material; the record site publishes official bundles and status; journalism investigates and interprets; the platform hosts interaction; machine systems assist search, translation, summarization, and anomaly review. None is sovereign memory. Each layer needs visible provenance, an accountable human owner, error reporting, challenge, and a route back to source. Risk frameworks can organize governance, mapping, measurement, and management, but they cannot make an opaque output authoritative by attaching a human approval label (NIST, 2023a; UNESCO, 2021b; C2PA, 2026).

The City will not be the only interpreter of its own records. Journalists will investigate. Citizens will discuss. Artificial Intelligence systems may summarize. Civic platforms may host questions. Scholars may analyze. Political actors may frame. Participants may reply. Critics may challenge. This plurality is necessary because no official site should own public meaning.

Role collapse is the central danger. The official record site may try to become the final interpreter. A newsroom may treat its interpretation as if it were the archive. An Artificial Intelligence summary may appear more neutral than it is. A civic platform may confuse popularity with evidence. Public discussion may become mob judgment. The City must distinguish these roles before crisis.

No single memory sovereign is the final principle. Public memory should have official custody, independent interpretation, machine assistance under limits, civic interaction, legal review, scientific boundaries, and democratic judgment. The City should strengthen public memory, not centralize it into one voice.

This separation of voices protects the City from a final temptation: the desire to make memory simple. Public memory should be coherent, but it should not be monolithic. The public deserves a record sturdy enough to inspect and open enough to be challenged (Council of Europe, 2024; NIST, 2023a; UNESCO, 2023).

The City's maturity will be shown by how well it tolerates interpretations it does not control. A record site can be excellent and still be criticized. A newsroom can be adversarial and still be useful. A civic platform can be noisy and still reveal burden. The point is not to end interpretation, but to govern the memory that interpretation uses.

10.6.1 — Record Site Is Official Interface

The record site is the official interface for governed public material. It provides public bundles, status labels, release notes, correction logs, context restoration, dispute visibility, and access routes. Its authority comes from custody and governance, not from final interpretation. It shows what the City is officially releasing and under what conditions (NIST, 2023a; UNESCO, 2021b).

The official record interface reads like a civic instrument rather than a campaign. It presents source, status, time, authority,

context, dispute, correction, and next review in restrained language. Favorable and adverse material receive the same grammar, and the interface neither defends participants nor attacks critics. Credibility comes from predictable structure, durable identifiers, visible revision, and a correction route that works when the institution itself is wrong.

Official interface status gives the record site responsibility. If material is wrong, correction should happen there. If a status changes, the site should show it. If a protected summary is revised, the site should note it. If a bundle is disputed, the dispute should be visible. The site cannot be casual because public meaning will rely on it.

The record site has a bounded authority. It can state what governed City records show, how the material was produced, which status applies, and what correction or dispute remains. Courts determine legal consequences, newsrooms exercise independent editorial judgment, scientists adjudicate scientific claims, election authorities administer elections, and citizens reach political conclusions. The interface supports interpretation by making evidence legible; it does not own the verdict.

The official interface should be stable enough that public references do not decay. Records, bundles, corrections, release notes, and status labels need durable identifiers so public debate can return to the same object. A disappearing link or shifting public item can create confusion as damaging as a false record.

The site should also disclose its governance. Readers should know who operates the interface, who audits it, what correction

route exists, what vendor dependencies exist in category terms, and how Artificial Intelligence assistance is labeled. Official status without visible governance invites suspicion.

The official interface should include a clear statement of non-sovereignty. It can present records, status, correction, and release authority, but it should remind readers that public judgment, legal authority, scientific evaluation, journalism, and democratic choice remain outside its ownership.

The official interface should also be designed to survive leadership change. If new operators, new politics, or new controversies arrive, the site should not become an instrument of the current leadership's tone. Governance, style, correction, and audit rules should outlast personalities.

The official interface should be boring in the best sense. It should resist outrage architecture, infinite scroll, algorithmic sensationalism, popularity sorting, theatrical thumbnails, fan commentary, and shame amplification. Its authority comes from disciplined access, not from engagement.

The official record interface should also expose its own limits. It should tell readers when material is official, when it is summarized, when it is disputed, when it is protected, when it is delayed, when it is under review, and when it should not be used as a verdict. Official does not mean total. It means governed.

The official interface should be designed for review rather than addiction. It should privilege stable navigation, clear source paths, readable summaries, status clarity, search discipline, and correction visibility over engagement metrics. A record site that

optimizes for time-on-page has already begun to forget why it exists.

10.6.2 — Newsroom Is Interpretation

A newsroom interprets. It investigates, compares, contextualizes, questions, exposes, criticizes, narrates, and challenges. This function is essential because the City must not be allowed to narrate itself alone. Independent journalism can see institutional self-protection, participant myth, staff burden, donor influence, public confusion, and record-site weakness that the City may normalize.

Journalism is not the archive. A news story may rely on records, interviews, leaks, context, expert opinion, public reaction, and editorial judgment. It may be excellent or irresponsible. It may reveal truth or distort it. The City should not confuse a newsroom's interpretation with official source memory, and the public should not confuse an official record site with independent investigation (ISO, 2016a; European Union, 2016; NIST, 2020b).

The governing record design should make records usable for journalists while preserving protected categories. Release notes, status labels, provenance, correction logs, and public bundles help responsible reporting. At the same time, nonparticipant masking, intimate-record protections, child shielding, and legal categories must not be broken because a story would become more dramatic with raw detail.

Newsrooms should be free to criticize the City. The City may correct factual errors through context restoration and public correction tools, but it should not treat criticism as disloyalty or

threat. A public-power formation institution needs adversarial interpretation. A City that fears journalism is already drifting toward image protection.

A further requirement is to protect the public from confusing journalism with official classification. A headline may call a participant ready, corrupt, redeemed, fragile, or unfit. The record site should not convert such character labels into official status. It may report specific findings about conduct or a defined procedural decision, with its evidence, authority, and challenge route. Journalism is a civic interpreter. It is not a City status layer.

Institutional memory should expect adversarial journalism and design for it. Records should be citable with context, correction pathways should be easy to find, and public summaries should be clear enough that a journalist cannot plausibly claim the City hid status labels. Good records do not guarantee good reporting, but they reduce preventable distortion.

The record site's relationship to journalism should include correction, not control. If a newsroom misstates official status, the City may provide correction. It should not use correction pathways to intimidate reporting or chill critical interpretation. The boundary between correction and pressure must be guarded.

Journalistic interpretation may also reveal flaws in the record site itself. If reporters repeatedly misunderstand a label, find an undisclosed gap, or expose overrelease, the City should treat that as feedback. The newsroom can become an external sensor of public-memory design.

Journalists also need protection from becoming accidental record subjects. Entering the public interface to ask questions does not place a reporter under the Vow or authorize a profile of sources, movements, contacts, or private life. Media accountability and media privacy require separate rules, especially when hostile audiences target the press.

Archival practice should make room for adversarial journalism without surrendering protected persons to narrative pressure. A reporter may have a strong public-interest question, but that does not erase child protection, medical confidentiality, legal privilege, intimate boundaries, or nonparticipant rights. Journalism interprets under rights, not above them.

Media access must not depend on friendliness to the institution. Preferential treatment for sympathetic newsrooms would make the City media-captured even if formal rules remained unchanged. Access standards should protect independent scrutiny, including scrutiny that produces unfavorable interpretation.

Newsrooms should be able to quote, investigate, compare, and criticize the record site, but they should not receive privileged raw access merely because they are influential. Press freedom and protection duties can coexist when access classes, public-interest standards, delay rules, and affected-person safeguards are specified before controversy arrives.

10.6.3 — AI Summary Is Assistance

Artificial Intelligence may assist retrieval and comprehension, but it cannot become the first institution of memory. A tool can locate

records, compare status labels, summarize chronology, identify open disputes, or translate technical language into plainer form. It may not rank persons, infer moral worth, decide readiness, or convert a complex record state into a civic verdict. The Council of Europe convention, the European Union's AI law, and NIST's voluntary risk framework offer relevant governance comparators; none substitutes for the City's lawful authority, human review, or affected-person remedies (Council of Europe, 2024; NIST, 2023a; European Union, 2024).

Every generated summary should preserve source anchors and uncertainty. The interface should show which records were used, which were excluded or protected, whether the output is current, what disputes affect it, and when a human last reviewed the system or the item. Fluency is not provenance. A smooth paragraph without inspectable sources invites readers to trust style over custody.

Summary use and model training are separate decisions. A tool may be authorized to summarize public bundles without permission to train on protected source records, export embeddings, build profiles, or reuse material elsewhere. Misleading output should enter both the public correction route, where public harm occurred, and an internal failure process, where system repair is required. The secondary-use register must show which authority governs each purpose.

Machine assistance can reduce the burden of navigating complexity, but it cannot supply a verdict. It may explain labels, locate related records, translate terminology, flag dispute, or help a reader follow sequence. Truth, legal effect, public meaning,

motive, dignity, and readiness remain human and institutional questions governed by distinct authorities. The interface should state that limit where the output is read, not only in a distant policy.

The central risk is authority by fluency. Confident prose can make disputed records seem settled, hide uncertainty, and compress protected nuance into a damaging generalization. Ranking and recommendation features intensify that risk by turning design choices into apparent neutrality. The system should be evaluated for the public inferences it invites, not merely for sentence accuracy.

People affected by machine output need an appeal route. Misstated records, omitted disputes, protected inference, mistranslation, exaggerated readiness, or misuse of a protected summary can all cause real public injury. Interim labels and temporary withdrawal may be necessary while review proceeds. The institution should be able to correct both the output and the system behavior that produced it.

Machine-summary authority does not include model training. Any later training use requires its own purpose, authority, and protected-person safeguards under the record lifecycle; a public assistant must not conceal a private dataset pipeline.

Refusal is a necessary capability. The tool should decline requests for protected inference, ranking, motive attribution, person comparison, or answers that the available record cannot support. It should also abstain when a source is under integrity review or when a dispute makes compression materially misleading. A

useful assistant knows the difference between uncertainty and permission to improvise.

Adversarial testing should include leading prompts, attempts to reconstruct protected categories, requests for rankings, deceptive source combinations, and efforts to override status labels. The system should refuse unsafe inference, preserve the attempt where appropriate for security review, and direct the user back to governed records. Testing must examine how the assistant behaves under pressure, not only how it performs on cooperative questions.

Certain disputes and breaches should narrow or disable summary functions. When provenance is uncertain, a record is under integrity review, or a correction has not propagated, continued generation can spread uncertainty as if it were knowledge. Temporary restraint should be status-labeled and reviewed, not hidden. Public access to source records and human explanation must continue where lawful.

The system needs downgrade and exit paths. Poor performance, unsafe inference, vendor failure, overreliance, or inability to read status correctly should trigger restriction, replacement, or removal without breaking access to the archive. Model retirement is part of memory continuity. A public institution should never become operationally trapped by the tool it chose for convenience.

Official machine summaries are convenience layers with visible uncertainty. They can help identify chronology, themes, versions, or relevant bundles, but they cannot replace source records,

human review, participant reply, journalism, or legal judgment. The interface should resist the common tendency to treat the shortest explanation as the final one. Compression is useful only when its losses remain visible.

Auditability requires a record of model version, instruction or prompt class where appropriate, source scope, exclusions, known limitations, review state, and correction history. Logs should be proportionate and protected so they do not create a new surveillance layer. The purpose is to reconstruct consequential output and repair failure, not to retain every user's curiosity forever. A machine summary without a correction route is unmanaged interpretation.

Artificial Intelligence must never become the sole practical interpreter of public memory. Human-readable source pages, plain-language explanation, accessible formats, expert assistance, translation, and non-digital access should remain available beside machine summaries. If the model is the only usable gateway, the record system has transferred public understanding to a vendor and its hidden assumptions regardless of formal policy.

10.6.4 — Civic Platform Is Interaction

A civic platform allows interaction. Citizens may ask questions, submit burden reports, discuss public bundles, flag confusion, request accessibility support, contribute expertise, or participate in bounded civic input where ratified. This interaction can make public memory more democratic, but it can also become noisy, abusive, manipulative, or mistaken for evidence (UNESCO, 2023; European Union, 2016).

Comments are not records. Popularity is not truth. Civic signal is not readiness. Public anger is not proof. Public approval is not human worth. A platform may reveal concern, attention, misunderstanding, lived burden, or manipulation. It should feed review channels carefully, not become a tribunal.

Moderation is therefore part of memory governance. The platform should prevent doxxing, harassment, sexualized commentary, child exposure, nonparticipant identification, bot manipulation, brigade behavior, false claims of official status, and attacks on staff or families. Moderation rules should be public enough to inspect and flexible enough to protect people.

The platform should also protect moderation staff. Civic interaction can generate intense emotional and informational burden. Moderators may see abuse, threats, intimate speculation, false claims, and coordinated campaigns. The City must not hide this labor. Platform integrity includes workload, rotation, support, appeal, and anti-retaliation protections for those who maintain the interface.

The civic platform should distinguish affected-person reports from general comment. A person harmed by a record needs a protected route, not a public thread. A citizen with expertise needs a verified submission path. General discussion should not swallow higher-duty channels.

The platform should also prevent participation metrics from becoming participant metrics. The number of comments, likes, questions, or approvals around a participant should not be treated as readiness evidence. Public attention can reveal interest,

confusion, manipulation, or controversy. It does not measure public worth.

The platform should preserve evidence of manipulation without exposing ordinary users unnecessarily. Bot patterns, brigade behavior, and harassment campaigns should be auditable, but the system should avoid turning civic participation into public surveillance of citizens.

The civic platform should include pathways from interaction into formal process where appropriate. A comment may become a complaint, a burden report, a correction request, or expert submission only through defined channels. This prevents public noise from becoming unofficial adjudication.

Civic platform interaction should be designed so public response does not become evidentiary force by popularity. A thousand comments may reveal civic concern, but they do not prove a record, settle a dispute, determine readiness, or rank a participant. Public interaction can inform review only through bounded channels and protected procedures.

The platform should therefore separate questions, evidence submissions, complaints, expertise, interpretation, public sentiment, and abuse reports. Collapsing them into one feed rewards heat over burden. A fair civic platform helps the public contribute without making crowd pressure sovereign.

A civic platform should include proportionate friction against impulsive harm. Context prompts, pauses before high-risk posting, anti-doxxing warnings, and direct routes to official bundles can slow the conversion of public discussion into

punishment. Friction must remain viewpoint-neutral and subject to appeal rather than becoming covert moderation of criticism.

The civic platform should also protect silence. Citizens may be affected by City records and still choose not to comment, vote, testify, or enter public debate. Public interaction is a right and a contribution channel, not a demand that every burdened person become visibly engaged with the system that touched them.

10.6.5 — No Single Memory Sovereign

Interpretive power should remain plural. Archivists preserve source memory; the record site structures civic access; journalists investigate; lawful authorities decide questions within their jurisdiction; participants and affected persons reply; citizens judge; scholars may study material through separate governance. Each function checks a different burden, and none should absorb the others (C2PA, 2026; Vaccari and Chadwick, 2020).

Concentration should be audited like financial or vendor capture. A single platform, newsroom, search engine, archive office, machine assistant, donor, or public-interface team can become the place where meaning is effectively settled even without formal authority. Convenience is often the route by which this power accumulates. Dependence, reach, correction control, and switching cost should therefore be visible governance questions.

The alternative is governed plurality, not informational chaos. Source custody, status-labeled bundles, independent audit, reply, correction, journalism, machine limits, platform integrity, and lawful review should connect without collapsing. The City makes

public judgment possible but does not own judgment. Memory serves the public best when no single institution can both create, interpret, and close the record.

Platform monopoly is different. A social or civic platform may control attention without controlling the official file, yet viral framing can become the memory most people encounter. The response is not to suppress discussion but to maintain routes back to source, status, correction, and context. Attention should never silently acquire the authority of evidence.

Machine monopoly can emerge when a summary tool becomes easier to consult than the record itself. Users may begin trusting its prose more than sources, replies, law, or human judgment. Visible limitations, source routes, alternative interfaces, and the ability to remove the system are therefore structural safeguards. An assistant that explains everything can become sovereign by habit.

The no-sovereign principle is not hostility to expertise or authority. It is a refusal to let custody, interpretation, ranking, legal decision, and public judgment fuse into one unchallengeable voice. Each function may be strong within its lane. The danger begins when one actor can define the record, explain it, and deny the appeal.

Plural memory still needs structure. Official custody, common identifiers, status standards, correction propagation, and retention rules prevent disagreement from becoming a pile of incompatible fragments. The aim is disciplined tension, not relativism. Public meaning can remain contested while the provenance and state of

the underlying objects stay clear.

Every new dashboard, summary layer, credibility indicator, search feature, research portal, or public ranking should face a concentration test. If it merges functions, creates vendor dependence, or turns convenience into the default verdict, redesign should occur before authority becomes habitual.

Major releases should anticipate independent interpretation, affected-person response, lawful review, and correction. Preparing those routes is not loss of narrative control; it is refusal to claim such control. A memory system that treats disagreement as an incident will eventually pathologize criticism.

No aesthetic should make one memory source feel sacred. Architecture, typography, technical language, and visual authority can make an interface seem more truthful than its evidence warrants. Design should convey gravity while preserving uncertainty, version, and challenge.

People often want a final voice because uncertainty is tiring. The City should cultivate a harder habit: custody, interpretation, reply, correction, and judgment remain in productive tension. Readers learn that habit when the interface shows disagreement without collapsing into disorder.

Governance should translate plurality into lanes and appeals. Archivists, record-site staff, journalists, machine-system owners, platform moderators, auditors, lawful authorities, and affected persons need defined authority and limits. Overlap should be declared, reviewed, and traceable.

The decisive test is whether a person harmed by public memory

can reach an authority other than the one that caused the harm. If every route returns to one office, plurality is fictional. Appeal must cross an actual boundary.

The same principle applies to emotional framing. The institution should not ask the public to revere the archive, fear it, or treat technical complexity as proof of impartiality. Public confidence should arise from source access, correction, independent review, and visible limits. Memory is most credible when the interface does not demand a posture toward itself.

Conflicts among memory actors require a protocol. Source custody, disputed classification, independent interpretation, shielding, and oversight access may collide. The City should identify which authority controls each decision, preserve claim status, and show how appeal, correction, and lawful restraint move through the disagreement.

Separation of memory powers should be visible in ordinary use. Custody, release, journalism, machine assistance, regulation, correction, and public judgment belong to different actors. When one actor absorbs several functions, concentration itself should trigger audit rather than waiting for obvious abuse. Periodic role-accumulation review should flag when temporary combinations of custody, release, interpretation, or correction authority begin to look routine.

Official monopoly is a primary danger. The City cannot be the only narrator of its own records because institutions routinely miss, minimize, or rationalize their failures. Structured releases must remain open to investigation, scholarly analysis, legal

challenge, affected-person response, and public criticism. Custody without external interpretation easily becomes self-protection. External interpretation should remain possible even when the institution believes its own account is complete, because closure of a City review does not end lawful public scrutiny.

A public disagreement register can preserve conflict without grading speakers. It should record what is contested, which source or status is affected, what review is underway, what remains public or shielded, and the next decision date. Unresolved dispute should not disappear into official certainty. Closed disputes should retain the reason for closure and links to superseded public interpretations so later readers can reconstruct how the official account changed.

Chapter 11 — Record Lifecycle and Access

One recording can live several institutional lives. At capture it may be a security event; during access it may be restricted to a small response team; at release it may become part of an official bundle; in journalism it may be interpreted; in research it may become data; in machine training it may become a statistical influence that cannot easily be withdrawn. Treating those stages as one permission is how a transparent institution becomes a dossier system. This chapter follows the record through each transformation and asks what authority, purpose, protection, review, and remedy must be renewed along the way.

The City's record architecture becomes trustworthy when every use has a name and every transition requires renewed authority. A record that exists may still be unavailable for browsing, publication, interpretation, research, training, reuse, or indefinite retention. The active record gains civic value by preserving public-power formation before persona and office. Lifecycle discipline keeps that value attached to the role rather than letting it expand into a general permission over the person.

The record lifecycle is a grammar of permission. It asks what the object is allowed to become, who owns the decision, which evidence supports the transition, who carries new burden, which label must travel, when the permission expires, and how misuse is challenged. The chapter concentrates on permission creep because many serious record harms occur after lawful capture, when a later use is treated as a harmless technical continuation.

The Transparent Vow authorizes a narrow active-period record for adult public-power formation. It does not authorize universal release, collateral-person exposure, scientific research, Artificial

Intelligence training, commercial reuse, merged identity profiles, or machine judgments of trust. The lifecycle preserves that boundary long after the original act of capture by requiring purpose, standing, review, and remedy at each later stage.

A critic should be able to ask what happens after capture and receive a structural answer. The record enters declared custody, receives a category and status, becomes available only through defined access classes, moves toward public release only through review, carries context and correction when released, and returns to time review rather than remaining exposed by inertia. Trust comes from that knowable path, not from institutional assurances that the system is responsible.

The civic question changes as the record moves. Capture governs acquisition; custody governs control and preservation; access governs viewing; release governs public availability; interpretation governs attached meaning; research governs systematic inquiry; Artificial Intelligence training governs model influence; reuse governs new purposes; retention and deletion govern duration. Separating these stages lets each one carry the authority, safeguards, affected-person route, and failure test appropriate to the burden it creates.

Digital convenience is not a lawful bridge between stages. A debugging export can become a dataset; an internal review corpus can become research material; a public bundle can be scraped into a model; a correction log can become a reputation feature; a search tool can become a ranking device. Lifecycle controls make those conversions visible before scale and automation make them difficult to reverse.

Delayed release, escrow, redaction, protected summaries, restricted access, sealing, deletion, and time review are not one category called secrecy. Each has a distinct purpose, owner, clock, status, and appeal. These tools protect children, health, counsel, intimacy, nonparticipants, security, and due process while preserving source memory for later accountability. Reviewability and expiry distinguish protection from a hidden active-power channel.

Lifecycle discipline protects the people who operate the system. Staff need clear duties, least-privilege access, separation of roles, protected refusal, supervision, incident support, and complaint routes when asked to browse, export, release, summarize, or repurpose material improperly. A record architecture that relies on workers silently absorbing ethical conflict is already moving burden away from accountable leadership.

Lifecycle discipline also respects the public. Citizens need material that is authentic, usable, contextual, current in status, corrected when wrong, disputed when contested, and limited when limitation is the honest state. A raw dump transfers interpretive labor and exposure risk to the reader. A closed archive demands trust without evidence. Governed release provides enough structure for judgment while preserving the possibility of challenge.

Three permissions remain especially separate. Public release supports democratic inspection; it does not create research consent. Research consent authorizes a defined inquiry; it does not create permission for Artificial Intelligence training. Training permission does not authorize a trust score, office-eligibility

model, or general person profile. The distinction lets public memory, science, and technical assistance each pursue a legitimate purpose without borrowing authority from the others.

The No Cross-Architecture Dossier rule carries that separation across the series. City records remain distinct from Religion of Fairness participation, Workgame contribution, PTVC research, public voting, donor histories, government files, platform traces, and machine inference. Where a narrow status handshake is genuinely necessary, the interface transmits the minimum fact, purpose, authority, expiry, and appeal route without exposing the underlying record system.

Lifecycle discipline is an ethics of declared transition. Before a record becomes a new kind of object, the City identifies the purpose, authority, affected people, access rule, review clock, expiry, and remedy. Capture does not automatically authorize access; access does not authorize release; release does not authorize research; research does not authorize training; training does not authorize scoring. A later gate may be refused even when every earlier use was lawful.

The formal shorthand “Total Record” can invite incompatible interpretations: raw files for the public, a unique longitudinal dataset, opposition research, donor intelligence, or a permanent machine-readable profile. Public-facing materials should therefore lead with complete active-role record and reserve “Total Record” for defined legal or technical contexts. The lifecycle then replaces those projections with governed states by showing which material exists, which audience may receive which form, what

remains protected, how disputes and corrections travel, and where later purposes require new authority.

The City's record ethic is severe toward hidden influence and hidden use, and humane toward the people who can be exposed by them. It insists on traceable capture, access, conversion, merger, and scoring while protecting children, families, patients, clients, counsel, staff, visitors, protesters, bystanders, and future selves. The point is not softer recordkeeping. It is a stronger institution whose power can be located and corrected.

By the end of the chapter, any City record should answer a practical sequence: what stage is this, what purpose authorizes it, who owns the decision, which people are affected, what status travels with it, when does the permission expire, who may appeal, and what remedy follows misuse? A missing answer should become a stop signal rather than an invitation to improvise.

Enacted law, jurisdiction-specific retention duties, public-record obligations, professional privilege, labor rights, and data-protection requirements remain for competent legal drafting and review. The City-owned contribution is the operational floor beneath that work: existence creates no automatic access, public interest does not erase proportionality, scientific value does not create consent, and efficiency does not create machine authority. Every use must identify its own legal basis or voluntary authority, purpose, burden, review, and remedy.

11.1 — Capture, Access, Release, Interpretation, and Research

The record lifecycle should be modeled as a sequence of distinct authorizations. Capture asks whether information may be acquired. Access asks who may inspect it and for what purpose. Release asks what may leave the controlled system. Interpretation asks who may characterize it and under what standards. Research asks whether systematic inquiry is authorized. Training asks whether machine learning is permitted. Reuse asks whether a new purpose is compatible with the original authority. A single consent box or broad institutional mission cannot answer all of these questions. Records and privacy governance become most reliable when each stage has its own owner, legal or ethical basis, metadata, review clock, audit trail, and closure condition (ISO, 2016a; European Union, 2016; NIST, 2020b).

A useful operational device is a record-stage passport. The passport is not a public score or visible badge. It is an internal governance object attached to a record class, naming the current stage, the permitted next stages, the prohibited next stages, the owner of the gate, the required labels, the affected-person constraints, the appeal route, and the review clock. If a record cannot carry such a passport, the City has not governed it well enough to move it.

The passport idea matters because record systems often fail through transition rather than through original collection. A record may be properly captured but improperly accessed. It may be properly accessed but released in the wrong form. It may be

properly released but interpreted without status labels. It may be properly studied but later used to train a model. Each failure is a different kind of burden movement, so each requires a different stop point.

Institutional practice should also maintain a data map that is understandable by governance, not only by engineers. The map should identify record classes, sensitive categories, nonparticipant risk, authorized repositories, public-interface outputs, research pathways, model-training prohibitions, vendor touchpoints, access logs, retention clocks, and deletion or sealing constraints. A map that only technical staff can read is not enough, because the burden of a record is moral and civic as well as technical.

This stage discipline should apply to metadata as well as content. A timestamp, location, access log, role label, incident tag, search query, route history, or release note can expose as much as a visible recording. Metadata can reveal relationships, routines, clinical interfaces, staff patterns, crisis episodes, family presence, or political pressure. A lifecycle that protects only raw content while leaving metadata free to travel has preserved the appearance of privacy while losing much of its substance.

The practical discipline is to write a separate permission sentence for every stage. The City should be able to say, in plain language, this record was captured for this purpose, accessed by this role, released in this form, interpreted under this status, studied only under this protocol, excluded from training unless separately authorized, and reused only after fresh review. If the sentence cannot be written, the permission does not yet exist.

The record lifecycle begins by refusing the most dangerous simplification in record systems: the idea that collection creates permission. The City captures active public-power formation because the participant has accepted a role-specific burden. That does not authorize every later use. A record can move from creation to viewing, from viewing to public release, from release to interpretation, from interpretation to research, from research to model training, and from training to reuse. Each movement changes who carries burden.

The City therefore needs a cumulative record-use rule: a proposed use is not authorized unless purpose, authority, scope, affected-person protection, contestability, time limit, and review are all present. Purpose without authority is insufficient; authority without scope becomes overreach; scope without protection becomes extraction; protection without contestability becomes paternalism; and permissions without time limits or review can become indefinite. If any element is missing, the use pauses until the gap is supplied or the proposal is rejected.

The test also gives staff and reviewers a common language. Instead of arguing only about whether a use feels important, they can ask which element is missing. Is the purpose too broad? Is the authority wrong? Is the scope too large? Are affected persons unprotected? Is the challenge route unclear? Is the time limit absent? Is review dependent on the same office that benefits from the use? The questions make record power easier to inspect.

Purpose asks why the record is being used. Authority asks who has lawful and institutional power to permit that use. Scope asks what portion of the record is needed. Affected-person protection

asks who may be harmed by seeing, releasing, summarizing, studying, or reusing it. Contestability asks how participants and affected persons may challenge the use. Time asks whether the permission ends. Review asks who audits the decision.

These questions must apply even when everyone involved has good intentions. Good intentions do not prevent drift. An archive team may want faster public explanation. A researcher may want better data. A platform team may want improved search. A journalist may want context. A mentor may want to study patterns. A vendor may want to train an interface. Each desire may be understandable. None should silently override lifecycle boundaries.

The lifecycle stages make those boundaries legible only when they remain operationally distinct. Capture is record creation. Access is permissioned viewing. Release is public availability. Interpretation is meaning-making. Research is formal inquiry under independent governance. Artificial Intelligence training is model-development use. Reuse is any secondary purpose beyond the original stage. The City remains fair only if these words stay separate in practice.

11.1.1 — Capture Stage

Capture is the creation of the record. In the Transparent City, capture begins from a specific moral fact: the participant has entered active public-power formation under the Transparent Vow. Capture is not justified by curiosity, technical ease, institutional appetite, or the hope that future uses might be useful.

It is justified by the chosen role burden of public-power formation (ISO, 2016a; European Union, 2016; NIST, 2020b).

The capture stage must be narrow in purpose even when the active record is broad in scope. This sounds paradoxical, but it is the heart of the City's archive ethic. The active-period record may be comprehensive enough to prevent hidden active life, yet its purpose remains bounded: to preserve the formation of public power for lawful accountability, review, correction, and later public context. Breadth of capture does not mean breadth of later permission.

Every capture system should therefore carry a capture statement. The statement should identify the participant's active status, the spatial and temporal scope, the recording systems involved, the categories of protected handling, the nonparticipant safeguards, and the failure logging rules. Without a capture statement, the archive becomes a fog. With one, the City can later explain what was captured, why, and under which limits.

The next inquiry is who carries capture burden. The participant carries the burden of active record. Staff carry the burden of operating systems. Nonparticipants may carry incidental exposure risk. The public carries the burden of trusting the record's integrity. Future reviewers carry the burden of interpreting context. Because capture touches all of them, it cannot be treated as a purely technical event.

The main misuse at this stage is overcapture by convenience. A system may record more than required because storage is cheap, because vendors recommend it, because auditors want

redundancy, or because the institution fears being accused of missing something. Overcapture can harm nonparticipants, intensify participant load, create unnecessary breach risk, and increase future temptation for reuse. The City must document why each capture channel exists.

Capture is therefore the beginning of accountability, not the beginning of possession. The City may create records under the Vow, but it does not own the person. Capture should make public-power formation answerable while leaving dignity, lawful shielding, nonparticipant protection, and later stage limits intact. If capture is designed as ownership, every later stage will inherit that error.

Capture must also distinguish sensor fact from civic fact. A camera, microphone, keycard reader, document system, deliberation transcript, calendar entry, visitor log, repair ticket, and staff note may all produce material, but they do not carry the same interpretive weight. The City should keep a capture-source class for every record type so later readers know whether they are looking at direct recording, administrative metadata, human annotation, derived summary, or correction history.

The fairest capture system is therefore both complete and modest. It captures the active public-power environment because that is the burden the participant accepted, but it refuses theatrical excess, covert expansion, or needless sensory detail. Capture quality should be sufficient for accountability, reconstruction, correction, and rights protection. It should not turn every breath, gesture, pause, bodily function, or vulnerable interval into civic material unless the record purpose truly requires it.

Capture audit should also test blind spots. A system can be unfair by missing relevant public-power conduct just as easily as by collecting too much. If donor contact, staff influence, back-channel advice, professional dependency, repair work, or technical failure falls outside capture, the public receives a clean record of the wrong thing. Capture review must therefore compare the formal capture map with the actual ways power moves through the City.

Every governed record should carry a record-stage passport. The passport states the original purpose, source class, rights holder, nonparticipant risk, current custodian, permitted stage, authorized roles, release status, retention rule, correction route, research status, training status, last review, next review, and any unresolved incident. It moves with copies and derivatives, but it does not make protected contents public. Its function is to prevent a record from crossing from capture to access, release, interpretation, research, training, or reuse without leaving an intelligible authorization trail. Where the passport is missing or inconsistent, the default is pause and reconstruction, not silent permission (NARA, 2023; ISO, 2016a; ISO, 2017).

11.1.2 — Access Stage

Access is permissioned viewing. It is not the same as capture and not the same as release. A record may exist in the archive while remaining unavailable to most people, available only to a limited reviewer, available to an affected person, or available to oversight under special controls. The difference matters because seeing creates new burden.

The access stage asks who may look, for what purpose, with what training, through what interface, for how long, under what logging, and with what prohibition on copying, leaking, summarizing, or using the material beyond the permission granted. In a serious City, access is not a casual privilege. It is a role-bound act that carries responsibility.

Access classes should be separate because public access, affected-person access, staff access, oversight access, emergency access, research access, and expert-review access do different moral work. The public may need contextual evidence. An affected person may need deeper material to correct harm. Oversight may need source records. Staff may need operational access. Each class requires a different scope and audit trail.

Access is itself a burden route. If it is too narrow, public power hides. If it is too broad, dignity collapses. If it is unlogged, misuse hides. If it is overlogged without protection, staff and reviewers may become afraid to perform legitimate work. The access architecture must place enough responsibility on those who view records that inspection cannot quietly become appetite.

Browsing is the main corruption of access. A staff member, reviewer, official, expert, or authorized user may have a legitimate role and still browse outside purpose. The City must distinguish access to perform a duty from access because a record is interesting. Audit logs, purpose prompts, sampling review, abuse penalties, and affected-person remedies all protect against this drift.

Access is the first stage at which the record begins to move toward another mind. That movement changes the burden. The City should teach everyone who receives access that they are not merely looking at information. They are carrying a limited civic trust. The record has not become theirs. It has entered their duty.

Access should follow function and protection rather than rank. A senior participant receives no automatic breadth, while a technician, clinician, archivist, or investigator may receive narrowly necessary material for a defined duty. Ordinary access uses least privilege; emergency access uses a fast break-glass route with reason, time limit, logging, notification, and later review. The governing question is what this role must see to perform a duty, protect a right, preserve continuity, or repair a failure, and no more.

Every access event should leave its own trace. The access log should record who entered, what class of material was seen, under what purpose, for how long, by what authorization, and whether any export, note, summary, or secondary action followed. This is not bureaucracy for its own sake. It is how the City prevents the viewer from becoming invisible while the viewed person bears the burden of visibility.

Access design also needs a refusal route for staff. A worker may be asked to view material outside their role, pressured to help a superior, or told that speed matters more than permission. The system should let staff refuse improper access requests without retaliation, and it should record the refusal as institutional integrity rather than obstruction.

11.1.3 — Release Stage

Release is public availability under defined conditions. It is the stage most likely to be confused with transparency itself. The City must resist that confusion. Public release can serve democratic judgment, but only when the released material carries context, status, scope, timing, protected-category review, affected-person safeguards, and correction paths.

The release stage asks whether a record should be made available to the public, in what form, with which labels, with what delay, with which redactions, with which summaries, and with what route for dispute. Release is not a natural consequence of capture. It is a separate civic act. It changes the scale of burden from institution to public culture.

Public release should therefore be governed by relevance to public-power formation. The question is not whether someone would click, speculate, condemn, admire, or share. The question is whether public availability helps citizens, lawful institutions, affected persons, critics, or future reviewers evaluate the formation, conduct, burden, correction, or readiness of public power. Curiosity is not sufficient.

The main danger of release is context loss. A clip travels faster than a record bundle. A quote travels faster than a status label. A still image travels faster than the event that explains it. A single painful moment can become a public identity. Release must therefore be designed against fragmentation through context layers, version history, release notes, right of reply, and correction logs.

Release also affects nonparticipants. A participant may be the public-power subject, but a released record can include family members, staff, visitors, bystanders, professionals, or host-community members. Nonparticipant masking, protected summaries, category review, and affected-person challenge rights must occur before release. A public record system that harms people by proximity is not moving burden upward.

Release is where transparency becomes public culture. The City should release enough to make power answerable and withhold or summarize enough to keep accountability from becoming punishment. If release becomes appetite, the City becomes spectacle. If release becomes fearfully narrow, the City becomes opaque. Fair release lives between those failures.

Release should also include a comprehension duty. A public bundle that is technically accurate but practically unreadable moves burden back to citizens, journalists, and affected persons who must guess what the record means. The City should release with enough structure, index, context, status label, and correction pathway that the public can understand the evidence without needing insider knowledge or dependence on a single interpreter.

Release supplies evidence and context, not automatic judgment. The City can provide provenance, status, relevant explanation, correction, and a route for challenge; citizens and institutions may still interpret selectively or in bad faith. That remaining disagreement does not make release futile. It makes versioning, context, public education, independent journalism, and visible correction part of the release design, while preserving humility about what an open record can settle.

Release planning should include hostile-cropping review. Before a bundle travels, the City should ask which sentence, clip, still image, chart, or status label is most likely to be removed from context and weaponized. The answer should not always block release, but it should shape labels, sequencing, summary placement, and correction routes so public evidence remains harder to distort cheaply.

11.1.4 — Interpretation Stage

Interpretation is meaning-making. It begins when a record is described, summarized, explained, judged, compared, clipped, taught, reported, or used to support a conclusion. Interpretation is not the same as data. The same record can be interpreted with care, cruelty, intelligence, ignorance, context, ideology, or appetite. The City must make interpretation visible enough to challenge.

The record itself rarely speaks completely. A draft may be tentative. A pause may be care rather than evasion. A protected summary may carry a legal limit. A delayed release may protect a nonparticipant. A crisis exception may be lawful. A visible mistake may be evidence of correction rather than unfitness. Interpretation decides whether the public sees burden honestly or through distortion.

A lawful lifecycle should therefore distinguish official interpretation, journalistic interpretation, scholarly interpretation, participant explanation, affected-person response, civic discussion, and Artificial Intelligence summary. None of these should be treated as sovereign. Official interpretation may be

incomplete. Journalism may be sharp but partial. Scholarship may be slow. Participant explanation may be self-protective. Machine summary may be fluent and wrong.

The institution must identify who bears the cost of bad interpretation. Participants may be misjudged. Nonparticipants may be exposed. Staff may be blamed. The public may be misled. Future candidates may learn performance instead of accountability. Opponents may weaponize fragments. The institution may protect itself by framing records too favorably. Interpretation is therefore one of the record lifecycle's major power points.

Context integrity is the core safeguard. Interpretation should carry source status, date, role relevance, dispute labels, protected-category limits, known gaps, correction history, and uncertainty where needed. A public record without interpretive humility can become a false verdict. A public interpretation without correction routes can become a public injury.

The interpretation stage should teach citizens to read records as evidence under burden, not as soul access. The City gives the public better material than campaign persona, but not omniscience. A fair interpreter remains able to say: this record matters, this context limits it, this dispute remains, this person is not reducible to it, and this conclusion may need revision.

Interpretation should be treated as a second-order public act. A transcript can show words, but interpretation asks about motive, sequence, pressure, contradiction, omission, and institutional meaning. Those judgments may be useful, but they should not be

smuggled into the record as if they were the record itself. The City should make clear when it is presenting data, when it is presenting an official explanation, and when an outside body is offering analysis.

This distinction matters most when the record is emotionally charged. A clip of hesitation, anger, fatigue, grief, confusion, or silence can invite public overreading. The interpretation stage should require contextual anchors: what came before, what came after, what role was active, who was affected, what correction exists, what protected material is absent, and what uncertainty remains. Interpretation without uncertainty becomes another form of hidden power.

Interpretation should have plural routes where stakes are high. An official explanation, independent newsroom analysis, oversight statement, affected-person reply, and later scholarly interpretation may all coexist. The City does not need one final voice to own meaning. It needs visible routes that let competing interpretations disclose their sources, limits, interests, and corrections.

11.1.5 — Research Stage

Research is formal inquiry under independent governance. The City may produce records that researchers one day find valuable, but operational value is not research permission. The record exists first for public-power formation, accountability, correction, and lawful memory. Scientific use must not be smuggled in through institutional convenience.

The research stage asks a separate set of questions. What is the research purpose? Who reviews it? What consent is required? Which records are necessary? How are nonparticipants excluded or protected? What claims may be made? How are uncertainty and bias handled? Who benefits? Who bears the burden? How will results be corrected or withdrawn if wrong? These questions belong to research governance, not to ordinary archive administration.

Scientific claim status remains with *The Science of Fairness*. A functioning City may generate operational evidence about feasibility, burden, safety, accessibility, participation, correction, and public value under tested conditions. That success does not validate terminal closure, turn PTVC research estimates into public scores, or convert record patterns into scientific verdicts. Any research use needs a separate protocol, measurement bridge, consent or lawful authority, rival comparison, and appropriately bounded reporting.

The central danger is background conversion. A staff team may say that the records are already there. A researcher may say that the dataset is too important to waste. A funder may want evidence. A public audience may want proof. The City must answer that the existence of record does not erase consent, governance, scope, or nonparticipant protection. Usefulness is not permission.

Research access must also avoid social scoring. Findings from City records should not become participant ranking, candidate filtering, civic trust scores, spiritual seriousness, Workgame evaluation, donor qualification, or employment screening.

Research may study patterns under strict conditions. It may not return as hidden authority over persons.

The research stage is a doorway that should open rarely, deliberately, and with independent oversight. If the City treats research as automatic, it betrays participants and nonparticipants. If it forbids all future research forever, it may block learning that could protect future people. Fairness requires a governed doorway, not a hidden tunnel and not a sealed wall.

Research requests should meet a higher standard than curiosity because research can multiply exposure beyond the original civic purpose. A study can preserve records, extract variables, compare participants, publish patterns, and influence future design. Those acts may produce knowledge, but they also move burden into academic, clinical, statistical, and institutional channels. The City must never assume that research is harmless because it is prestigious.

The research stage should therefore require an independent protocol: question, necessity, consent pathway, data minimization, exclusion of nonparticipant material, risk review, publication plan, withdrawal limits, adverse-event plan, and result-reporting duty. Negative results and failed hypotheses must remain publishable. If the City allows only flattering research, it stops learning and begins using science as reputation protection.

Research review should ask whether the City itself is the right source of data. Some questions may be answered with synthetic test environments, published public bundles, voluntary interviews, simulations, external public-administration data, or

ordinary research cohorts. The existence of City records does not make them the least burdensome source. A serious research pathway begins by asking whether the record can be avoided.

11.1.6 — Artificial Intelligence Training Stage

Artificial Intelligence training is not research by another name and not technical housekeeping. It is a distinct use stage because training can produce future systems that infer, summarize, classify, imitate, retrieve, or act on patterns far beyond the original record context. A participant's active record is not automatic permission to train machines.

The training stage asks whether a record may be used to develop or change an Artificial Intelligence model through training or fine-tuning. Evaluation, safety testing, benchmarking, and operational monitoring may use a model without changing its learned parameters; these are distinct uses and still require their own purpose, authority, data boundary, and risk review. Any proposal must also state whether the system will operate inside the City, outside it, in public interfaces, in research, or in unrelated contexts. Each use changes the burden.

The City's fairness discipline treats training use as future burden creation. A record used for training may shape outputs seen by people who never knew the participant. It may embed errors, biases, protected details, emotional patterns, or contextual distortions. It may make future summaries sound authoritative. It may expose nonparticipants through inference. It may create tools that rank, flag, or profile people. These burdens do not vanish because the use is technical.

Separate consent and authority are therefore required. Participant consent to the Transparent Vow is not training consent. Staff role exposure is not training consent. Nonparticipant presence is not training consent. Affected-person access is not training consent. Public release is not training consent. Even public material may be restricted from training where dignity, law, status labels, or purpose limits require it.

Artificial Intelligence systems inside the City may assist with search, alerting, accessibility, translation, summarization, anomaly detection, and workflow support. They may not decide truth, worth, readiness, spiritual status, legal status, public trust, or scientific validity. Training controls must be designed to preserve that subordination. A system trained on City records must not become a hidden judge of City people.

This stage should be governed by a principle of refusal by default. Training may be considered only where purpose is strong, authority is clear, nonparticipants are excluded or protected, bias and error review is possible, human audit remains final, and later use is bounded. If the City cannot explain why training is necessary, it should not treat human records as machine food.

Training a model is not the same as allowing a person to read. A human reviewer can be assigned, audited, sanctioned, and limited in time. A model trained on records can carry patterns into future outputs, embeddings, inferences, retrieval systems, and hidden classifications that may be difficult to reverse. That difference makes model training a separate stage, not a technical extension of access.

Training permission specifies the model class, data classes, excluded categories, training-artifact retention, evaluation duties, deletion or unlearning limits, human oversight, downstream-use bans, and public explanation. If those conditions cannot be stated plainly and enforced, the records do not enter the model. Explainability here begins with authority and purpose, not merely with technical description.

Model evaluation should also include refusal performance. A system exposed to City materials should be tested on whether it declines to infer worth, loyalty, hidden intent, holiness, psychological fitness, public eligibility, or trust. A model that produces elegant summaries while making forbidden inferences is not safe enough for City use, even if its summaries are accurate.

11.1.7 — Reuse Stage

Reuse is any secondary use beyond the purpose, stage, and authority originally granted. It is the stage where record systems often drift over time. A record captured for accountability becomes training material. A public bundle becomes a political ad. A correction log becomes research data. An access log becomes staff evaluation. A summary becomes media content. Reuse is not always wrong, but it is never automatically innocent (International Council on Archives, 2012; NARA, 2023).

The reuse stage asks whether the new purpose is compatible with the original role burden. It asks who authorizes the new use, what additional consent is needed, which affected persons are implicated, whether the use changes public meaning, whether it creates new risk, whether it can be challenged, and whether it has

an end point. If a reuse cannot pass these questions, it should pause.

Operational record practice should classify reuse requests by risk. Low-risk internal correction may be allowed under controlled conditions. Public education may require context and redaction. Research requires scientific governance. Artificial Intelligence training requires separate authority. Media use requires release discipline. Cross-system use is presumptively prohibited unless explicitly authorized by the correct domain and lawful review.

Mission creep often arrives as reasonable requests. Dashboards, recruitment, donor reports, training tools, persuasion, scoring, discipline, or opposition research can turn a bounded archive into propaganda or a general-purpose data mine. Because the first purpose does not travel automatically, every new use needs fresh authority, affected-person analysis, and a closure rule.

A reuse ledger identifies the original and proposed purposes, authority, scope, affected persons, protections, approval path, challenge route, time limit, and public notice where needed. Reuse without that ledger lets appetite replace law.

Reuse tests whether the City can resist its own usefulness. Existing data may lower technical cost, but they do not lower the duty to protect the people who carry new exposure and give them recourse.

A fresh decision sheet names affected persons, exclusions, consent or legal authority, the review body that can refuse, and the status label that travels with reused material. The added time is part of the protection.

Secondary use inherits every correction, right of reply, status change, redaction revision, and oversight finding. Reuse without that history carries an old error into a new room.

Every proposed reuse begins with a notice and compact impact assessment. It states access changes, outputs, retention, reviewer, and whether less data, a protected summary, synthetic material, or no reuse can meet the objective.

Secondary use expires unless affirmatively renewed. Sunset review tests continuing necessity, changed risks, and copy migration; closure revokes access, disposes of derived files, propagates corrections, and updates public status. Escrow and shielding remain accountable only when their owners, triggers, review clocks, and remedies are explicit. A shielded object should remain unavailable for downstream reuse until its release or access status is lawfully changed. The design must address material that must be preserved but not yet released because law, safety, dignity, or nonparticipant protection requires delay.

11.2 — Delayed Release, Escrow, and Lawful Shielding

Delayed release and escrow are justified only when a specific, reviewable harm cannot be managed by a less restrictive measure. Delay may protect an active investigation, emergency response, third party, legal privilege, clinical care, or immediate safety; it does not serve embarrassment control. The escrow record identifies custodian, access conditions, release trigger, maximum interval, review body, notice rule, and audit trail. Every shield has a clock, every clock a responsible reviewer, and every extension reasons that can later be inspected (International Council on Archives, 2012; European Union, 2016; NIST, 2020b).

A delayed record should never be invisible to authorized governance. Oversight should be able to establish its existence, delay category, authorizing office, review date, and possible release or summary conditions. Public notice should disclose these facts only at a level that is lawful and safe: even a record's existence or timing can expose a protected person. Where an individual notice would do so, aggregated reporting and independent assurance should make the withholding accountable without revealing the protected connection.

Escrow should also have an adversarial possibility. A participant, affected person, oversight office, or lawful authority may need to challenge the delay, not merely wait for the institution to review itself. The challenge route should not expose protected content by default, but it should allow an independent reviewer to ask

whether the delay is serving dignity, safety, law, or nonparticipant shielding, or whether it is serving reputation management.

Delay decisions should be written in language that can survive later public reading. A vague note such as sensitive matter withheld is too weak. A better status explains that material is delayed because of a child-protection category, a clinical interface, active security risk, counsel review, nonparticipant masking, or other lawful reason. The public does not need raw exposure to know that a delay has a governed reason.

Lawful shielding needs a visible architecture. The public does not need immediate access to every protected fact in order to know that a fact exists, that a reason for delay has been stated, that a custodian is responsible, that a clock is running, and that oversight can test the decision. Lawful shielding should create a structured public absence, not a hole in memory (European Union, 2016; International Council on Archives, 2012).

The City therefore needs to explain absence without betraying what the absence protects. Too little explanation breeds suspicion; too much explanation defeats the shield. The right standard gives the public enough to know that active public-power conduct is not being hidden while keeping protected persons from carrying the full cost of immediate release.

Delayed release is one of the City's most easily misunderstood tools. A critic may see delay and suspect concealment. A participant may see delay and hope for privacy. An institution may see delay and feel tempted to avoid embarrassment. The City must define delay so carefully that none of these interpretations

can own it. Delay protects dignity, safety, law, and nonparticipants while preserving accountability for later review.

Escrow is the companion idea. A record in escrow is not erased, hidden as a favor, or left to institutional discretion. It is preserved under defined custody while a release condition, review clock, legal proceeding, safety concern, clinical need, nonparticipant protection, or expert category review is resolved. Escrow says: accountability remains, but immediate exposure would place burden wrongly.

Lawful shielding is not an exception to the Vow. It is part of the Vow's humane architecture. The participant cannot maintain hidden active public-power conduct, but the City may shield or delay certain materials to protect legal counsel, medical care, intimacy, children, family-law matters, security, professional interfaces, or bystanders. Shielding protects categories of vulnerability. It must never become a route for unrecorded power.

The practical discipline is time. A delayed record needs a review clock. It needs a reason. It needs a later trigger. It needs an abuse-prevention mechanism. Without these, delay becomes indefinite concealment. With them, delay becomes a lawful bridge between immediate harm and eventual accountability.

Delayed release is a burden-placement instrument. It asks what harm immediate release would create, what harm indefinite withholding would create, who is protected, who is burdened by delay, who reviews the decision, and when the decision must return to scrutiny. A fair City can say both: not now, and not never.

11.2.1 — Delay Purpose

Delay purpose defines why a record is not released immediately. A delay without purpose is suspicion waiting to happen. The City must state whether the purpose is dignity, safety, legal process, medical care, nonparticipant shielding, child protection, security, family-law sensitivity, or correction of context. Naming the purpose keeps delay from becoming atmosphere (International Council on Archives, 2012; European Union, 2016).

The purpose should be tied to a specific burden. Immediate release may burden a child, expose a medical fact, undermine counsel, endanger a person, distort a crisis, reveal a nonparticipant, or turn intimate material into spectacle. Delay is justified only when release now would place burden in the wrong place. The City should not delay because material is embarrassing to the institution.

A delay purpose should also state what accountability is preserved during delay. The source record remains in custody. Access may be available to oversight. An affected person may receive protected access. A summary may be released. A status label may state that material is delayed under defined category review. Delay should not create a blank where public meaning should be.

Moral laundering is another danger. Institutions often use dignified language to protect themselves. A record delayed to protect a child is one thing. A record delayed to protect leadership from criticism is another. The City must distinguish protected-

person burden from reputation burden. Reputation burden alone is not sufficient reason for delay.

Delay purpose should be written in language ordinary readers can understand. A public status label should not hide behind jargon. It should say the category, the reason for withholding, the authority, the expected review, and the nonpublic protections in place. Plain language is part of trust.

The delay purpose is therefore the first check on lawful shielding. It tells the public that the City has not forgotten the record. It tells the affected person that protection has a reason. It tells the institution that shame is not a category. It tells future reviewers what question they must revisit.

A delay should name the harm it prevents. Safety delay, child-protection delay, legal-process delay, medical-stabilization delay, security delay, professional-confidentiality delay, family-law delay, and operational-continuity delay are not interchangeable. Each has a different reviewer, clock, notification rule, and release trigger. When delay categories blur, the public cannot tell whether the City is protecting people or protecting itself.

Delay also carries a least-restrictive-safeguard duty. The decision file should explain why narrow redaction, protected summary, affected-person notice, staged release, or partial access cannot manage the risk. Full delay is justified only when a faster and narrower protection would leave harm that later correction cannot repair. The power to slow public access must include reasons for rejecting the less restrictive route.

Delay should be distinguishable from embarrassment. Reputation risk, political inconvenience, public criticism, donor pressure, staff discomfort, or institutional fatigue should never become delay purpose. The City may protect people from exposure, not protect itself from answerability. A delay code that cannot name a human or legal burden is suspect.

11.2.2 — Escrow Function

Escrow preserves accountability without immediate exposure. A record in escrow remains under lawful custody, protected from deletion, tampering, selective editing, informal access, or institutional disappearance. It is not public yet, but it is not free from review. The escrow function is to hold memory until the conditions for responsible access or release are satisfied.

In the City, escrow may apply to records involving legal counsel, medical care, crisis response, child protection, security, nonparticipant exposure, intimate handling, pending complaint, or unresolved category classification. Each escrow category should have authority, custody, access limits, audit trail, review clock, and trigger conditions. An escrow label should not be a dark room. It should be a controlled room with a door, a log, and a calendar.

Escrow also protects the public from false immediate certainty. Some records cannot be understood responsibly at the moment they are captured. A crisis may still be unfolding. A legal matter may be pending. A bystander may need masking. A protected summary may need expert review. Escrow slows release long enough to prevent harm and misinterpretation.

Escrow becomes dangerous when difficulty alone is enough to trigger it. If every controversial record disappears into protected custody, the public will reasonably suspect strategic concealment. Eligible categories, entry criteria, named custodians, expiry, review clocks, and public status notices keep escrow narrow enough to remain credible.

Escrow also protects against selective pressure. Participants cannot hide merely unflattering material, and critics cannot force release that would harm a child or compromise care. Donors, officials, platforms, and journalists do not decide escrow status. Authority, criteria, and appeal are fixed before pressure arrives.

The escrow function is one of the City's ways of saying that accountability and mercy are not enemies. Memory can be preserved without feeding appetite. Delay can be lawful without becoming concealment. The record can remain answerable even while public release waits.

Escrow should have institutional custody outside the interested office. A record held only by the same body that benefits from delay is not meaningfully escrowed. The custodian should have defined independence, security duties, access logs, audit obligations, and authority to resist improper pressure. Escrow without independent custody is merely storage with better language.

People outside the institution may not see the escrowed content immediately, but the public should be able to see the existence of the escrow event when lawful. A stub can state that material exists, identify the category of protection, name the reviewing

body, state the clock, and identify the public consequence of future release or continued shielding. The stub keeps absence from becoming deception.

Escrow should include technical integrity as well as legal custody. The escrowed record needs checksum, provenance, chain of custody, access controls, migration plan, tamper alerts, and recovery procedures. If the record cannot be trusted when the release trigger arrives, escrow has failed. Preservation is part of protection.

11.2.3 — Shielding Review Clock

A review clock prevents delay from becoming permanent by inertia. Every delayed or escrowed record should carry a time marker: when the delay began, when it must be reviewed, who reviews it, what evidence the review considers, and what outcomes are possible. Time discipline is one of the strongest defenses against hidden power.

The length of the review clock should depend on the category. A medical matter may require one timeline. A legal proceeding may require another. A security issue may require short and repeated review. A child-protection matter may require long shielding with periodic reconsideration. A pending correction may require rapid review. The City should not use one universal clock for every type of delay.

The practical question is who carries the cost of waiting. The public may carry uncertainty. An affected person may carry unresolved harm. A participant may carry suspicion. A nonparticipant may carry safety risk if release is too fast. Staff

may carry review burden. The clock should be set with these burdens in view, not only administrative convenience.

A review clock should also trigger status communication. Silence breeds rumor. A public status note can say that review remains pending without exposing the protected content. Affected persons may need more detailed notice. Oversight may need deeper access. The clock should not only exist internally. It should create a visible duty to return.

A review clock can become calendar theater. An institution may set review dates and then rubber-stamp delay. The review must therefore be substantive. It should ask whether the original purpose remains, whether harms have changed, whether a summary can be released, whether redaction is sufficient, whether continued shielding is lawful, and whether delay is now protecting the institution rather than the people at risk.

The review clock teaches the City that protection is not possession. A delayed record remains under question. The institution must come back, look again, explain again, and revise if burden has shifted. This is how the City keeps lawful shielding from calcifying into secrecy.

A review clock should also have consequences when missed. If a clock expires without review, the record should not simply remain hidden by inertia. The missed clock should trigger escalation, public status update where lawful, oversight notice, and review of why the deadline failed. Time is one of the places where secrecy becomes normal; clocks exist to keep protection from falling asleep.

People using the public interface should know that a clock exists even when the content is protected. A record can be shielded without making time invisible. The status label may say that review is pending, that the next review date exists, that delay continues under a named category, or that oversight has confirmed the current shield. Time labels keep lawful shielding from feeling like a locked drawer with no handle.

11.2.4 — Release Trigger

A release trigger defines the conditions under which delayed material may become public, partially public, available to affected persons, available to oversight, or converted into a protected summary. Without triggers, delay becomes indefinite judgment by mood. With triggers, the City can explain when the next stage may occur.

Triggers may be temporal, legal, safety-based, clinical, technical, or contextual. A case may conclude. A threat may pass. A nonparticipant may be masked. A child may remain protected but a summary may be released. A technical validation may be completed. A right of reply may be added. A dispute label may be finalized. Each trigger should match the reason for delay.

A release trigger should survive pressure from scandal, media campaigns, political opponents, donors, participants, and online crowds. Intensity is not authority. The decision turns on the predeclared condition, lawful purpose, burden analysis, and review route, not on who can generate the loudest demand.

There is also a danger in trigger avoidance. The institution may keep adding conditions so that release never occurs. Oversight

must be able to ask whether trigger criteria are being manipulated. Public summaries should disclose enough of the trigger logic to make abuse harder. Affected persons should have challenge routes where delay harms them.

Release triggers give the City temporal honesty. They turn protection into a process rather than a fog. They tell the public, the participant, nonparticipants, and oversight what must happen before memory moves outward. That clarity is one of the ways the City earns trust without surrendering dignity.

Release triggers should be legible before the crisis arrives. Completion of legal proceedings, safety stabilization, affected-person consent, age threshold, security downgrade, correction of technical failure, independent review, or expiration of a defined harm period may all trigger release or partial release. A trigger decided only after pressure appears will look like public relations rather than rule.

The trigger should also define the form of release. Some delayed records may become raw public bundles. Some may become redacted bundles. Some may become protected summaries with oversight confirmation. Some may remain sealed with a stronger public explanation. The trigger should not ask only whether release occurs; it should ask what form of public meaning can travel without transferring protected burden downward.

A release trigger should never be written so broadly that the institution can avoid it by redefining the facts. Terms such as safe, resolved, stable, or no longer sensitive require decision standards. Who decides that safety exists? What evidence is required? Who

can challenge the decision? A trigger without standards is a promise that can be moved.

11.2.5 — Abuse Prevention

Every protection can be abused. Delay can protect a child, or it can protect a powerful adult. Escrow can preserve legal process, or it can bury institutional misconduct. Shielding can preserve dignity, or it can restore hidden public-power conduct. Abuse prevention is therefore not an afterthought. It is part of the design of lawful shielding (NIST, 2020b; ISO, 2016a).

The first abuse-prevention rule is reason specificity. A delayed record must state its category and purpose. The second is independent review. Someone other than the person or office embarrassed by release should examine the reason. The third is a time clock. The fourth is logging. The fifth is challenge. The sixth is public status where appropriate. Together they make concealment harder.

A credible interface should distinguish protected facts from protected power. A medical fact may be shielded, but a decision made through hidden medical pretext may not be. Legal counsel may be protected. A political strategy meeting falsely routed through counsel may not. Intimacy may be shielded. Coercion hidden inside intimacy may require review. Abuse prevention requires the City to notice when a protected category is used as cover.

Oversight access is often necessary. The public may not see a protected record, but an authorized oversight body may need deeper access to verify that shielding is not being abused. This

requires oversight bodies themselves to be trustworthy, rotated, audited, and constrained. Shielding cannot simply move secrecy to another unreviewed room.

Abuse prevention must also protect against over-release. Not every suspicion of concealment justifies public exposure. A culture that treats every protected domain as suspicious will punish the vulnerable and reward the shameless. Abuse prevention is balanced: it blocks hidden power and blocks public appetite from pretending to be accountability.

The final safeguard is remedy. If a delay was abused, the City must correct the record, notify affected persons, and discipline the responsible pathway. If shielding was wrongly denied, the City must repair the harm. Abuse prevention is credible only when abuse has consequences.

Abuse prevention should look for patterns, not only individual excuses. If one category is repeatedly delayed, comparable participants receive inconsistent shielding, one staff unit invokes security unusually often, or public controversy produces sudden protection language, the system should trigger a pattern review. Abuse often hides in repetition that each isolated decision can explain away. A useful comparison examines similar requests handled by different units, making a recurring institutional practice easier to distinguish from a genuinely unusual case.

Abuse prevention should educate without exposing protected content. Public explanations, aggregate statistics, reversal rates, elapsed-time data, and sample reason codes can show how shielding is governed. The public needs evidence that the City

recognizes secrecy risk and constrains discretionary concealment. Reports should explain the denominator and reporting period, so a count of reversals can be interpreted alongside the number of decisions reviewed.

A purpose-bound system should publish delay and escrow statistics showing category use, missed clocks, and oversight reversals. This makes the protection system answerable without exposing protected content. A correction in the reporting method should remain visible across successive releases, allowing readers to distinguish improved practice from a changed way of counting.

11.3 — Redaction, Protected Summaries, and Category Review

Redaction manages residual identification and meaning risk; it does not create guaranteed safety. Place, time, role, voice, relationship, and unusual events may reidentify a person after direct identifiers are removed, while a compressed summary may protect identity yet distort the institutional act that matters. A strong process defines audience and threat model, tests linkage and inference, documents each removal, preserves the governed source, and reviews repeated categories. The accurate claim is risk reduced under stated assumptions, not anonymity assured (Garfinkel, 2015; Ohm, 2010; Narayanan and Shmatikov, 2008).

Category review is the place where the City admits that some records are not safe for ordinary processing. A child reference, a medical episode, an intimate encounter, a security incident, a legal consultation, a clinical note, a source identity, or a family crisis may be role-relevant in one sense and still dangerous in another. The category label tells the institution to slow down before ordinary access or release logic touches the material.

A protected summary should be written as a bridge, not a veil. It should tell the public what role-relevant burden can lawfully be known while withholding what would turn dignity, safety, or nonparticipant privacy into exposure. A summary that hides all meaning is not accountability. A summary that hints enough to invite speculation is not protection. The craft is to preserve civic relevance without creating a puzzle built from another person's vulnerability.

Redaction audit should include reverse inference. The City should ask whether the remaining text, timeline, location, relationships, pronouns, event sequence, or category labels allow a reader to reconstruct what has supposedly been protected. Redaction that removes a name but leaves the person unmistakable is not real shielding. In a city built around records, inference risk must be treated as a first-order burden.

Sensitive records create a public-meaning problem that cannot be solved by choosing only between raw exposure and silence. A fair record system needs middle forms: narrow redaction, protected summary, category tag, expert review, affected-person path, and audit. These middle forms are not compromises with truth. They are how truth remains public without making vulnerable people pay the entire price (European Union, 2016; Nissenbaum, 2010).

The strongest test for this section is whether a skeptical reader can still understand the public-power issue after protection has been applied. If protection removes all public meaning, the City may be hiding too much. If meaning survives only by exposing protected material, the City has not designed well enough. The chapter asks the archive to become intelligent about form.

Redaction and summary are among the most powerful acts in the archive. They decide what the public does not see, what the public receives instead, and what meaning survives after protection has been applied. A careless redaction can erase relevant power. A careless summary can become propaganda. A careless release can harm a child, expose a patient, compromise legal counsel, or turn intimate life into public appetite.

Redaction removes protected material; it does not smooth the history into a more favorable story. Protected summaries should preserve civic meaning when raw exposure would be wrong, category review should identify sensitive domains before crisis, and independent expertise should enter when staff lack competence. Audit must test both overexposure and concealment disguised as dignity.

Every redaction redistributes risk. Removing too little moves burden onto vulnerable people; removing too much moves burden onto the public as ignorance and onto future reviewers as uncertainty; summarizing badly moves burden into interpretation. The review should identify that transfer explicitly rather than treating redaction as a simple reduction in information.

Protected meaning requires a practical institutional ethic. The public should know what matters for public-power formation. Protected persons should not be exposed merely because the record exists. Oversight should be able to verify the balance. Participants and affected persons should be able to challenge errors. The archive should remain useful without becoming raw.

11.3.1 — Redaction Standards

Redaction standards govern when protected information is removed before broader access or release. The standard is specific enough to guide staff and constrained enough to prevent institutional hiding. It names the protected category, exact scope, reason, authority, reviewer, public status, and appeal route, then records what meaning may have changed through removal (Garfinkel, 2015; Ohm, 2010).

Lifecycle governance should redact only what must be protected. Redaction should not remove public-power relevance merely because it is uncomfortable. It should not erase staff influence, donor contact, participant misconduct, institutional failure, or decision pathways under the language of privacy. Narrow removal is the safeguard. Broad removal is a danger.

Protected categories may include children, medical information, legal counsel, intimate material, reproductive health, safety-sensitive locations, nonparticipant identifying details, cybersecurity details, active security operations, and some family-law materials. Each category requires its own standard. A child-protection redaction is not the same as a security redaction. A legal redaction is not the same as an intimate dignity redaction.

Redaction should be visible as redaction. The public should not be given a smooth record that conceals the fact that material was removed. Status labels should say that redaction occurred, identify the category where lawful, and provide a public explanation of the reason in general terms. Visible redaction respects the public by acknowledging that memory has been handled.

The danger of redaction is two-sided. Under-redaction can harm people. Over-redaction can hide power. The City should therefore require second review for high-impact redactions and sampling audit for ordinary redactions. Affected persons should have correction routes if redaction fails to protect them or if redaction misrepresents their role.

Redaction standards should never be treated as a nuisance. They are one of the archive's central tools for remembering with mercy. A record that cannot be safely released raw may still be released with public meaning if redaction is precise, reviewable, and honest about what it has done.

Redaction should be narrow enough that the public can still see the accountable act. A redaction that removes names, medical details, child information, or intimate facts may be proper. A redaction that hides the decision path, influence chain, role conflict, public consequence, or reason for action may defeat the point of the record. The standard must distinguish protected vulnerability from power-relevant fact.

Every redaction should carry a reason code and a reviewer path. The reason code should be understandable without exposing the protected content: child material, medical privacy, legal privilege, intimate dignity, safety, nonparticipant identity, or security. The reviewer path should allow challenge by those with standing. This makes redaction accountable without requiring the public to see what the redaction protects.

Redaction design should account for mosaic risk. Separate harmless fragments can combine into exposure when dates, locations, role titles, family references, rare medical facts, language patterns, or unique events are placed together. A redaction reviewer should read across the bundle, not only within a single paragraph or clip.

11.3.2 — Summary Standards

A protected summary provides public meaning without raw exposure. It may describe the civic relevance of protected material, the status of a dispute, the existence of a protected category, a decision outcome, or a burden pattern while withholding the details that would harm a person or violate law. Summary is not concealment if it is honest, bounded, and reviewable.

A protected-summary standard defines what the summary may do: identify public-power relevance, explain why raw material is protected, describe timeframe or decision consequence, preserve an oversight finding, and maintain affected-person dignity. It does not editorialize beyond the record, shelter the institution through vague language, or turn withheld detail into insinuation. Readers should know both the summary's civic function and its evidentiary limit.

The best protected summaries are humble. They say enough to prevent false public blanks and not so much that protection becomes theatrical. For example, a summary may state that a record involves protected medical handling and no public-power misconduct was found, or that a protected family-law issue affected schedule but not decision authority. The details may remain shielded, but public meaning is not abandoned.

The next inquiry is who carries the cost of summary. The public may carry less detail. The protected person carries less exposure. The participant carries the risk of partial interpretation. The institution carries the duty to be accurate. Oversight carries the

duty to verify. A summary is fair only if these burdens are acknowledged and contestable.

Summary abuse can occur in both directions. A summary can sanitize harmful conduct. It can hint at protected material in a way that invites speculation. It can imply wrongdoing without evidence. It can be too vague to help civic judgment. It can become the institution's preferred narrative. The City must therefore require summary review, right of reply where appropriate, and correction logs when summaries change.

A protected summary should be honest about its limits. It should tell the reader whether it omits raw words, names, medical detail, intimate content, child material, security detail, or privileged communication. It should not pretend to be a full substitute for the record. Its authority comes from describing the protected absence while preserving the public meaning that can lawfully be shared.

Summaries should be reviewable by more than the office whose conduct is summarized. The risk is that a summary becomes narrative control. A fair summary process should include source linkages, drafting logs, reviewer identities or bodies, correction routes, affected-person reply rights where appropriate, and a public version history. A summary should reduce exposure, not become a polished defense.

Summary language should avoid moral laundering. It should not soften misconduct, flatten conflict, hide uncertainty, or turn an affected person's objection into institutional phrasing. A protected summary can be humane and still exact. Its duty is not to make

the City look calm; its duty is to carry public meaning without exposing protected material.

11.3.3 — Category Review

Category review flags sensitive material before release decisions are made. It asks whether a record involves children, health, clinical care, legal counsel, intimacy, reproductive health, pregnancy, custody, security, cybersecurity, professional interfaces, nonparticipant exposure, or other high-risk domains. The point is to prevent ordinary release workflows from handling extraordinary material casually.

Category review should occur early in the lifecycle. Waiting until public release creates momentum and pressure. A record should be classified at capture or first review where possible, then revisited if context changes. Category labels should be stored with provenance so later reviewers understand why the record was treated differently.

Any defensible lifecycle has to avoid category inflation. Not every uncomfortable record is high-risk. If ordinary misconduct is mislabeled as protected, power hides. If every record receives a sensitive label, the public interface becomes useless. Category review should be principled, not defensive. It should identify real protected domains, not embarrassment.

Some records carry multiple categories. A crisis event may involve medical care, security, staff conduct, nonparticipant exposure, and participant decision-making. Multi-category records should not be pushed through the simplest path. They require layered handling. One part may be redacted, another

summarized, another released to oversight, another held in escrow.

Category review also determines expert need. Staff should not improvise child protection, trauma interpretation, legal privilege, reproductive health handling, family-law status, cybersecurity risk, or intimate-record release without specialized review. The category label should trigger competence, not merely caution.

A mature City will treat category review as an act of humility. The archive admits that not all material can be handled by the same process. Some records require slower judgment because they carry heavier burden. Category review keeps the City from pretending that one transparency rule solves every human domain.

Category review should happen early, preferably at capture and again before access or release. Waiting until public demand arrives creates pressure to decide quickly and invites mistakes. Early tagging does not decide final release, but it tells the lifecycle that a record contains child, medical, legal, intimate, security, professional, nonparticipant, or other high-risk material requiring special handling.

The categories should be conservative at first and precise over time. Overinclusive flags can slow access unnecessarily; underinclusive flags can expose people. The City should therefore allow provisional tagging, specialist review, correction, and audit. The goal is not perfect classification by machine or staff intuition. The goal is a defensible path for careful human judgment.

Category review should be revisited when context changes. A security category may expire; a child-protection category may change when a person reaches adulthood; a legal category may shift after proceedings end; a medical category may remain sensitive long after public interest fades. Category labels should open review, not freeze reality.

11.3.4 — Expert Review Need

Expert review need marks the point where the City must admit that internal judgment is not enough. Some records require legal expertise, clinical judgment, child-protection knowledge, disability expertise, trauma review, cybersecurity analysis, family-law review, data-protection expertise, or independent ethics review. The City is not weakened by seeking expertise. It is strengthened by knowing its limits.

Expert review is purpose-bound. Reviewers receive the minimum material needed for the question, a logged role, confidentiality and conflict rules, a reuse limit, and a visible review trail. Their conclusion remains contestable and cannot silently govern unrelated matters. The City solves a technical problem without creating an unreviewed center of authority.

The governing inquiry is what expertise protects. It protects children from adult assumptions. It protects patients from amateur clinical judgment. It protects legal counsel from institutional trespass. It protects intimate dignity from public appetite. It protects cybersecurity from naive disclosure. It protects disabled participants and staff from design blindness. Expertise is one way burden is not dumped on the unprotected.

Expert review should also protect the public from false assurances. An internal team may say that a redaction is necessary. An expert may reveal that a summary would be sufficient. An internal team may say that release is safe. An expert may reveal hidden risks. Expertise can narrow secrecy and narrow exposure. Its purpose is not always to withhold; sometimes it is to release more responsibly.

Expert capture remains possible. Experts may be selected because they agree with the City, depend on City access, serve donors, favor a profession's norms, or misunderstand the City's unique burden. Expert panels should therefore be rotated, conflict-reviewed, and sometimes adversarial. Expert review should remain accountable to the record's purpose and to affected persons.

Expert review need turns the City away from self-sufficiency. A City that records difficult human life must not pretend it has all knowledge inside itself. Seriousness means knowing when the next act of fairness is to ask someone qualified, independent, and reviewable to help decide what should happen to a record.

Expert review should follow the type of harm and decision. Clinicians assess health and treatment burden; lawyers address legal authority and privilege; child-safeguarding specialists examine child risk; accessibility reviewers examine usable access; security experts assess technical and physical threats; records professionals examine custody and lifecycle. A review map can require joint judgment where domains intersect, while preventing any single profession from becoming a general authority over the person.

Expert review should also remain accountable to the City's public-purpose boundary. Specialists may recommend shielding, summary, delay, notice, or release form, but they should not silently redefine the City's mission. The expert protects the domain of risk; the institution remains responsible for explaining how that risk interacts with public-power accountability. Expertise without route can become another hidden power.

Specialists contribute reasons, evidence, and professional judgment without inheriting the institution's responsibility. The City should record the question asked, information supplied, conflicts, opinion, dissent, decision owner, and action taken. That trail protects experts from scapegoating and prevents operators from hiding behind professional prestige. Accountability remains with the actor authorized to decide and with the institution that designed the route.

11.3.5 — Audit of Redaction

Audit of redaction tests whether protected handling remained accurate, narrow, justified, consistent, and documented. It examines residual identifiability, the quality of protected summaries, category assignment, decision authority, access logs, correction, and whether protection language concealed institutional failure. Review should include samples of material that was released, withheld, and later reclassified so the audit can detect both exposure and overshielding (Narayanan and Shmatikov, 2008; ICO, 2025).

An audit should review both individual decisions and patterns. One redaction may be defensible. A pattern of redacting staff

influence, donor contacts, participant errors, or institutional failures may reveal drift. A pattern of under-redacting nonparticipants may reveal public appetite. The audit must look for burden movement across time, not only compliance in isolated files.

The audit should include sample review, high-risk case review, affected-person complaints, oversight access, expert sampling, and public summary of audit findings where lawful. It should not publicly expose the very material the redaction protected. The point is to make the redaction system answerable without undoing its protections.

The City's fairness discipline treats audit as a burden return. Redaction decisions move knowledge away from the public for reasons of dignity, law, or safety. Audit returns burden to the institution by requiring it to justify that movement. Without audit, the City asks the public and affected persons to trust its discretion too much.

Redaction audits should produce reform. If staff misunderstand a category, training changes. If a rule is overbroad, it narrows. If repeated access logs show curiosity browsing, controls change. Audit without correction becomes ritual.

Redaction audit should include both over-redaction and under-redaction. Over-redaction hides power and creates public suspicion. Under-redaction injures people and destroys trust. A serious audit samples decisions in both directions, reviews contested cases, compares similar categories, checks reason

codes, and asks whether protected summaries preserved enough public meaning.

The audit should also include the experience of affected persons. A redaction may look technically correct while still exposing a pattern, relationship, location, health condition, or family fact through context. Affected-person feedback does not decide every case, but it helps the City see burdens that technical reviewers may miss. Privacy harm often arrives through inference, not only through visible words.

Redaction audit should include public usability. If citizens repeatedly misunderstand redacted bundles, if journalists cannot distinguish protected absence from missing evidence, or if affected persons find summaries misleading, the redaction system may be technically correct and civically weak. Audit should test whether protected records still tell the public what it has a right to know.

11.4 — Public, Affected-Person, and Oversight Access

Access should follow standing, purpose, and proportionality rather than a single public-private switch. The general public may need official bundles and accountability records. An affected person may need fuller access to understand and contest harm. Oversight bodies may need protected source access. Emergency personnel may need temporary, logged access to save life or prevent imminent harm. Researchers and journalists may require governed pathways rather than privileged browsing. Differentiated access is not secrecy when categories, reasons, review, and audit remain visible. It becomes secrecy when the institution can move inconvenient material into an unreviewable class or deny an affected person the information necessary for remedy (UN Human Rights Committee, 2011; International Council on Archives, 2012; European Union, 2016).

Access rights differ by audience. The public needs civic evidence. Affected persons may need deeper access for remedy. Oversight needs depth to test what the public cannot see. Emergency actors may need fast access to protect life. Staff need operational access that ends when the duty ends. Combining these audiences into one access category would either overexpose people or disable accountability (European Union, 2016; NIST, 2020a).

Access categories should be taught as civic humility. The public is not insulted by having some material withheld under review; affected persons are not privileged for needing remedy; oversight is not sovereign because it sees more; staff are not owners because they operate the system. Each access path carries a burden

appropriate to its function, and each path can fail if it forgets why it exists.

Access also differs by duty. Public access is broad but contextual. Affected-person access may be deeper but narrower in purpose. Oversight access may be deepest but heavily constrained. Emergency access may be urgent but temporary. Staff access may be routine but logged. The burden question asks who carries burden if each access path fails.

Record accountability also depends on preventing access privilege from becoming status. A person with deeper access is not closer to truth in a spiritual or social sense; that person is carrying a duty. Oversight, staff, experts, and emergency responders must not become a hidden class who know the real story while the public receives narrative. Access hierarchy is justified by purpose, never prestige.

11.4.1 — Public Access

Public access is the City's democratic-facing access layer. It gives citizens structured material for evaluating public-power formation. It should make the record more useful than campaign persona without turning the archive into a spectacle machine. Public access must be broad enough to matter and bounded enough to protect dignity (UN Human Rights Committee, 2011; International Council on Archives, 2012).

People using the public interface should receive records through bundles, context layers, status labels, summaries, correction logs, dispute notices, and plain-language explanations. Raw archive browsing should not be the default. The public interface should

help readers understand what they are seeing and what they are not seeing. A record without context can become a weapon against both truth and dignity.

Public access should be tied to public-power relevance. Citizens do not need every detail that exists. They need material that helps them evaluate formation, conduct, correction, reasoning, staff influence, conflict handling, role readiness, and lawful limitations. If a detail does not serve public-power relevance and creates harm, it should be withheld, summarized, or redacted.

Democratic access can be corrupted by voyeurism. More disclosure may feel like more accountability even when the additional material contributes only intimacy, humiliation, or spectacle. Public interest should be tied to the question of public power, while appetite remains outside the release rationale. Citizens need evidence for judgment, not a license to consume vulnerability.

Public access also requires accessibility. Records should be readable by nonexperts, people with disabilities, people who use assistive technologies, people with limited time, and people outside elite civic language. Access that only experts can use is not public access in the full sense. Plain explanation is part of fairness.

Public access is the outer face of the City's memory. If it is too narrow, the City hides. If it is too raw, the City harms. If it is too polished, the City persuades rather than informs. The fair public interface gives enough to judge, enough context to understand, and enough restraint to avoid appetite.

Public access should be designed for civic use, not endless consumption. Search, browsing, feeds, alerts, clips, and recommender tools can turn public evidence into addictive material. The City should make important records findable and understandable, while resisting design choices that reward voyeurism, outrage, or partisan fragment extraction.

A public access system should offer context-first pathways. Before a user reaches raw material, they should be able to see the record class, status label, correction history, relevant summaries, protected absences, and uncertainty notes. This does not prevent bad-faith use, but it makes fair use easier than unfair use. Design cannot guarantee virtue; it can lower the burden of responsible reading.

Public access should include rate limits and anti-harassment design where needed. A record site can be open without enabling mass scraping, stalking, intimidation, automated clipping, or harassment campaigns. The City should not confuse maximum extractability with democracy. Access exists to support public judgment, not to mechanize public cruelty.

11.4.2 — Affected-Person Access

Affected-person access protects people who are named, shown, implicated, harmed, misrepresented, or otherwise burdened by a record. An affected person may be a participant, staff member, family member, visitor, bystander, professional, complainant, host-community member, or someone whose rights or reputation may be impacted by the record. Their access need is different from general public access.

Affected persons may need access to correct memory, challenge release, request redaction, understand harm, support a complaint, seek remedy, or respond to public interpretation. That access may be deeper than public access, but it should be limited to the affected purpose. The goal is protection and correction, not general archive browsing.

The burden lens places special weight on affected-person access because harm often begins when records speak about people who cannot respond. A public record system without affected-person routes becomes an unanswerable authority. A person wrongly exposed or mischaracterized must have a way back into the record.

Affected-person access must protect other affected persons too. A complaint record may involve multiple people. A family record may include children. A staff record may include protected employment details. Giving one person access should not wrongly expose another. The City must sometimes use summaries, supervised review, redacted views, counsel-mediated access, or oversight routing.

Notice is part of affected-person protection. People cannot challenge what they never know exists. Where lawful and safe, affected persons should receive notice of planned release, disputed interpretation, or harmful exposure. Where notice would create danger, oversight should document the reason and review it.

Affected-person access makes the record less imperial. It says the archive is not only for public viewing or institutional memory. It

is also accountable to the persons it touches. A City that cannot let affected people correct its memory should not claim to make power answerable.

Affected-person access may need to be deeper than public access because remedy often requires detail. A nonparticipant whose words, image, relationship, professional role, family status, or safety was affected may need to see enough to understand the impact and challenge the handling. The City should not tell affected persons to trust a public summary if their own rights are at stake.

This access should be trauma-informed and supported. Some records may be painful to view, especially where harm, humiliation, conflict, illness, or family exposure is involved. Affected-person access should include notice, explanation, support options, viewing controls, copy limits where lawful, appeal paths, and an ability to request correction or contextual reply. Access without care can become a second injury.

Affected-person access does not require public self-exposure. A harmed or implicated person can seek review, correction, protection, or representation through confidential and accessible routes, with public status only where necessary. The remedy path preserves standing without demanding theatrical visibility from someone already burdened. Public explanation describes institutional responsibility rather than consuming the claimant's privacy.

11.4.3 — Record Oversight Access

Oversight access enables deeper review than public access. Oversight bodies may need source records, protected material, redaction originals, access logs, classification decisions, escrow records, breach histories, complaint files, and internal audit material. Without oversight access, the City's public interface could become a polished surface over hidden failure.

Oversight access must be broad enough to test the institution and narrow enough to prevent oversight from becoming another sovereign. The reviewer's purpose, authority, scope, confidentiality, conflict status, logging, reporting duty, and limits on reuse should all be defined. Deep access without limits is not oversight. It is a new hidden power.

The institution must identify who audits the burdens the public cannot see. Oversight may inspect protected material so the public does not have to. It may verify that redactions are legitimate, that delays are not abusive, that staff are not browsing, that nonparticipants are shielded, that Artificial Intelligence systems remain subordinate, and that vendor systems are not capturing memory.

Oversight access should produce public summaries where possible. The public may not receive raw protected material, but it should know whether oversight found the shielding justified, the breach repaired, the access abuse disciplined, or the redaction overbroad. Summary reporting keeps oversight from becoming a silent room.

Oversight can itself be captured. Oversight bodies can grow dependent on access, prestige, funding, or institutional relationships. Rotation, conflict review, audit of auditors, meta-complaint routes, and external red teams are therefore necessary. Deeper access must carry deeper accountability.

Oversight access should include enough depth to test the institution's story. If oversight can see only what the City already chose to release, it is public relations with a formal seal. Oversight must be able to inspect raw protected material, access logs, delay justifications, redaction decisions, staff browsing patterns, technical failures, and contested summaries under strict confidentiality.

Oversight bodies should also publish their own limits. Who appointed them, who funds them, what conflicts they hold, what data they can see, what they cannot see, what methods they use, and how they are audited all matter. The City should not ask the public to believe in oversight by title. It should show the burden oversight itself carries.

Oversight access should include technical reproducibility. If an oversight body reviews a search result, timeline, transcript, model summary, or public bundle, it should be able to reconstruct how that output was produced. Auditability requires more than seeing content; it requires seeing the path by which content became public meaning.

Oversight access should produce an access-decision record separate from the substantive material reviewed. That record identifies the request, purpose, scope, approving authority,

conflicts, conditions, start and expiry time, queries or exports performed, findings category, downstream disclosure, and destruction or return of working copies. It should be available to an independent auditor and, in protected form, to the affected person where lawful. The point is not to expose oversight deliberation; it is to prevent privileged inspection from becoming an invisible second archive with no accountability of its own (European Union, 2016; NIST, 2020a; International Council on Archives, 2012).

11.4.4 — Emergency Access

Emergency access protects life and continuity when ordinary access procedures would be too slow. Medical crisis, fire, security threat, cyberattack, missing-person concern, family emergency, infrastructure failure, or immediate harm may require rapid viewing or use of records. The City must allow emergency access because care comes before evidence.

Emergency access should be tightly defined. It should state who can invoke it, what circumstances qualify, what records may be accessed, how the access is logged, how long it lasts, who reviews it afterward, and how misuse is corrected. Emergency cannot be a general password for bypassing the lifecycle.

The relevant test is what burden delay would create. If waiting for ordinary review would endanger a person, damage continuity, worsen a crisis, or prevent urgent care, emergency access may be justified. But the same lens asks what burden emergency access creates. It may expose protected material, create staff power, or become a secrecy habit. Both burdens must be counted.

Emergency access should trigger after-action review. The review should ask whether the emergency was real, whether the access was necessary, whether the scope was limited, whether protected persons were harmed, whether notice is required, whether records need correction, and whether the protocol should change. Emergency is not outside accountability. It is accountability on a delayed clock.

Emergency logic must remain exceptional. Staff shortage, convenience, reputation risk, political pressure, or recurring operational difficulty should not be relabeled as emergency simply because the label accelerates access. A genuine exception protects life, safety, or essential continuity, carries a clock, and returns to ordinary review as soon as the danger permits.

Emergency access expresses one of the City's humane limits. Record rules exist for people, not the other way around. When life or safety is at stake, the City may act quickly, but it must return to the record afterward and explain why quick action was necessary.

Emergency access should have a break-glass design. Breaking the glass should be possible when life, safety, or continuity demands it, but the break should make noise. The system should log the event, notify a responsible reviewer, freeze relevant context, preserve a reason statement, and require after-action examination. Silent emergency access is not emergency access; it is a secret exception.

The emergency pathway should include human discretion because not every crisis fits a code. But discretion should be

bounded by duty, training, and post-event review. The City should honor the person who acts quickly to protect life, and it should still ask whether the action was necessary, proportionate, and repairable. Care before evidence does not mean care outside accountability.

Emergency review should include care outcomes as well as rule compliance. Did the access help? Did it reduce harm? Did it create new injury? Were affected persons notified when appropriate? Were staff supported after the event? A system that reviews only whether the box was checked may miss whether the emergency pathway actually served life and dignity.

11.4.5 — Abuse and Browsing Controls

Abuse and browsing controls prevent authorized access from becoming curiosity, gossip, harassment, informal power, or hidden interpretation. The City's records will be unusually interesting to many people. Interest is not purpose. A person with access should not be able to wander through lives because the system permits it (European Union, 2016; Bovens, 2007).

Browsing controls include purpose prompts, role-limited views, access logs, unusual access alerts, sampling audits, peer review, separation of duties, training, sanctions, and affected-person notice where appropriate. These controls should not make legitimate work impossible, but they should make purposeless access difficult and visible.

Abuse can also occur through accumulation. A staff member may view many records, each technically allowed, and build a private sense of a person. An analyst may search patterns that reveal

protected facts. A reviewer may access records outside their assigned case. A moderator may clip material for private sharing. Controls must detect patterns, not only individual violations.

The City's fairness discipline treats browsing as a burden theft. The person viewed carries exposure without public purpose. The institution gains informal knowledge without authority. The viewer gains power without accountability. If browsing becomes normal, the City becomes surveillance from within even if public release rules are strong.

Controls must also protect against overcontrol. If staff fear every legitimate access will be treated as suspicion, they may avoid necessary work. The City needs a culture of accountable use, not fear. Training should explain why access exists, why limits matter, how to ask for broader access lawfully, and how to report misuse.

Abuse and browsing controls close the access section by returning to purpose. A record may be seen only because seeing serves a defined duty. The moment viewing loses that purpose, the City begins moving burden downward again. The archive must make misuse visible before misuse becomes culture.

Browsing control should include social controls as well as software controls. Staff culture, peer expectations, supervisor review, sanctions, whistleblower protection, and training may matter as much as access architecture. A technically restricted system can still be abused through screenshots, gossip, informal summaries, private devices, or hallway interpretation. The City must treat misuse as an institutional risk, not only a user error.

The strongest culture is not fear but reverence for purpose. Staff should understand that every record represents someone carrying visible burden for a narrow public reason. Access is not a privilege of proximity to the archive. It is a temporary duty owed to the public and to the person recorded. When that duty ends, access should end with it. Periodic access recertification can require each role to justify the categories it still needs rather than carrying yesterday's permissions forward by inertia.

Browsing controls should also address executives and founders. High-status figures often receive informal exceptions because people fear saying no. The City should make improper access by senior leadership easier to detect, not harder. The higher the role, the clearer the access purpose should be, because hidden browsing by power is one of the burdens this institution exists to reverse. Independent sampling of executive access can test whether informal exceptions are accumulating around status.

Browsing controls should detect patterns without turning staff into subjects of indiscriminate surveillance. Access analytics can flag unusual volume, repeated searches for prominent people, access outside role hours, attempts to open unrelated protected categories, or downloads preceding departure. A human reviewer should then examine context, because an emergency responder, auditor, or records specialist may have a legitimate explanation. The control must protect records while preserving notice, proportionality, appeal, and due process for the worker whose access is questioned (NIST, 2020a; European Union, 2016). Pattern thresholds should be documented and periodically

recalibrated so routine operational changes do not become permanent false alarms.

Canary records and decoy identifiers can test privileged-access misuse, but their governance must be explicit. They do not entrap ordinary error or support unsupported accusations. Their purpose is to reveal deliberate browsing or extraction under controlled conditions. Authorization, scope, review criteria, evidence handling, employee rights, and retirement are recorded. A security mechanism that cannot be reviewed becomes another hidden source of power. Test records should be removed when their purpose ends, and their use should appear in the same audit trail as other privileged-access controls.

11.5 — Retention, Deletion, Sealing, and Time Review

Retention should be justified record class by record class. Some materials may require durable preservation because they evidence public-power formation, institutional decision, complaint, remedy, or systemic failure. Other materials should expire because continued storage adds little accountability while increasing exposure, security, or chilling risk. Deletion, sealing, and posthumous review must therefore be governed by declared criteria, holds, appeals, provenance, and periodic reconsideration. A deletion rule that can erase institutional wrongdoing is corrupt; an eternal-retention rule that preserves every intimate or incidental trace is also corrupt. The fair design makes both preservation and forgetting answerable (ISO, 2016a; International Council on Archives, 2012; European Union, 2016).

Time review should be scheduled before controversy arrives. If the City waits until a participant is famous, disgraced, deceased, or politically contested, the review will be pulled by public mood. A fair retention system sets review clocks early, names categories, identifies reviewers, and states what questions will be asked when the clock matures. Time review is not mercy by surprise; it is part of the original architecture.

Retention should distinguish institutional memory from public exposure. A record may remain in protected custody because future audit, remedy, or historical reconstruction requires it, while the public interface narrows, seals, summarizes, or contextualizes the same material. This distinction prevents a false binary

between erasure and endless display. The City can remember without always showing.

Deletion should be difficult where deletion would let power escape answerability. A participant, office track, staff office, donor, vendor, or governing body should not be able to erase inconvenient public-power formation history by invoking privacy after the fact. Privacy is a real claim, but convenient amnesia is not. The deletion gate must therefore ask who benefits from disappearance and who would carry the burden if the record vanished.

Posthumous review should treat death as a change in vulnerability, not as a release of all restraint. A deceased participant cannot answer every interpretation, and surviving family members, children, patients, clients, staff, and nonparticipants may bear renewed burden from old records. At the same time, public-power memory may remain important. The review must preserve accountable history while refusing the public appetite that often attaches to a life once the person can no longer speak.

Public memory needs a clock. The City cannot treat a record's future as an afterthought because the future is where many records do their greatest harm. Search improves. Context fades. Families change. Offices end. Technologies infer more. Public appetite returns during scandal. A record held safely today may become dangerous tomorrow, and a record deleted today may erase accountability that future citizens need (International Council on Archives, 2012; ISO, 2016a; NARA, 2023).

The answer is not permanent exposure and not easy erasure. The answer is lifecycle judgment across time. Retention, sealing, deletion limits, review intervals, and posthumous dignity allow the City to ask again what the record is doing. A fair archive is not a warehouse of old visibility. It is a living discipline of memory under purpose.

Record systems often fail morally because they treat time as neutral. They preserve because storage is possible. They delete because embarrassment is inconvenient. They expose because the public once had interest. They seal because a category sounds sensitive. A fair City cannot handle time this casually. Memory has burden, and exposure changes across years.

Retention preserves public-power memory. Deletion limits protect against convenient erasure. Sealing protects high-risk categories from ordinary access. Time review asks whether continuing exposure in the same form still serves public-power accountability. Posthumous review asks how memory and dignity interact after death. Each tool exists because the City must remember enough and not possess too much.

The practical question is who pays when records remain, disappear, or stay public forever. The public may pay for deletion by losing accountability. Participants and nonparticipants may pay for indefinite public access. Families may pay after death. Staff may pay through records that outlive the role. Future institutions may pay if failure memory is erased. Time review is how these burdens are reconsidered.

A long-memory ethic pairs memory with mercy. The City resists public forgetting while retaining purpose, status labels, sealing, time review, correction, and posthumous dignity. Permanent public exposure is not the default merely because a record exists. The governing question is what continuing public-power relevance remains and which less exposing form can carry it.

11.5.1 — Retention Purpose

Retention purpose states why a record is kept. The archive should not retain material merely because it can. It should retain records that support public-power memory, accountability, correction, failure learning, rights protection, dispute resolution, institutional audit, or lawful historical review. Purpose keeps retention from becoming hoarding (ISO, 2016a; NARA, 2023).

Some records must be retained because deletion would protect hidden power. Decision paths, staff influence, donor contact, public release history, correction logs, complaint outcomes, access abuse, continuity breaks, and institutional failures may remain necessary for public accountability. The City should not allow privacy language to erase power-relevant memory.

Other records may require retention in protected form. Medical, legal, intimate, child, family-law, security, or nonparticipant materials may need to be preserved for accountability or remedy while shielded from public or ordinary access. Retention and exposure are separate decisions. A record can be kept and protected at the same time.

The retention purpose should be attached to record classes, not improvised case by case alone. Class-level policies help staff act

consistently and help the public understand why certain records remain. Case-specific review still matters, but without class purpose the archive becomes arbitrary.

Indefinite accumulation creates its own danger. Retaining everything forever creates breach risk, interpretive risk, staff burden, infrastructure cost, and future temptation for reuse. Retention should include time review and access limits. The City should not preserve records in the strongest form merely because future people might find them interesting.

Retention purpose makes memory answerable to fairness. It asks whether keeping the record continues to place burden where it belongs. If retention protects public power accountability, it may be necessary. If it merely feeds future appetite, it should be narrowed, sealed, summarized, or time-reviewed.

Retention purpose should be reviewed against changing risk. A record that was needed for an active dispute may later be needed only as an audit stub. A raw recording may later be replaced for public purposes by a verified summary while the raw material remains sealed. A public bundle may require continued public access because it documents a pattern of power. Time can narrow or strengthen the retention purpose.

Retention also has infrastructure cost. Storage, encryption, migration, search, audit, breach response, staff training, vendor exit, and format preservation all carry burden. The City should not speak of keeping records as if memory were free. A fair retention policy counts the work required to remember safely and refuses to hide that work in future staff or fragile technology.

Retention purpose should be linked to public questions. What future question would this record answer? Did the participant abuse power? Did the City fail? Was a right violated? Did a correction occur? Was a decision captured accurately? A record without a plausible future accountability question should not remain in its most exposed form merely because storage is cheap.

11.5.2 — Sealing Criteria

Sealing criteria define when a record remains preserved but is removed from ordinary access or public release. Sealing is not deletion. It is protected custody. The City may seal records to protect children, medical privacy, legal counsel, intimate dignity, family-law matters, security, nonparticipant safety, or other high-risk categories.

Sealing should require a stated category, authority, review clock where appropriate, access conditions, affected-person notice where lawful, and a public status label if public absence would otherwise mislead. A sealed record should not disappear into institutional convenience. It should remain accountable through defined custody.

Sealing criteria should identify both what the restriction protects and whom it burdens. A seal may protect a child, a participant's dignity, or an active legal process; it may also limit public understanding, affected-person access, or oversight. The decision should state those competing interests, the authority relied upon, the least restrictive alternative considered, and the review date. A seal that names only its protective purpose hides half of its consequence.

Sealing should be harder to use for material involving public-power conduct than for material involving collateral vulnerability. If a record directly concerns misuse of power, staff influence, donor capture, misconduct, or institutional failure, sealing should require stronger justification and oversight. The City should protect vulnerable details without sealing the public-power fact itself where possible.

Sealing can protect vulnerable people or hide the institution's worst failures. Independent audit, protected oversight access, public category summaries, expiry, and affected-person challenge are what separate the two. A sealed object is legitimate only when someone outside the interested operational chain can verify the reason and someone harmed can seek review.

Sealed material may be opened only through a lawful, recorded route. Informal request, senior preference, political pressure, donor curiosity, newsroom pressure, or institutional embarrassment cannot supply authority. The route should identify who can petition, who may oppose, what standard applies, what notice is given, which safeguards remain active, and what public status label follows.

Some sealed records should remain discoverable as existence without content. A public stub can protect accountability by showing that a sealed record exists, that it belongs to a class, that a custodian holds it, that a clock or standard governs it, and that a challenge route exists. Existence disclosure is not always lawful or safe, but where it is possible it prevents sealing from becoming disappearance.

Sealing criteria should avoid class prejudice. Some lives include more medical records, legal contact, immigration issues, disability support, family complexity, poverty bureaucracy, or safety risk. If sealing is handled poorly, people with heavier life burdens will either be exposed more or hidden in ways that make their records look suspicious. The City must not let unequal background burden distort public meaning.

11.5.3 — Deletion Limits

Deletion limits prevent convenient erasure. A City built to make public-power formation answerable cannot allow participants, staff, donors, vendors, or operators to erase records simply because the records are uncomfortable. Deletion is the most final form of record handling and should be narrow, justified, and auditable.

Some records may need deletion because they were wrongly captured, unlawfully obtained, duplicative beyond necessity, technically corrupted, dangerously overinclusive, or harmful in a way that cannot be solved by sealing or redaction. Deletion may also be required by law in some circumstances. But deletion must not become a private bargain with power.

The next inquiry is who benefits from deletion. If deletion benefits a powerful actor while burdening the public, oversight, affected persons, or future accountability, it should be treated with suspicion. If deletion protects a nonparticipant who never consented and preserves public meaning through summary, it may be fair. The beneficiary and burden-bearer must be named.

Deletion decisions should preserve a deletion receipt where lawful. The receipt can identify the class of record, reason, authority, date, reviewer, and whether a protected summary or status note remains. The receipt should not reveal the deleted protected content. It should make the act of deletion accountable.

Deletion can create false completeness. A public record may look whole even after material has been removed. Status labels should prevent this where public interpretation requires it. A citizen should not be deceived by a smooth timeline if lawful deletion has affected public meaning.

Deletion should be especially hard when the record documents institutional failure, public-power conduct, access abuse, donor pressure, technical breakdown, staff misconduct, or rights violation. The City should not let the language of privacy become a tool for cleansing institutional memory. Deletion protects dignity only when it does not erase the evidence needed to prevent future burden.

That safeguard has a counter-risk: deletion may be required for material that never should have been captured, duplicates that create unnecessary breach risk, temporary technical artifacts, corrupted non-evidentiary files, or protected nonparticipant material outside the City's purpose. A refusal to delete anything can be as unfair as convenient erasure. The rule is not maximum memory. The rule is purpose-bound memory.

11.5.4 — Time Review

Time review reassesses whether continuing exposure, retention form, access class, sealing status, summary form, or public label

remains fair as years pass. A record may be publicly relevant at one moment and too burdensome in another form later. Time does not erase accountability, but it can change the balance between public memory and human dignity.

High-impact record classes and sensitive cases require scheduled time review. Readiness bundles, public corrections, disciplinary matters, protected summaries, intimate categories, child-adjacent records, nonparticipant exposure, and post-exit records may all change in relevance or harm. The question is not whether the record once mattered. The question is what continuing purpose justifies its present state and who bears the cost of keeping it there.

Time review asks whether continued access still serves the declared public purpose. Raw detail may no longer be necessary; a protected person may be carrying growing harm; the participant may have returned to ordinary life; office relevance may have changed; historical value may have increased; or new platform practices may make old release assumptions unsafe. Retention is a continuing decision, not the absence of deletion.

Time review is not quiet revisionism. Powerful participants cannot bury old records because they are inconvenient, and the institution cannot erase failure memory to protect its image. Public-power relevance may last for decades. Review therefore balances dignity and continuing accountability through stated criteria rather than using dignity as a disguise for reputation management.

Time review may produce several outcomes: continued public access, summary substitution, sealing, renewed release with

context, correction, deletion where lawful, restricted access, posthumous review, or further review date. The outcome should be logged. Affected persons should have routes to request review or challenge the result where appropriate.

Time review should ask whether the record's public form still serves the original burden shift. The answer may change. What was necessary during candidacy may be less necessary after retirement. What was sensitive during a legal process may become releasable later. What seemed harmless at release may become dangerous under new technologies of search, facial recognition, inference, or model extraction.

A time review should include technical aging. Formats decay, encryption weakens, metadata standards change, search tools improve, and models become more capable of inference. The City cannot assume that a record's risk remains constant because the file did not change. The surrounding world changes the burden carried by the same record.

Time review should include a public-interest decay question. Public curiosity often survives long after public need has faded. A record may remain searchable because people still click, not because accountability requires it. The City should ask whether continued prominence, indexing, and discoverability still serve public-power memory or merely feed retrospective appetite.

11.5.5 — Posthumous Review

Posthumous review separates continuing public relevance from the appetite to treat death as unrestricted access. A participant's death may leave public-power records that still matter, protected

material whose purpose has ended, and family or third-party interests that remain vivid. The review should name the authority, record category, historical value, legal constraint, family-notice route, expiry, and appeal before access changes. These proposed duties should be distinguished from the legal rules that apply: the GDPR does not itself apply to deceased persons' data, although Member States may regulate their processing, and records may still contain protected data about living people. Public memory can preserve accountable conduct while refusing to turn the dead into ownerless material (European Union, 2016, recital 27; International Council on Archives, 2012).

The review should consider the participant's public role, the record's relevance to public power, the rights and dignity of family and nonparticipants, historical value, legal requirements, protected categories, and foreseeable misuse. Some records may remain public. Some may be sealed. Some may be summarized. Some may require long-term historical access under strict conditions. Death changes the burden map, but it does not eliminate it.

Family dignity matters because families can be harmed by posthumous exposure, especially when records involve intimacy, health, children, grief, household conflict, or private dependency. But family preference cannot automatically erase public-power memory. The City must distinguish family dignity from family control over public accountability. This is delicate and requires law, ethics, and expert review.

Posthumous review must identify the living people and institutions that continue to carry the record's effects. Public

history, family protection, nonparticipant privacy, staff accountability, institutional self-interest, and lawful research may pull in different directions after the person can no longer answer. The process should not assume that death resolves those conflicts. It should provide a lawful forum, representation where appropriate, and time-based reconsideration.

Historical use should be governed. Scholars, journalists, civic educators, and future reviewers may need access, but not every posthumous record should become public entertainment. Historical access can include delays, conditions, redactions, summaries, ethical review, and limits on reproduction. The City should not confuse historical importance with unrestricted use.

Posthumous review completes the time section by extending dignity beyond active life. A public-power record may outlive the person, but the person should not be reduced to the record. Memory without possession is the standard. Accountability remains, but appetite does not inherit the dead.

Posthumous review must resist two temptations: turning death into total public ownership and using death to erase accountability. The participant's active public-power record may still matter after death, especially where public trust, office history, institutional failure, or harmed persons are involved. But death also leaves families, dependents, colleagues, and communities who can be injured by careless exposure.

Operational record practice should therefore distinguish public-power relevance from biographical appetite. A record that explains a consequential decision may remain important. A

record that merely satisfies curiosity about illness, intimacy, grief, religion, family conflict, or bodily decline may not. The dead cannot be asked again, so the City must carry a heavier duty to separate memory from possession.

Posthumous review should also consider unfinished remedies. A person may die before correction, reply, appeal, complaint, or oversight review is complete. Death should not cancel the route for affected persons, families, or the public when the record still matters. The City should finish the repair work without pretending the deceased can participate in it.

Posthumous review should occur on a declared schedule rather than only when controversy erupts. The first review may follow death after a humane interval, with later reviews tied to public-role relevance, legal change, newly affected persons, historical value, or emerging privacy risks. A panel should include records expertise, legal authority, affected-person representation, and independent review. Its task is not to create a final biography. It is to decide what remains necessary, what can be summarized, what should be sealed, and what unresolved corrections still require action.

Memorialization and accountability must remain separate. Families, colleagues, institutions, and the public may want remembrance, tribute, criticism, or historical interpretation. Those activities can coexist with the archive, but they should not rewrite source status or suppress adverse material. A memorial page is not an official record bundle. An archive is not a memorial. Keeping those functions distinct protects grief from institutional use and protects public memory from becoming

reverence by default. Continuing prominence should be reviewed separately from lawful retention so historical value does not become perpetual amplification.

Long-term dignity also requires control over copies beyond the main record site. Syndicated media, cached pages, downloaded bundles, research extracts, and machine-generated summaries may outlive a sealing or correction decision. The City cannot guarantee erasure from the world, but it can maintain a propagation register, issue authenticated correction or withdrawal notices, update its own interfaces, notify known recipients, and preserve proof of what it attempted. Posthumous review is credible only when it addresses the distributed life of records, not merely the authoritative copy. Affected third parties should retain a route to correct posthumous records even when memorial preferences point in another direction.

11.6 — Research Use and Model Training

Operational participation does not imply research consent, and research consent does not imply permission for artificial-intelligence training. Those uses alter purpose, audience, risk, and future control. Research governance requires a defined question, minimization, independent review, meaningful consent or another valid authority, data security, withdrawal terms, and a plan for reporting harms and negative results. Machine-training pathways add model memorization, inference, bias, opacity, downstream reuse, and withdrawal difficulties. The City should therefore prohibit silent dataset conversion and require a separate training authorization that identifies the model class, data scope, retention, evaluation, human owner, release boundary, and deletion feasibility (National Commission, 1979; World Medical Association, 2024; NIST, 2023a; UNESCO, 2021b).

Research governance should also include an estimand discipline. A proposal should say what question the data can actually answer, what it cannot answer, what population it represents, what biases enter through City selection, what claims would be forbidden, and what negative result would matter. Without that discipline, City records could produce impressive-looking findings that are really only artifacts of who entered, who stayed, who was protected, and what the City happened to measure.

Model-training review should require a model-use boundary before any data is supplied. The City should know whether the proposed system is retrieval, accessibility support, summarization, translation, integrity monitoring, anomaly

detection, classifier training, embedding generation, evaluation, fine-tuning, or another technical function. These uses are not interchangeable. A person may accept one form of assistance and reject another because the future burden differs.

The chapter's rule against silent dataset conversion should also bind public materials after release. A public bundle is public for democratic review, not automatically available as a training corpus, scraped benchmark, commercial analytics asset, campaign classifier, or donor intelligence layer. The City cannot control every unlawful outside use, but it can label permissions, prohibit official cooperation, design against scraping where lawful, and treat misuse as part of its public-risk environment.

The City refuses to become a laboratory by accident. The City's operational record will be tempting to researchers, technologists, institutional designers, journalists, and model builders because it is unusually continuous and richly contextual. That is exactly why the boundary must be bright. Interesting data is not consent. Rich data is not ethics approval. Technical usefulness is not permission (National Commission, 1979; World Medical Association, 2024).

The governing protocol should make knowledge possible only by making extraction difficult. That sounds paradoxical, but it is the foundation of trustworthy science and trustworthy technology. Research that cannot survive consent, minimization, nonparticipant exclusion, rival review, negative results, and model-training boundaries is not serious enough to deserve City records.

Research and model training are special because they transform records into something beyond the original operational function. A record created for public-power formation may become evidence in a study, a dataset for pattern analysis, a benchmark for tools, a training source for Artificial Intelligence, or a reusable corpus for future systems. These transformations create new burdens and therefore require separate governance.

The richness of City records creates a special temptation for researchers and technologists. Reasoning, stress, daily conduct, correction, relationships, staff interaction, crisis response, and public interface can form an unusually revealing dataset. Knowledge is not the problem; silent conversion is. Secondary use requires separate authority, consent where applicable, nonparticipant protection, purpose limits, and claim-status humility.

The key rule is simple: operational record is not research consent. The participant entered the City for public-power formation, not as a research subject by default. Nonparticipants did not enter at all. Staff entered role employment, not total research exposure. Public release does not automatically authorize scientific use. Richness is not permission.

The same rule applies even when research or model training is said to serve fairness. Many privacy and research abuses have been justified by public benefit. The City cannot rely on benevolent purpose alone because benevolent purpose can still move burden onto people who did not agree to carry it. A participant may want better public power and still refuse to become research material. A staff member may support the City

and still refuse to have role traces mined for science. A nonparticipant may believe in the mission and still never consent to dataset inclusion.

A separate secondary-use register should make every approved research or model-training project traceable without exposing protected source records. It should identify record class, purpose, authority, consent basis, nonparticipant exclusions, oversight body, permitted claims, retention period, publication limits, vendor restrictions, withdrawal constraints, and complaint route. The public should be able to see that the archive is not becoming a silent reservoir. Visibility of governance is part of the permission structure.

This register also protects scholarship and responsible technical work. Serious researchers and engineers should not be asked to work in ambiguity. Clear gates, consent rules, dataset boundaries, and claim-status labels protect them from producing work that later harms participants or overstates what the data can show. Good research is not obstructed by governance. It is made more trustworthy by it.

11.6.1 — Operational Record Is Not Research Consent

The distinction protects the moral basis of the Vow. The participant accepts burden because they seek a public-power role. If that burden automatically becomes research participation, the City has changed the agreement after the fact. The person would have entered one institution and unknowingly become subject to another. That is not informed consent.

The distinction also protects nonparticipants. Visitors, family members, staff, clinicians, lawyers, children, bystanders, host-community members, and incidental contacts may appear in operational records. Their presence does not create research permission. A dataset built from their traces would move burden onto people who never accepted any research role.

Silent conversion of operational records into research material launders one burden through another purpose. People accepted capture for a defined civic role; researchers or institutions then gain data, publications, prestige, or future tools without a new decision by those who carried the exposure. That is not ordinary reuse. It is extraction unless authority, consent, minimization, benefit, withdrawal limits, and independent review are separately established.

Lifecycle governance should therefore require research-use notices, consent pathways, review bodies, nonparticipant exclusion, minimization, de-identification where meaningful, claim-status labels, withdrawal rules, publication review for exposure risk, and public registry of approved research categories where lawful. These do not guarantee fairness, but they make research accountable.

Operational consent is tied to the City function. The participant accepts record burden so public-power formation can be accountable, not so every future question can be asked of their life. Treating operational consent as research consent would convert role-bound visibility into unlimited institutional extraction. That would betray the very burden discipline that justifies the City.

This distinction also protects the science book. *The Science of Fairness* must be able to ask hard research questions under its own ethics, rival-model discipline, and consent rules. If the City quietly hands over records as research material, the science becomes contaminated by civic coercion and public trust in both books weakens. Good boundaries make stronger evidence possible later.

Operational consent should be written in plain language before activation. Participants should not discover the research boundary only after a request arrives. The City should tell them from the beginning that public-power record, research participation, model training, public bundles, and other reuse pathways are distinct. Clarity before burden is part of consent.

11.6.2 — Research Consent Pathway

A research consent pathway defines how City records may be used for formal inquiry when such use is lawful, ethical, independently reviewed, and limited. It should state who may be asked, what records are requested, what questions are being studied, what risks exist, what alternatives exist, how withdrawal works, and how claims will be labeled.

The pathway should include independent review, not only City approval. The City has institutional interest in showing value. Researchers may have interest in publication. Funders may have interest in results. Independent review helps protect participants, staff, nonparticipants, and public interpretation from these pressures. It also protects the credibility of any findings.

Research consent is specific and renewable where possible. It names purpose, scope, data categories, duration, recontact rules, withdrawal conditions, protections, and publication limits rather than granting all-records permission for unspecified future studies. Broad future research requires stronger governance, narrower access, independent review, and stricter exclusion of nonparticipant material.

Research claims drawn from City records must remain inside the design that produced them. Operational traces may generate questions, reveal implementation problems, or support a bounded institutional evaluation. They do not validate the formal Law, rank participants, establish readiness formulas, or become universal science merely because the dataset is continuous. Scientific verdicts, reference classes, rival comparisons, and evidentiary limits remain under the discipline of *The Science of Fairness*.

The pathway must handle vulnerability. A participant may feel pressure to consent because refusal might appear uncooperative. Staff may feel pressure from employment. Former participants may fear public interpretation. Consent must therefore include refusal without penalty, separation from readiness evaluation, and clear statements that research refusal is not evidence of moral deficiency.

A research consent pathway should include the right to decline without civic penalty. A participant who refuses research should not lose City standing, office-track consideration, public dignity, housing support, debt stabilization, or narrative respect. Consent

is not real if refusal quietly marks a person as less committed to fairness.

The pathway should also address withdrawal and derived data. A participant may agree to one study, then discover that variables, coded features, quotations, deidentified extracts, or models derived from the data continue to travel. The consent form should explain what can be withdrawn, what cannot practically be withdrawn, what will be destroyed, what will remain, and what public reporting duties survive.

A research pathway should require plain public verdict language. The outcome of a study should not be marketed as proof of the Law, proof of City success, proof of participant worth, or proof of political legitimacy. Study reports should use status labels that distinguish operational evidence, research finding, uncertainty, negative result, and open question.

11.6.3 — Artificial Intelligence Training Consent Pathway

Model training requires a new authorization because it changes future system behavior rather than merely inspecting the present record. Any approved pathway must separately govern purpose, provenance, included data, affected persons, exclusion rights where applicable, evaluation, downstream correction, and model retirement.

The pathway should identify the proposed Artificial Intelligence use. Training and fine-tuning change learned model parameters; evaluation, safety testing, retrieval benchmarking, synthetic-data generation, and operational assistance may instead use an existing model without training it. Each activity still requires its own

purpose, authority, data boundary, and risk review. Training a public-facing summarizer is not the same act as testing a controlled search tool, and permission for one must not silently authorize the other.

The pathway must also identify the data form. Raw records, redacted records, protected summaries, metadata, access logs, public bundles, and synthetic transformations carry different risks. A claim that material is anonymized should be treated cautiously. Rich City records may be re-identifiable through context, timing, role, speech, or relational patterns.

The governing inquiry is what future burden the model may create. Could it infer trust? Could it reproduce protected patterns? Could it reveal nonparticipants? Could it rank participants? Could it generate misleading summaries? Could it become indispensable to staff judgment? Could it be reused by vendors? Could it turn the City's archive into machine authority? These questions must precede training.

Model-training consent includes refusal without penalty, no effect on readiness, nonparticipant exclusion, model-use limits, audit rights, deletion or non-use conditions where feasible, bias and error review, human oversight, and a ban on hidden scoring. Training pauses when those conditions cannot be enforced. Technical promise does not substitute for authority, and consent does not authorize civic ranking.

Artificial Intelligence training consent is the place where the City tells machines no on behalf of people. It may allow carefully governed machine assistance, but it must never treat public-power

formation records as fuel for systems that later judge human beings.

Research approval and training permission are separate decisions rather than broader or narrower versions of one consent. A person may authorize one defined use without authorizing the others, subject to the lawful and ethical basis applicable to each.

The relevant architecture should also require model-use boundaries after training. A model trained or evaluated with City material should not later support candidate ranking, trust scoring, public eligibility, donor targeting, personnel discipline, religious profiling, emotional inference, or public voting persuasion. The training pathway must govern downstream use, not merely data ingestion.

Training consent should address model memory after withdrawal. If technical deletion cannot fully remove learned effects, the participant should know that before consent. If unlearning is possible only within limits, those limits should be stated. Consent that hides the persistence of model effects is not consent worthy of the City.

Model-training permission requires a derivative inventory and an exit plan before training begins. The City should identify source records, transformations, labels, embeddings, checkpoints, evaluation sets, generated examples, vendors, downstream systems, retention periods, and stop conditions. If authority expires, consent is withdrawn where applicable, a protected category is discovered, or prohibited inference appears, the institution must know what can be deleted, what requires

retraining or retirement, which outputs need correction, and which residual risks require notice. One authorized run does not create indefinite permission for every derivative (Council of Europe, 2024; European Union, 2024; NIST, 2023a).

11.6.4 — Nonparticipant Data Exclusion

Nonparticipant data exclusion is a core condition for any research or model-training use. Nonparticipants include children, family members, partners, staff outside role scope, visitors, bystanders, professionals, host-community members, protesters, journalists, contractors, and incidental contacts. They did not accept the participant's Vow, and they usually did not consent to research or training.

Nonparticipant protection is designed before extraction. Research and training proposals identify incidental-person risks, exclusion methods, masking, summary substitution, metadata stripping, access limits, derivative controls, and verification procedures before data move. A proposal that cannot protect people who never joined the study does not receive the records.

Nonparticipant data belongs outside research and training corpora unless an independently justified route explicitly includes and protects it. The City exists to place visibility on public-power seekers, not on the people around them. Absorbing collateral persons into a dataset reverses that direction and can expose family, staff, professional, visitor, or protester information through inference even after names are removed. This is an institutional-purpose violation, not merely a technical privacy defect.

Some nonparticipant traces may be difficult to remove because context itself identifies them. A family role, a location, a date, an event, or a professional relation may reveal the person even without a name. Exclusion must therefore include inference review. Redaction is not enough if the remaining record still points to the protected person.

Exclusion receives independent audit rather than self-certification by the research or model team. Sampling, adversarial re-identification testing, affected-person review where appropriate, expert review, access logs, and breach response form the pathway. Discovery of nonparticipant material pauses use, triggers containment, and opens correction and remedy.

Nonparticipant exclusion requires more than removing names. A voice, face, location, relationship, profession, schedule, medical clue, family reference, immigration status, legal problem, or distinctive event can identify a person without a name. Research and training review should therefore test inference risk, not only explicit identifiers.

When exclusion is impossible because nonparticipant material is woven into the relevant public-power event, the default should be heightened protection, protected summary, affected-person notice where lawful, and independent review. The City cannot solve every collateral exposure by deleting the surrounding world. It must instead admit when public-power evidence contains nonparticipant burden and design around that burden.

Nonparticipant protection should include household and professional shadows. A participant's record may reveal spouse

routines, child schedules, lawyer strategy, therapist context, doctor identity, staff relationships, journalist sources, or neighborhood patterns. Exclusion review must look for these shadow disclosures because the nonparticipant often appears through the participant's life rather than through a direct file.

11.6.5 — No Silent Dataset Conversion

No silent dataset conversion means that records cannot quietly change status from operational archive to research corpus, model-training data, vendor dataset, internal analytics pool, or public benchmark. Conversion must be named, authorized, reviewed, logged, and contestable. The City must not let data drift because systems make drift easy (NIST, 2023a; UNESCO, 2021b).

Silent conversion often begins with convenience. Staff export records to improve search. A vendor copies material for debugging. Researchers request a sample that becomes a larger study. Public bundles are scraped for analysis. Access logs become performance metrics. Summaries become training examples. No one announces a major change, but the record's purpose has shifted. The City must design against this small-step transformation.

Silent conversion shifts burden because affected people often cannot see that a record has changed purpose. Participants lose a refusal point, nonparticipants cannot challenge use, staff cannot appeal workflow pressure, the public cannot interpret status, and oversight cannot reconstruct authority. A transition passport therefore accompanies every change of purpose, audience, system, or derivative, with notice, source, owner, expiry, and

remedy proportionate to the new burden. Making conversion visible exposes hidden resource and authority flows.

Before data cross a system boundary, the dataset route should also record vendor restrictions, research approval where applicable, default prohibition on model training, export logging, public status, and the alert or review triggered by the transfer.

Discovery of an unauthorized conversion should trigger pause, containment, identification of affected persons, deletion or quarantine where possible, notice to oversight, correction of downstream use, and a review of the pathway that enabled the conversion. The response should address both the copied material and the institutional habit that treated reuse as harmless.

Dataset conversion should require public artifact review if any output may travel. A chart, dashboard, benchmark, model card, research table, or public visualization can compress sensitive decisions into a misleading image. Before a dataset becomes an artifact, the City should ask what the artifact hides, who can be misread through it, and what status label must travel with it.

A governed dataset should receive a birth record before the first export. That record names the fields, provenance, inclusion and exclusion rules, lawful or consent basis, nonparticipant treatment, transformation history, intended users, access environment, retention, deletion, and prohibited inferences. It should identify whether the dataset contains direct records, protected summaries, labels, embeddings, or derived features. Without this object, later reviewers cannot tell what was actually created or whether an apparently harmless table carries hidden human traces.

Export controls should follow the data rather than ending at the City boundary. Approved recipients need purpose limits, security duties, re-identification prohibitions, correction propagation, incident notice, audit rights, subcontractor rules, and a termination plan. High-dimensional or linked data require special scrutiny because names can disappear while identity remains inferable. De-identification is a risk-reduction method, not a promise that persons have vanished from the data (Narayanan and Shmatikov, 2008; Ohm, 2010).

Dataset closure needs evidence covering primary files, backups, derived tables, model checkpoints, shared workspaces, and vendor copies. Where complete destruction is impossible, the City should record the residual risk, restriction, and next review. Retirement requires traceable evidence, not a changed purpose statement.

Before secondary use begins, a cross-system map should show how a source record could become an export, coded variable, research table, embedding, model checkpoint, vendor copy, public graphic, or decision aid. The map names every custodian, permission, transformation, retention rule, correction duty, and closure route. Its purpose is not to celebrate interoperability but to expose where a bounded record could acquire a second life outside its original purpose. When the institution cannot trace that route or cannot withdraw an unauthorized derivative, the proposed use has not earned permission.

11.7 — No Cross-Architecture Dossier

The no-dossier rule prevents the City's record from becoming the backbone of a general system of person classification. Cross-linking civic formation with religion, employment, voting, donation, affect research, public controversy, or inferred trust can produce an informational identity more powerful than any individual record. Surveillance studies describe this as an assemblage: fragments gathered for different purposes become a new object of governance. The danger is not only privacy loss. It is function creep, behavioral chilling, unequal error correction, and the conversion of participation into eligibility. Architectural separation, independent keys, purpose barriers, query controls, and prohibition of inferred trust profiles are therefore constitutive safeguards, not optional cybersecurity features (Haggerty and Ericson, 2000; Lyon, 2007; Nissenbaum, 2010).

The No Cross-Architecture Dossier rule does not forbid every lawful interface. Sometimes systems must communicate narrow status information: a participant has exited, a protection category applies, a research refusal must be honored, a public bundle has been corrected, a donor has no access rights, or an emergency contact route is active. The rule forbids merger into a total profile. Minimal handshakes may protect people; total profiles expose them.

The safest interface is purpose-bound, minimal, logged, capable of being narrowed or revoked where lawful, and readable by the person affected. It transfers only the status needed for a defined function and not the underlying record. A research office may

need to know that no consent exists; it does not need the participant's City archive. A government interface may need an active-status label; it does not need Religion of Fairness participation or donor proximity. A public platform may need a correction notice; it does not need staff notes or access logs.

Dossier prevention must also reach outside actors. A party, newsroom, donor network, advocacy group, vendor, university, foreign intelligence service, platform, or private model builder may try to merge released City material with other public or private data. The City cannot guarantee that no hostile actor will attempt it, but it can refuse to assist, limit machine-readable exposure where lawful, watermark or label public materials, monitor abuse patterns, challenge unlawful extraction, and explain to citizens why merged profiles are an attack on the City's purpose.

This boundary is one of the City's deepest contributions to the series. It accepts that public power needs more visible formation, then refuses the conclusion that more visibility should become total personality infrastructure. The City does not repair hidden power by building a universal file. It repairs hidden power by binding special burden to special role and then stopping that burden from spreading.

This rule matters because modern systems rarely become dangerous in isolation. Danger grows when records combine. A City record plus a Religion of Fairness profile could become spiritual dossiering. A City record plus a Workgame record could become project-contribution scoring. A City record plus PTVC research estimates could become pseudo-scientific person

ranking. A City record plus public voting could become popularity-as-worth. A City record plus donor data could become access capture. Artificial Intelligence could infer trust across all of them.

The design turns on where burden goes when architectures collapse. Burden moves onto the person as a totalizing file. It moves onto ordinary life because private domains begin serving public evaluation. It moves onto religion because spiritual practice becomes civic status. It moves onto science because research estimates become control tools. It moves onto democratic life because popularity becomes worth. It moves onto labor because contribution becomes identity. The dossier is the enemy of role-bounded fairness.

The prohibition is not hostility to integration in ordinary administrative terms. Some systems may need limited interoperability to prevent duplicate burden, verify status, or protect safety. But interoperability is not dossiering. Interoperability answers a narrow purpose and then stops. Dossiering collects identity across roles until the person becomes a composite object for judgment. The City must preserve that difference in every technical specification.

Separation must be treated as a positive safeguard rather than a failure of efficiency. Efficient systems often want one profile, one identity graph, one search layer, one dashboard, and one inferred score. Fair systems sometimes need friction, walls between meanings, role-specific records, and refusal of the total view. The person must remain larger than every architecture that touches them.

The plus signs in the subsection titles mark the prohibited act: fusion. Each neighboring architecture may maintain a legitimate record for its own purpose, but the records cannot be assembled into a master profile that judges the person across roles. Separation is deliberate friction, not an implementation defect.

11.7.1 — No City + Religion of Fairness Profile

Civic formation records and Religion of Fairness participation records require a hard separation. Religious practice, Fair Life Records, Religion of Fairness community involvement, spiritual commitments, service, or Clean-Slate City materials cannot be assembled into a joint profile of belief, virtue, loyalty, or civic suitability. Carefully governed interfaces may exist for a specific lawful purpose, but the default is nonconnection. Optional spiritual life cannot become an input to public-role judgment (Haggerty and Ericson, 2000; Lyon, 2007).

A joint profile would also pressure people who do not participate in the Religion of Fairness to perform religious alignment for public trust.

Combining civic and religious records would make one person carry two different forms of exposure in the same file. Public audiences could begin reading religious identity as readiness, and religious communities could read civic visibility as spiritual status. The harm lies in the merged inference, even if each source record was lawfully created. Separation protects ordinary civic dignity and the optional character of the Religion of Fairness.

A participant in the Religion of Fairness may enter the City. A nonparticipant in the Religion of Fairness may enter the City. A

participant may pray, refuse prayer, attend religious services, remain secular, or belong to another tradition under appropriate personal protections. The City may need to protect schedules or spaces. It may not convert religious status into City evaluation or public readiness material.

The Religion of Fairness boundary requires separate identifiers, custodians, permissions, access groups, retention rules, and public statements. City admission or readiness records may not contain religious participation, House involvement, covenant status, or inferred spiritual seriousness. Technical systems and staff training should make nonconnection the default, with any narrow lawful interface logged and independently reviewable.

The Religion of Fairness boundary is especially important because spiritual interpretation can turn records into moral atmosphere. A person's City record should never become evidence of holiness, covenant seriousness, religious rank, pastoral trust, spiritual readiness, or sacred vocation. The City may form public power; it may not supply raw material for religious judgment.

This separation also protects the Religion of Fairness. A voluntary religion becomes unsafe if its communities can quietly import civic records to assess believers or leaders. The Religion of Fairness must remain one path among many, not a hidden layer of City evaluation. The City record should not follow a person into prayer, ritual, pastoral care, household life, or sacred belonging.

This boundary should be taught in both directions. City staff should know that Religion of Fairness records do not belong in City evaluation, and Religion of Fairness communities should know that City records do not belong in spiritual discernment. The rule protects pluralism, freedom of conscience, and the credibility of both domains.

11.7.2 — No City + Workgame Profile

Workgame contribution data must remain outside the City participant profile. Project tasks, coordination history, team status, completion records, and contribution metrics answer questions about collaborative work, not civic worth or readiness for public power. A person may be an excellent contributor and an unsuitable officeholder, or the reverse. Joining the systems would turn participation into an informal credential.

Project contribution becomes dangerous when labor is translated into civic caste. Writing materials, moderating platforms, fundraising, coordinating teams, or solving technical problems may demonstrate expertise within a work context, but none of it establishes moral seriousness or entitlement to public power. Nonparticipation must not be treated as weak loyalty, and extraordinary contribution must not buy a faster path into the City.

This separation also protects workers. If Workgame records can affect City evaluation, participants may feel pressured to overwork, perform loyalty, or accept unpaid burden for future public status. Staff and contributors may become trapped in

hidden ambition channels. The City must not recreate prestige pipelines through project contribution.

Implementation should keep Workgame and City identifiers, databases, access roles, scoring systems, and public displays separate. Contribution points or histories cannot enter admission, readiness, or public ranking. Relevant expertise may be evaluated through the ordinary role-fit process with the same evidence rules available to people who never joined the project. Loyalty evidence is not a lawful substitute for competence.

The boundary should include reverse separation. City participation should not inflate Workgame status, unlock project authority, privilege proposals, or make criticism harder. A person under the Transparent Vow is not automatically a better builder, and a strong builder is not automatically a better public-power bearer. Different burdens require different records.

The Workgame boundary prevents project labor from becoming civic identity. A person may contribute brilliantly to project work and still be unfit for visible public-power formation; another may carry City burden well without winning contribution points. Combining the systems would invite the public to confuse loyalty, productivity, expertise, and civic readiness.

The Workgame boundary should also prevent gamification drift inside the City. Participants should not begin to act as if visible life earns points, badges, levels, or project credibility. The Vow is a burden for public-power formation, not a game mechanic. The City must not borrow the motivational grammar of contribution scoring.

11.7.3 — No City + PTVC Research Profile

Candidate phenomenal-valence estimates, affective measurements, experimental indicators, and other scientific outputs cannot enter a City readiness profile. Those objects belong to research protocols with declared instruments, uncertainty, reference classes, and verdict limits. They are not trust scores, public-worth measures, or evidence of political fitness. The City may protect research participants and route lawful interfaces without importing a research estimator into civic judgment.

Scientific-score misuse is especially dangerous. A participant's record could be combined with research estimates to create an apparent measure of burden-carrying capacity, fairness sensitivity, emotional cost, resilience, civic trustworthiness, or readiness. Such a profile would be both scientifically overreaching and ethically dangerous. It would make measurement look like personhood.

The merger would also corrupt the science. Staff and public audiences would begin treating uncertain estimates as stable traits, while researchers could face pressure to produce socially useful classifications. City records describe public-role formation; scientific records address registered research questions. Combining them would make research data govern civic evaluation and civic incentives distort research.

Scientific expertise may improve record-burden assessment, accessibility, sleep protection, survey design, and operational evaluation, but candidate phenomenal-valence estimates remain

research objects rather than public labels. They cannot determine admission, refusal, readiness, campaign value, office eligibility, or trust. A City pilot can provide operational evidence about its own conditions; it does not validate the formal Law, and no participant becomes certified by a research estimate. The research record, City record, and public identity therefore remain separate.

Operational records may enter research only through a separately approved pathway, and research outputs do not return as person-level civic judgments.

The prohibition on importing PTVC research constructs protects science by keeping it answerable and protects participants by keeping them from becoming measured souls. The City can be informed by science without becoming a scoring regime (UN Human Rights Committee, 2020; OHCHR, 2024; UNESCO, 2018).

This research boundary is one of the ethical firewall's public forms. Estimators of felt experience must never become City readiness scores, trust marks, discipline tools, wellness rankings, or interpretations of worth. The City record may show conduct under a voluntary public-power formation role. It does not measure a soul, a life, or the hidden totality of a person's experience.

This boundary also prevents scientific authority from leaking into civic hierarchy. If PTVC research estimates were linked to City records, citizens could be invited to believe that leadership should be selected by experiential metrics. That would be a confusion of

a research hypothesis with civic authority. The City should keep scientific humility outside the gate of civic rank.

The PTVC research boundary should be visible in public summaries. If a reader sees stress, grief, exhaustion, joy, or calm in a City record, they should not infer that the City has measured the person's phenomenal life. The record shows public-power formation under conditions of visibility. It does not disclose or estimate the hidden totality of felt experience.

11.7.4 — No City + Public Voting Profile

Public voting, approval signals, platform reactions, polls, endorsements, and crowd sentiment cannot become a unified participant profile. Public input may matter in a lawful decision process, but popularity does not measure worth, readiness, or truth. The system should preserve the event and its stated purpose without converting fluctuating attention into a durable trait. A crowd response is context, not identity.

Popularity becomes a hidden worth score when approval, controversy, attention, brigading, or platform sentiment is treated as a durable trait of the participant. Bots, prejudice, misinformation, organized opponents, and unequal access can distort the signal before any formal decision is made. Democratic judgment requires context and lawful procedure, not the conversion of crowd intensity into personhood.

Crowd error has identifiable victims. Minorities can be punished, unpopular truth-tellers discouraged, participants misranked, and audiences trained to treat approval as moral evidence. Platforms and bots can also manufacture apparent civic meaning. Public-

input systems therefore need purpose limits, manipulation review, and a prohibition on exporting their signals into a person file. The burden of collective error cannot be placed on the individual as a permanent profile.

Public voting or approval, where ratified, must remain bounded input. It can signal public concern, interest, or reaction under strict scope. It cannot prove truth, certify worth, grant office, replace voters in lawful elections, authorize transition, or determine readiness by itself. It must be auditable, appealable, anti-mob, anti-bot, and clearly labeled.

Public-interaction records should remain separate from the participant archive. Approval totals, engagement rates, platform reactions, or crowd sentiment cannot become readiness ranks or public-trust engines. Where a lawful process uses bounded public input, the object should state its question, population, manipulation controls, decision weight, expiry, and appeal route. The signal ends with that purpose.

The City plus public voting prohibition preserves democratic dignity. Voters remain voters, public judgment remains human and contextual, and the City's record remains evidence rather than popularity theater. Public signal may inform, but it may not become a hidden measure of the person.

Public voting signals may be useful as bounded legitimacy input in domains where law later permits them, but they must not merge with City records to create popularity-weighted person files. A participant's public support, criticism, controversy, or online attention should not become a hidden measure of civic worth.

Popularity is a signal about public response, not a ledger of the person.

The voter or contributor also needs protection. Votes, comments, objections, questions, and credibility judgments should not be linked to a participant profile in ways that expose citizens, map political relationships, or enable retaliation. Public contribution can inform a bounded process without creating a reusable social graph between critics, supporters, and candidates.

The voting boundary also protects dissent. A person who criticizes a participant, opposes a bundle, files a public objection, or votes against a readiness signal should not become part of a retaliation map. Public input must be usable without becoming a data trail that future power can punish.

11.7.5 — No City + Donor Profile

Donor and funding records require audit for capture risk, but they should not become a general participant profile. Gift history, sponsor contact, philanthropic access, financial networks, and institutional influence answer questions about money and leverage, not human worth or civic identity. The relevant disclosure should attach to the transaction, decision, or conflict, with access proportionate to that purpose. A donor map must not become a social map of the person.

Donor-linked access can capture the archive. If donor relationships are linked to City records without strict purpose limits, the archive can become a map of influence for those with money. A donor might use record insight to shape candidates. The institution might favor funder-linked participants. Public trust

might depend on financial networks. Private funding could become public-power formation's hidden nervous system.

The practical test is whether money is moving burden secretly. Donor data can reveal capture risk, but it can also create new capture if merged into participant evaluation. The City must audit donor influence without making donor proximity a hidden score of viability, seriousness, or opportunity.

Donor audit belongs to governance, not to participant dossiering. The City should record donor limits, funding transparency, conflict checks, no admission influence, no archive access, no naming sovereignty, and no priority governance. Those records should test the institution and donors, not create a private profile of participant value.

Donor information belongs in anti-capture review, procurement oversight, conflict files, and funding transparency, not in participant ranking. Funders receive no privileged archive access, private readiness analytics, sponsor fields in public bundles, or donor-linked opportunity maps. The separation should extend to vendors whose technical access could reveal influence, vulnerability, or future political utility.

The City plus donor prohibition protects the public from private ownership of visible formation. Money may support lawful work under strict limits. It may not become a second archive, a candidate map, a readiness signal, or a hidden path through the City.

The boundary also protects participants from becoming investment objects. A donor may believe in the City, but a

participant is not a portfolio, a sponsored future leader, a reputational asset, or a leverage opportunity. Donor records, gift restrictions, vendor interests, and participant records should remain separated, audited, and visible where lawful. Hidden linkage would move burden from public accountability into private influence.

11.7.6 — No AI-Inferred Trust Profile

No Artificial Intelligence inferred trust profile means that no machine system may combine City records, public interaction, access logs, staff observations, speech patterns, correction history, sentiment, biometric traces, research estimates, Workgame data, Religion of Fairness data, donor data, or voting signals into a hidden score of trust, worth, readiness, seriousness, risk, or fairness. This prohibition must be explicit (Nissenbaum, 2010; Eubanks, 2018).

A hidden trust score may arrive under another name: recommendation, risk flag, priority queue, anomaly signal, support tool, fit assessment, confidence label, or readiness aid. Function governs the prohibition. If an output quietly orders people, shapes access, or pressures a consequential decision, renaming it does not make the profile acceptable.

Machine-inferred trust profiles collapse burden and authority in one step. The person supplies exposure; a model generates an opaque claim; staff defer to it; the public sees a ranking without the route by which it was made; collateral persons enter through inference; appeal becomes difficult because the object has no clear author. This is how a technical convenience acquires

sovereignty without a formal transfer of power. The prohibition should cover hidden scores, embeddings used as traits, recommender outputs, and labels that function like trust even when named otherwise.

Artificial Intelligence may assist search, accessibility, translation, alerting, integrity review, and workflow when each function has named inputs, limits, logging, human challenge, and a shutdown route. It cannot decide trust, infer inner life, rank readiness, combine record architectures, or create a shadow dossier. Human review after profiling is insufficient if an undisclosed model has already shaped access, attention, or opportunity. The design must prevent prohibited inference before it becomes an invisible decision path.

The technical control set should include a complete model inventory, declared allowed functions, prohibited features and linkages, inference testing, explanation and appeal, human audit, vendor obligations, public reporting, and a mandatory shutdown route when a tool begins functioning as readiness or worth classification.

Outside actors may still attempt such profiles from public material. The institution cannot control every newsroom, vendor, party, donor, researcher, platform, or private analyst, but it can refuse to build, buy, endorse, feed, or rely on those systems. Provenance labels, terms of access where lawful, misuse monitoring, and public correction make the refusal operational rather than symbolic.

Culture completes the technical firewall. Staff, journalists, researchers, and citizens should learn to recognize inferred trust as the old hidden-power problem wearing a modern interface. Judging a public-power claim should remain reasoned, contestable, attributable, and humanly accountable. Procurement and audit should also test whether a tool changes access, attention, or opportunity through proxies even when no explicit score is displayed. A system that produces unexplained ordering effects should be suspended until the decision path is understood and made contestable.

Chapter 12 — Perimeter, Visitors, and Media

Four claims arrive at one gate: a relative needs to reach a participant in crisis, a journalist seeks a deliberative session, protesters ask to be seen from the main approach, and an ambulance needs immediate passage. A fair perimeter cannot answer them with one badge or suspicion. It distinguishes purpose, protects households, and remains intelligible when time is short.

The City remains open through legible boundaries, not borderlessness. Citizens, critics, journalists, experts, inspectors, hosts, and affected persons need routes to understand and challenge it. Households, staff, archives, care spaces, visitors, and nonparticipants need protection from unrelated exposure. The perimeter coordinates access, recording, assistance, complaint, emergency movement, and review.

The perimeter is a civic grammar rather than a prestige wall. It marks when a person is entering a role-bound institution, which record state applies, where protected domains begin, how visitors may approach, and which routes remain open for complaint, protest, inspection, family contact, service, or emergency response. Its legitimacy comes from making burdens and permissions intelligible, not from distance, ceremony, or force.

Public legibility begins at the edge. A visitor should know where to ask a question, how to request accommodation, what may be recorded, where protest and media access are possible, which zones are protected, and how a denial can be reviewed. Participants and staff should know when the active record begins, when professional or household protection applies, and who can

change an unsafe boundary. Clear edges reduce hidden influence and hidden labor at the same time.

Security enters as a bounded public service. The City faces real risks, including harassment, stalking, sabotage, unauthorized access, crowd pressure, cyber-physical incidents, emergency response, and ordinary conflict. It therefore needs trained people, proportionate screening, de-escalation, incident command, and review. Security remains subordinate to civic purpose through visible authority, narrow powers, staff support, accessible complaint, after-action review, and expiry of exceptional measures.

Access classes give the perimeter its functional grammar. Participants, staff, visitors, experts, media, vendors, emergency responders, critics, auditors, temporary contributors, relatives, and ordinary citizens approach for different purposes. Each route should specify zone, time, escort, record status, protection, decision owner, review, and remedy. The differences describe temporary permissions, not human rank; they prevent a journalist from being treated as a participant, a vendor as an adviser, or a critic as a threat.

Outside expertise strengthens the City when it remains independent enough to disagree and bounded enough not to govern in secret. Disability, privacy, legal, archival, technical, labor, clinical, child-safety, community, journalistic, and administrative reviewers can reveal burdens that insiders normalize. Their purpose, access, compensation, conflicts, materials, findings, dissent, institutional response, and expiry

should be recorded so knowledge enters without prestige becoming hidden authority.

Protest and dissent are routes by which public burden returns to view. People who reject the City's premises or effects must be able to be seen, heard, documented, protected, and answered. Protest design therefore considers proximity, accessibility, sight and sound, traffic, media, counterprotest, de-escalation, arrest risk, staff burden, and complaint. Safety limits address conduct rather than viewpoint and protect protesters, participants, staff, families, visitors, hosts, and nonparticipants together.

Independent media prevent the City from becoming the sole author of its public meaning. Reporting, documentary access, public-record review, interviews, and investigation can reveal patterns that official bundles miss. The same practices can create spectacle, performance pressure, misleading fragments, or collateral exposure. Purpose rules, context, masking, role boundaries, correction, and right of reply let scrutiny remain independent while placing the burden of protection on the institution that grants access.

Controlled openness is the chapter's positive standard. The City remains reachable, inspectable, criticizable, and publicly understandable, while households, care, archives, staff, nonparticipants, and protected record states remain governed. The test is not whether a boundary looks open or strict. It is whether the arrangement increases accountable knowledge, preserves lawful challenge, and reduces wrongful exposure better than available alternatives.

The chapter can be read as an access charter. Every opening identifies who may enter, for which purpose, into which zone, under what record state, for how long, with which protection, and with what remedy. Every closure identifies the public interest it protects, the less restrictive alternatives considered, the decision owner, the review clock, and the route of appeal. This structure makes both access and refusal answerable.

The perimeter belongs before entry and activation because applicants cannot evaluate the Vow in the abstract. They need to know how family contact works, how citizens approach, how critics and journalists enter, how protest is protected, how professional care remains private, how emergency response overrides ordinary routes, and how security is reviewed. The edge is part of the participation bargain, not a later facilities detail.

The public often meets the City first through a gate, route map, visitor page, protest line, media rule, denied entrance, or emergency closure. Those objects can communicate the institution's civic character more forcefully than a formal statement. The edge should therefore be among the City's clearest public surfaces: accessible, calm, specific, multilingual where needed, correction-ready, and honest about both invitation and limit.

The perimeter protects in two directions. It protects people inside and nearby from public appetite, hidden influence, harassment, and accidental exposure. It protects the public from a sealed institution that asks for trust without inspection. This dual duty requires different movements at once: easier low-risk public

approach, stronger protected-domain shielding, deeper oversight access, narrower prestige access, and faster emergency routes.

The perimeter rules make that dual duty operational. For relatives, public visitors, journalists, protesters, experts, critics, vendors, emergency responders, participants, and staff, they identify purpose, route, accessible screening, record state, protected zones, time limit, decision owner, emergency override, review, deletion, and remedy. The rules follow burden rather than prestige and preserve the distinct legal authority of the host jurisdiction (United Nations, 1966; UN Human Rights Committee, 2011; UN Human Rights Committee, 2020).

Civil-liberties readers should find protest, privacy, due process, and challenge routes in the same design. Security readers should find real incident authority, training, and review rather than moral wishfulness. Journalists should find independent access without official editorial control. Participants, staff, families, and hosts should find protection from harassment and spillover. The chapter is successful only when these readers can locate both their access and the institution's duty toward them. Peak-event testing should compare burdens on nearby residents, staff, visitors, and protected occupants rather than optimizing access for only the most visible group.

One burden test governs every gate decision: who gains knowledge or influence, who carries risk, who can refuse, and who can correct the result? More access and more shielding can each be right in different places. The fair arrangement makes public power answerable without consuming people who did not choose its burden. Routes that repeatedly shift screening, protest,

media, or waiting pressure onto the same neighbors or workers should trigger redesign before that burden becomes normalized.

Perimeter design is public ethics in spatial form. It shows whether openness is real, security remains subordinate, criticism can approach, family life is protected, staff are not sacrificial buffers, and archives resist whoever presses hardest. A legible, revisable edge keeps the City public without making it borderless. The design identifies what the perimeter protects and what it must never hide. The edge should be tested under ordinary, protest, media, emergency, and high-attention conditions rather than only through a curated visit.

12.1 — Why the Perimeter Exists

The perimeter preserves distinctions that openness alone cannot hold: participant from visitor, household from public route, source archive from public interface, care space from media space, protest from intrusion, and emergency access from ordinary access. Its rules are legible, reviewable, and proportionate, telling people when recording begins, which route applies, where assistance is available, and how to leave. Physical and digital boundaries correspond; a room is not private if microphones, remote viewers, access logs, or later search make it public. The design goal is intelligible jurisdiction over attention, capture, and access rather than enclosure for its own sake (Nissenbaum, 2010; W3C, 2023).

A perimeter is one of the easiest features of the City to misunderstand. Critics may see a wall and imagine custody. Supporters may see a boundary and imagine prestige. Media may see a line and ask what is being hidden. Participants may feel protected or watched depending on how that boundary is built. The City must answer before suspicion fills the space. The perimeter exists to make roles, duties, protections, and record conditions legible.

The Transparent City is not a private enclave. It is also not an open plaza where anyone may enter any domain, record any person, interrupt any routine, or reach any participant. Its purpose requires controlled openness. The perimeter marks the point where ordinary public space meets a role-bound public-power

formation institution. It tells the public that access is possible, but not for every purpose and not at every depth.

The Law of Fairness question is decisive: who is protected by the boundary, and who is burdened by it? A perimeter becomes unjust when it protects status against accountability. It becomes necessary when it protects the Vow from hidden access, the archive from sabotage, households from exposure, staff from harassment, and nonparticipants from record spillover. The City must therefore justify every barrier by burden placement, not by institutional comfort.

The perimeter also prevents public confusion. Without an intelligible boundary, visitors may not know when record conditions begin, where public access ends, which domains protect dignity, how protests may approach, or where emergency responders enter. Confusion can create accidental violations, conflict, fear, and mistrust. A fair boundary teaches people how to approach without being trapped by rules they cannot see.

A humane perimeter should explain itself without intimidating the person approaching it. Prison grammar, luxury enclosure, sacred precinct symbolism, and military posture would all distort the institution's purpose. Materials, signs, sight lines, staff conduct, and entry sequence should communicate protection, public access, review, and limits. The question is not whether the boundary looks impressive, but whether it helps openness remain safe.

The perimeter's statement of public purpose governs every later gate. Every later gate, screening rule, visitor path, media

boundary, protest route, and protected domain traces its authority back to one of these purposes. If a rule protects nothing named here, it may be institutional convenience rather than fairness (United Nations, 1966; UN Human Rights Committee, 2020).

12.1.1 — Transparent Vow Protection

The perimeter protects the Transparent Vow by preventing hidden access from returning through casual entry. A participant under the Vow cannot have a second, informal life of private meetings, unlogged influence, unauthorized visitors, and side-channel arrangements. If anyone can enter without role, notice, and status, the active record becomes porous at the very point it claims continuity (Nissenbaum, 2010).

This protection is not suspicion toward every visitor. It is honesty about public power. Influence often enters through convenience rather than conspiracy. A friend drops by. A donor asks for a walk. A party figure requests privacy. A journalist offers informal help. A staffer makes an exception. Without a perimeter, these contacts become difficult to distinguish from ordinary public access.

The perimeter establishes that entry into active participant space is never merely physical. It is also a status event. The person entering has a role, purpose, access class, record condition, and boundary. The participant also knows that the entry has meaning. This protects the participant from hidden pressure as much as it protects the public from hidden influence.

A weak perimeter would force the archive to solve problems the architecture should have prevented. After an unbounded contact

occurs, the City may struggle to classify it, explain it, shield third parties, or distinguish accident from misconduct. Good perimeter design reduces later interpretive burden by making role status clear before contact happens.

Transparent Vow protection also prevents the participant from using public openness as a loophole. A participant cannot say a private influence channel was simply public access if the access rules are clear. The boundary makes evasive explanations harder. It places burden on the participant and the institution to keep public-power formation within knowable channels.

The rule is narrow. It does not mean participants are hidden from the public. It means public contact must travel through forms that preserve the Vow. A fair perimeter does not isolate public-power seekers from citizens. It prevents citizens, donors, allies, and opponents from becoming unclassified forces inside active formation.

This subsection also defines a diagnostic test for every proposed opening in the perimeter: would this access allow influence to reach a participant without being classed, noticed, and later interpretable? If the answer is yes, the opening is not public access. It is an unrecorded path back into the hidden formation the City exists to prevent.

A workable implementation should therefore include an access-intent register at the edge of active participant space. The register should not become a social-credit instrument, a personality file, or a public popularity ledger. It should record only the operational facts needed to preserve the Vow: role, purpose, sponsoring office

or invitation, time window, access band, record status, and the human authority responsible for denial, approval, or later review.

The fairness test is whether the boundary prevents hidden influence without making public encounter sterile. Participants must still meet citizens, hear grievance, receive expertise, and face dissent. The perimeter must route those contacts into accountable forms so public contact remains possible while private leverage loses its easiest path.

In practice, the perimeter should make improper private access boringly difficult rather than heroically resisted. The better design does not praise participants for refusing secret influence; it gives secret influence fewer plausible doors and makes every exceptional route visible to review.

The practical audit should ask whether informal access ever seems easier for the well-connected than for the ordinary citizen. If a donor, party figure, celebrity, friend, former colleague, or admired journalist can reach a participant through warmth while an ordinary resident must use a public channel, burden has quietly moved back down the social ladder. The perimeter must make lawful access dignified and improper access unglamorous.

12.1.2 — Archive Protection

The archive is one of the City's most vulnerable public objects. It holds source memory, status labels, correction trails, protected categories, provenance records, access logs, and public-facing bundles. A perimeter protects the archive not because records belong to the institution, but because records carry public trust, participant burden, nonparticipant dignity, and future correction.

Archive protection includes physical, digital, procedural, and human boundaries. A server room may need restricted entry. A records office may need access protocols. Staff who handle classification may need protection from harassment. Public visitors may need to know that curiosity does not grant raw access. The perimeter helps convert record stewardship into a visible civic duty.

The archive is vulnerable to intrusion, sabotage, theft, tampering, deepfake contamination, selective leak, malicious photography, and social pressure. If the City allows uncontrolled access near archive functions, it invites the very memory corruption it was designed to resist. Public memory requires protection before it can serve public accountability.

Archive protection must not become archive secrecy. The public has a legitimate interest in how records are captured, protected, corrected, and released. The perimeter must therefore support tours, oversight windows, public explanations, audit displays, and record-site access where appropriate. Protection and explanation must travel together.

A perimeter also protects against informal archive authority. Not every person who works near records should be able to browse them. Not every staff member should gain access by proximity. Not every expert visitor should be treated as a reviewer. The boundary must be internal as well as external, marking who may touch memory and under what authority.

The archive's deepest protection is against becoming mystified. If the public imagines the archive as a hidden vault of truth,

suspicion grows. If the public imagines it as a raw content store, appetite grows. The perimeter helps teach a third posture: lawful memory, protected enough to be trustworthy and explainable enough to be accountable.

A public-trust archive should therefore be protected by layered permission rather than by vague reverence. Physical access, technical access, classification access, correction access, and public interface access are different powers. A City that treats them as one power will eventually let the wrong person hold too much of public memory.

Archive protection should also separate emergency preservation from emergency publication. A breach, fire, cyberattack, or protest event may require rapid safeguarding of records, but urgency should not become permission to release or interpret material without the proper stage controls.

Archive protection should be designed around three separate risks: physical disruption, informational corruption, and interpretive capture. A locked room can protect devices and still fail if access logs are weak, if staff are pressured informally, or if public bundles are released without context. The perimeter therefore protects the archive only when physical security, credentialing, provenance, staff support, and public explanation are treated as one integrity system rather than as separate technical chores.

This is also where the City should practice visible humility. The public should be able to see enough about archival governance to know that records are not being curated for institutional self-

defense. Protected zones, controlled access, and tamper-resistant custody are credible only when paired with correction routes, adverse audit, status labels, and the willingness to publish errors in the archive's own handling.

The archive boundary should also include a contamination protocol for synthetic media, misfiled material, altered metadata, and accidental overcapture. Public memory is fragile when recorded material can be fabricated, spliced, stripped of origin, or circulated ahead of verification. The City must treat contamination as a civic event, not merely a technical incident, because damaged memory places burden on everyone who later has to guess what was real.

12.1.3 — Household Protection

The perimeter protects households because the participant's Vow cannot become a gravitational force pulling family, partners, children, dependents, and visitors into exposure. A City without a clear boundary will blur active participant space with ordinary relational life. Once that blur begins, nonparticipants become vulnerable to accidental record capture, public interpretation, and social pressure.

Household protection is one of the conditions that makes voluntary public burden possible. The participant may accept active visibility; a child, partner, dependent elder, visiting relative, or household support person retains separate consent, privacy, and complaint rights. Residential and care routes should therefore use the least revealing access and record needed for safety and service. The boundary prevents civic participation

from becoming a transparency obligation inherited by anyone who shares a home.

Household edges, participant residence, visitor approach, family consultation rooms, protected nonvisibility areas, and public-interface zones need distinct spatial grammar. A visitor should not drift into family space, and a participant should not turn household contact into an off-record extension of active public life. The design protects both the household from the City and the City boundary from being used as a loophole.

Household protection also shields ordinary affection from public performance. If the City's public edge allows strangers, journalists, or volunteers to observe family contact too easily, relationships may become staged or defensive. A fair City must not turn ordinary love into evidence of public readiness or family burden into civic content.

Household protection is incomplete without remedy. Family members and dependents need a direct route to report overexposure, harassment, unsafe access, coercion, or misuse of household material, together with interim protection and independent review. A line on a plan becomes a right only when someone can enforce it after the line fails.

This principle governs every later place where household material appears: the question is not whether family context can matter, but whether public meaning can be preserved without converting the household into evidence. The City must learn to summarize burden without exhibiting private life.

The household boundary also teaches the public what the City is not. When the City refuses to make family life public, it demonstrates that its project is not universal exposure. It is role-bound burden around public power.

Household protection should be legible in the map itself. A visitor should not need insider knowledge to know that a family threshold, dependent-support route, child-protection path, or intimate care space is outside public access. The architecture should spare households the burden of constantly explaining why they are not public material.

The perimeter also prevents resentment from accumulating inside families. If the participant's public burden repeatedly spills into dinner, rest, school calls, medical appointments, or ordinary affection, family members may begin to carry the cost of a Vow they never made. A fair City measures its perimeter not by how close the public can get to the participant, but by whether the participant's private circle can remain real.

Household shielding should include a plain noninheritance rule repeated wherever family access appears. No spouse, partner, child, dependent, relative, roommate, guest, or intimate associate becomes transparent by proximity. When household context is genuinely relevant to public-power formation, the City must use the least exposing route that preserves meaning, such as protected summaries, affected-person consent where lawful, independent review, or category labels instead of raw exposure.

12.1.4 — Staff Safety

Staff safety is a perimeter purpose because staff often stand between the City's ideals and the public's pressure. They greet visitors, screen access, maintain systems, moderate public interfaces, classify records, clean spaces, feed participants, protect zones, handle complaints, respond to conflict, and explain rules. Without a perimeter, staff become the first absorbing surface for confusion and aggression.

A rights-respecting City may not treat staff exposure as the price of participant visibility. Staff are not participants under the Transparent Vow. Their role records may be necessary, but their full lives remain private. A perimeter helps protect staff from stalking, harassment, doxxing, pressure from participants, pressure from media, pressure from donors, and pressure from visitors who want more access than the rules allow.

Staff safety includes physical safety, psychological safety, role clarity, and authority limits. If staff cannot enforce boundaries without retaliation, the perimeter fails. If staff become petty gatekeepers, the perimeter also fails. The City must train and protect staff so that boundary enforcement remains calm, reviewable, consistent, and dignified.

The staff safety function is especially important during protest, media events, public tours, emergencies, and high-profile participant controversies. Public anger often lands on the people nearest the door. The City must not celebrate dissent while allowing staff to become the unprotected target of dissent. Safety

boundaries protect both criticism and the workers who keep criticism from becoming chaos.

A perimeter can also reduce hidden staff burden by reducing improvisation. When visitors know access rules, when signage is clear, when roles are defined, staff spend less time absorbing preventable confusion. Clarity is a labor protection. Bad boundary design creates emotional labor and then hides it as professionalism.

A practical audit must ask whether staff nervous systems are paying for the City's openness. If so, the openness is not fair. Staff safety is not the opposite of public access. It is one of the conditions under which public access remains humane and durable.

The staff-safety rule should also be read as a staffing-budget rule. If the City cannot provide enough trained people to keep boundaries calm, accessible, and reviewable, it should not compensate by asking fewer workers to absorb more conflict. Understaffing is a boundary failure disguised as thrift.

Staff safety should be evaluated by patterns, not heroic anecdotes. A worker who handled one hard visitor well does not prove the system is humane. Repeated incidents, emotional load, staffing ratios, and complaint patterns reveal whether the boundary is fair to those who operate it.

Staff-safety design should include a conflict-load ledger for the boundary itself. This ledger should not score staff temperament or punish workers for distress. It should identify where the perimeter is producing repeated anger, confusion, harassment,

overtime, emergency calls, or moral injury, so the institution repairs the design rather than asking workers to absorb preventable strain.

A staff-protective perimeter must also keep authority accountable. Workers need enough backing to enforce rules, but not so much informal power that they become unreviewed gatekeepers. The fair balance is role clarity plus complaint routes: staff can say no, visitors can challenge wrongful denial, and neither side has to win by volume, status, or intimidation.

Staff protection should be visible in hiring, training, pay, breaks, staffing ratios, security backup, complaint channels, and exit rights. A boundary that looks calm to the public may still be purchased by hidden staff exhaustion. The City must not praise its openness while workers carry panic, insults, stalking risk, moral injury, or impossible discretion at the threshold.

12.1.5 — Public Legibility

Public legibility begins before entry. A person approaching the City should be able to understand basic zones, roles, access limits, recording rules, protest routes, complaint options, accessibility services, and protected domains without insider vocabulary. Too little explanation breeds rumor; too much technical language produces a different form of exclusion (W3C, 2023; Steinfeld and Maisel, 2012).

Public legibility begins at the physical edge. Signage, wayfinding, visitor information, accessibility routes, protest zones, media rules, security screening explanations, and public record-site directions should all communicate that the City is reachable but

not borderless. Confusing edges create unnecessary conflict. Clear edges reduce both fear and misuse.

Legibility also protects against prestige enclosure. If the boundary looks like a private fortress, the public may reasonably suspect status protection. If it looks like a spectacle venue, the public may approach as consumers. If it looks like a prison, the public may fear coercion. The perimeter's tone should communicate civic seriousness, modesty, and reviewability.

Public legibility must be multilingual, disability-aware, and culturally sensitive. A person who cannot read the primary language, move easily, hear clearly, process complex instructions, or understand institutional codes should not be excluded from basic orientation. The boundary must not quietly favor elite fluency.

Access is not authority. Citizens may approach, observe public materials, protest, submit reports, ask questions, and use lawful interface routes. Those permissions do not include raw-record demand, entry into protected zones, exposure of nonparticipants, harassment of workers, or command over response timing. Clear boundaries protect public participation from becoming coercion.

The final test is whether the perimeter makes fair behavior easier. A good boundary helps participants carry the Vow, helps visitors comply, helps critics challenge, helps staff protect, helps households remain private, and helps the public understand what kind of institution stands before them. A boundary that does not teach fairness is merely a wall.

A skeptical first-time visitor should be able to explain the boundary after a short encounter without adopting the City's ideology. If the boundary requires belief before it becomes understandable, it is not yet public enough for a civic institution.

Public legibility should be tested with people who do not already admire the City. A host-community resident, a skeptical journalist, a disability advocate, a protest organizer, a visitor with limited language access, and a person who simply got lost should all be able to understand the first layer of boundary logic. If only insiders can decode the perimeter, the City has built a private grammar around a public institution.

Legibility also requires visual restraint. A boundary can be beautiful without becoming ceremonial, secure without becoming militarized, and serious without becoming cold. The City must avoid both fortress drama and invitation without warning. The edge should say: you may approach, you may ask, you may object, but no person or record is available for appetite.

Legibility should be revised after real use. The first sign, map, app, desk script, visitor handout, protest notice, and access explanation will almost certainly miss something. A fair City treats confusion as evidence, not as visitor stupidity. If people repeatedly misunderstand the boundary, the institution should redesign the boundary before blaming the people who approached it.

12.2 — Security Without Carcerality

Security without carcerality begins by separating unfamiliarity from threat. Risk assessment, screening, de-escalation, emergency response, and force are distinct functions with different thresholds and review. Staff receive role-specific training, supervision, fatigue controls, complaint review, and narrow limits on search, restraint, exclusion, and information gathering. The least intrusive effective response governs ordinary situations; imminent danger may justify stronger action under law, documentation, and later review. Humiliation, collective punishment, detention aesthetics, and fear-based design contradict the City's formative purpose (United Nations, 1990b; United Nations, 2015; OHCHR, 2024).

Security is necessary in the Transparent City, and that necessity is dangerous. A City that forms public-power seekers under record will attract attention, anger, curiosity, loyalty, intrusion, media pressure, protest, opportunism, and sometimes threat. Ignoring danger would be irresponsible. But building security in the emotional language of prison would betray the institution. The City must become safe without becoming carceral.

Carcerality is not only bars, cells, and guards. It is a grammar of suspicion, humiliation, obedience, intimidation, and bodily control. A City can become carceral through architecture, tone, screening rituals, staff behavior, constant commands, opaque security discretion, harsh lighting, punitive queues, and the assumption that every entrant is a problem. Such a City may be orderly, but it will not be fair.

Security without carcerality means protection remains subordinate to the City's civic purpose. It protects the Vow, archive, staff, households, visitors, and nonparticipants while preserving dignity, protest, access, and calm. It treats confusion as a design issue before treating it as threat. It treats dissent as legitimate until conduct crosses a safety boundary. It treats screening as limited, explainable, and reviewable.

Security burden should be audited by asking who is made to feel like a threat. A system that purchases safety through participant fear, staff hypervigilance, humiliating screening, protest suppression, or intimidation of ordinary visitors has moved burden onto the people it claims to protect. Risk management remains necessary, but it must be proportionate, explainable, and contestable rather than expressed through a generalized profile of suspicion.

Security review is essential because security tends to expand. Every incident can justify another rule. Every rule can justify another device. Every device can justify another data stream. Every data stream can create new authority. The City must audit security as a potential source of hidden power, not merely as a service that protects against outside danger.

The section also gives security a burden test: does the measure reduce real harm without teaching people fear, obedience, humiliation, or suspicion as the price of civic access? If a security measure cannot pass that test, the City should redesign it before it becomes normal.

12.2.1 — Non-Prison Design

Non-prison design begins with the refusal of custody aesthetics. The City must not look or feel like punishment. Its entries, screening spaces, visitor routes, public edges, and protected thresholds should communicate seriousness without communicating captivity. A person entering for civic review should not feel as if they have entered a detention regime (United Nations, 1990b; United Nations, 2015).

Non-carceral security should be tested at the moments where authority is felt: screening, waiting, denial, escort, search, emergency separation, and exit. Each should use the least restrictive lawful method, state its purpose, preserve a review route, and avoid turning uncertainty into intimidation.

Non-prison design also protects participants. Participants under the Vow already carry unusual burden. If the City's security atmosphere teaches them to associate public burden with confinement, the formation becomes distorted. Public power should be formed under accountability, not under the emotional education of custody.

The same design protects staff. Staff who work in prison-like surroundings may begin to act through prison-like assumptions. They may interpret confusion as defiance, protest as threat, or access requests as suspicious. A humane environment does not remove the need for training, but it makes dignified conduct easier to sustain.

Non-prison design does not mean naive openness. Doors may lock. Visitors may be screened. Records may be protected.

Emergency protocols may exist. The difference is whether the design explains purpose, preserves dignity, allows appeal, and avoids unnecessary domination. Safety can be firm without becoming punitive.

The test is simple: does the boundary protect people from harm, or does it make ordinary people feel morally suspect for approaching? If the City's security teaches fear, it has taught the wrong lesson about visible power.

Design review includes people who have experienced carceral, institutional, psychiatric, immigration, military, or highly securitized environments. A designer may not notice fear grammar that a visitor's body recognizes immediately. The City's boundary must be tested by those most likely to feel its shadows.

Non-prison design should be revisited after incidents because fear often grows by addition. A barrier added after one event, a device added after another, and a posture added after a third can slowly create prison feeling without any single decision declaring it.

Non-prison design should be specified before the first security contract is signed. Materials, sightlines, staff posture, queue layout, holding areas, screening devices, visitor instructions, and escalation rooms all teach the body what kind of place it has entered. If the perimeter copies airports, prisons, luxury estates, or military compounds without thought, it imports their emotional politics before the City has spoken a word.

The non-prison standard does not mean naive design. It means that restriction must never borrow captivity as its default aesthetic. Doors may lock, zones may close, and dangerous access

may be refused, but the surrounding language, furniture, lighting, staffing, complaint route, and exit path should continually remind entrants that the City is a civic institution, not a custody regime.

The anti-carceral test should be applied to small choices as much as large ones. Tone of voice, barrier height, bench placement, camera visibility, search posture, waiting-room design, and the route from denial to exit can all communicate custody even when the policy manual says visitor. The City must make noncustody visible through ordinary design discipline rather than through reassurance after fear has already been created.

12.2.2 — Proportionate Screening

Proportionate screening begins with the recognition that screening itself places burden. A bag check, identity question, device restriction, metal detector, pat-down alternative, escort rule, waiting line, denied pass, or secondary review can protect people, but it can also humiliate, delay, exclude, or mark some visitors as suspect before they have done anything wrong. The City must treat screening as a civic act requiring justification, not as a ritual of institutional power.

The fairest screening system uses the least intrusive method that can reasonably meet the specific risk. A routine public tour does not require the same rule as a high-risk archive inspection, a medical emergency, a contentious protest, a visit by a targeted participant, or a vendor repair in a protected systems room. Proportionality is lost when one fear level governs every doorway.

Screening should match purpose. A participant entering active zones, a vendor entering technical rooms, a journalist entering a media access window, an emergency responder entering under crisis conditions, and an ordinary visitor entering a public education space should not face identical screening. Proportionate screening prevents the City from turning every access event into maximum suspicion.

The screening question should be stated plainly: what risk is being addressed, what information is necessary, who sees it, how long it is kept, what happens if something is flagged, and how can a person appeal or correct an error? Screening without explanation quickly becomes humiliation. Screening with clear purpose becomes a safety practice people can understand.

Proportionality also limits data collection. The City must not collect more identity, device, biometric, behavioral, or background information than necessary for the specific access class. A security system that gathers excess data creates a new record burden. It may also create new harm if breached, reused, or merged with other systems.

The dignity of screening matters. People may arrive anxious, disabled, elderly, grieving, angry, confused, or unfamiliar with the City. Screening should avoid unnecessary exposure, physical humiliation, public embarrassment, ableist assumptions, and class-coded suspicion. Security that protects the archive while degrading visitors has not placed burden fairly.

Proportionate screening also protects the City from performative safety. Some security rituals make people feel protected while

doing little. Others create inconvenience and fear without meaningful risk reduction. The City must audit screening for actual function, not symbolic hardness.

A proportionate system can still refuse entry. It can delay, redirect, escalate, or require oversight. But every escalation should be explainable, logged where material, and reviewable. Screening is not a sovereign judgment. It is a bounded protection practice.

Proportionality should be documented as a living standard. The City must be able to show why one access class requires identification, another requires orientation, another requires escort, and another requires no more than ordinary visitor notice. If the reason cannot be stated, the burden may be arbitrary.

Symbolic escalation after public controversy deserves particular resistance. A scandal, protest, or media cycle may make stricter screening feel reassuring, but reassurance is not the same as risk reduction. Proportionality must survive embarrassment.

Proportionate screening requires a written relationship between risk and method. The City must not use the most invasive screen because it is available, dramatic, or reassuring to anxious observers. It should ask what threat is being addressed, what less burdensome measure could work, who is most likely to be humiliated by the procedure, how disability and trauma will be accommodated, and what remedy exists for misuse.

This standard is especially important for critics, protesters, journalists, visitors from marginalized communities, and people with medical or religious needs. Screening that feels neutral to

designers can feel like accusation to those accustomed to being treated as suspicious. The City's burden is to protect without making entry itself a lesson in subordination.

Screening should also include an appeals path for pattern complaints. One humiliating search matters, but repeated reports matter differently. If certain bodies, languages, clothing styles, disabilities, protest affiliations, religious markers, or political views are screened more harshly, the City has not solved risk; it has reproduced suspicion under the language of safety.

12.2.3 — De-Escalation Norms

De-escalation is not softness. It is disciplined protection against unnecessary escalation of burden. Many boundary incidents begin in confusion, fear, anger, disability mismatch, language barriers, grief, public frustration, or imperfect signage. If security responds first with domination, the City will create harm while claiming safety.

De-escalation norms require staff to distinguish confusion from threat, dissent from violence, agitation from danger, and rule violation from malicious intent. This does not mean every act is harmless. It means the City must not convert every difficulty into a security identity. The first response should often be explanation, redirection, translation, cooling space, supervisor review, or access clarification.

Protest settings make de-escalation essential. A protestor may shout, accuse, insult, or gather with others. The City must not treat criticism as threat. It should intervene where harassment, stalking, doxxing, violence, protected-zone breach, obstruction, or

nonparticipant exposure occurs. De-escalation preserves the difference between adversarial speech and danger.

De-escalation also protects participants from being overprotected. Participants must learn to face criticism and public discomfort. If security removes every hostile word, the City becomes a comfort environment rather than public-power formation. If security ignores real intimidation, the City becomes unsafe. The art is calibrated response.

Staff need training, backup, and recovery to de-escalate well. A worker cannot maintain calm indefinitely without support. De-escalation is labor. The City must count the emotional cost of asking staff to absorb conflict. Rotation, supervision, complaint routes, and after-incident care are part of the standard.

De-escalation should also have a record category. Not every exchange needs public release, but incidents involving force, removal, denial, or repeated conflict should be reviewable. Otherwise the City may train humane language at the surface while allowing escalation patterns to disappear into staff memory.

De-escalation should be tested across difference. A norm that works only with calm, fluent, culturally familiar visitors is not yet a City norm. It must work with anger, disability, language difference, grief, and mistrust without turning difference into threat.

De-escalation should be treated as a professional competence, not a soft virtue. Staff need training in confusion, panic, grief, anger, disability communication, crowd energy, language barriers, protest dynamics, and media confrontation. A perimeter that

depends on individual charisma instead of trained de-escalation will eventually hand power to the loudest person or the most fearful guard.

De-escalation begins in the built and procedural environment. Visible help points, wide waiting areas, quiet rooms, clear signs, shade, water, interpreters, non-digital options, and realistic time buffers reduce the number of conflicts that security must solve. The most humane intervention may occur before anyone raises a voice.

De-escalation should preserve the dignity of staff as well as entrants. Workers should not be expected to absorb abuse endlessly in the name of openness. The City needs thresholds for support, rotation, supervisor intervention, refusal, and repair. Humane security does not mean staff become emotional shock absorbers for the entire public edge.

12.2.4 — Perimeter Security Review

Security must be reviewed because it tends to justify itself. Once a security office names a risk, other parts of an institution often defer. The vocabulary of danger can silence ordinary governance. The City cannot allow security to become the one domain whose claims are treated as self-proving.

Security review examines whether each practice remains necessary, proportionate, lawful, humane, and aligned with the City's purpose. It should examine searches, visitor denials, protest responses, use of force, device rules, incident classifications, emergency exceptions, retention of screening data, staff complaints, and patterns of unequal treatment.

Review must include external inspection. Internal security teams may normalize their own growth. An outside reviewer can identify fear drift, racial or class bias, disability mismatch, overcollection, protest suppression, staff burnout, and technology creep. The City needs critics who are not rewarded for making the security system look successful.

Security review also includes affected-person complaint routes. A visitor wrongly denied entry, a protestor wrongly treated as threat, a staff member pressured to overenforce, a participant overprotected into isolation, or a family member exposed by a security choice must have somewhere to go. Review without remedy is theater.

Public reporting should summarize security without exposing vulnerabilities or private persons unnecessarily. Categories of incidents, corrective changes, complaints, review findings, and rights concerns can be reported with care. The public should know whether the City's perimeter remains civic or is drifting toward fortress logic.

This review includes false-positive and false-negative analysis. The City must ask whom security wrongly treated as threat and whom security wrongly allowed to create harm. Both errors place burden, and both errors reveal whether fear or care is governing the edge.

Security review examines whether the City is becoming safer or simply more insulated. Insulation may lower visible conflict while raising hidden mistrust. A safe City is not one that hears no

criticism at the gate. It is one that can hear criticism without losing dignity or protection.

Security review remains independent enough to criticize security's own self-description. A security unit will naturally notice threats it prevented and may undercount fear, intimidation, wrongful denial, over-screening, or staff fatigue. Review includes civil-liberties knowledge, disability review, labor review, protest-rights experience, privacy expertise, and participant representation where appropriate.

The key question is not whether security feels effective. It is whether security remains subordinate to lawful public purpose. The review examines patterns of denial, use of force, visitor complaints, protest incidents, false suspicion, surveillance drift, staff stress, and emergency exceptions. Security that cannot be reviewed becomes the hidden power the City was built to resist.

Security review has access to uncomfortable evidence. Body-worn records where lawful, incident logs, visitor complaints, protest reports, disability-access complaints, staff debriefs, denial patterns, and media disputes should be reviewable without allowing casual browsing. The review body must see enough to judge power and be bound enough not to become another source of exposure.

12.2.5 — Safety Without Fear

Safety without fear is experienced through ordinary interactions: signage that explains rather than threatens, staff who begin with assistance, screening that preserves dignity, accessible alternatives, calm waiting spaces, visible complaint routes, and

predictable escalation. The atmosphere should let a lawful visitor understand what is happening without feeling accused and let staff enforce a boundary without performing dominance. This is a design outcome that can be observed, reported, and corrected.

Fear changes behavior. Participants under constant fear may become compliant rather than honest. Staff under fear may become rigid. Visitors under fear may avoid asking questions. Critics under fear may conclude the City is hiding behind force. A fear-based perimeter weakens the public meaning of the City even when no formal abuse occurs.

Clarity is the first safety tool. People should know which behavior creates risk, who may intervene, what de-escalation steps come first, when emergency power begins, how disability or communication needs are accommodated, and how an incident is reviewed. Force becomes less likely when rules, routes, roles, and exits are intelligible. Where stronger action is necessary, its scope, duration, record, and after-action remedy remain explicit.

Safety must not be purchased through wealth and exclusion. A quiet enclave can appear calm because ordinary people, protest, disability access, translation needs, civic education, and everyday confusion have been designed out. That is luxury insulation, not a public standard. Humane security should remain compatible with scrutiny, accessibility, and the imperfect presence of the public.

This standard should shape security uniforms, language, architecture, staffing ratios, waiting spaces, technology placement, and post-incident procedures. The sensory experience

of safety matters. A person's body should not be trained to fear the City before their mind can understand it.

Any defensible access system has to treat fear as data without making fear sovereign. Participants, staff, visitors, critics, and neighbors may all report whether the perimeter feels intimidating, confusing, or unsafe. Those reports should inform design review, not function as a popularity vote over necessary protection.

Safety without fear should also protect the public's willingness to approach. If ordinary citizens feel they must prepare for interrogation before asking a question, the City has narrowed public access even if it never formally closed the gate.

Safety without fear is a measurable atmosphere even if it cannot be reduced to one metric. The City must watch whether people lower their voices around guards, avoid complaint routes, feel watched in ordinary movement, or interpret the perimeter as warning rather than orientation. Fear may protect a boundary in the short term, but it corrupts civic formation over time.

This principle governs every visual artifact of the City. A diagram that makes the perimeter look like a fortress will do public damage even if the technical design is humane. A photograph that glamorizes armored presence will invite the wrong fantasy. The City's safety image should be disciplined, plain, calm, and answerable. Routine experience reviews should test whether security practices changed willingness to enter, ask for help, or complain.

Safety without fear also requires repair after fear has been caused. If an entrant is wrongly treated as dangerous, if a protester is

mishandled, if staff overreact under pressure, or if security language becomes publicly humiliating, the City should have a correction route. The purpose of repair is not image recovery. It is returning burden to the institution that caused it. Security remains legitimate only when its limits, review routes, and humane operating tone survive ordinary pressure. Access classes should distinguish participants, staff, visitors, experts, media, vendors, emergency responders, critics, and temporary contributors without treating any category as public property. Repeated fear reports should trigger operational retraining or design change rather than be dismissed as a communication problem.

12.3 — Access Classes, Gates, and Screening

Access classes describe temporary permissions rather than human rank. Participant, staff, visitor, vendor, journalist, expert, critic, emergency responder, and family routes each carry a defined purpose, zone, time, record state, expiry, and review. Digital access follows the same logic through least privilege, separation of duties, and logged exceptional entry. Denial receives reasons and a review path whenever rights or public participation are affected. A badge can open a door; it cannot certify civic virtue (NIST, 2020a; ISO/IEC, 2022; UN Human Rights Committee, 2011).

A City with only two categories, inside and outside, cannot govern public access well. The Transparent City contains active participants, staff, visitors, experts, media, vendors, emergency responders, critics, auditors, and public users of different kinds. Each person may enter for a different purpose, carry a different exposure status, and require a different boundary. Access classes prevent the City from flattening all entry into one dangerous category.

Access classes are not moral ranks. A staff member is not higher than a visitor. A participant is not higher than a critic. An expert is not higher than an ordinary citizen. Access class means purpose and duty. The City needs to know why a person enters, what they may see, what they may do, what record conditions apply, what must be protected, and how exit or remedy works.

Gates then turn access classes into lived practice. A gate can be physical, digital, procedural, or temporal. It may be a doorway,

check-in process, credential verification, visitor orientation, vendor log, media agreement, emergency route, or public interface window. The gate should not become a symbol of domination. It should make transition explicit.

Screening attaches to role. The City must screen enough to protect people, records, and zones, but not so much that entry becomes humiliation or data extraction. Participant movement is governed by the Vow. Staff access is governed by role. Visitors receive civic visitation rules. Experts and media enter with purpose-bound limits. Emergency and vendor access must be fast enough to function and controlled enough not to become hidden authority.

The access system's deepest purpose is to prevent category collapse. When categories collapse, harm follows. A vendor becomes an unlogged advisor. A journalist becomes an unbounded recorder. An expert becomes a hidden governor. A volunteer becomes staff without labor protection. A visitor becomes a record subject. A participant treats public openness as private access. The City must make each role visible before harm must be repaired.

Access classes form the City's grammar of entry. The grammar matters because access decisions will happen hundreds of times a day, often under pressure. If the grammar is vague, daily improvisation will become hidden government at the door.

12.3.1 — Participant Access

Participant access is governed by active status under the Transparent Vow. A participant is not simply a resident moving through a campus. Movement may carry record status, protected nonvisibility boundaries, public interface rules, staff interaction limits, and access restrictions tied to role pathway. Participant access therefore combines ordinary movement with public-power formation conditions (NIST, 2020a; ISO/IEC, 2022).

Public openness depends on the City's ability to make participant access legible to participants themselves. They should know when they are entering public zones, protected zones, staff zones, deliberative rooms, archive-adjacent areas, recovery spaces, and public interface windows. Confusing internal access can create accidental violations and unnecessary anxiety. Legibility is care.

Participant access is role-limited like every other access class. A participant receives the material needed to understand and challenge their own record and to perform defined duties, but not unrelated raw archives, staff-private space, protected third-party material, or service routes as informal privilege. Access rules should identify purpose, area or dataset, time, supervision, logging, and remedy. Full active recording increases answerability; it does not create a passport to every place or file.

The opposite danger also matters: participant access should not be punitive. The City must avoid creating a maze of restriction that makes participants feel held under suspicion. Access rules must be tied to burden, safety, dignity, and role, not to

institutional desire for control. The participant should experience the City as bounded public formation, not custody.

Internal gates should record material transitions without overlogging every ordinary step. A participant's movement into a deliberation hall may matter. A crisis room entry may matter. A protected nonvisibility boundary may matter. Ordinary movement to meals and walking grounds may not require the same interpretation. Proportionality keeps records meaningful.

Participant access should also define the burden of temptation. A participant who knows unreviewed contact is difficult may be protected from pressure they would otherwise have to resist alone. Good access design can reduce moral heroism by making bad paths harder to enter.

Participant access should also prepare for status change. A person who moves from applicant to participant, participant to office interface, pause to reentry, or exit to former participant should not carry outdated access by inertia. Role status must update with life status.

Participant access should be governed by active status rather than personal privilege. A participant moves through the City because the role requires work, study, deliberation, rest, care, correction, public interface, and protected nonvisibility. Access must not become a badge of superiority, a hidden reward system, or a way to separate supposedly higher citizens from ordinary people.

The useful formula is simple: access authority equals role plus purpose plus zone plus time plus record condition plus review. Remove any part and the permission becomes too vague. This

formula should appear in operational training because vague permission is how influence, favoritism, and later confusion return.

Participant access should be integrated with de-loading and health review. A participant may have permission to enter a public interface but lack the present capacity to carry it safely. Access rules should not force performance after distress, exhaustion, threat, grief, medical need, or overload. The City protects public trust by refusing to treat every active status as immediate readiness.

12.3.2 — Staff Access

Staff access must separate role authority from personal authority. A staff member may enter certain spaces because they teach, clean, repair, secure, archive, operate, translate, moderate, provide care, or manage logistics. That access belongs to the role, not to the person's private curiosity or informal power. The City must make staff permissions precise.

Staff access is necessary for the City to function. A maintenance worker may need a mechanical room. An archivist may need custody systems. A clinician may need a protected care space. Security may need emergency routes. An educator may need classroom materials. Operators may need public interface systems. Each access class should be sufficient for work and limited against misuse.

Staff privacy also depends on access design. If staff must use participant routes for all work, their labor may become overexposed. If staff are always hidden, their influence and

burden disappear. The City needs role-appropriate routes that protect staff from full-life visibility while making material influence and work burden accountable.

Access logs for staff should focus on material role use. Overlogging staff can create surveillance of workers. Underlogging staff can hide influence. The appropriate standard is role-bound traceability: when staff access affects records, participants, protected domains, public interface, or security, the access should be reviewable. Ordinary work should not become a dignity violation.

Staff access should include appeal and correction. A staff member wrongly denied access may be unable to do their job. A staff member given excessive access may be placed at risk or tempted into misuse. Supervisors should not use access control as retaliation. Access governance belongs inside labor dignity.

This rule connects to labor review. If staff need broader access to make an understaffed system function, the solution may be staffing, not permission expansion. A City must not solve operational shortage by giving workers more power than their roles can safely carry.

Staff access must be legible to participants so hidden staff authority does not appear magical. Participants should know which staff roles can enter which spaces and why, without receiving access to staff private information. Role transparency reduces suspicion.

A work-specific access grant does not imply full-life exposure or institutional inferiority. Staff access should end where the assigned duty ends, with privacy preserved beyond the role.

Another nonoptional duty is to prevent access caste formation among workers. People who hold restricted credentials can be tempted to treat proximity as status, and others can be tempted to treat service roles as invisible. A fair access system records role authority, protects role dignity, and reminds the institution that labor is not background scenery.

Staff access should also be limited against surveillance creep. The fact that a worker uses a service route, enters a records area, or supports a protected domain does not make that worker's movement a public story. Role accountability requires enough record to review work power and safety, but it must not become a map of the worker's private life, habits, vulnerabilities, or dignity.

12.3.3 — Visitor Access

Visitor access should be understandable before arrival. Public information should describe available routes, hours, accessibility accommodations, recording conditions, protected zones, prohibited conduct, identification needs where lawful, expected wait, non-digital assistance, complaint, and appeal. A person should not have to cross the boundary before learning what the boundary means.

A visitor path also needs a dignity floor. People arrive with disabilities, language differences, trauma histories, anxiety, confusion, grief, political anger, or simple curiosity. A fair gate

does not require visitors to perform confidence or institutional fluency before they can be received.

Visitor access is the ordinary public face of the City. Visitors may come to learn, observe public materials, attend approved sessions, submit questions, tour limited spaces, participate in civic education, or understand the City's public role. They are not participants. They are not staff. They are not automatically record subjects. Their access must be welcoming enough for public legitimacy and bounded enough for safety.

Visitors need orientation before access deepens. They should know what they may see, where they may go, whether they may document, how record conditions apply, how nonparticipant masking works, how to submit concerns, how to ask questions, and how to leave. A visitor who does not understand the rules may violate boundaries unintentionally. The City must design orientation as fairness, not formality.

Visitor access also protects those who seek information without seeking visibility. Attendance at a tour, public session, complaint meeting, protest, family visit, or record-site appointment should not become an endorsement label or participant trace. Capture and release rules should distinguish operational security from public identification, provide masking or opt-out routes where feasible, and delete visitor data when its purpose expires.

The visitor path should avoid protected domains. It should not pass casually by intimate, clinical, household, staff-private, child-sensitive, or archive-custody zones. The public should be able to

understand the City without being brought too close to people whose dignity depends on distance.

Visitor access must also prevent celebrity behavior. Some visitors may come hoping to see participants as objects of fascination. Others may seek confrontation or proof of hidden wrongdoing. The City must distinguish public interest from appetite. A visitor may learn and criticize. A visitor may not consume.

Visitor design should include an educational sequence. A first visit should teach the City's distinction between openness and exposure before the visitor encounters any dramatic public material. A visitor who understands the boundary is less likely to demand spectacle as the price of trust.

The visitor path should include an exit ethic. A visitor should know how to leave, how their data is handled, how to ask for correction, and how to avoid becoming public material. Ending an access event is part of protecting it.

Visitor access must begin with the visitor's right to understand the visit. Public curiosity is not wrongdoing. A visitor may come to learn, criticize, study, accompany a family member, attend a public event, or inspect a public-facing process. The City's task is to convert curiosity into bounded entry rather than punish it or exploit it.

A visitor pathway should therefore include plain notice, non-digital options, accessibility support, record-status explanation, consent boundaries, complaint access, and a clear exit. The visitor should not leave unsure whether they were filmed, whether their presence became a public record, what they may say, or how to

correct a mistake. Confusion is a hidden burden that sophisticated institutions often export to ordinary people.

Visitor access must include a no-surprise principle. A person should not discover after the fact that the visit was recorded, restricted, searchable, or interpreted in a way they did not understand. Notice must be layered, because one sign at the gate is not informed access for people under stress, with disabilities, using translation, accompanying children, or entering during a public event.

12.3.4 — Expert and Media Access

Experts and media both shape public understanding, but they do so through different powers. Experts may inspect systems, advise, test, diagnose, or critique; journalists observe, question, investigate, interpret, and reach people who will never visit. Neither role is an enhanced visitor category. Each requires its own purpose, independence protections, access boundaries, and remedy for misuse.

Expert access should follow the dedicated purpose, competence, conflict, access, and influence-trace controls in Section 12.4; this subsection focuses on how that route differs from media access.

Media access must also begin with purpose. Public-interest reporting is not the same as entertainment, promotional imagery, humiliation, or personality content. A journalist may need to see, ask, investigate, and challenge. That does not mean raw intimacy, child exposure, staff vulnerability, or protected nonvisibility material becomes available. Media freedom and human dignity must both be protected.

Their review trails should therefore differ. Expert influence may alter design, safety, rights, technical systems, or policy, while media output shapes public knowledge outside the City's control. The institution may record conditions of access, protected categories, conflicts, and correction routes without approving conclusions. Documentation should reveal influence and boundary, not create editorial control.

Both roles require conflict awareness. An expert may have donor ties, vendor ties, ideological commitments, professional incentives, or prior public positions. A media organization may have sensational incentives, political commitments, or business pressures. The City must not exclude every conflict automatically, but it must make relevant conflicts known and manage access accordingly.

Post-access review should examine consequences rather than reward favorable output. Did the expert relationship create hidden authority, did the report expose protected people, did the coverage omit decisive context, or did the access produce public understanding that the previous design could not? Future access rules should learn from those outcomes. Review cannot become a retrospective loyalty test.

Duration changes the risk. Extended presence creates familiarity, relationships, informal access, altered participant behavior, and possible dependence on future invitation. Longer engagements therefore need clearer renewal, conflict, rotation, data handling, and post-access rules. Time is part of authority even when no formal title changes.

A blended expert-media credential would erase essential differences. Technical reviewers may need confidential depth and access to staff or systems; journalists may need observation, interview, imagery, source protection, and editorial independence. Both can strengthen accountability, but they should not inherit each other's privileges. Separate agreements make the reason for each access route inspectable.

Each access event should carry a purpose memo stating why entry is justified, what may be seen or recorded, which categories remain protected, what may be quoted, how influence is logged, who can challenge misuse, and what status travels with resulting artifacts. The memo should be public in proportionate form and reviewable after the event. Without it, expertise can become hidden governance and reporting can become extraction.

Mutual capture is the final risk. Experts may seek future invitations; journalists may seek exclusivity; the City may seek favorable attention from both. Ordinary, published terms, conflict disclosure, rotation, and prohibitions on private favors or unlogged bargaining protect independence. Access should not create a prestige economy around proximity to the institution.

12.3.5 — Emergency and Vendor Access

Emergency access must be fast enough to save life and controlled enough to preserve lawful record and dignity. Medical responders, firefighters, crisis teams, public safety officials, technical responders, and urgent repair crews may need to cross boundaries that ordinary visitors cannot cross. The City must

prepare those routes before crisis, not improvise them during panic (UN Human Rights Committee, 2011; W3C, 2023).

Emergency entry should have role status, route clarity, after-action review, and protected-category handling. Life comes before record formalities, but record status does not disappear. The City must know who entered, why, what was accessed, what was protected, and what public explanation may be needed afterward. Emergency access is not a secret exception by default.

Vendor access is different but equally risky. Vendors may repair capture systems, maintain archive infrastructure, service security devices, support accessibility tools, provide food systems, repair utilities, or update software. Vendor entry can become technical dependency, data access, or hidden influence if not governed tightly.

Vendor access should be minimal, escorted or supervised where needed, logged when material, and governed by contract. A vendor should not gain archive access because they maintain the building. A software vendor should not browse records because they support search. A maintenance vendor should not become a private observer of active formation.

Emergency and vendor access both require preclassification because crisis and maintenance are common loopholes. People will enter under urgency or technical necessity. The City must respect those necessities while preventing them from becoming unreviewed access classes. Preparation is the ethical form of speed.

The rule is practical: urgent roles receive the access needed to protect life, continuity, and repair, but not the authority to bypass the City's purpose. Every emergency or vendor pathway must answer afterward to the record of why it existed.

Emergency and vendor access should be tested in dry runs. A protocol that looks safe on paper may fail when an ambulance arrives, a server breaks, a fire alarm sounds, or a vendor needs urgent repair. The City must rehearse the boundary before crisis writes the first draft.

Vendor access should never become the invisible architecture of the City's memory. If a vendor's tools determine what can be found, searched, labeled, repaired, or explained, the vendor has practical governance power that must be named and limited.

Emergency and vendor access tests whether the City can remain lawful under pressure. A fire crew, ambulance team, cyber incident responder, repair contractor, utility crew, or structural inspector may need rapid entry. Delay can endanger life or continuity. Yet emergency need must not erase later accounting.

The fair rule is accelerated entry with after-action review. Urgency may narrow notice, but it should not remove record reconstruction, protected-person handling, access logging where feasible, vendor boundaries, and post-event correction. Emergencies reveal whether the City's safeguards are real or only ceremonial during calm periods.

Vendor access deserves special suspicion because technical necessity can hide private control. A vendor who repairs cameras, storage, gates, analytics, translation tools, security devices, or

visitor systems may temporarily stand close to institutional memory. Contracts should therefore include least-access rules, escorted zones where appropriate, logging, data nonuse, incident reporting, exit rights, and a ban on turning access into leverage.

Every accelerated entry should generate an emergency access receipt after the immediate danger has passed. The receipt records who entered, under what trigger, which zones or systems were reached, what notice was bypassed, what information was exposed, what actions were taken, and who will review the event. It should be available to affected people and oversight in forms that do not reveal security vulnerabilities. The receipt converts urgency from an invisible exception into a reviewable episode and gives the City a basis for correcting routes that failed under pressure.

Vendor exit is designed before vendor entry. Contracts specify credential revocation, return or destruction of data, transfer of documentation, continuity assistance, vulnerability disclosure, migration or escrow of critical configurations, and post-termination audit. The City tests whether capture, access, correction, safety, and public memory continue if a vendor fails, is acquired, raises prices, or refuses cooperation. An institution that cannot dismiss a vendor without losing its own memory has transferred practical sovereignty to a private dependency.

12.4 — Experts, Critics, and Temporary Contributors

Experts, critics, and temporary contributors add the most value when invitation cannot be converted into dependence. Purpose, access, compensation, conflicts, deliverables, publication rights, data handling, and end date are declared before entry. Critics receive protection from retaliatory exclusion, selective editing, and compelled endorsement, while the review trail preserves recommendations, institutional responses, and unresolved disagreement. Legitimacy comes from qualified outsiders being able to inspect difficult claims and publish reasoned dissent, not from displaying eminent names (UN Human Rights Committee, 2011; Bovens, 2007; O'Neill, 2002a).

Outside intelligence is a structural need, not a courtesy. An institution cannot fully perceive the burdens produced by its own habits, incentives, architecture, records, and language. Experts, critics, and temporary contributors can reveal blind spots in law, privacy, disability access, labor, security, child protection, intimacy, technology, host-community burden, and public interpretation. Their value depends on independence and the ability to remain unconvinced.

Yet outside access also creates risk. Expertise can become hidden governance. A critic can become a performer. A temporary contributor can gain influence without accountability. A public reviewer can see protected material beyond their purpose. A famous expert can shape the City by prestige rather than argument. The City must welcome outside knowledge and limit outside authority at the same time.

Inviting expertise does not require institutional surrender. The City must invite expertise with clear purpose, role boundary, access limits, review trail, and conflict handling. It should protect critics from retaliation and also protect participants and nonparticipants from critics who confuse adversarial review with entitlement to everything. A critic is not a threat by default. A critic is also not a sovereign.

Temporary contribution is especially important in a prototype. The first City may need outside architects, technologists, clinicians, civil-liberties lawyers, disability consultants, labor auditors, public administrators, security reviewers, child-protection specialists, and host-community representatives. Their contributions may be essential. Their authority must still remain bounded.

Institutional fairness depends on whether outside access moves burden toward truth or simply creates new hidden power. A good expert pathway reveals influence. A bad one hides it behind credentials. A good critic pathway strengthens the City. A bad one turns critique into spectacle or harassment.

The section's discipline is that outside knowledge must help the City see, not quietly rule. A City that refuses outside knowledge becomes insular; a City that grants unbounded outside authority becomes captured by prestige, outrage, expertise, or informal influence.

12.4.1 — Expert Purpose Statement

Every expert entry should begin with a purpose statement. The City must know what problem the expert is being asked to

examine, what competence they bring, what materials they need, what protected categories remain outside scope, and what kind of output will follow. Without purpose, expertise becomes an all-purpose access pass (UN Human Rights Committee, 2011; O'Neill, 2002a).

Purpose statements protect the expert as well as the City. An expert brought in for accessibility review should not be expected to judge readiness, legal validity, archive ethics, or security policy beyond their competence. Scope protects against prestige overreach. It also helps the public interpret what an expert finding means.

The statement should identify conflicts where relevant. A vendor-connected expert, donor-connected expert, political ally, former critic, activist, academic researcher, journalist, or professional consultant may still contribute, but the City should not hide the context of their influence. Conflict disclosure is not automatic disqualification. It is burden placement.

The purpose statement also determines access depth. Some experts can work with public materials. Others may need restricted records, staff interviews, facility walkthroughs, technical logs, anonymized bundles, or protected summaries. Access must follow need. It should not follow status.

Expert purpose statements should be preserved in a review trail when the expert's contribution materially shapes design, policy, safety, record handling, or public interpretation. Public trust requires knowing when outside knowledge changed the City.

Hidden expertise can become hidden power even when the advice is good.

The purpose statement should also distinguish advisory access from evidentiary access. An expert may advise design without seeing individual records, or examine system categories without seeing raw identities. The City must not use expertise as a shortcut around minimization.

The expert purpose statement should be written in language the public can understand. It should not hide behind credentialed fog. If an expert is entering to review disability access, child shielding, cybersecurity, archive integrity, labor burden, protest routing, or clinical safety, the statement should name that purpose without exposing protected details.

This purpose statement also protects experts from being used as ornaments. The City must not invite critics or specialists merely to decorate legitimacy. A real expert purpose includes scope, independence, evidence access, limits, response rights, disagreement handling, and a public explanation of what the expert was and was not asked to judge.

The expert purpose statement should include what the expert is not judging. A cybersecurity reviewer is not certifying the City's moral legitimacy. A clinician is not approving political formation. A journalist is not validating the Law of Fairness. A disability reviewer is not endorsing the entire institution. Stating the boundary of expertise prevents the City from borrowing authority beyond the expert's actual task.

12.4.2 — Temporary Role Boundary

Temporary contributors enter for a defined purpose and leave when that purpose ends. This principle matters because temporary access can quietly become ongoing authority. A consultant becomes indispensable. A reviewer becomes a regular informal adviser. A critic becomes a gatekeeper. A vendor expert becomes the only person who understands a system. Temporary roles must not become shadow offices.

The perimeter duty requires the institution to define the beginning, scope, duration, permitted contact, access depth, record duty, confidentiality limits, and exit conditions for temporary contributors. A person invited to review a public interface should not gain informal access to participants. A technical specialist should not become a policy adviser unless a new role is created and reviewed.

Temporary role boundaries also protect participants and staff from informal pressure. A famous expert, donor-connected visitor, journalist, political figure, or institutional critic can affect behavior simply by being present. The City must prevent temporary presence from becoming unlogged influence inside active formation.

Exit from a temporary role should be recorded where material. If the contributor's work shaped design, a summary should exist. If a concern was raised, the response should be tracked. If recommendations were rejected, the reasons should be preserved where appropriate. Influence does not disappear because the contributor leaves.

Temporary contributors should also be protected from being used as legitimacy props. The City must not advertise an expert's presence as approval unless the expert actually gave approval under clear terms. A consultant's name can become a public artifact. The City must not borrow credibility beyond what was earned.

Temporary roles should also carry communication limits. A contributor with temporary access should not privately brief participants, donors, media, or public officials about protected observations unless the role explicitly permits that communication. Knowledge gained under boundary must not leave through informal prestige channels.

The temporary boundary should also protect the contributor. A temporary expert should not be blamed for decisions outside their scope, used as cover for choices they did not approve, or kept publicly tied to a system after their role ended.

Temporary role boundaries should be visible to insiders as well as outsiders. A temporary contributor should know when the role starts, what authority it grants, what material may be handled, who supervises, how conflicts are logged, when the role ends, and what continuing obligations survive exit. Without an end condition, temporary access becomes shadow membership.

Charismatic contributors require especially clear boundaries. Fame, donor connection, professional prestige, or public influence can produce informal authority simply through presence and access. A temporary role should therefore state scope, term, conflicts, decision rights, publication freedom, and

exit. The institution needs protection from help that slowly becomes unreviewed power.

Temporary role boundary should include post-role silence and speech distinctions. A temporary contributor may be bound not to disclose protected information, but should not be gagged from reporting wrongdoing, misuse, coercion, unlawful exposure, retaliation, or institutional failure through proper channels. Confidentiality that blocks accountability becomes capture by contract.

12.4.3 — Critic Protection

Critics are necessary because admiration misses burden. A critic may notice surveillance drift, legal overclaim, staff exploitation, child exposure, intimate-record danger, host-community resentment, disability exclusion, or public artifact misuse before supporters do. The City must treat criticism as part of its safety system, not merely as public-relations risk.

Adversarial review deserves a legitimate and safe route. A critic should not lose access merely for being unfriendly, be labeled malicious for asking difficult questions, or be placed in a crowd setting that makes careful inspection impossible. Anti-retaliation, viewpoint-neutral criteria, privacy, security, correction access, and protection from doxxing or fan harassment let criticism test the City rather than test the critic's tolerance for abuse.

A further complication is that critic status does not erase boundaries. A critic may not demand access to protected intimate material, child-related records, nonparticipant identities, clinical spaces, legal counsel interactions, or raw archive material beyond

purpose. The critic's legitimacy comes from asking hard questions under lawful limits, not from claiming total entitlement.

Public openness depends on the City's ability to create channels for protected criticism. Some concerns may need confidential submission before public release, especially when they involve safety, breach, staff retaliation, nonparticipant exposure, or technical vulnerability. A critic should be able to warn the City without immediately exposing the very harm they are trying to prevent.

Public response routes protect both critic and institution. The City must have a method for acknowledging, classifying, answering, correcting, or rejecting criticism. Silence breeds suspicion. Defensive rhetoric breeds distrust. A reviewable response helps the public see whether criticism changed the City or why it did not.

Critic protection is not a generosity. It is self-protection against the City's own blind spots. An institution that forms public power should be able to survive adversarial review before asking the public to trust its participants.

Critic protection should include protection from supporters of the City. A movement around visible public power may develop defenders who see criticism as betrayal. The City must publicly refuse harassment done in its name, even when the harassment comes from people who think they are protecting the project.

Another nonoptional duty is to learn to separate critic motive from critic evidence. A critic may dislike the City and still produce accurate evidence of burden. Dismissing evidence because the

critic is hostile is one of the oldest ways institutions protect themselves.

Critic protection means more than allowing polite disagreement. The City must be structured so a serious critic can ask hostile questions, inspect public claims, review boundaries, publish adverse conclusions, and remain safe from retaliation, credential removal, access blacklisting, or reputational targeting. A critic who must flatter the City to remain present is not a safeguard.

The protection also runs in the other direction. Critics do not gain permission to harass, expose protected persons, misrepresent access, endanger staff, or turn dissent into stalking. The City must protect adversarial review by distinguishing critique from coercive conduct, not by pretending the distinction is always easy.

Public response policies should condemn supporter harassment, refuse loyalty tests, and preserve critic access even when criticism wounds the project's image.

12.4.4 — Access Limits

Access limits protect people from the moral appetite of expertise and critique. A good reason to enter the City does not become a good reason to see everything. Experts and critics should receive the narrowest access sufficient for their purpose, with escalation only when justified, logged, and reviewed.

Limits should be category-specific. Child-related material, intimate records, health and clinical material, legal counsel material, household material, staff private records, archive custody systems, security vulnerabilities, and nonparticipant

identities require separate handling. The City must not use broad nondisclosure agreements as a substitute for actual access design.

Access limits also protect the quality of review. Too much material can overwhelm experts and create false confidence. A clear scope allows a reviewer to focus on what they are competent to examine. If broader access is needed, the purpose should be amended rather than assumed.

Boundary legitimacy requires the City to include affected-person protections in expert and critic access. If a reviewer must see sensitive material, the handling should include masking, summaries, restricted rooms, access logs, and remedy for misuse. The reviewer's public function does not erase the dignity of the person whose material is reviewed.

Access limits should be explainable to the public. When the City denies a critic raw access, the reason should be more than institutional dislike. It should be tied to protected domains, safety, scope, law, or public purpose. Explaining limits reduces the risk that every boundary is interpreted as cover-up.

A fair access limit is a burden statement. It says: this knowledge would help, but this exposure would harm too much or exceed the role. The City must learn to say that without shame and without hiding behind vagueness.

Access limits should also be reviewable and adjustable. A critic or expert who demonstrates a legitimate need for deeper access should have an escalation path. Access that creates unanticipated harm or authority drift should be narrowed. Fixed categories

become unfair when the actual burden differs materially from the predicted burden.

Access limits should be paired with substitute evidence where possible. When raw access is denied, the City should ask whether a summary, aggregate, protected demonstration, or independent inspector can give the critic enough basis to evaluate the claim.

Access limits can protect the conditions of truthful inquiry. A critic excluded from a child-protected zone may still receive a status summary, audit finding, protected explanation, or independent reviewer's report. Privacy therefore routes inquiry rather than ending it. The institution must show that the alternative is timely, informative, independently checkable, and no broader than needed to protect vulnerable people.

This is where legal humility matters. Some limits will depend on host law, professional duties, medical confidentiality, child-protection obligations, labor rules, security risks, and publication law. The City must not pretend its internal moral architecture overrides lawful duties. It should show how those duties are recorded, explained, and reviewed.

Access limits should be explained without implying distrust of the person limited. The City may deny a critic raw access to a protected domain while still respecting the critic's integrity. The tone matters because humiliation breeds escalation and suspicion. The fair sentence is not, we do not trust you. It is, this category may not be exposed through any person's curiosity, including ours.

12.4.5 — Review Trail

A review trail shows how outside input entered the institution and whether it changed anything. Its fields may include purpose, access class, materials reviewed, conflicts, questions, recommendations, institutional response, implementation, dissent, expiry, and a public summary where appropriate. Without that object, invited expertise can become invisible governance (Bovens, 2007; Fung, 2006).

Two abuses become easier when influence is unrecorded. Hidden dependence lets an adviser shape policy without public knowledge; false endorsement lets the institution borrow a person's name while concealing the narrowness or disagreement of the role. Traceability protects against both secrecy and prestige laundering.

Proportionality keeps the trail from becoming bureaucratic capture. A passing visitor comment, a journalist's question, a legal memorandum, and a disability audit that redesigns access do not require the same public object. Material influence, consequential access, and changed practice are the triggers, not every conversation.

Later failure gives the trail another use. Reviewers can ask whether a risk was identified, whether access limits prevented necessary knowledge, whether a warning was ignored, and whether the institution implemented only the flattering parts of advice. Failure memory becomes specific rather than anecdotal.

The public layer may be narrower than the oversight layer. Protected reviews can be acknowledged by category, date, owner,

and disposition without exposing identities or sensitive records. Influence can be visible even when the underlying material remains lawfully restricted.

Leaving a trace is an act of intellectual humility. The institution admits that outsiders contributed to its design and that accepting or rejecting their work was itself a consequential decision. Expertise becomes safer when neither the expert nor the City can rewrite the relationship later.

Disagreement deserves preservation. A rejected warning, unresolved objection, minority report, or staff dissent may become important after later harm. Recording only accepted advice would turn the trail into a celebration ledger rather than evidence of judgment under uncertainty.

Future stewards also need the reasons behind access decisions. Leadership change should not erase why a reviewer was admitted, what limits were imposed, which conflicts were known, or why a recommendation was rejected. Institutional memory prevents the same preventable argument from restarting as if nothing had been learned.

Influence should be neither hidden nor exaggerated. When outside input changes a gate rule, archive label, protest route, screening method, safety practice, or media protocol, the change should link back to the contribution. Where the City rejects serious criticism, the reason should remain visible enough for later reassessment.

A category-based schema prevents selective quotation. Favorable experts, skeptical critics, local residents, staff reviewers, and

temporary technical contributors enter the same basic fields. The institution cannot feature praise while burying adverse findings simply because the latter are inconvenient.

Minority positions should remain attached to the final disposition when they bear on safety, rights, evidence, or burden. Consensus may be the operational decision without becoming the historical fiction. Readers should be able to see that the institution acted despite unresolved disagreement.

The stable schema is contributor and role, purpose, access, materials, conflicts, questions, findings, dissent, institutional response, implementation owner, expiry, and later reassessment. It is not a prestige score and does not imply equal evidentiary weight. It makes the chain of influence inspectable.

Temporary authority expires automatically. Credentials, editing rights, and advisory access should carry an end date; continued access requires a new decision. Public descriptions should identify the dates of the role so former contributors are not mistaken for current advisers. Confidentiality and other protective duties survive the role for as long as applicable law and the relevant agreement require. Recurring contributors should receive a fresh conflict and access review rather than inherit privileges from earlier work.

Independence also requires disclosure of payment, travel support, access arrangements, publication timing, and confidentiality without treating compensation as automatic disqualification. The City cannot purchase favorable silence, delay adverse findings, or reward compliant reviewers with privileged access. The trail

records both the support that made review possible and the safeguards that kept support from becoming ownership. Outside expertise is now bounded as a source of correction rather than private rule. Adversarial legitimacy extends from invited review to protest, dissent, and organized challenge, where disagreement is less orderly but no less important. Closeout should verify that credentials, shared folders, distribution lists, and informal access actually ended when the appointment did.

12.5 — Protest, Dissent, and Adversarial Presence

Peaceful protest gives the City an external view of its own burdens. A credible route preserves sight, sound, accessible participation, media observation, and proximity sufficient for expression without forcing entry into residential, clinical, child-protected, archive, or emergency domains. Restrictions require lawful purpose, necessity, proportionality, nondiscrimination, de-escalation, and review. The institution should also answer organized criticism through records, meetings, corrections, or policy decisions so protest produces a public response rather than mere containment (UN Human Rights Committee, 2020; OHCHR, 2024).

A City that cannot be protested cannot be trusted. Public-power formation must remain exposed not only to official review, friendly dialogue, and expert inspection, but also to lawful dissent. The City's claim is too powerful to be protected from people who reject it. Protest is not an embarrassment at the edge of the City. It is part of the environment that keeps public power from mistaking support for legitimacy.

Dissent tests whether the City understands democracy beyond admiration. People may oppose the City because they fear surveillance, distrust its founders, reject its theory, object to its costs, defend privacy, worry about children, see elite capture, oppose public records, or believe no such institution should exist. Some objections may be wrong. Some may be partly right. Some may reveal burdens the City has missed. The City must not treat disagreement as impurity.

The same rule needs a limiting condition: protest can harm. It can become harassment, doxxing, stalking, intimidation, blocked access, family exposure, staff targeting, or violence. It can be manipulated by bots, media incentives, partisan campaigns, or personal grievance. The City must protect dissent without letting dissent become a tool for destroying the very people and protected domains the City is obligated to shield.

Adversarial presence should be designed as a real civic interface. Demonstration areas and routes must be visible to their intended audience, accessible, reachable by media and observers, and connected to a named response process rather than banished beyond relevance. Separate safety plans protect children, households, staff, visitors, records, and emergency access, while viewpoint-neutral rules distinguish expressive disruption from harassment, stalking, blocked rescue, or violence. The design preserves dissent without requiring vulnerable people to absorb it.

The design should be judged by whether the City is using safety to avoid burden or using openness to dump burden on the vulnerable. Both errors are possible. The right design preserves lawful criticism while preventing harassment and collateral exposure.

Dissent belongs within the City's public ecosystem. The City must expect moral disagreement as a permanent condition, not as a launch problem. A protest route that works only during calm times is not yet a real protest route (UN Human Rights Committee, 2020; OHCHR, 2024).

12.5.1 — Protest Zone Design

Protest zone design is not the art of moving criticism out of sight. Distance, sightline, sound, weather protection, accessibility, safety, public interface, and media visibility should keep objection visible, audible, and answerable without letting crowd pressure control the City. A zone that is technically available but practically invisible is suppression by design (UN Human Rights Committee, 2020).

Protesters carry risks of their own. A critic approaching a highly visible institution may face counter-harassment, hostile surveillance, doxxing, crowd confusion, or misclassification by security. Dissent is not protected if the institution merely permits it while leaving dissenters exposed to foreseeable harm. Route design, anti-retaliation rules, privacy options, and a complaint channel should protect the person without weakening the protest's public visibility.

A protest zone belongs to the civic edge, not an exile map. Placement that makes dissent impossible to see, hear, or understand converts opposition into decoration. Proximity, accessibility, sight and sound, emergency passage, counterdemonstration, and protected-domain integrity can be designed together. The standard is criticism close enough to matter without forcing households, children, care rooms, archives, or ordinary visitors to carry avoidable risk.

Closeness, however, must be balanced with protection. Protest must not make children, households, protected nonvisibility zones, clinical interfaces, archive custody, staff entrances, or

emergency routes vulnerable. The City must distinguish symbolic proximity from unsafe proximity. Protest can be visible without becoming invasive.

The protest zone should be accessible. People with disabilities, elders, people using transit, people with language barriers, and ordinary citizens without elite resources should be able to dissent. A protest location that only the physically strong or locally connected can use will distort whose criticism becomes visible.

Design should include sound, signage, public information, weather protection where possible, safe pedestrian routing, emergency access, and a complaint method for protesters themselves. Protesters can also be harmed by bad design, hostile crowds, security overreach, or unclear rules. The City must protect the right to criticize in practice.

Protest zones should include anti-harassment boundaries. The right to protest does not include the right to stalk families, expose children, target staff off duty, block emergency movement, or demand raw access to protected records. Clear lines make legitimate protest stronger because they distinguish it from coercion.

The protest zone should also be evaluated by actual use. Empty design assumptions often fail when crowds, weather, counterprotest, disability access, media presence, and emotion arrive together. Protest design must be corrected after real events rather than defended because it looked balanced on a plan.

The protest zone should never be designed only for orderly dissent. A real protest may be emotional, inconvenient, noisy, and

urgent. The question is not whether protest remains pleasant, but whether lawful protest remains possible without collapsing safety.

Operational design should also protect protesters from being consumed by the City's record system. Protesters may choose public action, but that choice does not automatically make their full identity, associates, health status, children, or unrelated private life public material. Protest visibility and protester dossiering are not the same thing.

Protest zones should be designed with ordinary human needs in mind. Water, shade, accessibility, toilets, safe approach routes, emergency assistance, and clear communication can determine whether dissent remains lawful and humane. A City that claims to welcome protest while making protest physically punishing is shifting burden onto dissenters rather than hearing them.

A protest route should preserve sight and sound, accessibility, emergency passage, counter-demonstration, media observation, and a real path for institutional response. Distance may be used for safety or protected-domain integrity, but not to make dissent invisible. Rules should be content-neutral, published in advance, and reviewable after each major event. Entry logs, camera systems, and incident records may not be repurposed into a protester dossier or a future access penalty merely because a person opposed the City. Peaceful disruption is a democratic condition to be facilitated and bounded, not a character defect to be archived (UN Human Rights Committee, 2020; OHCHR, 2024).

12.5.2 — Dissent Is Not Threat

Dissent is not threat. This rule should be repeated in training, signage, security review, media handling, and participant formation. The City will hear harsh criticism. It will be accused of surveillance, elitism, cult behavior, waste, illegality, naivety, or danger. Criticism can be painful without being unsafe.

Security systems often blur dissent and threat because both may be loud, inconvenient, and emotionally charged. The City must resist that blur. Threat involves conduct that endangers people, records, lawful access, protected domains, emergency function, or personal safety. Dissent involves disagreement, protest, accusation, argument, satire, refusal, and public challenge.

Participants need this distinction as part of formation. A person seeking public power must learn not to treat public opposition as personal persecution. If the City protects participants from every hard word, it will train fragility. If it exposes them to harassment without boundary, it will train fear. The distinction between dissent and threat is therefore educational as well as operational.

Staff need the same distinction. A gate worker, moderator, security officer, public interface operator, or participant support staff member may feel pressure to remove critics quickly. Training should help staff respond to discomfort without overclassification. Supervisory review should catch patterns where certain groups, viewpoints, or forms of expression are misclassified as threat.

Protected dissent and prohibited conduct should be stated in plain language before conflict. People need to know that criticism,

leafleting, observation, counter-speech, and peaceful assembly are not threats, while violence, targeted harassment, doxxing, and coercive obstruction cross different boundaries. Vague rules invite selective enforcement, and selective enforcement teaches critics that the perimeter protects the institution rather than rights. Legitimacy depends partly on whether opponents can predict fair treatment.

Dissent being protected does not mean dissent is always wise, fair, or well-informed. It means public power should be answerable even to imperfect critics. A City that only accepts elegant dissent has already privileged the fluent.

This rule must be protected from viewpoint bias. The City must not become more tolerant of dissent that sounds polite, elite, or familiar while treating angry, local, religious, labor, youth, or marginalized dissent as inherently unsafe. Tone may affect management, but it must not replace threat assessment.

The perimeter duty requires the institution to train participants to hear criticism of the institution as distinct from an attack on their person. Without that discipline, participants may unconsciously recruit security, staff, or supporters to protect their identity rather than the boundary.

Staff and security should begin with the assumption that criticism is part of public legitimacy unless conduct crosses defined safety lines. The City must not classify anger, satire, chanting, signs, investigative questions, or refusal of praise as danger merely because they are uncomfortable.

This rule is also protection against institutional vanity. Institutions that claim to welcome critique often confuse embarrassment with harm. This fairness discipline asks whose burden is being reduced by calling dissent dangerous. If the answer is mainly institutional comfort, the classification should fail.

The dissent-is-not-threat rule should survive high emotion. The most revealing protests may happen when participants fail, records expose harm, staff speak out, or host communities object. If the City only honors dissent when it is abstract, calm, and convenient, it has accepted protest as decoration rather than as an instrument of public correction.

12.5.3 — Adversarial Review

Adversarial review is the disciplined use of opposition to improve the City. It differs from protest because it creates structured channels for critics to test claims, records, access rules, security practices, public artifacts, and institutional drift. It differs from expert review because the critic's value may lie precisely in refusing the City's assumptions.

Any defensible access system has to invite adversarial questions at several levels. Civil-liberties critics may test ordinary privacy. Labor critics may test staff burden. Disability reviewers may test access. Child-safety critics may test shielding. Media critics may test spectacle risk. Local residents may test host burden. Technologists may test inference and vendor control. Each adversarial angle sees a different burden route.

Adversarial review is structured enough to produce usable findings. A critic should know what question is being examined, what evidence is available, what access limits apply, how responses will be recorded, and what remedy or correction path exists. Unstructured hostility can produce noise. Overstructured review can domesticate criticism. The City needs a middle form.

Adversarial reviewers need not become friends of the project. They may remain opposed, publish severe findings, and reject the institution's preferred interpretation. The City's obligation is to protect their access and answer their evidence, not to convert them. An unconvinced critic can still reveal where burden, secrecy, or authority is moving wrongly.

Adversarial review must also protect against performative opposition. A token critic who cannot access meaningful information becomes legitimacy theater. A friendly critic presented as hostile misleads the public. A televised confrontation designed for drama may create spectacle rather than review. The City must distinguish real adversarial testing from public artifact management.

Adversarial review includes a right to publish conclusions within lawful limits. If the City invites critics only to absorb their insight privately, criticism becomes institutional resource extraction. Public criticism may be uncomfortable, but the City must not convert opponents into unpaid internal consultants without public voice.

Adversarial review is invited into specific channels before crisis makes it chaotic. The City must maintain methods for structured

opposition: hostile briefings, red-team visits, public questions, independent reports, protest memoranda, external legal analysis, and staff-protected dissent. These channels do not replace protest, but they keep opposition from depending entirely on spectacle.

Boundary legitimacy requires the City to be willing to let adversarial review change design. If the same criticism recurs from protesters, experts, staff, host residents, and journalists, the institution should not answer only with explanation. It should ask what hidden burden the repeated objection is locating.

Adversarial review also teaches participants how to hear opposition without performing victimhood or domination. Public-power formation includes learning not to treat criticism as personal annihilation, not to manipulate sympathy, and not to counterattack through institutional channels. The City's training should make disagreement a burden of power rather than a surprise to power.

12.5.4 — Safety Boundaries

Safety boundaries protect protest, dissent, participants, staff, visitors, and nonparticipants at the same time. A boundary that only protects the City's image is not a safety boundary. A boundary that only protects protest without protecting children, households, and staff is incomplete. The governing standard requires the burden of public conflict to be placed carefully.

The first safety boundary protects protected domains. Protest may not enter or target child spaces, household edges, clinical interfaces, legal counsel spaces, intimacy-related protections, archive custody rooms, or staff-private areas. The public can

criticize these protections. It cannot violate them as a method of criticism.

The second boundary protects persons from targeted harm. Doxxing, stalking, threats, harassment, private-address exposure, family targeting, and coordinated intimidation are not civic dissent. They move burden downward onto individuals and nonparticipants. The City must respond firmly without treating all criticism as part of the same category.

The third boundary protects emergency and accessible service routes. Protest arrangements must preserve prompt medical, fire, and emergency access and a safe, accessible way to obtain essential services. Disruption of ordinary visitor or staff movement should be assessed separately: inconvenience alone does not make an assembly violent or justify dispersal. Restrictions should follow applicable law, address a specific risk, remain necessary and proportionate, and use communication, alternative routes, and de-escalation where these can protect both access and peaceful dissent.

The fourth boundary protects protesters from overreach. Security must not use safety language to move protest out of sight, collect excessive data on dissenters, retaliate against critics, or create chilling fear. Protestor complaint routes should exist because security power is itself a source of possible harm.

Safety boundaries require review after incidents. A line that seemed fair in design may fail in practice. A protest may reveal a better location, clearer signage, more staff training, or a safer

response route. Boundary review turns conflict into learning rather than escalation.

Safety boundaries should be written in verbs, not identities. A person becomes restricted because they threaten, stalk, dox, block, breach, or expose, not because they belong to a disfavored group or hold a hostile view. Conduct-based boundaries are essential to legitimacy.

Safety boundaries should also distinguish individual conduct from group blame. A harmful act by one protestor should not automatically narrow the rights of all protesters. Collective restriction requires its own justification.

Safety boundaries around dissent should be content-neutral to the greatest lawful extent. A protest that praises the City should not receive easier access than a protest that condemns it. A friendly crowd can still endanger families, staff, visitors, and records. A hostile crowd can still be peaceful. The City must not let agreement become the hidden admission ticket.

Boundary enforcement should be documented carefully because protest conflict creates high-risk public memory. If people are moved, denied, restrained, dispersed, protected, or separated, the public will need later explanation. That explanation should include the specific conduct risk, the least burdensome intervention considered, and any remedy for wrongful restriction.

Safety boundaries must protect nonparticipants during protest events with special care. A child, partner, dependent, visiting relative, staff member off duty, or passerby should not become the object through which protesters seek pressure. The City must

preserve dissent while refusing tactics that transfer the participant's public burden onto private lives.

12.5.5 — Public Response Route

A protest that receives no response can become a wound in public trust. The City does not need to answer every slogan, rumor, or insult in real time. But it should have a public response route for substantive criticism, especially where critics allege surveillance drift, rights failure, child exposure, staff exploitation, host burden, or record misuse (OHCHR, 2024; United Nations, 1990b).

A public response route begins with intake. The City must classify criticism by topic, urgency, evidence, affected persons, and potential remedy. Some criticism requires immediate safety review. Some requires public explanation. Some requires referral to external audit. Some requires correction. Some may be rejected with reasons. Intake prevents criticism from disappearing into public-relations fog.

The response should avoid defensive triumph. A City that answers every criticism by praising its mission will appear unable to hear burden. The better response states what was alleged, what can be confirmed, what is still under review, what protections apply, what cannot be released, and what correction or explanation will follow.

Public response routes should protect critics from retaliation. If raising a concern leads to access denial, harassment by supporters, staff hostility, or reputational attack, the route becomes unsafe. The City must distinguish false claims from

protected criticism. Even mistaken criticism can be handled without punishing dissent as such.

The route should also protect sensitive persons. A criticism involving a child, intimate material, staff complaint, or nonparticipant exposure may require public acknowledgment without detail. The City must not answer public pressure by releasing the very material that should be protected.

A good response route makes the City more accountable and less theatrical. It allows criticism to enter correction without making every disagreement a public war. It teaches the City to answer rather than merely react.

Public response should include silence discipline. Some accusations require inquiry before answer. The City must be able to say that review is underway without filling the gap with speculation, defensiveness, or premature certainty.

The public response route should prevent criticism from disappearing into a comment box. Protesters and critics should know how a serious objection becomes received, categorized, answered, escalated, published, or left unresolved. A route that cannot produce visible institutional memory turns dissent into emotional venting rather than civic input.

The response route should also protect against crowd rule. Loud criticism may reveal burden, but loudness alone should not govern. The City must answer reasons, evidence, affected-person accounts, and design failures rather than chasing volume. Fairness requires both permeability to objection and resistance to mob authority.

The response route should include a visible unresolved category. Some criticisms cannot be answered immediately, and some should not be smoothed away by public-relations prose. Naming an objection as received, under review, disputed, partially accepted, or unresolved is more honest than pretending every public challenge can be resolved by the institution that receives it.

The public response route should publish service standards. Safety allegations may require immediate acknowledgment and protection; rights complaints need a named owner and review clock; complex policy objections may require staged response, sources, and hearing. Different categories need different timelines, but silence should never be the default. If a case moves between offices, the receiving office should inherit the original receipt date and deadline, and the critic should receive a protected transfer notice identifying the new owner and the next expected response without exposing confidential testimony.

An unresolved-objections register should preserve challenges that survive the first answer. Each entry can show the issue, affected group, status, institutional response, dissenting view, next review, and interim safeguard. It is memory, not a popularity poll, and prevents recurring problems from disappearing under polished replies. Submissions about the same failure may be linked, but consolidation must preserve distinct affected-person accounts and must not restart the response clock.

Written, in-person, remote, and accessible routes should reach the same owner, status system, appeal route, and correction history. Equivalent consequence matters more than identical channels for

people who cannot travel, speak quickly, use a platform, or risk identification. Dissent now has a visible route and safety boundary. Purpose, context, masking, release discipline, and right of reply must travel with the material after it leaves the City. Media governance must ask how journalism, documentation, official communication, and public storytelling can expose hidden burden without producing spectacle.

12.6 — Media, Documentation, and Narrative Pressure

Media access can deepen accountability when public-role formation is documented without turning private vulnerability into entertainment. Accreditation may organize capacity and safety, but its criteria remain viewpoint-neutral, published, appealable, and no broader than operational need. Context packages carry source, time, status, correction, protected-person handling, and known limits; masking occurs before distribution; reply operates within the same information cycle. Content credentials can trace origin and edits, but provenance alone does not establish truth or fair framing, so verification, proportionality, and correction remain journalistic duties (UN Human Rights Committee, 2011; UNESCO, 2018; Society of Professional Journalists, 2014; C2PA, 2026).

No defensible implementation can be allowed to tell its own story alone. Journalism, documentary access, public explanation, and independent documentation are necessary because any institution that controls its image will eventually protect its image. Yet media attention can also distort the City faster than almost any other force. A single clip can travel without context. A photograph can expose a nonparticipant. A headline can turn a prototype into a prison, cult, shrine, or proof event.

Narrative pressure is unavoidable because supporters, opponents, journalists, political actors, donors, staff, participants, former participants, hosts, and online communities will describe the City from different positions. The institution should not seek control

over those accounts. It should govern the parts it actually owns: access terms, documentation rules, status and context packages, nonparticipant masking, correction, right of reply, and equal treatment of favorable and adverse reporting. Plural narratives become safer when the source record remains traceable and contestable.

Documentation changes the scene it records. Participants may perform, staff may become guarded, visitors may hunt for clips, and protesters may escalate for visibility. Media plans should therefore define camera windows, routine no-performance periods, protected routes, remote access, rotation, pooling where appropriate, and review of behavioral effects. The aim is sustained public understanding of formation over time, not a constant demand that ordinary work become theater.

Media and documentation require bounded scrutiny. The City must be criticizable by reporters and visible to the public, but not available for spectacle, nonparticipant exposure, context-stripping, or public punishment (UN Human Rights Committee, 2020; UNESCO, 2023; Society of Professional Journalists, 2014).

12.6.1 — Media Purpose Rules

Media access begins from public interest, not institutional comfort. Reporting on record governance, access denials, protest, failure, staff burden, host-community effects, or public-power formation may be damaging to the City's reputation and still be legitimate. A rule becomes suspect when it shields embarrassment rather than people. Protection must be tied to

wrongful exposure, safety, privilege, and other defined harms (UNESCO, 2018; Society of Professional Journalists, 2014).

The rule also distinguishes gathering from publishing. A journalist may observe a space, interview an authorized person, inspect a public bundle, or request access under a purpose statement without gaining permission to release protected raw material, expose nonparticipants, misstate record status, or turn a restricted encounter into public spectacle.

The access decision should ask what public understanding the proposed work can serve. Investigation of rights handling, archive practice, staff conditions, security, host effects, or governance may justify observation and documentation. A segment designed chiefly to display vulnerability, intimacy, crisis, or emotional spectacle requires a different answer. Purpose governs access type and safeguards, not viewpoint.

Media governance must distinguish education, investigation, public accountability, public-interest documentary work, routine reporting, emergency reporting, and promotional material. Each creates different risks. Promotional material is especially dangerous because it can polish the City into myth. Investigative access is necessary, but it still operates within protected-domain limits.

Terms should be disclosed before access. Journalists and documentarians need to know which zones are available, what may be recorded, how source independence is protected, how nonparticipants are masked, what safety rules apply, and how correction or reply works. The City should know what authority

it is claiming and what it is not. Clear terms protect public understanding without licensing editorial control.

Favorable coverage can never be the price of entry. The institution may enforce child protection, masking, lawful privilege, safety, and role boundaries, but it may not condition access on promotional tone or suppress criticism through future invitation. A critical account may be legitimate; wrongful exposure remains wrongful even when packaged as criticism. Independence and protection have to coexist.

The same rules apply to City-produced media. Official videos, photographs, diagrams, tours, captions, public summaries, and social posts can expose nonparticipants, romanticize breakdown, erase staff labor, or present disputed material as settled. An internal communications team should not receive permissions denied to an independent newsroom. Institutional authorship increases, rather than reduces, the duty to correct.

A defensible access system must also separate access for reporting from access for image capture. A written investigation may need documents and interviews. A documentary crew may create visual risk. A podcast may create different consent issues. Media is not one format, and format changes burden.

Purpose rules should be enforced even when the media is favorable. A flattering documentary that violates nonparticipant dignity is still a violation. The City must not become less careful when the narrative helps it.

Public interest and audience appetite often point in different directions. The public may need to know whether the City is

lawful, humane, captured, discriminatory, unsafe, wasteful, or failing. Audiences may instead reward humiliation, romance, tears, conflict, beauty, or scandal detached from context. Access design should protect the first without feeding the second merely because both generate attention.

The rules should be written before high-profile controversy. In crisis, every side will want the image that helps its story. Predrafted purpose rules give journalists, participants, staff, and the public a known framework for access, limits, correction, and refusal, reducing the temptation to negotiate dignity under pressure.

Journalistic independence also requires protection from quiet exclusion. Access should not be reserved for friendly outlets, withdrawn because framing was adverse, or traded for promotional intimacy. Reporting can be incomplete or sensational, but the response is a stronger record, correction, and reply architecture, not a loyalty filter. The institution should publish access criteria and review denials for viewpoint discrimination.

Media access should be organized through a purpose-and-format packet rather than prestige or favorable coverage. The packet states the reporting purpose, requested spaces and records, recording methods, protected categories, masking duties, interview consent, pool arrangements where capacity is limited, correction contact, publication timetable where volunteered, emergency limits, and remedy for misuse. Independent, local, nonprofit, freelance, international, and critical journalists should face the same functional rules. Access can be narrower for a

camera crew than for a document review without making either outlet more legitimate. The rule follows the burden created by the method, not the status of the storyteller (UN Human Rights Committee, 2020; UNESCO, 2023; Society of Professional Journalists, 2014).

12.6.2 — Anti-Spectacle Limits

Anti-spectacle limits prevent public-power formation from becoming entertainment. Spectacle begins when the public is invited to watch the difficulty of others for emotional stimulation rather than civic understanding. It can appear as humiliation, intimacy, breakdown, conflict, dramatic crying, romantic tension, family exposure, staff confrontation, or public shaming framed as transparency.

No credible design permits the City to sell attention by displaying vulnerability. A participant under the Vow may experience exhaustion, error, apology, grief, health crisis, household strain, intimate difficulty, staff conflict, or public criticism. Some of these matters may have civic relevance. Relevance does not require raw spectacle. Summary, delay, masking, restricted review, and context can preserve public meaning without feeding appetite.

Anti-spectacle limits apply to supporters as well as critics. A glowing documentary that turns participants into heroes may be as distorting as a hostile clip that turns them into villains. Heroic spectacle creates pressure to perform virtue. Punitive spectacle creates pressure to hide failure. Both undermine the City's purpose.

Spectacle also harms the public. It trains citizens to seek emotional consumption instead of civic review. It teaches them to confuse access with understanding, vulnerability with truth, humiliation with accountability, and dramatic footage with evidence. A City that allows this has degraded democratic attention.

Certain categories require presumptive limits and explicit review triggers: children, intimacy, clinical care, crisis, breakdown, family conflict, staff vulnerability, protected nonvisibility, and nonparticipant exposure. The rules should specify when documentation is prohibited, when masking or delay is required, and who may authorize an exception. Leaving these decisions to editorial instinct alone transfers too much burden to the moment of capture.

The anti-spectacle rule can be stated directly: public interest may require knowledge that something happened, why it mattered, and how it was handled. It rarely requires the public to consume a person's raw humiliation.

Anti-spectacle review should apply two tests before release. First, would the material still be released if the person were not charismatic, infamous, attractive, vulnerable, disliked, or politically useful? Second, would the material still help a citizen judge public-power burden if the dramatic element were removed? If either answer changes because of shock, humiliation, intimacy, or public appetite, the release is probably not governed by civic relevance.

Anti-spectacle limits should govern staging as well as release. A camera can turn a room into a performance before anything is published. Participants may begin to act for the lens, staff may overexplain, critics may dramatize, and visitors may become extras. The City must reduce theatrical pressure through camera zones, time limits, context briefings, non-filmed alternatives, and refusal paths.

The limit is not anti-media. It is pro-truth. Spectacle rewards the moment that travels best, not the burden that matters most. A City built to form public power must teach the public to ask for context, pattern, and correction instead of merely asking for the most vivid clip.

Anti-spectacle limits should apply to internal audiences too. Participants, staff, donors, visitors, and supporters can turn the City into a drama even without television cameras. Public tours, conference panels, social posts, recruitment materials, and ceremonial events should avoid making visible burden look glamorous, holy, punitive, heroic, or entertaining. The City must resist becoming its own audience.

12.6.3 — Context Requirements

Context requirements protect public judgment from fragments that look self-explanatory. A clip of anger, hesitation, apology, refusal, security presence, protected-room entry, or protest interaction may carry very different meaning depending on role, sequence, simulation status, record status, prior event, and later correction. The released artifact should supply the minimum context needed to prevent the most foreseeable false inference

without becoming an official command about what the audience must conclude.

Context labels are required for access class, record status, release status, protected summary, staged simulation, public interface window, protest setting, emergency exception, delayed release, disputed record, correction history, and nonparticipant masking. They do not tell a viewer what to think. They tell the viewer what kind of material is being seen.

Unfinished thought requires its own context grammar. A seminar hypothesis, draft clause, crisis simulation, working note, deliberative disagreement, and final public statement occupy different stages of formation. Media and official releases should preserve that stage because learning depends on the ability to revise. Treating every provisional record as a settled belief would reward performance and punish the very correction the City is designed to cultivate.

Context should include limits. A public bundle may state that certain material is protected, that a summary substitutes for raw exposure, that a dispute is pending, that an affected-person correction exists, or that a clip does not represent full sequence. Limits are part of honesty. They prevent false certainty.

No defensible implementation can guarantee that every outside actor will preserve context. It can control its own releases, access agreements, record-site labels, correction logs, and public education. It can also call out context-stripping when it creates harm. Public meaning requires maintenance.

Context is the enemy of both propaganda and outrage. It slows interpretation just enough to ask what burden is actually at stake. That slowing is one of the City's public duties.

Context requirements should travel with reposts where the City can control the artifact. Embedded labels, watermarked status notes where appropriate, companion captions, transcript context, and correction links can help prevent the first public copy from being the last contextual copy.

Context also has to be brief enough to travel. If a status label is too long, it will be cut away. The City must design durable short labels and fuller explanations together so public artifacts do not shed their safeguards in ordinary circulation.

Context requirements should travel with every authorized media fragment. A short clip of a participant's anger, a staff denial, a protest exchange, a security screen, or a protected-area refusal can become misleading without the role, time, record status, preceding event, response route, and correction opportunity. The City must design release metadata as a dignity instrument, not a technical afterthought.

This requirement should apply to the City's own communications with particular force. The institution will be tempted to circulate beautiful proof of its seriousness. It should instead model context discipline: what is shown, what is not shown, what status applies, what remains disputed, and what should not be inferred from the image.

Context requirements should include uncertainty labels. If a clip is disputed, if a record is partial, if a protected category prevents

full explanation, if legal review is pending, or if an affected person has not yet replied, the released material should say so. Honest incompleteness is better than narrative confidence purchased by leaving protected facts unmentioned.

12.6.4 — Nonparticipant Masking in Media

Nonparticipant masking protects people who appear near the City without accepting its burden. A visitor in a hallway, a child near a family boundary, a staff member off duty, a protestor in a crowd, a professional helper, a local resident, or an incidental bystander may be captured by media or institutional documentation. Appearance is not consent.

Masking may involve blurring faces, removing names, altering identifying details, limiting location data, delaying release, using protected summaries, excluding audio, or restricting publication. The method should match the risk. A child requires stronger protection than an adult visitor who agreed to be interviewed. A clinician requires different protection from a public official at a scheduled interface.

Nonparticipant masking must be built into capture protocols, not added only after harm occurs. Camera angles, visitor routes, media zones, signage, consent notices, and release review should all reduce accidental exposure. Good design prevents the need for later apology.

Masking also protects critics. A person visiting to oppose the City should not automatically become public material. Public dissent may be visible, but individual identification should be handled with care, especially where exposure could lead to harassment,

job loss, family harm, or doxxing. The City must not use media access to intimidate critics.

Masking is honest only when it protects collateral people without concealing relevant public-power conduct. Privacy language cannot hide staff misconduct, institutional failure, or official action that the public has a lawful reason to understand. Review separates the identity and intimate detail of the nonparticipant from the conduct, authority, and consequence that make the event publicly relevant. Dignity and accountability travel in different layers rather than being traded against each other.

The City's rule is that proximity does not equal permission. If someone did not accept the Transparent Vow or a media role, the City must ask why their identity needs to travel into public memory at all.

Masking should be audited for inference, not only direct identity. A blurred face may still be identifiable through voice, location, clothing, timing, relationship, or surrounding facts. Nonparticipant protection must ask what a motivated viewer could reconstruct, not only what the City intended to reveal.

Inference review should also test badge shapes, vehicle plates, hallway sequences, school references, and local landmarks that can make a masked person identifiable.

Nonparticipant masking must assume that identifiability changes over time. A blurred face, altered voice, removed name, or cropped background may be enough today and insufficient tomorrow when combined with location clues, social media, school schedules, protest footage, or public comments. Masking

should be risk-reviewed rather than treated as a single technical operation.

The masking rule protects children, partners, visitors, workers, protesters, bystanders, clinicians, counsel, host-community members, and ordinary citizens who cross the City's edge. Their incidental presence should not become searchable biography. Public-power formation cannot be made honest by converting everyone near it into collateral evidence.

Masking should include downstream accountability. If a partner, child, staff member, protester, or bystander is later identified despite masking, the City should have a harm response rather than a shrug. That response may include takedown requests where lawful, correction, support, further masking, public explanation, or review of release practice. The burden of failed masking belongs first to the institution that released.

12.6.5 — Media Right of Reply

Media and public artifacts can injure long before correction catches up. Participants, staff, nonparticipants, critics, and host-community residents therefore need a route to answer materially false, misleading, incomplete, or context-stripped material. The route should attach to the object, preserve evidence of the claim, and distinguish correction from disagreement. Public reach increases the urgency of repair (C2PA, 2026; Kovach and Rosenstiel, 2021).

Reply does not confer a power to suppress criticism. It adds relevant contestation to the public record when identity, role, fact, exposure, or context is disputed. A participant may challenge

interpretation, a nonparticipant may correct exposure, a staff member may clarify responsibility, and a critic may answer institutional description. The audience remains free to judge the record and the response.

The reply process should distinguish factual correction, contextual statement, affected-person objection, participant response, staff response, and institutional response. Not all replies have equal status. A factual error should be corrected. A contested interpretation may be labeled. A protected matter may require summary rather than raw reply.

Timeliness matters. If a damaging narrative circulates for weeks before correction appears, the injury may be done. The City must have rapid provisional labels for disputed material, followed by fuller review. A visible status label can slow harm while preserving investigation.

Official artifacts must be subject to the same reply route. If a City video, diagram, bundle, tour narrative, or public summary misstates a person's role or exposure, correction cannot depend on the goodwill of the communications team that created it. The institution should record the request, decide under a clock, and propagate the result across every official derivative. Storytelling is also an exercise of power.

A visible reply teaches that records are governed objects rather than magic windows into truth. Public memory requires source, contestation, correction, and context. An institution that cannot be answered in public should not claim authority over public

memory. The lesson is conveyed by the route, not by a slogan about humility.

People with the least leverage may need reply most. Staff, visitors, protesters, household members, affected professionals, host-community residents, and other nonparticipants may lack the platform available to a public participant. A plain-language, time-bounded route should offer a protected contact method, translation, disability access, representative assistance, and anti-retaliation safeguards. A named office should carry the administrative burden; a lawyer, publicist, or insider connection should not be a condition of use.

Reply protects context integrity rather than reputation alone. A lawful publication may still omit sequence, role, later correction, or an affected person's perspective. The response should identify the relevant omission without becoming a general demand for favorable portrayal. Context can be added without rewriting the source.

Reply does not automatically delete criticism, adverse evidence, or embarrassing truth. It adds answerable context, correction, dispute, or affected-person perspective. Where continued display is lawful and safe, the public record should hold both the original claim and the reply, with their relationship clear.

Correction duties should follow distribution. When a City-issued bundle, caption, clip, transcript, or machine summary is corrected, the institution should update the authoritative source, attach a visible correction history, notify known syndication partners, and provide a stable notice that downstream publishers

can reference. It cannot compel every independent outlet to revise lawful reporting, but it can make the corrected record easy to verify and harder to suppress. A right of reply that stops at the original page is too weak for networked media. Correction records should also name which derivatives were checked and which could not be reached, so propagation limits remain visible. Where correction cannot reach a derivative artifact, the authoritative record should state that limitation rather than imply complete propagation.

Machine-generated clips and summaries require the same context discipline as human reporting. A transcription tool may omit uncertainty, a search system may surface an obsolete version, or an automated excerpt may detach a sentence from its status label. The reply route should accept challenges to automated presentation, identify the source and system involved, preserve the original output for audit, and correct both the public artifact and the process that generated it. Assistance remains useful only when error can travel backward into system repair (C2PA, 2026; NIST, 2023a). A recurring automated error should trigger review of the prompt, retrieval rule, model configuration, or source-selection logic that produced it. Review should distinguish isolated model error from a repeatable system condition, because the remedy may need to reach configuration, workflow, or vendor governance.

12.7 — Openness Without Boundary Collapse

Openness is a governed relationship among access, protection, explanation, challenge, and review. The public should be able to learn what is withheld, under which category, for how long, by whose decision, and through what appeal without receiving every room, record, or person. Boundary review should test exclusion patterns, expanding categories, release harms, less-exposing alternatives, and whether protected domains are sheltering misconduct. Limits become trustworthy when they are as legible and contestable as the openings they govern (International Council on Archives, 2012; UN Human Rights Committee, 2011; Nissenbaum, 2010).

The City is built on a paradox that is not really a contradiction. It must be open enough to be trusted and bounded enough to be fair. If it closes itself too tightly, it becomes suspect, insular, and self-protective. If it opens without discipline, it becomes spectacle, harassment, exposure, and data injury. The task is not to choose openness or boundary. The task is to design openness that does not collapse the boundary that makes it humane.

Controlled openness is the chapter's final standard. It allows public access, protest, media, experts, critics, visitors, and civic questions while preserving protected domains, role-limited entry, release discipline, and boundary review. It does not ask the public to trust a sealed institution. It asks the public to respect the difference between public accountability and unlimited access to persons.

Boundary collapse usually arrives through accumulated permissions rather than one dramatic breach. Visitor convenience drifts into participant life; media access becomes content extraction; expert access becomes influence; protest becomes harassment; security becomes overcollection; release becomes raw exposure; staff and nonparticipants become public subjects. A permissions ledger should therefore record the purpose, beneficiary, burden carrier, expiry, and review of each opening so small exceptions cannot combine into an ungoverned regime.

The relevant burden test is whether each opening keeps burden moving upward toward public power. If it does, the City may open more. If it moves burden downward onto families, staff, children, critics, visitors, local residents, or bystanders, it must narrow. The standard is not maximum openness. It is fair openness.

Boundary review closes the loop. The City must audit whether its access rules, media rules, protest zones, security practices, visitor routes, release policies, and public interfaces are still carrying the right burden. Openness is not once achieved. It must be maintained.

The maintenance standard is reciprocal. When an opening creates avoidable harm, the City should narrow, redesign, or end it; when a boundary hides active power, the City should open, explain, or subject it to stronger independent review. Neither openness nor protection is a prestige value by itself. Their legitimacy depends on whose burden they move, which public purpose they serve, and whether affected people can challenge the result (United Nations, 1966; European Union, 2016).

12.7.1 — Public Access Principle

The public access principle starts with a demanding sentence: a City that forms public power must be reachable by the public it claims to serve. Reachability includes physical approach where feasible, accessible visitor design, remote access for people who cannot travel, public explanations, record-site usability, complaint channels, and ways for ordinary citizens to ask questions without needing elite credentials (International Council on Archives, 2012; UN Human Rights Committee, 2011).

Access also has a democratic modesty. The City can organize evidence and protect people, but it cannot decide that the public's conclusion is already settled. Citizens must remain free to be persuaded, unconvinced, offended, reassured, skeptical, or opposed.

The public access principle begins with the truth that the City is not private. It exists because public power affects people beyond the walls. Citizens, critics, journalists, experts, host communities, and affected persons have a legitimate interest in how the City forms public-power seekers. Public access is therefore part of the City's legitimacy.

Public access must include understandable explanation of the City's purpose, visitor orientation, public record-site access, civic education, protest routes, public questions, complaint routes, accessibility accommodations, and periodic reporting. A person should not need elite fluency to understand how the City claims to place burden.

Public access also includes the right to disbelieve. The City must not define public legitimacy as approval. A citizen may visit and remain opposed. A journalist may report critically. A host-community member may submit complaint. A civil-liberties advocate may reject the model. Public access is meaningful only if it does not require emotional consent.

The principle has limits. Public access does not include raw archive browsing, intimate exposure, child-related material, clinical details, household access, staff private life, security vulnerabilities, or nonparticipant identity by default. These limits do not betray public access. They protect it from becoming morally indefensible.

Access must be reviewed for class, disability, language, geography, technology, and time barriers. A City that claims public access but is only usable by educated, nearby, affluent, digitally fluent, able-bodied people has narrowed the public while using the public's name. The access principle must be tested against actual usability.

Public access is the City's promise that it does not belong only to insiders. It belongs to public judgment, but not to public appetite. The difference must be built into every path of approach.

The public access principle should be evaluated against actual trust, not applause. People may understand the City better and still oppose it. That outcome can be healthy. Access succeeds when disagreement becomes more informed, not when criticism disappears.

Public access must be measured against the least powerful legitimate visitor. A donor, journalist, expert, or famous critic may gain access easily. The City must ask whether an ordinary local resident, disabled visitor, or skeptical citizen can also reach meaningful public understanding.

The public access principle should be framed as a right to know the City's public function, not a right to possess the City's people. Public access includes readable explanations, visitor routes, public materials, audit summaries, protest channels, media access, records lawfully released, and mechanisms for asking hard questions. It does not include general entitlement to intimate life, protected domains, staff privacy, or unmediated search of every recorded moment.

A criticizable City should also be understandable without loyalty language. The public should not have to accept the Law of Fairness, admire the project, or join any associated practice to know how the boundary works. Public access is strongest when it remains available to the skeptical, the indifferent, and the opposed.

Public access must include a burden-report path. People outside the City may see harms insiders miss: traffic, noise, prestige effects, policing spillover, media congestion, staff treatment, disability barriers, host-community resentment, or public confusion. Access is not only looking in. It is also giving the City structured ways to hear what its boundary does outward.

12.7.2 — Protected Domain Principle

The protected domain principle states that some spaces, records, relationships, and conditions require shielding even inside an open City. Health care, legal counsel, intimacy, modesty, grief, worship, child protection, family consultation, staff privacy, nonparticipant masking, and security-sensitive systems may require restricted handling. Openness that destroys these domains is not fairness.

Protected domains require an anti-conversion rule. A counsel room cannot become a donor meeting, a clinical interface cannot become political planning, a household boundary cannot carry unrecorded influence, and an emergency route cannot become routine secrecy. Interface charters, occurrence logs, anomaly review, affected-person complaint, and a clear return to ordinary recording protect dignity and lawful process while keeping active public-power conduct answerable.

The principle requires category review. The City must know why a domain is protected, who may enter, what record status applies, what summaries may be public, what oversight exists, how abuse is prevented, and how affected persons can challenge misuse. A protected domain without review becomes secrecy. A visible domain without protection becomes cruelty.

Protected domains must be communicated without exposing their contents. The public may need to know that a protected domain exists and what rule governs it. The public does not need raw access to make the protection legitimate. Status labels,

summaries, and audit reports can make protection accountable while preserving dignity.

Protected domains also require audit for overuse. Too much shielding can conceal public power; too little can expose vulnerable life. The boundary is not self-maintaining, and the institution that benefits from secrecy cannot be its only reviewer. Periodic sampling, affected-person input, appeal, and public category reporting should test both overclosure and overexposure.

Protected domains should also have sunset or review conditions where appropriate. Some protections are permanent, such as child shielding or intimate dignity. Others may be time-bound or status-bound. Review prevents protection from becoming a warehouse for inconvenient public-power material.

Protected domains should not be hidden from ethics education. The City can teach the public why certain domains are protected without exposing the domain itself. This education turns restraint into an intelligible civic virtue rather than an object of suspicion.

The protected domain principle should be stated with unusual steadiness because it is easily attacked from both sides. Some will say any protected space proves hypocrisy. Others will use protection to hide embarrassment. The City's answer must be neither defensive nor vague: some domains are protected because dignity, law, care, child safety, and professional duties require protection, and each protection must carry review against abuse.

The principle also prevents moral performance inside protected spaces. A participant should not be praised for exposing what should have been shielded. Staff should not be rewarded for

extracting intimate detail. Media should not be rewarded for making private grief public. The City's courage includes refusing content the public may want.

Protected domains should not be explained through shame. Medical care, legal counsel, intimacy, family life, child protection, spiritual practice, grief, and crisis support are not embarrassing exceptions to transparency. They are proof that the City understands its own limits. The public should learn that restraint can be part of truth rather than a failure of truth.

12.7.3 — Role-Limited Entry

Role-limited entry gathers the access logic of the chapter into one rule. Entry into the City should always answer: who is entering, for what role, into what domain, under what record condition, for what purpose, with what limit, and with what review? If those questions cannot be answered, the entry is not ready.

Role-limited entry protects visitors from becoming participants by accident. It protects staff from overexposure. It protects experts from hidden authority. It protects media from vague expectations. It protects vendors from becoming unreviewed operators. It protects emergency responders from procedural delay while preserving after-action review. It protects participants from informal influence.

Role clarity prevents status inflation. An expert visitor is not a governor, a volunteer is not staff, a journalist is not a public official, a critic is not a threat, and a donor is not an owner. Each role grants permission for a stated purpose and expires with that

purpose. It creates no general elevation or hidden claim to authority.

Role limits should be visible enough for others to understand. A staff member should know whether a visitor is an expert, media representative, volunteer, vendor, or ordinary public visitor. A participant should know whether they are entering a public interface or a protected domain. Public confusion about roles creates hidden influence and mistrust.

Role-limited entry requires update and expiration. A temporary role should end. A vendor credential should expire. A media pass should not become permanent access. An expert review should not become indefinite presence. Role drift is one of the quietest ways hidden authority returns.

Role-limited entry must be visible in the record where material. If an expert, journalist, vendor, or temporary contributor enters a space that later matters to public interpretation, the role context should travel with the record. Otherwise later readers may mistake one kind of presence for another.

Role-limited entry also prevents good intentions from becoming bad precedent. An exception granted because someone seems trustworthy can become the template for later misuse. The City must prefer role rules over personality judgments.

Role-limited entry must be supported by visible credential grammar without theatrical ranking. A badge, pass, route, escort rule, or digital credential should communicate purpose and access limit rather than importance. The design should avoid visual

hierarchies that make some roles look sacred and others disposable.

For controlled access, the operational test should identify the authorized role, purpose, zone, time, record conditions, and reviewer, together with the person's identity where that is necessary for the permission. Missing authority should trigger narrowing, escalation, or refusal proportionate to the risk. Ordinary public access should not require unnecessary identification. Emergency assistance should proceed promptly under the emergency protocol, with the minimum necessary record completed or reconstructed afterward.

Role-limited entry uses graduated friction. Low-risk public approach is easy and accessible; sensitive entry requires purpose and review; emergency access is rapid but reconstructable; expert access is deep enough to test claims and narrow enough to avoid hidden authority; media access remains independent without becoming extractive. Different friction follows different burdens, not prestige. The design is fair when every route is understandable, time-limited, reviewable, and capable of correction.

12.7.4 — Release Discipline

Release discipline separates seeing from publishing. A person may enter a space, observe a process, or review material without gaining the right to publish everything encountered. This distinction is essential because uncontrolled release can harm nonparticipants, distort context, expose protected domains, or convert public-interest access into content extraction.

Release discipline begins before access. Media, experts, visitors, staff, and temporary contributors should know what they may record, quote, describe, summarize, photograph, share, or publish. Ambiguity invites harm. A City that leaves release rules unclear will later face either overexposure or overrestriction.

The discipline should include context labels, masking, protected summaries, delay, correction, access logs, right of reply, and public harm review where needed. Release is not merely technical. It is a moral judgment about how public meaning travels beyond the City.

Release discipline also applies to the City itself. Institutional communications should not publish inspiring images, dramatic stories, or simplified diagrams that strip safeguards away. Public artifacts must survive hostile cropping. A caption can create drift. A social clip can undo a chapter. The City must be more disciplined than its admirers.

This discipline does not mean suppressing unfavorable information. Bad news, failures, complaints, staff burden, host burden, and corrections may need public release. The question is not whether the City looks good. The question is whether release places burden honestly and protects people who should not be exposed.

Release discipline should treat speed as a risk. The faster material is released, the less time there is for masking, context, reply, and harm review. Some public-interest material may require urgency, but urgency should be named as a release condition rather than treated as a reason to abandon discipline.

Release discipline must include post-release monitoring. Material can acquire new harm after publication when combined with other records, platform trends, political events, or new identifiability. The City must not assume that release risk ends when publication begins.

A slow release lane remains necessary under public pressure for masking, category review, affected-person notice, status labels, reply, and security checks. The City can explain the category of delay without exposing the protected reason.

Derivative uses remain governed: the City controls its release terms, metadata, licensing, monitoring, correction route, and refusal to amplify stripped context.

Rehearsals using clips, photographs, visitor accounts, protests, or leaks expose missing labels, unclear authority, weak masking, slow replies, and artifact vulnerabilities before real people carry the cost.

12.7.5 — Boundary Review

Boundary review asks whether the City's openness is still fair. Staff burden will change. A boundary that was fair at opening may drift (Nissenbaum, 2010; European Union, 2016).

Boundary review examines access denials, visitor complaints, protest incidents, media disputes, nonparticipant exposure, staff safety reports, security escalations, expert access, vendor entry, emergency pathways, release decisions, and protected-domain classifications. Each category reveals where openness may be too narrow, too broad, or too confusing.

Review includes those affected by the boundary. Staff, participants, visitors, critics, media representatives, host-community members, disability reviewers, child-safety experts, privacy reviewers, and security reviewers may see different burdens. A boundary reviewed only by those who administer it will likely protect administrators first.

The review produces correction, not only reports. An access class may need splitting. Boundary review is successful only if it can change the boundary.

Public summaries should show that boundary review occurs and what categories of correction follow, without exposing protected persons or security vulnerabilities. The public needs enough information to judge whether the City is using its boundary to protect people or to avoid scrutiny.

Boundary review ends with a public question: did openness this period make the City more answerable, or did it simply create more exposure? The answer should shape the next cycle. It is a recurring correction practice.

Boundary review remains brave enough to recommend both more openness and more shielding. A review that always expands access may become appetite. The honest path may move in both directions at once.

Boundary review includes a public-facing burden map. It should identify where burdens appeared during the review period: staff load, visitor confusion, protest restriction, media dispute, household spillover, nonparticipant exposure, expert access conflict, emergency exception, vendor entry, or release harm.

Naming categories teaches the public that the City is not managing image, but studying burden.

The review ends by asking whether the boundary has begun to protect the institution from accountability or expose the public to avoidable harm. Either failure is serious. The City's edge is fair only when it continues to let truth enter, let criticism approach, let lawful access function, and let protected life remain unconsumed.

Boundary review is allowed to embarrass the City. If the perimeter has become too grand, too tight, too porous, too confusing, too frightening, too media-hungry, too protective of insiders, or too punishing to critics, the review should say so. An institution that cannot be embarrassed by evidence will eventually make others carry the burden of its self-protection.

The final boundary review is recorded as a burden-and-expiry decision. Openness and protection remain credible because either can be revised without being mythologized (United Nations, 1966; UN Human Rights Committee, 2020; European Union, 2016).

Part IV — Entry, Vow, and Anti-Capture

Consider four hypothetical people at four different kitchen tables. One is eager to begin, one is curious but skeptical, one cannot accept the burden without endangering a dependent, and one discovers that another form of public service fits better. Each has the City's invitation beside rent, medication, childcare, work, and family obligations. The fairness of the threshold begins before any of them becomes a useful symbol, precisely where a private decision could be turned into public momentum.

The doorway is the City's first civic institution. Before there is a resident, role pathway, covenant, public record, or office interface, there is a person deciding whether to approach. That person is not institutional proof or public material. They remain a private human being whose freedom, circumstances, and ordinary dignity set the standard for everything that follows.

Applicants make an imagined institution feel real, which is exactly why the doorway attracts pressure. Donors may want momentum, journalists may want the first recognizable name, parties may want affiliation, and supporters may want a story that proves history has begun. The harder question is who carries the cost when an applicant becomes useful to others before the applicant is safe inside the process. Public-integrity systems repeatedly reveal a gap between rules on paper and implementation in practice; the threshold therefore needs monitoring, verification, and a protected route for exposing failure before institutional enthusiasm can bury it (OECD, 2003; OECD, 2026c).

The invitation should make the civic burden legible before it makes the City attractive. Work, exposure, study, correction,

material terms, protected boundaries, and exit routes belong in the first honest account. With those facts visible, applicants can bring mixed motives into a serious process without being cast as heroes or suspects. Equal dignity comes first; the threshold then asks how each motive behaves under burden.

Motives matter because desire is one of public power's earliest routing systems. People may approach authority to serve, repair injury, answer a calling, gain recognition, escape danger, find structure, or test themselves against severe responsibility. The City's task is to understand that ecology without turning it into a moral caste system or claiming access to a person's hidden essence.

Screening translates a human choice into a bounded institutional decision. It addresses support, safety, lawful eligibility, humane fit, and capture risk rather than searching for superior people. The gate asks whether a defined adult can enter a defined pathway under stated conditions, what the City owes before entry, and which later decisions remain with law, voters, appointing bodies, or operating institutions.

Covenant and stabilization give consent a material foundation. Debt pressure, housing insecurity, health-care precarity, dependent-care fear, gifts, sponsorship, donor access, and private rescue can steer visible service from outside the record. Support becomes anti-corruption infrastructure when it enlarges refusal capacity while remaining independent of loyalty, silence, testimony, political allegiance, or continued participation.

Pause, reconsideration, refusal, and return keep consent alive after the first signature. Health, family duties, security conditions, finances, comprehension, and institutional readiness can all change. A fair threshold can answer not yet, not this way, not under this load, or not at all, while preserving privacy, continuity, and an ordinary life beyond the application.

This sequence prevents the City from becoming a pipeline. *The Life of Fairness* protects ordinary private life as complete life. *The Constitution of Fairness* owns model legal architecture for lawful visibility and remedy. *The Government of Fairness* owns operating public administration. The City of Fairness owns only the bounded threshold for voluntary adult public-power formation, so it cannot stretch backward into childhood, family pressure, party grooming, donor expectation, movement belonging, or public curiosity.

The burden question changes shape at every step. If the applicant enters from service, who guards against exploitation? If wound or fear is present, who prevents unresolved pain from being converted into rule? If prestige is present, who prevents spectacle? If debt or family dependence is present, who removes the leverage? If the applicant pauses or refuses, who protects privacy, continuity, and future standing?

Part IV is not suspicious of public ambition. A society without serious ambition leaves public power to people who were shaped elsewhere, often under hidden pressure. The City needs people capable of effort, discipline, study, criticism, loss of image control, and long service. But a fair institution does not worship

ambition. It tests whether ambition can carry burden without demanding exemption from correction.

Part IV supplies the institutional grammar that any later admissions design must make concrete. Purpose limitation, separate decision lanes, observable evidence, accommodation, qualified human judgment, explanation, appeal, expiry, refusal, and remedy define the minimum architecture. Jurisdiction-specific law, clinical practice, security procedure, public-input design, and office eligibility remain with their lawful and professional owners. This Part gives those specialists a coherent threshold to test rather than pretending to replace their authority.

If Part III is the City's civil-liberties heart, Part IV is its threshold conscience. Entry must resist capture, remain humane enough for refusal, demand candor without rewarding moral theater, and remember that the first applicant is not evidence that the institution works. The person at the doorway is the first test of whether the City can carry the burden it proposes to place on others.

Chapter 13 — Who Applies and Why

The first hypothetical applicant is enthusiastic. She has spent years organizing local heat-response work and wants deeper preparation for consequential public responsibility, but she also supports an aging parent and cannot move on a heroic timetable. A fair process can receive her ambition without treating caregiving as a defect or enthusiasm as consent to every later burden.

The second applicant is skeptical. He wants to inspect the Vow, the privacy rules, the support terms, and the exit route before revealing a public biography. His hesitation is not evidence of disloyalty. It is a test of whether the institution can answer hard questions without converting inquiry into suspicion or publicity.

The third applicant decides not to proceed. Her work schedule, childcare, and housing make the present burden impractical, even though her interest in public service is serious. A threshold that leaves her with privacy, dignity, and future opportunity has succeeded; a threshold that turns refusal into failure has begun to own the person it claims to invite.

The fourth applicant is redirected. He wants public consequence, but repeated review shows that a local technical, legal, or community role fits his present capacities better than the pathway he first imagined. Redirection is not a lower civic rank. It is the institution admitting that service and office are not identical and that role matching should protect both the applicant and the public (Perry and Wise, 1990; Fox and Lawless, 2014).

The four outcomes reveal one governing question: where does an applicant's desire send burden when it meets reality? Ambition

can become durable public capacity or recruit staff, citizens, and records into an image project. Wound can sharpen attention or narrow judgment. Calling can sustain difficult work or become a private claim of destiny. The threshold follows each motive into conduct, correction, and consequence.

Public power is usually formed long before the public sees a candidate. Patronage, parties, donors, elite institutions, media rewards, platforms, and career scripts distribute opportunity and obligation in private. The City changes that timeline by asking earlier what a person wants power to do, which costs they can carry, which people may bear the remainder, and which other paths remain genuinely open.

Ambition is necessary civic energy, but its object and burden route determine its public value. Ambition that accepts ordinary work, shared credit, correction, and visible limits can mature into capacity. Ambition organized around image control, flattery, opacity, or exemption needs constraint before opportunity. The threshold neither glorifies striving nor mistakes it for a defect.

Service, wound, calling, prestige, escape, and fear are maps of possible pressure, not grades of moral purity. Each can support endurance and each can distort judgment. Their value emerges only through context: how the applicant responds to refusal, low-status work, contrary evidence, fatigue, dependency, loss of recognition, and the freedom to choose another route.

The third movement turns from motive categories to trait interpretation. Correction capacity matters because visible life will expose error. Staff dignity matters because treatment of

lower-power people is often a truer signal than polished speech. Status-centered drift and manipulation risk matter because the City will be watched, narrated, and gamed. Mixed-motive interpretation matters because a fair threshold must avoid both purity theater and naive acceptance.

A purity test rewards rehearsal. Applicants learn the institution's preferred language of service, humility, sacrifice, and courage, while the most polished narrator can appear more trustworthy than the most correctable future public servant. A stronger design welcomes honest complexity, compares words with conduct over time, and treats candor as useful material for formation rather than as a confession demanded for admission.

Voluntary entry is the legal and moral hinge. Adult status, informed understanding, freedom from coercion, independent advice, reviewable consent, and a practical route to pause or withdraw must all exist before activation. Family, party, donor, religious, employer, movement, debt, crisis, or media pressure may shape the surrounding facts, but none may supply the applicant's decision. The City answers hidden power by making the choice to enter more intelligible and more genuinely owned.

Applicant privacy before acceptance protects the freedom to explore a demanding civic path without becoming public material. Inquiry, consideration, pause, delay, refusal, and redirection remain private statuses unless a specific lawful duty requires otherwise. Internal records may support process integrity, safety, appeal, and audit, but they stay purpose-bound, access-limited, and subject to retention rules. Curiosity never

earns a dossier, hesitation never becomes suspicion, and nonentry never becomes stigma.

The Chapter establishes the threshold's operating logic before specialists translate it into instruments and lawful procedure. Legal eligibility, clinical review, security methods, role-specific assessment, and any public-input mechanism require qualified design and jurisdictional authority. Here the City defines what those processes owe the person: bounded purpose, separate questions, human explanation, contestable evidence, support, privacy, expiry, and a route back to ordinary life. Review authority remains answerable rather than sovereign.

The practical center is route. A motive becomes safer when there is a route for naming it, testing it, supporting it, limiting it, and revisiting it. A risk becomes less dangerous when there is a route for concern, appeal, delay, redirection, refusal, and privacy. A threshold becomes fair when each difficult human fact has somewhere lawful and humane to go.

Restraint is the emotional center of entry. Someone stepping toward public burden deserves the same seriousness as an institution refusing to own them too soon. The applicant may be brave, confused, ambitious, frightened, gifted, wounded, proud, and sincere at once. Whatever greatness the City may earn begins in refusing to simplify that person for public appetite.

Artificial Intelligence can improve access through translation, scheduling, form assistance, secure routing, and auditable clerical support under named human supervision. The current consolidated EU AI Act treats many employment and selection

uses as high risk and tightly restricts workplace emotion inference, reinforcing a threshold built around dignity, equality, privacy, transparency, and accountable human judgment (European Union, 2024; Council of Europe, 2024; EEOC, 2023; U.S. Department of Justice, 2022).

Field experts would expect the threshold to be planned, documented, and reviewed across each stage rather than improvised around charismatic applicants. Recruitment standards emphasize defined phases, responsible stakeholders, candidate experience, and learning; selection guidance emphasizes intended use, validation, fairness, and adverse-impact review. Those fields do not supply a universal admissions code, but they make unstructured intuition indefensible (ISO, 2023b; AERA, APA, and NCME, 2014; SIOP, 2018; EEOC, 2023).

A motive-burden matrix gives this inquiry a disciplined form. One column records the applicant's stated motive; a second records relevant observable conduct and its context; a third records burdens that the proposed participation may shift onto staff, family, citizens, or the institution. Further columns identify support, prohibited inferences, review points, and the conditions under which an interpretation must change.

The matrix is not a score and should never be converted into one. Its purpose is to stop reviewers from asking whether a motive feels beautiful and to require them to examine behavior under record, criticism, ordinary work, fatigue, family pressure, and loss of status. The matrix protects the applicant from being reduced to mood, story, diagnosis, or charisma.

13.1 — Ambition Under Visibility

Ambition is the first motive the City must learn to govern because consequential public work requires initiative, endurance, persuasion, judgment, and willingness to carry consequence. Private citizens who do not seek those burdens remain fully complete; the issue is role preparation, not human value. For applicants who do seek them, the City asks whether ambition finances its own work or sends the cost to staff, families, citizens, and institutions. That burden route is more informative than either admiration or suspicion (Fox and Lawless, 2014; Perry and Wise, 1990).

The ordinary public sphere often trains ambition under opacity. A future leader learns to manage rooms, please gatekeepers, cultivate donors, survive platforms, polish biography, hide uncertainty, speak in marketable conviction, and avoid correction until correction becomes scandal. By the time formal candidacy begins, ambition has already been shaped by private rewards. The City intervenes earlier by asking ambition to bear visibility before it asks the public to bear trust.

Visibility changes ambition because it removes the hidden surplus that often makes power attractive. Secret access, unrecorded influence, private image management, elite proximity, performative humility, and plausible deniability all become harder. A person who wants power mainly because it offers private exemption may find the City unbearable. That is not a defect. It is one of the City's filtering functions.

Visibility imposes a real cost even on honest ambition. An applicant may feel exposed, clumsy, misunderstood, slow, or bereft of familiar control over strategy and reputation. Those reactions are not automatic evidence of unfitness. The useful question is whether the cost produces greater candor, patience, repair, and respect for other people's standing, or whether it produces evasion, blame, and demands for exemption. The City studies the direction of adaptation rather than glorifying discomfort for its own sake.

Ambition is read through burden rather than intensity. What cost does the applicant accept, and what cost do they shift? How do they respond when correction comes from a person with less status? Can they continue useful work after praise is removed? Can they repair after embarrassment without making others manage their shame? These questions make ambition observable without pretending to measure the soul.

The City needs ambitious people who can become smaller before truth and larger before duty. It needs people who can be seen without making spectacle of being seen. It needs people who can aspire without demanding worship. Ambition under visibility is not the death of ambition. It is ambition stripped of hidden subsidy.

13.1.1 — Ambition as Energy

Ambition is the energy that moves a person toward difficult public work: study, boredom, criticism, decision, and sustained responsibility. The relevant question is not whether ambition exists, but where it sends its force. It may seek hidden relief,

reputation, or command, or it may sustain work that reduces burden for others. Naming ambition openly prevents institutions from disguising status selection as leadership, excellence, or vision and makes its route available for evidence and review.

Accordingly, the review team should welcome ambition only when it remains connected to public consequence. Ambition that wants skill, discipline, office readiness, and accountable authority can be formed. Ambition that wants only recognition, immunity, or special access needs constraint before it needs opportunity. The threshold should ask not whether the applicant is driven, but what the drive is willing to carry.

Ambition as energy should also be separated from extroversion, wealth, credential polish, rhetorical smoothness, and social ease. Some applicants will be quiet, awkward, locally rooted, technically minded, disabled, trauma-shaped, or cautious. They may still carry powerful public ambition. The City should look for direction of energy, capacity for burden, and willingness to be corrected rather than the familiar signals of elite performance.

A useful threshold question is simple: what does the applicant keep working on when no one is watching and no advantage is guaranteed? Ambition that survives without applause may be more valuable than ambition that shines only in selection rooms. The City should look for durable energy, not only visible fire.

For field-expert review, ambition should be treated here as a role-relevant motivational resource rather than as a personality halo. Selection experts would warn against confusing drive with virtue, and political theorists would warn against confusing ambition

with legitimacy. The City's contribution is to make ambition answerable to burden rather than to charisma.

Ambition is best read along two axes: intensity and object. Longitudinal research links ambition with attainment, income, and career movement, but those associations do not show whether a particular drive is democratically useful or ethically safe (Judge and Kammeyer-Mueller, 2012). Quiet persistence toward maintenance, remedy, and institutional learning may carry more public value than highly visible pursuit of prestige. The threshold therefore asks what the ambition notices, what it is prepared to sacrifice, and whose burden rises when progress stalls.

Public work also tests whether ambition can change form without abandoning purpose. Goals become impossible, unlawful, obsolete, or less important than a newly visible burden. Research on goal adjustment distinguishes rigid persistence from the capacity to disengage from an unattainable aim and reengage with another meaningful one (Wrosch et al., 2003). A mature applicant can release a plan, preserve the record of why it ended, redirect effort, and continue serving people whose needs outlast any single proposal.

A practical applicant file should therefore separate evidence of energy from evidence of direction. Work history, civic repair, study discipline, peer reliability, and response to unglamorous tasks may show energy without turning the person into a rank. The question is not how bright the ambition looks, but whether it makes hidden public burden more visible and more repairable.

13.1.2 — Ambition Under Burden

Ambition under burden is ambition after the hidden advantages of ambition have been removed. The applicant is not merely asked whether they want public office. They are asked whether they want public consequence when influence, record, critique, correction, and support obligations arrive with it. That is a different desire.

This is not punishment. It is burden alignment. Public power alters lives. It moves money, law, time, policing, services, climate policy, school design, migration routes, infrastructure, war, peace, and the tone of ordinary life. A person who seeks such power should not be formed entirely in private while ordinary citizens live with public consequences. Ambition under burden makes the future office seeker carry more of the visibility burden upstream (Deci and Ryan, 2000; Grant, 2008).

The applicant's response to burden reveals more than their declared ideals. Some people become more careful when watched because they understand that the record protects others. Some become theatrical because they feel watched. Some become resentful because they expected the City to confirm their exceptionalism. Some become humble in public but cruel with staff. The City must read changes in pattern rather than trust the first explanation.

Ambition under burden also protects the applicant. It can reveal that the role imagined by the applicant does not match the cost they can carry. That discovery should not be treated as failure. It is better to learn before activation, before campaign reliance,

before family rupture, before health collapse, and before public trust is built around a person who cannot live inside the burden.

Accordingly, a fair threshold should offer burden previews before activation and before any irreversible public disclosure. Shadow days, record simulations, deliberation exposure, visitor-pressure scenarios, correction exercises, family consultation, care review, and quiet periods can help applicants understand the demands. Previews should be disclosed, proportionate, protected, and open to refusal or withdrawal. They inform the applicant and identify support needs; a brief exercise should not be treated as proof of future character or capacity.

The operational test can be written as a burden conversion sequence: desire for power becomes acceptable only when it can be converted into duty, record, explanation, correction, and restraint. If any link breaks, ambition may still be humanly understandable, but the City should not treat it as ready for public-power formation.

This is also where field experts would expect attention to stress, identity, and social reinforcement. People often discover under pressure that they wanted the image of responsibility more than responsibility itself. The City should make that discovery early, privately, and repairably rather than after a campaign, office, or public crisis has magnified the cost.

13.1.3 — Status Hunger

Status hunger is not the same as ambition. Ambition seeks to do, build, learn, decide, or serve. Status hunger seeks to be seen as the kind of person who deserves those things. It is a hunger for

placement in the eyes of others. Under ordinary politics, status hunger can become nearly invisible because many political systems reward it while pretending to reward service.

Status hunger matters because visibility can discipline it or feed it. An applicant who is comfortable under attention may be carrying burden, or may be using staff, citizens, critics, and the archive as supporting material for a personal mythology. The threshold therefore examines whether scrutiny produces repair and ordinary work or turns correction into martyrdom, humility into performance, and service into image defense. Confidence is not condemned, but status reward is removed from the gate.

Status hunger should not be treated as a permanent moral diagnosis. Many people carry some desire to be admired. The issue is governance. Can the person notice the desire without obeying it? Can they receive praise without needing more? Can they accept obscurity? Can they let another person receive credit? Can they continue the work when the record shows imperfection?

Applicant-facing practice should look for status hunger in small forms, not only grandiose speech. Does the applicant exaggerate sacrifice? Do they name powerful acquaintances unnecessarily? Do they handle ordinary corrections as personal injury? Do they neglect work that is not visible? Do they treat low-status staff with impatience? Do they narrate every difficulty as evidence of exceptional depth?

The City's safeguard is not to humiliate status hunger out of the applicant. Humiliation often deepens the hunger. The better safeguard is to remove status rewards from the threshold. Make

ordinary work matter. Make staff treatment visible to reviewers. Make correction routine. Make praise modest. Make the applicant's story less important than the burden they can carry.

The most useful review posture is not to ask whether the applicant enjoys status, because many people do. The sharper question is whether status changes the applicant's burden behavior. Do they become less truthful when rank is threatened, less patient when credit is absent, or less humane when no audience rewards them for decency?

Status will form even inside an institution that rejects status worship. Research treats status desire as a recurrent human motive distinct from money, power, and belonging (Anderson et al., 2015). Admission, difficult assignments, mentor proximity, archive presence, public attention, and visible sacrifice can all become currencies. Institutional candor therefore requires watching how the City itself distributes admiration and deference instead of assuming that transparency has purified the social field.

The practical countermeasure is not humiliation. It is to make status less detachable from burden, correction, and ordinary contribution. Applicants should sometimes perform low-visibility work, share credit, explain dependence on staff, and continue when the audience disappears. Reviewers should observe whether the applicant treats unglamorous assignments as beneath them, converts every task into personal narrative, or becomes generous when recognition is scarce. These observations do not reveal a hidden soul. They reveal how status motive behaves under specific civic conditions. A person may still enjoy admiration.

The question is whether admiration governs the work, or whether the work can remain faithful when admiration moves elsewhere.

Public artifacts must also avoid feeding status hunger. If application materials, diagrams, portraits, interviews, or donor briefings make applicants look chosen, elite, sacred, or historically elevated, the City will attract the wrong hunger and then pretend to be surprised by it. The acceptance standard should remain ordinary, bounded, and role-specific.

13.1.4 — Public-Service Ambition

Public-service ambition is ambition that wants to reduce hidden burden through lawful public consequence. It does not mean the applicant has no ego, no longing, no fear, and no need for recognition. It means the desire for public action remains tethered to the people who will bear the results. The center of gravity is not the applicant's self-image but the public burden at stake.

This kind of ambition is recognizable by its patience with complexity. A public-service applicant does not need every problem to flatter their preferred solution. They can hold tradeoffs without pretending that one paragraph solves them. They are willing to ask who loses time, who waits in a queue, who carries cost, who is exposed, who is shielded, who can appeal, who is forgotten, and who will repair the damage if the decision fails (McClelland and Burnham, 1976; Hogan and Kaiser, 2005).

Public-service ambition also accepts record. A person who wants to serve but refuses to be explainable may be sincere in feeling but dangerous in role. The public cannot be asked to trust private righteousness. The City asks whether the applicant can translate

intention into reason, reason into record, record into review, and review into correction when needed.

The applicant's relationship to credit is a strong signal. Public-service ambition can celebrate success, but it does not need to own all success. It can work through teams, give staff credit, accept expertise, and recognize local knowledge. It does not treat every useful idea as a threat to its own significance. It can be ambitious for a public outcome more than for personal authorship.

Public-service ambition becomes safer when it can tolerate limits. The applicant must be able to hear no from the people they hope to help, accept rights and procedure as part of service, and notice when urgency is being paid for by staff, family, or the body. Service that cannot rest, consult, or be corrected does not reduce burden; it merely hides the people carrying its speed.

Public-service ambition becomes strongest when it can survive lowered drama. Much of government is maintenance, procedure, patient repair, boring vigilance, staff respect, and quiet prevention. An applicant who wants only heroic intervention may not be ready for public service. The City should honor ambition that can love maintenance.

A field-serious version of this test asks for concrete burdens, not only noble goals. Which queue, cost, exposure, delay, administrative humiliation, staff overload, legal gap, or maintenance failure does the applicant want to reduce? Public-service ambition becomes legible when it can name the burden without needing the public to admire the namer.

13.1.5 — Ambition After Correction

Ambition after correction is one of the most important signals in the City. Almost every applicant can speak well before correction. The threshold becomes serious when the applicant is wrong, challenged, slowed, redirected, or asked to revise a beloved idea. Power is dangerous when correction feels like insult. Public service becomes possible when correction becomes usable information.

What matters after error is how ambition changes once the mistake is named. Does the applicant become curious? Defensive? Performatively humble? Retaliatory? Strategic? Do they apologize quickly to end discomfort, or do they alter the pattern that caused harm? Do they blame process, staff, critics, unfair framing, or exhaustion before asking what the burden did to others?

Correction is institutional as well as interpersonal. The archive, record site, experts, affected people, staff reports, simulation outcomes, public questions, and role mentors all contribute distinct perspectives that can revise an applicant's account. Public-power formation begins when a person can remain responsible inside shared interpretation rather than treating personal explanation as the final word.

Correction also tests whether the applicant wants power or only validation. A person who truly wants to reduce burden should welcome accurate correction even when it wounds pride. A person who wants confirmation may treat every correction as

evidence that the City misunderstands them. The difference may not appear in one moment. It appears across repetition.

The entry process must correct fairly. Correction that is vague, humiliating, arbitrary, public beyond necessity, or infected by bias will teach fear rather than maturity. The applicant's response matters, but the institution's method also matters. Burden belongs on the City to make correction specific, reviewable, proportionate, and connected to the public-purpose standard.

Ambition that survives correction can be more trustworthy than untested confidence. The relevant change is not compliance alone, but deeper attention to who was burdened, what structure permitted the error, and what must change next. The City should neither fetishize failure nor preserve error as public stain; it should make reviewable repair consequential enough to improve conduct and humane enough that applicants do not learn to hide.

Correction should be logged across five separate fields: what was corrected, how the correction was delivered, how the applicant responded, what repair followed, and whether the pattern recurred. The separation matters because polite reception can coexist with no behavioral change, while an awkward first reaction can be followed by serious repair. Reviewers should judge the observable learning sequence rather than reward emotional smoothness.

Correction capacity includes more than accepting feedback after it arrives. It includes seeking information before failure becomes expensive. A large meta-analysis of feedback-seeking research found that people differ systematically in whether and how they

request evaluative information, and that the surrounding social environment shapes the costs of doing so (Anseel et al., 2015). The City should therefore look for active epistemic behavior: asking what evidence would change a view, inviting staff to identify foreseeable burden, checking whether affected people understood a proposal differently, and requesting review before a public commitment hardens. Passive politeness under correction is weaker than disciplined curiosity before correction is forced.

Correction capacity depends on an environment in which early truth is possible. Applicants will not seek difficult feedback when uncertainty becomes a permanent stain, staff fear retaliation, or revision is treated as proof of unfitness. Psychological safety research helps explain why learning behavior depends on whether interpersonal risk can be taken without humiliation or punishment (Edmondson, 1999). Accountability remains firm, but the strongest ambition is the one that can change method, relinquish ownership, preserve the record, and keep serving the underlying public burden.

13.2 — Service, Wound, Calling, Prestige, Escape, and Fear

Applicants rarely arrive with one motive. They arrive carrying histories, hopes, wounds, stories, pressures, and partial self-knowledge. The City would be unsafe if it demanded a single clean reason, and equally unsafe if it treated all reasons as interchangeable. Motive is not a verdict, but motive is a burden signal (Perry, 2000; Kim et al., 2013).

The six named motives are diagnostic categories, not applicant scores. Reviewers should ask how each motive interacts with dependency, refusal capacity, public burden, and the ability to change course rather than trying to identify a single pure reason for entry.

The Law of Fairness question is not, which motive deserves the City? The question is, what burden does this motive create, hide, shift, reduce, or make reviewable? A service motive may reduce public burden or create savior pressure. A wound motive may sharpen perception or transfer unresolved pain. A calling may sustain hard work or resist review. Prestige may be admitted and governed, or hidden and obeyed. Escape and fear may reveal coercion that should halt entry.

Motive categories become useful only when they resist moral romance. Suffering can deepen attention or harden resentment; service can be generous or controlling; vocation can sustain responsibility or place itself beyond review; prestige can be named and disciplined; fear can warn, narrow, or motivate preparation. None of those possibilities is settled by the label

alone. A fair institution follows motive into conduct, context, burden, support, and change over time.

Applicants also need protection from being reduced to origin stories. Public culture favors the wounded reformer, heroic servant, reluctant leader, outsider, visionary, child of hardship, or person who overcame disgrace. Biography may explain attention, but it cannot become credential, diagnosis, public entertainment, or substitute for present conduct.

The goal is a humane motive literacy. The City should help applicants see themselves more truthfully before the public sees them more fully. It should make mixed motives discussable without making confession into spectacle. Motive work belongs inside protected process until acceptance and activation create lawful public record.

13.2.1 — Service Motive

Service is a legitimate and valuable reason to approach public responsibility. A person sees need, failure, suffering, corruption, or neglect and decides to help. Civilization depends on people willing to accept inconvenience for the public good. The threshold receives that motive with respect, then asks how it handles consent, limits, ordinary work, ingratitude, and the independent agency of those it hopes to serve.

Service, however, is not automatically safe. A person may serve because they need gratitude, because being needed stabilizes identity, because rescue gives them control, or because service lets them avoid their own private difficulty. The motive can be

generous and still mixed. The City should not shame that mixture. It should make it visible enough for governance.

Service becomes civic when it can live inside boundaries. Urgency may tempt an applicant to bypass procedure, push staff, ignore rest, or treat rights review as delay. Rights, appeal, consent, and protected nonvisibility keep helpful intent answerable to the people carrying its consequences. They do not obstruct service; they prevent benevolence from becoming domination.

Service should also be tested under low recognition. Some public burdens are reduced by work that no crowd will celebrate: maintenance, forms, budget repair, scheduling, complaint response, boring training, quiet correction, and careful listening. An applicant whose service motive disappears when praise disappears may be seeking moral visibility more than public repair.

Accordingly, the review team should receive service with gratitude and caution. It should ask where the service motive has already worked, where it has overreached, how it treats refusal, how it handles ingratitude, and whether it reduces burden without demanding emotional payment from those it serves.

The service motive should also be tested against staff burden. Many service-driven people ask too much of the nearest workers because the public goal feels urgent. A fair City must teach that service which burns out staff, ignores procedure, or bypasses rights has merely moved burden from a visible public problem to a hidden institutional one.

13.2.2 — Wound Motive

A wound motive appears when an applicant's desire for public power is shaped by injury. They may have been betrayed by government, harmed by institutions, ignored by elites, trapped in poverty, humiliated by bureaucracy, failed by healthcare, targeted by violence, or marked by family history. Wound can become a source of attention because pain often notices burdens that comfort misses.

Institutional injury can sharpen attention to burdens that comfortable power overlooks. It can also narrow judgment, harden a demand for repayment, or make authority feel like the only available repair. Wound therefore enters the threshold as knowledge, vulnerability, and unfinished possibility at once. The relevant questions are whether the applicant can hear unlike histories, whether public reasoning extends beyond biography, and whether care, support, or time is needed before authority amplifies what remains unresolved.

The wound motive requires clinical and ethical humility. The City is not a therapy substitute, and application is not treatment. An applicant may need care, legal support, community repair, time, or ordinary privacy rather than visible formation. To welcome a wounded person too quickly can exploit their pain. To exclude them automatically can compound the injury. The threshold must be careful enough to hold both risks.

Wound also interacts with narrative pressure. Media, donors, movements, and supporters may prefer wounded applicants because their stories are compelling. The City must refuse to use

biography as recruitment material. Applicant privacy protects wounded persons from being turned into proof that the City is humane, revolutionary, or emotionally powerful (Mackenzie and Stoljar, 2000; Manson and O'Neill, 2007).

The fairest handling of wound is neither exposure nor concealment. The City should create protected review settings where history can be named as much as needed for support and fit, kept private where possible, and never converted into public credential unless lawful, voluntary, and relevant after acceptance.

Wound becomes dangerous when biography is treated as authorization. Suffering may deepen attention, knowledge, and urgency, but it does not grant a right to rule in the domain where harm occurred. The City honors testimony while keeping law, evidence, review, and the dignity of differently situated people in view.

Adversity has no single honorable trajectory. Some people experience durable distress, some recover gradually, some show resilient functioning, and some report growth that coexists with pain. Reviews of resilience and posttraumatic growth caution against treating one pattern as universal or morally superior (Bonanno, 2004; Tedeschi and Calhoun, 2004). The threshold neither presumes instability nor demands a redemptive story. It asks what present support and boundary allow the person to choose freely now.

Wound-informed expertise becomes strongest when biography is joined to comparison. A person harmed by a housing system may notice administrative cruelty others overlook, but their experience

cannot by itself establish the best housing policy, represent every affected group, or predict the consequences of a remedy. The City should help applicants move from singular experience to triangulated public understanding through data, law, comparative cases, affected-person testimony, frontline knowledge, and contrary evidence. This process honors the wound without turning it into a monopoly on truth. It also protects the applicant from being trapped forever in the role of survivor, witness, or symbolic representative when their civic capacities are wider than the event that first awakened them.

Clinical reviewers would also expect the City to avoid making applicants narrate pain repeatedly. Motive understanding should not become extraction. The applicant should not have to turn private suffering into admission currency, public story, or institutional proof that the City welcomes the harmed.

13.2.3 — Calling Motive

A calling motive appears when an applicant experiences public service as vocation. They may feel drawn by conscience, faith, civic responsibility, historical moment, personal gift, community need, or a sense that their life has prepared them for a task. The City should make room for serious vocation because some burdens require more than career planning. They require durable commitment.

Calling becomes dangerous when it resists correction. A person who believes they are destined for a role may hear review as obstruction, criticism as persecution, delay as betrayal, and refusal as proof that others lack vision. The City must distinguish

vocation that can kneel before evidence from destiny language that creates private sovereignty.

A healthy calling can survive uncertainty about form, timing, and role. It may give the applicant endurance and private meaning while still accepting redirection, delay, or the possibility that someone else is better suited. The City treats calling as serious testimony, not proof of destiny or public authority; it remains answerable to law, care, evidence, review, and the applicant's continuing freedom to refuse.

Calling should be tested through ordinary work. Does the applicant still feel called when asked to study budget constraints, meet with critics, revise a flawed plan, sit in complaint review, respect staff schedules, or accept a role below the one imagined? A calling that only survives heroic images may be imaginative intensity rather than civic vocation.

The entry process must also protect applicants from communities that impose calling on them. Families, religious leaders, political groups, donors, or activists may tell a person they have a destiny. That pressure can feel holy, necessary, or historic while still being coercive. Freedom from coercion includes freedom from being assigned significance by those who want the applicant to carry their hopes.

Calling should be translated into public terms before it can guide a role path. The applicant may privately use sacred, historical, or vocational language, but the City must ask what lawful burden the calling would carry, what limits it accepts, what evidence could

redirect it, and what refusal would mean. Untranslated calling becomes unreviewable authority.

A calling can sustain work that ordinary incentives cannot. It can give coherence to sacrifice, perseverance, and service across long periods of uncertainty. Yet research on deeply meaningful work also shows the double edge: workers who experience a calling may accept lower pay, longer hours, greater discomfort, and stronger moral obligation while holding the institution to demanding standards (Bunderson and Thompson, 2009). The City should treat this pattern as both resource and vulnerability. A person who calls the work sacred, destined, or inseparable from identity may be unusually persistent, but also unusually easy to exploit and unusually reluctant to leave when the institution becomes harmful.

For that reason, the threshold should ask whether the calling can survive plural expression. Can the applicant serve the same public purpose outside the City, in another role, after delay, or without recognition? Can they distinguish devotion to a burden from loyalty to one institution? Can they rest without interpreting rest as betrayal? A calling that has only one authorized vessel gives that vessel excessive power. The City should widen the applicant's map of meaningful contribution before asking for a Vow. The aim is not to extinguish vocation. It is to prevent vocation from becoming the lever by which a person consents to conditions they would reject if the work mattered less.

The safeguard is a vocation-without-destiny standard. A person may be deeply called to serve and still be wrong about timing, role, jurisdiction, method, or readiness. The City protects both

public and applicant by making redirection compatible with dignity.

13.2.4 — Prestige Motive

Prestige motive appears when an applicant wants the honor, distinction, influence, admiration, access, or symbolic elevation associated with the City. This motive is dangerous when hidden, but it is not unusual. Most public systems carry prestige. To pretend otherwise makes prestige more powerful because it moves underground.

Prestige is not disqualifying merely because recognition matters to the applicant. The safer person can name that attraction and accept rules that prevent it from directing the threshold. The review asks whether praise, access, or remembered significance bends conduct, whether criticism becomes image threat, and whether the applicant can continue ordinary work when recognition is absent. Denial of prestige desire is less informative than accountable awareness of it.

Prestige motive must be tested by removing some prestige. Give the applicant unglamorous work. Place them in learning settings where they are not the most impressive person. Ask them to receive correction from staff. Let them contribute without public credit. Observe whether energy remains when honor is not immediate.

Threshold governance must also examine whether its own design manufactures prestige. A beautiful campus, intense media interest, elite visitors, public record site, and historical language can make application feel like entry into a rare order. The City

must present entry as burden, not elevation. If public artifacts make applicants look chosen, the institution is already mis-teaching the threshold.

Scarcity can turn admission itself into a prestige signal. The answer is not to deny that effect but to design against it through dignified explanations, reviewable outcomes, restrained recognition, and equal respect for delay, redirection, and refusal. Acceptance begins a burden; it does not certify virtue or superiority.

Prestige therefore remains an acknowledged pressure rather than an organizing principle. The City can distribute honor across visible and low-status work, protect staff dignity, and connect recognition to burdens actually carried rather than images performed. That design leaves room for ambition while weakening the incentives that would convert entry into a status market.

Prestige should be handled through disclosure and design rather than moral scolding. If the City pretends it has no prestige, applicants will compete for prestige under service language. If it names prestige and reduces prestige rewards, applicants can learn to govern the desire instead of hiding it (Deci and Ryan, 2000; Grant, 2007).

A good operational audit would ask which parts of the application process generate unnecessary prestige: special invitations, public lists, elite references, dramatic ceremonies, rare access, donor attention, or media interest. Each prestige source should be justified by public purpose or removed.

13.2.5 — Escape Motive

Escape motive appears when an applicant seeks the City as a way out of another life. They may want to escape debt, family pressure, career failure, public disgrace, loneliness, unsafe conditions, ideological disillusionment, stalled ambition, or ordinary confusion. The City must handle this motive with special care because severe institutions often attract people who need shelter.

Escape is not always illegitimate. A person may honestly need a new path. They may be trapped in a profession that deforms them, a network that pressures them, a private economy that captures their choices, or a local environment where service has become impossible. Public formation can be a real calling after escape from a corrupt or exhausted setting.

The entry process first asks what the applicant needs, then whether civic formation is the right response. Housing, legal aid, debt counseling, clinical care, domestic safety planning, employment help, community repair, and private-life support often belong in ordinary service systems rather than an admissions pathway. Meeting urgent need before assessing entry protects the applicant from mistaking crisis relief for consent.

Escape motive also raises donor and party risks. A person trying to leave one dependency may be vulnerable to another. If entry offers material stabilization, public attention, housing, healthcare, or status, the applicant may feel unable to refuse. The stabilization architecture is meant to prevent support from becoming

ownership, but the vulnerability must be recognized before any support relationship begins.

A healthy escape motive can become public service when the applicant has enough ground beneath them to choose rather than flee. The City should slow the process, test alternatives, protect privacy, and ask whether the applicant would still want the role if another safe path were available. That question reveals whether the City is destination or emergency exit.

The fairest response to escape is not automatic refusal. It is de-loading, support, time, and review. The applicant may return later with clearer consent. The City's obligation is to protect the person from being consumed by the very door that looked like freedom.

Institutional dependency is a distinct risk. If the applicant's housing, care, debt relief, legal support, social identity, or safety becomes tied too quickly to application, the threshold can become a soft trap. Stabilization must remove leverage, not create it.

13.2.6 — Fear Motive

Fear motive appears when an applicant seeks the City because the world feels dangerous, unstable, corrupt, or impossible to trust. They may fear institutional collapse, violence, climate harm, authoritarianism, humiliation, poverty, technological domination, public disorder, or personal vulnerability. Fear can awaken responsibility, but it can also make power feel like the only shelter.

Fear becomes dangerous when it seeks control as relief. A fearful applicant may want authority to reduce uncertainty, silence opposition, force order, punish perceived threats, or build a world

where they never feel helpless again. The City must distinguish courage under fear from power-seeking as anxiety management.

Fear can also make coercion harder to detect. A family, party, movement, religious group, donor, or online community may tell the applicant that entry is necessary because catastrophe is near. Crisis rhetoric can compress choice. The applicant may feel that refusal would betray history, community, or future generations. The City must protect consent from emergency imagination.

A useful test is whether the applicant can tolerate lawful opposition. Fear often recodes dissent as danger. A person ready for public service must be able to hear criticism, protest, adversarial review, and public anger without immediately reaching for suppression. The perimeter protects dissent institutionally; the entry threshold asks whether the applicant can live with dissent internally.

Fear also affects the body. Hypervigilance, sleep loss, threat scanning, and emotional exhaustion can distort judgment. The City should not pathologize fear, but it must ask whether fear has become the applicant's main decision engine. Clinical and support review belongs later, but motive literacy begins here. Review should distinguish persistent threat arousal from a temporary response to conditions that can be changed by rest, safety, or reliable information.

Fear should be examined for proportionality and pluralism. Can the applicant distinguish danger from disagreement, urgency from permission, and public order from personal relief? The concern is not that fear exists, but that it may become an interpretive

monopoly in which every obstacle appears as threat and every critic as saboteur. Scenario work can test whether the applicant can revise a threat judgment after credible contrary evidence arrives.

Ask whether fear eases when information, care, and procedural clarity arrive. If it remains the governing engine, slow or redirect. Fear need not disqualify a person, but it cannot authorize the role. A later return to the pathway should document what changed rather than treat delay itself as a defect.

13.3 — Desired Traits, Dangerous Traits, and Mixed Motives

Self-description alone cannot govern the threshold. Applicants may misunderstand themselves, and polished candidates may know which motives sound acceptable. What the City needs is conduct-and-burden literacy: a disciplined ability to compare stated purpose with observable action across contexts, without converting patterns into worth scores or personality destiny (Fleeson and Jayawickreme, 2015; Mischel and Shoda, 1995).

The most important signals are often quieter than charisma, intelligence, or vision. Correction capacity, staff dignity, candor under incentive, refusal of special treatment, and ability to name affected people show how public burden is likely to travel. A person who cannot be corrected makes others carry the cost of their image; a person who mistreats lower-power workers has already displaced a burden the City is meant to expose.

Public-risk language should be attached to observable conduct and a declared decision. Manipulation, retaliation, rule evasion, deception, image defense, concealed obligation, or misuse of access can justify review when evidence and consequence are specified. Casual diagnostic labels add heat without improving judgment. Reviewers should instead record response to criticism, treatment of staff, truth under incentive, consistency across audiences, relationship to rules, use of special access, and willingness to let records correct self-narration.

Mixed motives are normal. Service may coexist with admiration, repair with escape from shame, calling with prestige, and public

concern with a desire to prove oneself. The gate should not choose one motive as the secret truth and discard the rest. It should ask which motive becomes louder under pressure, what conduct follows, and what boundary or support makes the burden safer.

Later screening instruments require lawful boundaries, qualified review, capacity and security analysis, accommodation, and appeal. The interpretive standard established here keeps those tools from becoming human sorting machinery: observations remain separate from inferences, conclusions remain pathway-specific, uncertainty remains visible, and every consequential judgment expires or returns for review.

The operative object is an observable-burden application rubric. It contains eight fields: the burden claimed; the conduct observed; the people affected; the burden shifted; the context and institutional contribution; support or accommodation tried; prohibited inference and remaining uncertainty; and the review, expiry, correction, and appeal route. No field produces a human score.

Serious conclusions require more than one context. An applicant who receives correction gracefully in a formal interview but retaliates during ordinary work has not shown stable correction capacity. An applicant who communicates stress awkwardly yet changes conduct may offer stronger evidence of learning than someone who performs calm without repair. Context is evidence, not noise.

Each entry distinguishes observation from inference. 'Interrupted a staff member four times after being asked to stop' is an

observation. 'Lacks empathy' is a broad interpretation that exceeds the evidence unless a qualified, role-relevant process supports it. The same discipline applies to flattering labels such as natural leader or unusually resilient (AERA, APA, and NCME, 2014; Gilliland, 1993).

The rubric also records what the institution contributed. Confusing instructions, inaccessible settings, biased review, unreasonable schedules, public humiliation, or inconsistent support can produce the behavior later attributed to the applicant. Fair review asks what changed after the City repaired its own conditions before concluding what the person could not carry.

No column is summed into a total. The output is a reasoned, pathway-specific narrative that states evidence, uncertainty, affected people, support options, prohibited uses, expiry, and appeal. This prevents an administrative convenience from becoming a portable reputation number, secret trust index, or permanent claim about fitness for public life.

The rubric can support delay, a different pathway, more support, a narrower burden, or refusal for a stated reason. It cannot identify the applicant in total, determine who deserves dignity, confer eligibility, predict officeholding, or decide how citizens should vote. Its authority ends with the bounded formation decision it was created to inform.

13.3.1 — Correction Capacity

Correction capacity is the ability to consider criticism or redirection, distinguish valid correction from error or abuse, and make a proportionate repair when warranted. It is not meekness

or passive agreement. Distress, an awkward first response, or a needed pause does not by itself establish incapacity. Assessment should follow the person's conduct over a fair period, with appropriate support, rather than reward a polished display of calm.

The City needs correction capacity because visible formation will produce correction constantly. Records will contradict memory. Staff will notice burden. Experts will challenge assumptions. Critics will question motives. Affected persons will object. Legal reviewers will narrow plans. Public questions will reveal gaps. Without correction capacity, the applicant will experience the City as a machinery of injury rather than formation.

Correction must be tested across power differences. It is easier to accept correction from prestigious experts than from a junior staff member, local resident, service worker, critic, or peer. Correction capacity matters most when the correcting person does not increase the applicant's status. Staff dignity and correction capacity often reveal each other.

Correction capacity is not proved by one graceful apology. Some applicants know how to perform teachability. The City should look for pattern after repeated friction. Does the applicant change behavior? Do they reduce the burden they caused? Do they name the affected person rather than only their own growth? Do they stop making the same correction necessary?

Correction capacity is a City design construct, not a validated personality trait. Its rubric should distinguish factual, moral, procedural, interpersonal, and public correction, then test each

category through multiple observations and opportunities for explanation. A person may handle one form well and another poorly, so no single interview moment can justify a global label. Before the rubric is used for consequential decisions, its intended use, reliability, validity, subgroup effects, and error costs require independent review (AERA, APA, and NCME, 2014; SIOP, 2018).

Correction capacity should include a record of feedback-seeking, not merely a record of feedback received. The distinction is important because many public failures are visible to staff and affected people before they reach the formal reviewer. Research on feedback seeking indicates that individuals weigh informational value against ego, image, and effort costs, and that supportive contexts can increase the willingness to ask (Anseel et al., 2015). The City's rubric should therefore record whether an applicant creates routes for unwelcome information, names the person authorized to interrupt them, and returns to people whose earlier warning proved accurate. These are concrete civic acts, not personality labels.

A second distinction separates correction from submission. An applicant should not be rewarded for agreeing quickly with every powerful reviewer. Sometimes the correct response is to challenge the correction, produce contrary evidence, protect a third party, or appeal an unfair process. The City therefore asks whether disagreement remains reasoned, documented, proportionate, and open to revision. Correction capacity is the ability to let better grounds change conduct while preserving the right to contest weaker grounds. That balance protects the

institution from two failures at once: the arrogant applicant who cannot be moved and the compliant applicant who learns that advancement depends on reading authority rather than serving truth.

Correction capacity also needs accessibility awareness. Neurodivergence, trauma, language difference, culture, disability, and class experience may shape how correction is received and expressed. The fair question is not whether the applicant performs the culturally preferred response, but whether they can use correction to reduce future burden.

13.3.2 — Staff Dignity Signal

The staff dignity signal asks how the applicant treats people who support, clean, schedule, protect, counsel, record, transport, maintain, review, and administer the institution. Public power often reveals itself in downward behavior. A person may speak beautifully to the public and treat staff as invisible burden carriers. The City must not miss that signal.

Staff are not props in an applicant's formation. They are workers, professionals, and human beings with their own rights, limits, fatigue, privacy, and dignity. Any entry process that makes staff burden invisible reproduces the hidden-power problem it claims to repair. An applicant who cannot honor staff dignity is not ready to carry public burden.

Staff dignity can be tested through ordinary friction. Does the applicant respect schedules? Do they demand exceptions through charm? Do they become impatient when a process protects someone else? Do they ask who will do the labor their idea

requires? Do they clean up after themselves, answer messages responsibly, accept waiting, and notice invisible work?

A staff dignity signal is especially important because applicants may be tempted to perform humility upward and domination downward. They may defer to founders, experts, donors, or senior reviewers while dismissing coordinators, cleaners, security staff, technicians, interpreters, care workers, or administrative personnel. The City should treat that split as a serious warning.

Staff insight belongs in protected channels with fair process. A confidential burden note can identify a concrete pattern without forcing staff to praise an applicant, absorb retaliation risk, or turn discomfort into public allegation. The channel protects both parties by replacing gossip with reasons that can be reviewed, answered, and corrected.

Staff treatment is not a minor etiquette proxy. Research with public-sector employees has linked workplace incivility to reduced satisfaction and psychological well-being, and it shows how low-intensity disrespect can become pervasive while remaining easy for powerful people to dismiss (Cortina et al., 2001). The City's interest is therefore practical. An applicant who interrupts, belittles, bypasses, pressures, or appropriates credit may be creating hidden workload and fear before formal authority begins. Repeated conduct toward coordinators, cleaners, drivers, translators, technical workers, assistants, and care staff can reveal whether the applicant experiences other people as collaborators, obstacles, servants, or scenery.

The signal must still be governed by fair process. One tense interaction should not become a secret character verdict, and staff should not be turned into informal surveillance agents. Reports need protected channels, behavioral specificity, context, opportunity for response, attention to hierarchy, and review for bias. The applicant should know the standard in advance. The value of the signal comes from patterns and repair: whether burdens recur across roles, whether the applicant changes after feedback, whether lower-status workers can speak without retaliation, and whether the City itself created unreasonable conditions. Staff dignity becomes trustworthy evidence only when the institution protects staff and applicant from rumor alike.

Behavioral specificity protects staff and applicant, but it does not eliminate interpretive bias. Directness, eye contact, emotional restraint, speed, deference, humor, and comfort with hierarchy vary across culture, disability, neurotype, trauma, class, and language. Reviewers should separate burden-producing conduct from unfamiliar style, offer the applicant a chance to explain context, and ask whether the institution created the friction. The standard is whether staff were burdened, pressured, bypassed, or denied repair, not whether the applicant performed a preferred etiquette (AERA, APA, and NCME, 2014; EEOC, 2007).

Applicants should know in advance that staff dignity is part of the threshold. Hidden tests create unfairness. The point is not to catch applicants in rudeness, but to teach from the beginning that public service includes how one treats the people who make public service possible.

13.3.3 — Status-Centered Drift

Status-centered drift names a pattern in which the applicant's relationship to the City bends increasingly toward self-display, specialness, admiration, grievance, or narrative control. It is called drift because it may develop gradually. An applicant may begin with sincere service and slowly learn to use visibility as proof of exceptional importance.

The term must be used carefully. The City should not diagnose applicants casually, and it should not use psychological language as a weapon. Status-centered drift is not a public insult. It is a review category for patterns that shift burden from public purpose to personal image. Expert input and due process are necessary whenever clinical or psychological interpretation becomes relevant.

Signs of drift may include contempt for ordinary rules, hunger for symbolic roles, exaggerated injury after mild correction, need to dominate the narrative, inability to share credit, fascination with public reaction, disdain for low-status work, and persistent conversion of institutional burden into personal drama. None of these signs proves unfitness alone. Patterns matter.

The City itself can feed status-centered drift. Constant record, public curiosity, media attention, expert visitors, and the drama of being watched may inflate self-importance. The institution must build humility into routine through ordinary chores, team tasks, staff review, study, public correction, and low-drama service that keep visibility from becoming a mirror.

A fair response to early drift is not immediate condemnation. It may be coaching, de-loading, altered role path, private warning, reflection, or delay. Some people can notice the drift and correct. Others cannot. The City should be patient with correctable vanity and firm against uncorrectable self-sovereignty.

Status-centered drift should trigger pattern review rather than instant expulsion. Early vanity, defensiveness, or self-focus may be correctable, especially in a setting that creates unusual visibility. The City should ask whether the applicant can notice the drift once named and whether support, lower-drama work, or role adjustment changes the pattern.

The archive must not feed status-centered drift. Metrics, summaries, follower counts, media clips, praise bundles, and reputation dashboards should not become status nutrition. Feedback belongs to burden, correction, and public consequence, not personal fascination. This follows from evidence that external rewards can displace more autonomous reasons for service (Anderson et al., 2015; Deci and Ryan, 2000).

13.3.4 — Manipulation Risk

Manipulation risk appears when an applicant can strategically perform the signals the City rewards without internalizing the burden those signals represent. Every selection system teaches applicants what to say. A City built around transparency, correction, service, humility, and burden awareness will attract applicants who can speak that language beautifully. The question is whether the language governs conduct.

Manipulation risk is not the same as intelligence, persuasion,

political skill, or social strategy. Public service requires communication. The risk appears when communication becomes concealment, when self-disclosure is staged to win trust, when correction is performed to end scrutiny, or when the applicant studies safeguards mainly to evade them.

The entry process should treat manipulation as a systems problem, not only a character problem. If the threshold rewards the right autobiographical story, applicants will learn to supply one. If it rewards tearful confession, applicants will become confessional. If it rewards technical mastery, applicants will speak in mechanisms. The threshold must reward patterns over performance and create spaces where inconsistency can be noticed.

Useful safeguards include separated reviewers, delayed decisions, role-specific observations, staff feedback, adversarial questioning, audit trails, appeal, and humility about false positives. One reviewer may be charmed. One instrument may be gamed. One public event may be staged. A pattern across contexts is harder to fabricate, especially when the applicant does not control the audience.

Manipulation risk also includes outside coaching. Parties, donors, families, consultants, social movements, or online communities may prepare applicants to pass the City's threshold for strategic reasons. The applicant may become a carrier of hidden agendas without understanding the full capture risk. The City must ask who has shaped the application before the applicant arrived.

Making immediate rewards modest and duties real can be one

useful filter against applicants seeking only rank, fame, or comfort, but it cannot carry the selection burden by itself. A skilled performer may endure heavy duties for later influence, while a capable applicant may decline because of privacy, care, disability, or family costs.

The pilot should therefore test both sides of selection: manipulation that passes the threshold and capable people the burden excludes. Independent review should rely on observable conduct rather than treating entry, endurance, or withdrawal as proof of motive.

Reliable review combines multiple sources, human judgment, contestability, and an explicit account of uncertainty. A manipulation concern should be framed as a reasoned, reviewable pattern rather than a claim to mystical insight into character. That discipline protects applicants and gives later appeal something concrete to examine.

13.3.5 — Mixed-Motive Interpretation

Mixed-motive interpretation reads applicants without collapsing them into one story. A person may seek service and prestige, repair and authority, belonging and sacrifice, vocation and escape. The file may state that a motive is present, that it became louder under a defined pressure, or that a boundary reduced its risk. It may not claim that an early conversation uncovered the person's final truth.

Purity reading searches for one real motive and then sorts the applicant as noble or corrupt. Burden routing is more exact. It follows how motives distribute work, risk, attention, dependency,

status, and consequence across time, relationships, staff, family, record, office, and public. Mixed motives become safer only when those routes remain observable, contestable, and revisable.

Protected reflection may ask what attracts the applicant, what they hope the City will give them, what image of themselves is involved, what they fear losing, and which burdens they may try to avoid. The applicant's answer is evidence about stated meaning at that moment, not a confession of hidden essence. The purpose is clearer consent and safer formation, not emotional extraction or a performance of moral purity.

Reviewers should distinguish motive from capacity. A person may have an imperfect motive and strong correction capacity. Another may have a noble motive and poor load tolerance. Another may be safe for local public-service formation but not for high executive burden. Mixed-motive interpretation supports role pathway matching rather than binary acceptance.

Documentation of motives must be handled carefully. Motive notes can become damaging if released, leaked, misread, or converted into character files. Applicant privacy and data limits apply here with special force. The City may need internal records for process integrity, but it should avoid permanent psychological dossiers based on early self-exploration.

The mature standard is disciplined charity rather than purity or suspicion. Applicants are complex; the institution asks what that complexity does under burden and whether conduct changes under support, correction, ordinary work, and loss of status. Formation remains possible without pretending anyone arrives

complete.

A practical sequence is Motive, Burden, Affected People, Risk, Support, Boundary, Expiry, and Review. For each apparent motive, reviewers ask what burden it may reduce, what burden it may shift, who could carry the consequence, what support changes the pattern, what boundary is needed, and what later evidence would revise the interpretation (Gilliland, 1993; Colquitt et al., 2001).

Consider an applicant who interrupts a service worker, apologizes, changes turn-taking, and invites renewed correction. Reviewers may see entitlement, stress, or repair. The record preserves conduct, conditions, interpretation, and correction; its conclusion concerns the pathway, not identity.

Interpretations expire unless later evidence renews them. One interview, simulation, or stressful week cannot become a permanent trait. The file records the review date, contrary evidence, and any institutional contribution, preventing tentative concern from hardening into reputation.

13.4 — Why Perfect Motives Are Not Required

If the City required perfect motives, it would fail before the first applicant arrived. No one approaches public power with entirely clean desire. The wish to serve can mingle with pride. The wish to repair harm can mingle with anger. The wish to answer calling can mingle with specialness. The wish to be trusted can mingle with fear. Human complexity is not a defect in the applicant pool. It is the condition under which all public institutions operate (Fleeson and Jayawickreme, 2015; Mischel and Shoda, 1995).

The City's task is not to find morally pure people and elevate them. That fantasy has damaged public life before. It produces saint narratives, purity theater, hidden shame, cults of personality, and systems that punish honesty. A person who has learned to narrate purity may be less safe than a person who can name their mixed motives without collapsing.

Perfect motives are also impossible to verify. Any process that claims to detect purity is likely detecting performance, class fluency, emotional style, ideological fit, or reviewer preference. The more sacred the language of purity becomes, the more applicants will learn to imitate it. A City that rewards false saintliness creates the very opacity it was built to resist.

The better question is whether this person can carry public burden with reviewable honesty, support, and correction. That standard is demanding without requiring a stainless inner life. It asks for patterns that reduce hidden burden rather than amplify it, and for an institution able to revise its interpretation when the evidence changes.

A sharp public-risk boundary lies here. Critics may fear a caste of superior future rulers, while supporters may be tempted to describe participants as unusually virtuous. Both readings fail. Acceptance is a role-bound threshold under review, not proof of worth, holiness, trustworthiness, courage, or destiny.

The practical consequence is mercy without softness. Applicants can be flawed and still continue. They can be delayed without humiliation. They can be redirected without stigma. They can be refused without being declared bad people. They can be accepted without being declared better people. That distinction keeps the City from becoming a moral sorting machine.

13.4.1 — Purity Theater Risk

Purity theater begins when applicants learn that the safest way to enter an institution is to perform a morally acceptable self. They do not lie crudely. They learn the emotional grammar. They speak of service, humility, burden, community, care, and sacrifice in the right sequence. The institution mistakes fluency for formation.

The City is especially vulnerable to purity theater because its language is morally intense. Transparent Vow, Total Record, burden, fairness, public power, correction, and civic service can all become dramatic self-presentation. An applicant may present themselves as already the kind of person the City hopes to form. That is precisely why the City must not reward purity performance.

Purity theater shifts burden onto honest applicants. A person who admits vanity, fear, status desire, unresolved wound, family pressure, or uncertainty may appear less ready than a person who

conceals the same things behind polished service language. The process then punishes truth and rewards image management. That is a direct violation of the City's own purpose.

The antidote is to make mixed motives normal in the process. Applicants should not feel that naming prestige, fear, anger, or desire for recognition automatically disqualifies them. They should understand that the real question is how those motives will be governed. When truth is not fatal, performance loses some of its advantage.

Reviewers also need training against purity preference. Many people are drawn to applicants who resemble their moral ideal. They may prefer the calm voice, the elite service resume, the trauma story told with restraint, the spiritual vocation, or the self-effacing reformer. The City must ask whether those preferences are evidence-based or merely aesthetic.

Purity theater can be reduced through time. First impressions are where theater thrives. Patterns over days, weeks, work blocks, correction events, staff interactions, and unglamorous duties reveal more. The City should slow enough to let performance tire and real burden patterns appear.

Threshold design must avoid purity scripts for future applicants. If the threshold overpraises the ideal applicant, real applicants will imitate the ideal. Virtues should therefore be described as burden practices, not as aesthetic traits to perform.

13.4.2 — Human Complexity

Human complexity is the ordinary condition of entry. The applicant is not one motive, one trait, one wound, one virtue, one

risk, or one future. They are a moving person with memory, body, family, desire, class location, culture, fear, hope, fatigue, imagination, and blind spots. A fair threshold begins by accepting that complexity.

Complexity does not mean anything goes. It means evaluation must be precise enough to ask which complexity matters for which burden. A fear that can be supported may not block entry. A status desire that can be acknowledged may be manageable. A wound that needs care may require delay. A manipulative pattern may require refusal. Complexity increases the need for disciplined review rather than eliminating judgment.

Review must resist flattening applicants into diagnostic or moral labels. Labels may be useful in expert contexts, but public-power formation requires role-specific interpretation. The question is not, what kind of person is this in total? The question is, what burden would this applicant carry or shift inside this role, under these conditions, with these supports and safeguards (Gilliland, 1993; Hausknecht et al., 2004)?

Human complexity also includes unequal starting positions. Applicants arrive with different educations, accents, disabilities, family histories, trauma exposure, social networks, financial reserves, legal risks, and cultural expectations around authority. A fair threshold must not mistake privilege-trained ease for readiness or hardship-shaped guardedness for unfitness.

The City can honor complexity by using multiple forms of evidence. Narrative, observation, role simulation, staff feedback, structured reflection, expert review, legal eligibility, relational

consultation, and applicant self-understanding all matter. No single channel should become sovereign. A person is not reducible to a test, interview, biography, record, or recommendation.

Complexity also requires humility about change. People can mature. People can deteriorate. People can be safer in one role than another. People can be too burdened now and ready later. The threshold should preserve delay, redirection, and return because human beings do not arrive at one permanent civic status.

Complexity also means that the City should document uncertainty honestly. A decision can be justified without pretending to know everything. The more severe the role burden, the more important it becomes to say what is known, what is inferred, what is unknown, and what would trigger review.

13.4.3 — Formation Over First Impression

Formation over first impression means the City should value how a person changes inside structured burden more than how they appear at the doorway. First impressions reward performance, polish, social confidence, class familiarity, and emotional control. Public power requires something deeper: the capacity to be formed by truth.

This principle is crucial because the applicant may arrive overprepared or underprepared. The overprepared applicant may know the language, the risks, the expected humility, and the right theory references. The underprepared applicant may be awkward, suspicious, emotionally intense, or unfamiliar with elite review

settings. Neither first impression should decide the person's civic future.

Formation is visible in response over time. Does the applicant become more truthful after learning the standards? Do they integrate correction? Do they notice staff burden? Do they respect applicant privacy for others? Do they stop seeking shortcuts? Do they become less theatrical? Do they ask better burden questions? These movements matter more than the initial shine.

Threshold governance must design actual formative intervals, not merely claim to value them. There should be protected learning windows, reflection tasks, role exposure, moderated contact, support review, and chances to revise. An institution that says it values formation but makes decisions immediately is still governed by first impression.

The principle has limits. Some risks cannot be postponed into formation. Clear coercion, serious deception, hostile capture, active danger, or inability to consent may require refusal or delay before any formative process. Formation is not an excuse to expose staff or participants to avoidable harm.

The design implication is to prefer evidence that resembles the actual burden. Structured interviews, work samples, simulations, and realistic previews can be tied to defined requirements more clearly than free-form impression, but even these methods require validation, accessibility, and attention to adverse impact (AERA, APA, and NCME, 2014; EEOC, 2007; SIOP, 2018). For the City, a formation task should not ask which applicant looks most statesmanlike. It should ask how the person handles a conflict of

evidence, a staff correction, an accessibility constraint, a privacy boundary, an unpopular maintenance choice, or an affected person's refusal. The task becomes informative because its relation to the civic burden is visible.

Formation evidence must also remain role-bounded. A person may learn quickly in deliberation and slowly in public communication, or show strong technical judgment while needing more relational support. The City should resist converting uneven performance into a global rank. Instead, it can ask what pathway, pace, supervision, and support make responsible growth possible. This permits serious differentiation without claiming that one applicant is a better human being. It also makes the institution's own teaching accountable. When many applicants fail the same task, the question is not only who lacks capacity. It is whether the instruction, environment, or criterion is poorly designed.

Formation over first impression also audits the City's image of a plausible leader. Reviewers may unconsciously prefer elite vocabulary, familiar accents, rapid confidence, uninterrupted careers, or institutional ease. An applicant from outside those pipelines may need time to learn local procedure without lacking judgment, while a polished applicant may merely know the performance. The City should compare growth under explicit teaching, accommodation, and repeated burden rather than reward prior access to the grammar of power (Fox and Lawless, 2014; Gilliland, 1993).

13.4.4 — Correction Over Flawlessness

Correction over flawlessness is the operational sibling of formation over first impression. The City does not need applicants who never err. It needs applicants who can discover error without collapsing into denial, self-hatred, revenge, or performance. Public life will expose mistakes. The question is whether mistakes can become repair.

Flawlessness is often a classed and staged appearance. Some people have been trained to speak without visible hesitation, hide confusion, manage emotion, and present achievement as natural. Others have not. If the City rewards flawlessness, it may reward concealment and privilege rather than civic readiness (Tyler, 2006; Colquitt et al., 2001).

Correction over flawlessness also protects the archive from becoming a punishment machine. If every visible error becomes permanent humiliation, participants will learn to perform safety rather than risk learning. The City must make correction real and consequential without making correction annihilating. Otherwise transparency will create fear, not formation.

Evaluation should follow the repair pattern. When they harm, do they notice affected persons? When they misunderstand, do they seek context? When they overreach, do they adjust future behavior? When they receive a rule, do they test it for loopholes or learn its purpose? Repair is the evidence that correction has entered the person's practice.

Correction over flawlessness requires the City to keep records of correction carefully. Internal correction notes should support

formation, not become gossip, stigma, or public entertainment. The record should distinguish allegation, finding, response, remedy, appeal, and unresolved dispute. Otherwise correction data can become its own unfair burden.

This standard should be built into public communication before the first participant is known. The public must understand that visible formation will show error. If the public expects flawless records, participants will be punished for the very visibility the City requires. The City should teach correctability as the public virtue, not spotless presentation.

Correction over flawlessness also gives reviewers a humane standard for delay. A person who can repair may need time, support, or a different pathway rather than refusal. The decision should ask what future burden is likely after correction, not whether the applicant's past contains a flaw.

13.4.5 — No Moral Sorting

No moral sorting means that each admissions decision remains a bounded judgment about role fit, public-risk burden, consent, supportability, and present readiness. Acceptance creates an opportunity for formation, not superior status. Delay protects time for repair or institutional readiness; redirection recognizes a different route; refusal protects a boundary that cannot presently be carried. None of these outcomes measures the value of a life, the worth of citizenship, or the depth of a person's possible contribution elsewhere.

No moral sorting also protects applicants inside the process. A person under review may feel that delay means they are defective.

They may fear that refusal will shame their family, supporters, community, or previous public image. The City must design outcome language that names the decision without assigning worth. Not this role, not now, or not safely are not moral condemnations.

The rule also protects reviewers from inflated authority. Reviewers are not judges of human value. They are stewards of a threshold. Their task is grave enough without pretending to see the whole person. This humility should shape records, meetings, letters, appeals, and public explanation where any explanation is lawful.

Public artifacts follow the same rule. Charts, diagrams, summaries, videos, and donor language describe role participation under burden rather than a search for superior people. Communication that presents acceptance as moral elevation would distort the threshold before any applicant enters, so each artifact should preserve the no-ranking rule, the dignity of nonentry, and the limited meaning of an admissions decision.

No moral sorting should appear in admissions artifacts, whether letters, forms, summaries, public explanations, internal dashboards, or donor reports. Language such as top applicants, highest-value candidates, civic excellence rank, or trust tier would convert a bounded decision into a verdict on the person. The City should speak in role fit, readiness, support, risk, and review status, using only constructs tied to a declared decision purpose and supported for that use (AERA, APA, and NCME, 2014; SIOP, 2018; Colquitt et al., 2001).

Applicants need a route to challenge language that feels stigmatizing. An admissions decision can be substantively justified and still written in a way that harms dignity. Correction and right of reply begin before public record because institutional language itself can carry burden.

Institutional culture can manufacture the purity it claims not to require. Recruitment copy, orientation speeches, ceremonies, staff praise, donor language, and media access teach applicants which story earns welcome. Periodic audit should compare the City's stated neutrality with the narratives applicants feel pressured to perform. If complexity disappears from applications, the likely explanation is not that humanity improved; it is that the gate taught people to hide.

Reviewers should also protect the honesty premium. An applicant who admits mixed motives, uncertainty, fear, or a need for support should not be disadvantaged merely because another applicant performs certainty. The relevant comparison is not whose story sounds cleaner, but who can participate in a process of evidence, correction, and change. When candid complexity is punished, the City selects for concealment. When candor is protected without excusing harmful conduct, the threshold becomes both more humane and more informative.

13.5 — Voluntary Entry as Civic Threshold

Voluntary entry is the hinge that keeps the City from becoming coercive. The Transparent City asks severe things of active participants: visibility, record, study, correction, role review, and loss of many hidden exemptions. Such a burden can only be legitimate if entry is adult, informed, noncoerced, reviewable, and protected by real refusal (Council of Europe, 1997; CIOMS, 2016).

Consent is not a magic word. Institutions often use consent to move burden onto the person signing. They say, you agreed, and then treat agreement as permission for every later exposure. The City must be better than that. Consent to consider the City is not consent to enter. Consent to apply is not consent to active record. Consent to train is not consent to public release. Consent must be staged.

The threshold is civic because it concerns public power. It is not ordinary lifestyle choice, self-help practice, religious vow, entertainment participation, elite school admission, or employment contract alone. It is a decision to enter a formation environment designed around possible public authority. That gives the institution stronger duties than ordinary recruitment would carry.

Voluntariness also requires attention to social pressure. A person can be pressured without a weapon. Family ambition, party strategy, donor interest, economic desperation, religious expectation, online fandom, activist urgency, personal crisis, or fear of missing history can all compress choice. The City must

ask whether the applicant can refuse without losing shelter, status, money, belonging, safety, or dignity.

The City does not own the complete legal architecture of consent. Its narrower responsibility is to make entry free enough to matter through plain information, independent advice, time, support, alternatives, refusal, and correction, while returning legal form to *The Constitution of Fairness*, public administration to *The Government of Fairness*, and rollout gates to *The Transition of Fairness*.

The applicant's freedom to refuse is not a weakness in the City. It is the condition that keeps the Vow meaningful. A vow without nonentry is possession. A threshold without refusal is a trap. A fair City must be able to lose applicants without punishing them for remaining private.

13.5.1 — Adult Status

Adult status is nonnegotiable for entry into the Transparent City. The City is a severe public-power formation institution. It is not a school for children, a youth leadership camp, a family tradition, a movement rite, or an inheritance pathway. Minors do not enter the Vow, and dependents do not inherit it through proximity.

This rule protects children and adolescents from adult ambition. Families, communities, parties, movements, media, and donors may be tempted to identify gifted young people early and narrate their future public role. The City must refuse that romance. Childhood is not a preparation dossier for later transparency. *The Life of Fairness* establishes the stronger claim: a child's privacy and development are not raw material for an adult institution.

Adult status remains a lawful threshold rather than an institutional invention. Host-jurisdiction rules governing age and capacity provide the starting point, with constitutional and safeguarding review where ambiguity exists. The City adapts its pathway to those standards instead of redefining adulthood to fit institutional demand.

Near-adults require protection from premature public mythology. A young adult may be legally eligible but still shaped by family pressure, economic dependence, educational leverage, political grooming, or online fame. Adult status is the floor, not the whole consent analysis. Freedom from coercion and reviewable consent remain necessary.

Young people remain central to the City's purpose because public power shapes childhood without children's consent. That fact strengthens their protection. Adults may prepare to serve children, but children are not recruited into adult exposure, displayed as evidence of family virtue, or used to justify an applicant's pathway.

The practical rule is simple: no minors, no inherited participation, no public grooming pipeline, no family-assigned destiny. Public-power formation begins only after lawful adult status and only after the person themselves can understand and refuse the burden.

The City may educate the public about public-power formation, but education is not recruitment. Youth-facing civic education, if ever created, must remain outside the Vow and should be governed by child privacy, non-performance, and ordinary-life protection.

13.5.2 — Informed Consent

Informed consent requires understanding, not merely disclosure. A document can list risks while leaving the applicant unable to imagine them. The City must therefore explain the Vow, record stages, access classes, protected nonvisibility, pause, refusal, possible office interfaces, staff roles, public exposure, family effects, and unresolved design questions in language the applicant can actually use.

Before consenting, applicants must understand the difference between capture and public release, active record and public bundle, internal review and public interpretation, applicant privacy and participant visibility, lawful shielding and off-record life, role burden and human worth. These distinctions are not technical ornament. They determine what the applicant is choosing.

Informed consent should be staged over time. First inquiry should receive a plain-language orientation. A formal application should receive deeper explanation. Pre-activation review should require renewed understanding after simulations, support review, household consultation, and role matching. A person may consent differently after the burden becomes concrete (Beauchamp and Childress, 2019; Manson and O'Neill, 2007).

Persuasion is not consent. Orientation materials should not be written like recruitment copy. They should not promise transformation, historic significance, moral elevation, career access, spiritual meaning, or public admiration. They should state

burden, limits, protections, alternatives, uncertainties, and refusal rights with beauty and seriousness, not salesmanship.

Comprehension should be checked without humiliating the applicant. The applicant may summarize what they understand, ask questions, receive corrections, and repeat later. Language access, disability accommodation, literacy support, non-digital access, legal consultation, and independent counsel where needed are part of the consent burden carried by the City.

Consent should be treated as a sequence of understanding, deliberation, and choice rather than a transfer of information. Shared decision-making models are useful here because they distinguish awareness that a choice exists, exploration of options, and a decision that reflects the person's circumstances and preferences (Elwyn et al., 2012; Elwyn et al., 2017). The City can adapt that architecture without medicalizing entry. It should first make clear that application, delay, redirection, refusal, and ordinary nonparticipation are legitimate options. It should then compare burdens and supports. Only after that comparison should it ask for a decision at the current stage.

Comprehension checks evaluate the quality of the City's explanation as much as the applicant's understanding. Teach-back can reveal that language, format, translation, timing, or accommodation needs improvement. When misunderstanding concerns record release, family exposure, support terms, or pause rights, the institution should revise the explanation and record what made the terms clear. This makes consent quality a City performance obligation and prevents literacy, disability, language

background, anxiety, or unfamiliarity with institutional vocabulary from being misread as lack of civic seriousness.

The entry process should also test consent under quiet conditions. A person who says yes in a ceremonial room, with supporters watching, may not be as free as a person answering privately after rest and independent consultation. Consent should be heard away from applause.

13.5.3 — Freedom From Coercion

Freedom from coercion means the applicant's entry is not produced by threat, dependency, manipulation, emergency, debt pressure, family pressure, political pressure, religious pressure, employer pressure, donor pressure, public shame, or crisis compression. The City must look for coercion even when the applicant says yes.

Coercion can be obvious, such as threats, blackmail, or conditional support. More often it is soft. A party tells the applicant this is their only path to relevance. A family says sacrifice is expected. A donor promises relief if the person applies. A movement says history needs them. A community treats refusal as betrayal. A person in crisis sees entry as the only way to be safe.

Entry becomes coercive when it is the only apparent route out of immediate housing, debt, healthcare, legal, employment, or safety crisis. The threshold therefore identifies urgent support needs before asking for civic commitment. Stabilization later in the Part removes leverage; the first gate begins that work by making nonentry materially possible.

Coercion review must be private and careful. Applicants may not know they are pressured. They may love the people pressuring them. They may fear consequences if they name the pressure. The City needs confidential consultation routes, independent support, and time away from interested parties before major consent stages.

Belonging to a family, party, religion, movement, profession, or community does not by itself establish coercion. Social embeddedness is normal. The question is whether the person can refuse without losing essential support, safety, belonging, or dignity. That question must be asked concretely.

A threshold that protects freedom from coercion is not slower because it lacks conviction. It is slower because the burden is severe. The City must make sure that when a person crosses, they are moving by choice rather than being carried by other people's need.

Threshold governance must also watch its own coercive charisma. A prestigious institution can pressure by invitation alone. The more important the City becomes publicly, the more carefully it must say that refusal is normal, private, and honorable.

13.5.4 — Refusal Right

The refusal right is the applicant's right not to enter. It requires protection against retaliation, exposure, threats, and the withdrawal of essential support as punishment for refusal. Declining may still mean losing the opportunity offered by this pathway. That ordinary consequence must be disclosed and

distinguished from an institutional penalty designed to make refusal unsafe.

Refusal must be protected at every pre-activation stage. A person may refuse after inquiry, application, orientation, simulation, support review, role matching, or immediately before activation. Pause and return add later protections, but the earlier truth is already complete: the door must open outward as well as inward (Committee on the Rights of Persons with Disabilities, 2014; WHO, 2021a).

Applicant-facing practice should create refusal language that is honorable and ordinary. Refusal should not be framed as cowardice, betrayal, unreadiness for moral life, lack of civic seriousness, or failure to serve humanity. Many people should refuse. Ordinary private life is complete. Other forms of service exist. The City is not the path for everyone who cares.

Refusal remains private by default. Stepping back does not create a public story, archive entry, donor disappointment, journalist's lead, or searchable status. Limited internal records may be retained for audit, safety, and appeal under defined access and deletion rules, while public dignity rests on the ordinary privacy of nonentry.

The refusal right also protects the City from false acceptance. If applicants feel trapped, they may comply outwardly while withholding truth, resenting burden, or collapsing later. A real refusal right improves the quality of consent for those who remain. The City becomes stronger by making departure safe.

The refusal right should be operational, not only theoretical. Forms, meetings, orientation materials, and staff scripts should tell applicants exactly how to pause or withdraw, what happens to their data, what support remains available, and whether they can return later. A right that cannot be used calmly is not fully real.

Refusal should also be protected from narrative capture by supporters. If a public supporter says the applicant abandoned the mission, the City should not amplify that frame. Its own language should protect nonentry dignity even when others want drama.

13.5.5 — Reviewable Consent

Reviewable consent means consent remains open to examination over time. The City cannot take one early yes and treat it as permanent authorization for every later burden. Consent must be checked when burden changes, when role pathway changes, when health changes, when household conditions change, when record conditions change, and before activation begins.

Consent should be reconfirmed whenever the burden materially changes. At each major threshold, the applicant receives the new terms, may ask questions or seek independent advice, and can refuse, pause, or withdraw before the next obligation begins.

Reviewable consent also requires independent routes for concern. Staff, clinicians, legal advisers, family consultants, ombuds, and the applicant themselves should have ways to flag coercion, overload, misunderstanding, or changed circumstances. Consent review should not depend entirely on the applicant's ability to speak forcefully at the right time.

Protection against coercion cannot become paternalism. Adults retain the right to make difficult choices. The institutional duty is to verify that the person understands the burden, has practicable alternatives, can seek independent advice, and can refuse without material or reputational punishment. Respect for agency and scrutiny of coercive conditions belong together.

Consent records should be precise and limited. They should document stage, explanation, questions, support offered, rights, refusal routes, and unresolved issues. They should not become a psychological dossier or public confidence score. The record exists to protect the applicant and the institution from coercive drift.

Reviewable consent also requires time. If each stage rushes into the next, review becomes ceremonial. The City should build intervals for sleep, consultation, legal advice, clinical support if needed, family conversation, and private reconsideration. The cost of time is part of the burden the institution must carry (Elwyn et al., 2012; Elwyn et al., 2017).

A final voluntariness audit should test the process rather than grade the applicant. In protected aggregate form, reviewers should examine uninterrupted decision time, whether questions changed proposed terms, whether pause and refusal were used without retaliation, whether support remained available after a no, whether return routes were usable, and whether applicants reported pressure from family, donors, employers, parties, media, or staff. These are measures of institutional freedom, not applicant quality. Repeated pressure at one stage requires redesign even when every consent form is complete.

Privacy after nonentry should be tested through ordinary requests. Can a former applicant obtain their file, correct an error, confirm deletion or sealing, learn who accessed the record, and challenge an improper disclosure without returning to the application process? Can they apply elsewhere without the City quietly transmitting a refusal, concern, or motive interpretation? The answer should be yes unless a narrow lawful duty requires otherwise. A protected exit from application is incomplete if the institution continues to follow the person through hidden data relationships.

13.6 — Applicant Privacy Before Acceptance

Applicant privacy before acceptance protects the person who has not yet entered the City. This is essential because the City's public intensity will make curiosity powerful. People will want to know who is considering entry, who was approached, who refused, who was delayed, who was redirected, and who failed a review. Without strong limits, application itself becomes exposure (European Union, 2016; Nissenbaum, 2010).

The applicant is not yet an active participant under the Transparent Vow. They have not accepted the active record burden. Their inquiry, uncertainty, motive reflection, consent questions, family consultation, health concerns, legal questions, or refusal should not be treated as public material. The City cannot punish consideration by turning it into public memory.

Applicant privacy also protects public legitimacy. If application becomes public too early, outside actors can pressure the applicant, attack them, flatter them, fund them, threaten them, or narrate their motives before the City can protect the process. Premature exposure shifts burden from the institution to the applicant and their household.

The City still needs some internal records. It must prevent fraud, coercion, duplicate applications, conflicts, capture, safety risks, and process abuse. It may need enough data for audit, appeal, legal compliance, and applicant support. But internal need does not equal public release, broad access, model training, donor visibility, media briefing, or permanent dossier formation.

Early applicant handling is therefore divided into inquiry, delayed status, refusal, redirection, and data limits. Each stage has its own purpose, owner, access class, retention rule, correction route, and exit condition. Private dignity remains the default until lawful acceptance and later activation create a different record status.

The guiding standard is narrow necessity. Collect only what the stage requires. Share only with roles that need it. Retain only as long as the purpose justifies. Delete, seal, or minimize when the purpose ends. Never let curiosity become a record reason.

13.6.1 — Inquiry Without Exposure

Inquiry is the earliest and most fragile stage. A person may ask a question, request materials, attend an information session, consult privately, or wonder aloud whether the City is right for them. That act should not begin public exposure. Curiosity is not consent.

Inquiry without exposure protects people who are not ready to be known. A local official, activist, judge, civil servant, journalist, teacher, worker, caregiver, religious leader, or private citizen may have good reasons to ask quietly. Premature exposure could affect employment, family, community standing, safety, or political relationships.

This safeguard also prevents recruitment theater. Inquiries must not be displayed, celebrated, leaked, or used in donor materials as signals of momentum. Minimised aggregate counts may be used privately to audit access and barriers, with safeguards against identification; they must not become proof of public desire, moral legitimacy, or historical inevitability.

Some inquiry channels may require identity checks for safety or integrity, especially if they lead to site visits, protected information, or role-specific consultation. Even then, the data should remain purpose-bound. The person should know what is collected, why, who sees it, how long it is retained, and how to withdraw where lawful.

Inquiry materials should also state that nonentry is honorable. A person should not feel that asking a question has started a journey they are morally expected to complete. The City should normalize inquiry as learning, not commitment. That reduces hidden pressure and improves later consent.

Inquiry systems should be designed with non-digital floors. Some people cannot safely or easily use online forms, searchable accounts, cloud profiles, or platform-linked identities. A fair City should allow protected human contact, written materials, and low-data routes where lawful and practical.

Inquiry data should not be converted into audience metrics. The number of interested people, their locations, occupations, or identities may tempt public communications teams. The City must resist treating private curiosity as proof of legitimacy or as fuel for fundraising.

13.6.2 — Delayed Application Status

Delayed application status occurs when a person has moved beyond inquiry but is not yet accepted, rejected, redirected, or activated. Delay may arise because the applicant needs more time, the City needs more review, documentation is incomplete,

support needs are unresolved, role pathway is uncertain, coercion concerns exist, or unresolved design questions affect the process.

Delay also remains private enough to prevent uncertainty from becoming public suspense. Supporters, critics, media, donors, and parties should not be invited to campaign around an unresolved applicant. Status communication, when necessary, stays minimal and prevents the institution from shifting the social cost of its own timetable onto the person waiting.

A delayed status should have a clear internal reason, review clock, applicant explanation, and appeal or question route where appropriate. Delay without explanation can feel like humiliation or hidden judgment. Delay with excessive disclosure can violate privacy. The balance is internal clarity with external restraint (Solove, 2006; NIST, 2020b).

Delay is a time-bounded status with a named reason, owner, support route, and return condition. It may reflect the City's unreadiness, an unfinished role pathway, incomplete legal or accommodation work, unresolved household burden, or the applicant's need for more time. Used honestly, not yet protects consent and prevents momentum from becoming authority. Its fairness depends on review, expiry, privacy, and the absence of social limbo.

Time does not enlarge the file. Information collected during a pending period remains tied to the unresolved decision, and each additional request needs a named use, retention rule, and explanation to the applicant. Irrelevant material should be deleted,

sealed, or never collected. A slow process earns no broader access to private life (European Union, 2016; NIST, 2020b).

Delayed status should also be protected from institutional drift. An application cannot sit indefinitely because no one wants to decide. If the City delays, it must carry the burden of time: check-ins, support, status updates, review deadlines, and opportunity to pause or withdraw. Administrative silence is a hidden burden on the applicant.

A delayed status should include a burden clock. Who bears the burden of waiting, and what support or explanation reduces it? If the City delays because it lacks capacity, the applicant should not carry the whole cost of institutional unreadiness. Delay must be honest enough to name which burden is being managed.

Powerful outsiders can use delay strategically. Donors, parties, factions, or media cycles may prefer an application to remain pending for narrative reasons. Delay should be governed by applicant safety and process integrity, not by public choreography.

13.6.3 — Refusal Privacy

Refusal privacy protects the person who does not enter. The refusal may come from the applicant, from the City, or from mutual recognition that the threshold is not right. In every case, nonentry should not automatically become public material. The applicant remains a private person.

City-initiated refusal must also be handled with dignity. There may be serious reasons: coercion, deception, unsupported load, role mismatch, security concern, safety risk, inability to consent,

or unresolved legal issues. Even then, the decision is not a public condemnation of the person. Internal records may exist for process integrity, but public labeling should be avoided unless lawful necessity requires some limited statement.

Refusal privacy protects future possibility. A person who refuses now may later serve in another role, apply again, enter ordinary politics, work in public administration, join a community effort, or live privately. A public refusal record could shadow them unfairly. The City should not create a lifelong burden from a threshold decision.

The public may have legitimate questions if a prominent figure's application was publicly known through other channels. Even then, the City should use minimal, dignity-preserving language. It can say process has ended or no active status exists without disclosing motives, health, family considerations, review details, or internal concerns unless law or safety demands more.

Refusal privacy coexists with specific safety and legal duties. Misconduct that independently requires reporting, protective warning, or lawful action follows the relevant process, with scope, review, and reasons recorded. That narrow exception does not convert ordinary nonentry into public exposure.

Refusal privacy should include breach response. If an applicant's refusal leaks, the City should have a route for correction, takedown requests where lawful, public noncomment discipline, support to the applicant, and internal review of how the exposure occurred. Privacy is not only a rule before breach. It is a repair obligation after breach.

This privacy also protects the public from misleading speculation. A refusal may have many reasons. Public narratives will tend to invent cowardice, scandal, elite rejection, ideological split, or hidden disqualification. The City should not feed that appetite.

13.6.4 — Redirection Privacy

Redirection occurs when the City determines that another path may better fit the person’s gifts, burdens, timing, or consent. The applicant might be directed toward ordinary public service, education, local government, technical work, community leadership, civic project work, private life, clinical support, legal help, or later reconsideration. Redirection is not failure.

Redirection privacy matters because alternative paths can reveal sensitive information. A recommendation for delay, clinical support, debt stabilization, family consultation, role change, or non-City service may expose private burdens if mishandled. The applicant should not have to carry a public explanation for why the City suggested another route. Purpose limitation, minimization, and role-based access should govern the redirection record as strictly as the original application (OECD, 2013; European Union, 2016; NIST, 2020b).

Redirection should be framed as fit and timing rather than rank. Saying “this path is not the best fit now” differs from saying “you are not serious enough”; saying “another role may carry the burden better” differs from saying “you are lesser.” Language matters because institutional wording can become inner shame.

Redirection should be useful, not dismissive. If the City suggests another path, it should provide enough information to make the

path real where appropriate: who to contact, what supports exist, what records are transferred if any, what consent is required, what data stays behind, and whether return is possible. A vague redirection can feel like polite rejection.

Data transfer during redirection requires strict consent and purpose. The City should not send applicant files to another institution, movement, employer, religious body, political actor, or service path without lawful basis and clear permission. Redirection is not a backdoor to cross-architecture dossier formation.

Redirection should be recorded as a pathway decision rather than as a deficiency label. The file should say what burden or fit issue made another path better, what options were offered, what the applicant chose to share, and what data may travel. It should not become a permanent mark of civic inadequacy.

Redirection can be an act of institutional humility: a recognition that another form of public service may fit the person and the community better. The option should be real, resourced, and freely refused, not a polished way to subordinate the applicant. An institution that can redirect without assigning a lower civic rank is less likely to imagine itself as the master route into public life.

13.6.5 — Applicant Data Limits

Applicant data limits are necessary because the City will be tempted to know too much too early. Motive reflection, identity, role interest, family context, financial strain, support needs, political history, references, and security review can all appear

useful. Without stage limits, application becomes a dossier before participation begins.

Separation controls begin before acceptance. Applicant data remains distinct from public record sites, donor databases, research files, Religion of Fairness records, public-voting systems, media lists, vendor analytics, model-training corpora, and future government files. Considering a public burden should not make a person more searchable elsewhere, and the No Cross-Architecture Dossier rule gives that protection a concrete institutional form.

Minimization still permits accountable records. The City must audit decisions, correct error, investigate misconduct, protect applicants, and answer lawful review. Each data field therefore carries a purpose, decision use, access class, retention period, correction route, deletion or sealing rule, and a prohibition on unrelated inference.

Data limits also protect application workers. Staff need access permissions, audit logs, conflict rules, breach routes, and authority to refuse improper requests from donors, parties, officials, researchers, vendors, or public-relations teams. Privacy cannot depend on a junior worker absorbing pressure alone.

Independent data audit belongs with people who are not rewarded for institutional growth. Privacy reviewers, civil-liberties advisers, security specialists, accessibility experts, and applicant advocates should be able to ask why a field exists and whether it can be deleted, sealed, summarized, or never collected (Council of Europe, 1997; CIOMS, 2016).

Purpose limitation should be visible at field level through a data card readable by both applicant and auditor. Each item should name the field, purpose, stage, owner, lawful or voluntary basis, permitted access, decision use, prohibited uses, retention, derivative systems, correction or challenge route, and deletion proof. Collection does not authorize indefinite reuse; the card turns minimization into an inspectable decision about each item (European Union, 2016; Nissenbaum, 2010).

Retention discipline is designed before the first application. Verification may need a short audit window, complaints a longer lawful period, and exploratory material rapid deletion or sealing. Access is logged without a public trace, identity stays separate from aggregate analysis, and records cannot migrate silently into later selection or prediction systems. Fields that never influence a lawful decision or remedy should become candidates for removal at the next scheduled review.

The City can publish what applicant-data categories exist, why they exist, who may access them, their retention windows, breach duties, and aggregate deletion performance without publishing a file. That makes restraint auditable while inquiry remains private and lets applicants challenge systemic overcollection without revealing why they applied or how the case ended (European Union, 2016; Nissenbaum, 2010). Deletion verification should include backups and authorized downstream copies rather than treating removal from the primary file as complete.

A cycle-end privacy review can examine the gate without reopening individual lives. Aggregate counts of fields, access events, extensions, corrections, breaches, appeals, deletions, and

disparate burdens show which data changed decisions and which can be removed. Independent reviewers can then test whether restraint survived institutional curiosity while preserving applicant anonymity and the dignity of refusal (European Union, 2016; NIST, 2020b; ISO, 2020a). Aggregate reporting should identify categories removed or narrowed so minimization produces visible institutional learning without exposing individual applicants.

Chapter 14 — Application, Support, and Role Pathways

A hypothetical applicant enters the review room expecting to be judged as a whole person. Instead, the first page names the pathway, burden, support, evidence, decision owner, review date, and inferences that are forbidden. That difference is institutional rather than cosmetic: the City evaluates a defined relationship among person, role, and conditions instead of claiming to discover civic worth.

Every institution that guards a threshold reveals what it believes judgment is for. A weak gate rewards polish, pedigree, familiarity, or public excitement. A frightened gate treats difference as danger. A romantic gate mistakes desire to serve for readiness to carry consequence. The City needs a more exact form of judgment: one that opens real paths into public-power formation while naming, supporting, and reviewing the burdens attached to each path.

Chapter 13 established that applicants arrive with mixed motives rather than purified hearts. Service may coexist with ambition, injury with calling, fear with courage, and prestige hunger with genuine public concern. Screening begins from that human realism. It does not search for an immaculate interior person. It asks whether a particular adult can enter a particular pathway, under stated conditions, with a fair chance to learn, remain safe, resist capture, and leave without stigma.

The threshold is a bundle of distinct decisions, not one judgment on a person. Identity verification, lawful eligibility, consent, support, functional capacity, accommodation, security, manipulation risk, pathway matching, local legitimacy, and any ratified public input answer different questions. Each needs its

own construct, owner, evidence limit, uncertainty statement, review clock, and appeal. Collapsing the lanes lets an impression in one domain become a verdict in every other domain (AERA, APA, and NCME, 2014; SIOP, 2018).

A well-designed gate broadens civic possibility while making consequence answerable. It reaches beyond inherited networks, matches preparation to real public burdens, identifies support before strain becomes crisis, and gives the institution honest ways to accept, delay, redirect, or refuse. The same architecture tells applicants what the City owes them. Evaluation authority must be at least as inspectable as the people it affects.

Every consequential inference begins with its intended use. Reviewers state what they are trying to know, why that question belongs to the pathway, and which decision it may influence before evidence is collected. The file then identifies allowed sources, prohibited inferences, assessor qualifications, conflicts, foreseeable false positives and false negatives, applicant access, correction rights, expiry, and reconsideration. That grammar turns judgment into something a person can inspect and challenge.

Assessment and recruitment standards contribute disciplined process without supplying a universal City code. The Standards for Educational and Psychological Testing, SIOP validation principles, ISO 10667:2020, and ISO 30405:2023 emphasize declared purpose, competent administration, intended-use evidence, candidate experience, responsible stakeholders, review, and learning. Fair-recruitment guidance adds transparency, non-discrimination, freedom from coercion, and protection against applicant-paid access costs. The City adopts those habits while

keeping admission distinct from employment, licensure, diagnosis, or election (AERA, APA, and NCME, 2014; SIOP, 2018; ISO, 2020a; ISO, 2023b; ILO, 2019a).

Jurisdiction therefore matters. Local law may govern equality, privacy, data protection, disability accommodation, labor status, background review, medical information, political participation, and appeal in very different ways. The architecture here is a candidate design, not enacted law. Qualified legal, psychological, security, disability, and public-administration review must translate it before any real threshold opens.

Identity and eligibility review begins with purpose limitation. The City needs enough verified information to support adult consent, lawful process, emergency responsibility, and later record integrity. It does not need a total account of family, migration, health, belief, association, or private history. Each requested fact must answer a declared threshold question, and the less intrusive reliable route is preferred.

Psychological expertise strengthens the threshold when it answers narrow questions about comprehension, foreseeable load, immediate safety, support, accommodation, or a temporary contraindication. It cannot reveal virtue, loyalty, courage, honesty, ideology, office fitness, or political value. Diagnosis, treatment history, unusual affect, and interview confidence require contextual interpretation rather than character inference. Support-first mental-health guidance also explains why applicants may conceal needs when disclosure is likely to bring discrimination or adverse use (World Health Organization, 2022a).

Disability and neurodivergence sharpen the duty to distinguish essential demands from inherited habits. Exclusion may be produced by the environment, inaccessible tools, schedule, communication norms, or denial of accommodation rather than by impairment alone. The process must examine what the City can change before attributing the barrier to the applicant (United Nations, 2006; EEOC, 2023; U.S. Department of Justice, 2022).

Role pathways prevent screening from becoming one prestige ladder. Municipal service, legislation, executive administration, adjudication, diplomacy, and technical public work demand different preparation, pace, judgment, confidentiality, communication, and recovery. Matching is provisional and reversible. A pathway is a route of formation, not a caste or a private title to office.

Security review also needs a defined object. Relevant concerns are conduct, access, deception, coercion, sabotage, material conflict, concealed obligation, and dependencies capable of steering formation. Belief, religion, nationality, race, class, dissent, disability, family form, or social unconventionality are not proxies for risk. Security becomes legitimate only when the behavior, source, uncertainty, owner, mitigation, and challenge route can be named.

Broad discovery and local legitimacy must be held together rather than traded against each other. The City should search beyond elite schools, donor circles, dominant languages, and established parties. Global reach still cannot erase host law, democratic authority, regional knowledge, language access, or the accountable relation required for a particular public role.

Discovery expands possibility; it does not appoint outsiders over a place.

Public input enters only as a bounded candidate mechanism where lawfully ratified. It may surface local knowledge, conflict, or practical concern that a closed panel missed. It may also become a popularity contest, harassment channel, or portable reputation score. Any future mechanism must therefore answer precise questions about authority, scope, access, moderation, review, and remedy while leaving authorization and weighting open. A public-input pilot should therefore publish its decision rule before receiving responses, so participants know what the input can actually change.

Artificial Intelligence may assist forms, scheduling, translation, document routing, accessibility, and audit logs inside a disclosed human workflow. Personality, emotion, credibility, mental state, pathway, and refusal decisions remain outside machine authority. Under the current consolidated EU AI Act, many employment and selection systems are high risk, while workplace emotion inference is generally prohibited outside medical or safety purposes; the exact legal classification of any City tool would still depend on jurisdiction and use. The City adopts a stricter institutional rule: named people disclose the tool and data, explain the evidence, receive challenges, correct errors, and remain responsible for the outcome (European Union, 2024; NIST, 2023a; SIOP, 2023; EEOC, 2023). Every automated aid should have a named fallback process that remains usable when the tool is unavailable, challenged, or withdrawn.

The gate ultimately returns one of four bounded outcomes: acceptance, delay, redirection, or refusal. Each is limited to this pathway, time, evidence, and support environment. Acceptance creates no civic rank or presumption of office. Delay receives a reason and review date. Redirection names a usable alternative without creating a lesser class. Refusal is narrow, private, appealable, and open to reconsideration when conditions change. The decision record should also identify the evidence that could reopen the outcome, preventing temporary judgments from hardening into permanent labels.

14.1 — Identity Verification and Eligibility

Verification gives the threshold an accountable administrative foundation. The City needs sufficient confidence that an adult is applying under a real identity, for a legally possible pathway, without material deception. Purpose limitation prevents that foundation from expanding into a total biography. Each fact answers a specific eligibility or integrity question, and reviewers use a less burdensome reliable route whenever one is available (ISO, 2020a; SIOP, 2018).

The verification record should separate identity, jurisdictional fit, background integrity, data minimization, and correction. Identity asks who is applying. Jurisdictional fit asks whether the proposed pathway has a lawful setting. Background integrity asks whether relevant representations are materially candid. Data minimization asks what may be collected and retained. Appeal asks how institutional error is repaired. A concern in one category cannot silently become an adverse conclusion in another.

Evidence must be proportionate to the consequence and accessible to people whose lives do not fit a single documentary norm. Official records may be appropriate for some facts, while sworn explanations, corroborating evidence, protected attestations, or qualified legal review may be needed when documents are missing, inconsistent, unsafe to obtain, or shaped by migration, adoption, displacement, disability, family change, or state error. Administrative difficulty is not the same as deception.

ISO 10667:2020 and professional selection standards offer a useful procedural lesson: the client, assessor, purpose, method, information flow, competence, and feedback route should be defined before assessment begins. The City's version adds a public-power burden test. A named human owner must be able to explain why each item was requested, who may see it, how uncertainty was handled, and what changes if the record proves wrong.

14.1.1 — Adult Identity

Adult status should also protect the meaning of future public consent. The City cannot accept a person into severe visibility because adults around them imagine that early exposure will produce greatness. Childhood, adolescence, dependency, and family ambition belong under the strongest shield. An adult-only threshold is not merely a legal precaution; it is the City refusing to harvest a young life before the person can own the decision. A careful adult-identity rule also protects later children and dependents. If the City verifies adulthood at the threshold and then limits the record, it has less reason to reach backward into family documents, school records, birth histories, or guardian narratives. The first adult safeguard is therefore also a family safeguard.

The admissions reviewer should also ask whether the identity proof can be summarized without retaining the proof itself. A verified-status note, protected by audit, may serve future process better than a copied document bundle. The City should prefer status, provenance, and correction route over hoarding sensitive identity artifacts. Adult identity is nonnegotiable because the

Transparent Vow is an adult civic burden. No minor may carry it, no dependent child may be drawn into it by proximity, and no institution may convert a family's hope, party ambition, donor excitement, or public fascination into early exposure of a young person. The City begins by making adulthood a status condition, not a flexible aspiration.

The construct here is narrow: legal adulthood and identity continuity for this application. Allowed evidence may include reliable identity documents, protected attestations, or accessible alternatives when ordinary documentation is unavailable or unsafe, but it may not be used to infer citizenship worth, social conformity, family legitimacy, or ideological belonging. A trained human verifier must record uncertainty, distinguish mismatch from deception, and explain any adverse conclusion. The process needs accommodation, secure correction, independent appeal, and an audit of whether documentation rules impose unequal burdens. Software may flag a missing field; it may not decide that a complicated identity is suspicious.

Adult identity must be reliable enough for consent, rights, appeal, emergency responsibility, pathway review, record status, and later public accountability. Reliability does not require a narrow cultural model of personhood. Names change, documents vary across jurisdictions, and applicants may carry migration, adoption, protective-name, family-estrangement, gender-transition, displacement, or incomplete-record histories. A fair process combines firm attribution with alternative evidence, protected explanation, correction, and review so that public trust is secured without punishing the complexity of real life.

The reviewer should separate adult identity from public identity. The City needs to know that the person who signs the application is legally able to make an adult role commitment; it does not need to make the applicant's documentary history a public exhibit. When proof documents contain adoption history, migration history, name-change history, family conflict, gender history, or other protected facts, the verification file should preserve the decision basis under restricted custody while the public-facing record later states only the role-relevant status and any unresolved dispute.

A clean adult-identity gate also protects the applicant against impersonation and pressure. If another person, party apparatus, family member, employer, patron, or online following is effectively driving the application, identity review should stop long enough to verify direct agency. The remedy is not humiliation; it is private confirmation, independent contact, and a chance to withdraw without public trace. That is how the City prevents the first burden of transparency from being carried by someone who never freely chose it.

14.1.2 — Jurisdictional Fit

Jurisdictional review produces a pathway note, not a prestige label. The note identifies the relevant public body, constituency, office type, law, language, eligibility rule, and unresolved legal question. It then distinguishes an existing lawful route from a possible future route or a speculative one. When a path depends on reform, public authorization, or transition work, the record says so plainly and prevents the City from selling an opportunity it cannot yet lawfully honor.

Jurisdictional fit concerns the legal relationship between the proposed pathway and the relevant public setting, not whether the applicant belongs socially or culturally. Permitted evidence includes current legal requirements, residency or qualification rules where applicable, professional obligations, conflicts of law, and qualified counsel's analysis. Nationality, accent, migration history, party belief, or unfamiliarity may not be treated as proxies for incompatibility. The legal reviewer must disclose uncertainty and conflicts, identify another lawful pathway where one exists, and provide a reasoned appeal route. Because law changes, a negative decision needs a review date rather than a permanent mark.

Jurisdictional review gives the pathway an accountable destination. It asks which lawful public body, constituency, office type, language, eligibility rule, and local relation could later receive the formation work, while leaving enforceability and office conditions to actual law and institutions. This protects the public from admired outsiders with no accountable relation to place, and it protects applicants from training for roles that do not exist or cannot lawfully receive them. The City's question is practical and democratic: where would the proposed authority land, and who would have standing to judge its use? (AERA, APA, and NCME, 2014; Gilliland, 1993).

Jurisdictional review cannot become exclusionary nationalism or local gatekeeping by prejudice. People migrate, and public service can cross borders. Diplomatic, technical, advisory, or humanitarian pathways may require broader relationships. Fit concerns lawful public relevance, not ethnicity, class belonging,

or inherited status. A practical record names the pathway, legal setting, public body, likely constituency, language obligations, residency or professional constraints, known legal barriers, and unresolved expert questions. If the path depends on future legal change, the uncertainty is stated plainly.

Jurisdictional fit should be written as a map of lawful relevance, not as a passport of worth. A person may be deeply capable and still be pursuing a pathway that the host law, office rules, residency expectations, professional qualification requirements, or democratic context cannot support. The City should record the mismatch as a routing fact, not as a defect in the person. The fair outcome may be delay, another jurisdictional track, language preparation, legal advice, or redirection to a different civic pathway.

This gate also prevents the City from advertising global discovery while quietly ignoring local answerability. A future public servant does not carry an abstract public; they carry the burdens of a place, law, electorate, institution, or office environment. The record should therefore distinguish eligibility to enter the City from eligibility to pursue a particular office track. When those are collapsed, institutional admiration can become an unauthorized substitute for legal and democratic standing.

14.1.3 — Background Integrity

Background integrity is not a search for an unblemished past. It is a test of material candor about facts that bear directly on consent, lawful eligibility, security, conflicts, access, or the proposed pathway. The City should begin with a written

relevance rule so reviewers cannot turn curiosity, moral disapproval, or political disagreement into a moving target after an application arrives.

Allowed evidence should be linked to a stated question and evaluated for reliability, recency, context, and opportunity to respond. A discrepancy may reflect memory, translation, record error, name change, informal work, family instability, legal complexity, or fear of exposure rather than intent to deceive. Reviewers need training in source quality and must distinguish an unresolved fact from a proven falsehood.

Consistency of administration matters as much as the written rule. Similar discrepancies should trigger similar inquiry, and departures should be documented rather than improvised around a familiar or favored applicant. Periodic case review can compare how reviewers treated equivalent facts, how often additional inquiry changed the outcome, and whether some applicants were required to explain more of their lives than others. A threshold becomes more accurate when it can see variation in its own judgment rather than attributing every inconsistency to the people before it.

Materiality must be explained. A fact is material when accurate disclosure could reasonably change a defined pathway, support plan, conflict control, access boundary, or lawful eligibility decision. Embarrassment, unconventionality, or reputational risk to the City is not enough. The applicant should know the issue, the evidence, the relevance claimed, and the possible consequences before an adverse conclusion is finalized.

Error risk runs in both directions. A loose process may admit someone who concealed a serious conflict or coercive obligation. An overbroad process may exclude capable people whose records reflect poverty, discrimination, migration, protest, or unequal policing rather than pathway risk. Periodic audit should examine which sources generate reversals, which groups bear documentation burdens, and whether a less intrusive method would answer the same question.

Background integrity should use a relevance screen before it uses a search tool. The question is not what can be found; it is what would materially affect the chosen pathway, the safety of other participants, the risk of capture, or the trustworthiness of the active record. Old conflicts, poverty records, unpopular associations, untreated grief, family instability, or social embarrassment should not become admissions evidence unless a defined role risk makes them relevant and the applicant has a fair chance to contextualize them.

The application process should treat correction as evidence of integrity when the correction is timely, candid, and proportionate. An applicant who repairs an inaccurate statement, discloses a forgotten conflict, or names uncertainty should not be punished more harshly than an applicant who is merely better at presenting a polished file. Material concealment after fair notice is the decisive breach, not an honest correction made through the route provided. The remedy route is staged: clarification first, then restricted review, then delay or refusal only where the relevance and risk can be explained without turning the past into a scarlet record.

14.1.4 — Minimal Necessary Data

Verification should retain only the data needed to establish the specific eligibility or identity fact at issue. The verification record should preserve source, decision, correction route, and retention status without carrying forward unrelated applicant material.

The assessment architecture should prefer verified status over retained proof artifacts whenever the status is enough. A protected notation that adulthood or a qualification has been confirmed may serve better than retaining a full identity document, family record, address history, or professional file. Provenance and auditability matter, but they do not require indefinite possession of every artifact used to reach a conclusion.

Sensitive information should be separated by function. Identity evidence, accommodation information, clinical material, security information, legal advice, and public-facing status do not belong in one admissions dossier. Access should follow role and purpose, with no convenience search across categories. Separation reduces both misuse and the tendency to interpret unrelated facts as one story about the person (European Union, 2016; NIST, 2020b).

Data minimization also requires an account of future use. Application information cannot quietly become training data, research material, donor intelligence, campaign opposition material, staff gossip, or a portable credential. Any later use would require its own lawful basis, consent where required, independent review, and record regime. Public accessibility of one result would not authorize reuse of the underlying file.

Collection creates unequal burdens. Some applicants can produce documents quickly, while others face cost, travel, language barriers, inaccessible systems, unsafe family contact, or records destroyed by conflict and displacement. The City should measure time, expense, refusal points, and dropout across the verification process. An open threshold that only well-resourced applicants can document is not open in practice.

The data rule should leave the City able to defend every retained item in one sentence. If it cannot name the purpose, decision owner, access need, and review date, the item should not remain by default. Restraint at collection is stronger protection than promises of perfect security after overcollection.

14.1.5 — Appeal of Verification

Appeal of verification proves that the gate understands its fallibility. Applicants must be able to challenge identity mismatches, document authenticity, legal-fit conclusions, materiality judgments, and deception claims without public exposure. Notice should state the issue, usable evidence, decision owner, deadline, and review route in accessible language.

The appeal body must be independent enough to correct rather than repeat the original process. It needs authority to obtain source records, seek qualified review, accept alternative proof, order correction, limit retention, reverse findings, and define safe interim status. Recusal rules cover prior involvement, personal connection, donor pressure, and institutional embarrassment.

A usable appeal does not depend on wealth, legal sophistication, repeated travel, perfect fluency, or public advocacy. Accessible

formats, interpretation, disability accommodation, reasonable extensions, and a named human contact lower the practical cost of correction. The reviewer must be able to change the decision, repair the record, and explain the result. A remedy available only to highly resourced applicants is not a meaningful remedy.

The correction record should separate the original claim, applicant response, new evidence, reviewing reasons, and result. Corrections must propagate to every system and reviewer that received the error. The applicant should receive confirmation and notice of any lawful residual retention. A propagation receipt should identify each destination that accepted the correction and any system that still requires manual repair.

Appeals must move fast enough to matter. A corrected record after the application window closes may be formally satisfying and practically unfair. Emergency correction, assisted submission, and enforceable time limits should prevent slow administration from functioning as silent refusal (Hausknecht et al., 2004; Colquitt et al., 2001). Service-level targets should distinguish ordinary review from cases where delay would make the requested remedy meaningless.

Meaningful appeal also requires the usable basis of the decision. Security, third-party privacy, or lawful confidentiality may justify narrow withholding, but the restriction must be specific, logged, independently reviewable, and no broader than necessary. The system should audit resolution time, correction patterns, accommodation use, abandoned appeals, and propagation failures; recurrent burdens on particular documentation or access conditions require redesign of the gate, not repeated case-by-case

repair. Consistency review should test whether equivalent alternative evidence is accepted across applicants rather than only after escalation. Appeal corrections should propagate to every downstream eligibility or pathway record that relied on the disputed verification.

14.2 — Capacity, Psychosocial Support, and Load Review

Capacity review begins with the pathway's real demands and the institution's design choices. A burden may be essential, modifiable, distributable, schedulable, or produced by an unnecessarily rigid environment. Reviewers identify the support that makes participation feasible, the risk that remains after support, and whether the present mismatch belongs to the role, the timing, the applicant's circumstances, or the City's own capacity. Fit is therefore relational and revisable rather than a search for an ideal participant.

The clinical firewall separates care, accommodation, functional assessment, security, and institutional decision. A clinician may identify support needs, consent concerns, immediate safety issues, or the limits of an evaluation. The clinician does not decide civic worth, ideology, loyalty, office readiness, or moral seriousness. Treatment records are not an admissions dossier, and clinical candor cannot become costly through migration into unrelated judgment.

Psychological assessment is useful only when the construct is defined, the method is appropriate, the evaluator is qualified, uncertainty is explicit, and the decision is narrow. Labels such as resilient, unstable, narcissistic, or high potential cannot substitute for evidence about a specific burden. The process should prefer observed conduct, role simulations, support trials, and repeated review over personality storytelling or one interview.

Relational and load review require the same precision. The City may consider foreseeable strain on sleep, care obligations, communication, household privacy, recovery, and help-seeking. It does not receive an open file on intimate relationships or family conflict. The review asks what support the institution owes and what burden cannot fairly be imposed, not which private life appears most conventional.

The applicant must know which lane is active. Identity review verifies person and process. Legal review addresses eligibility. Functional assessment tests defined pathway demands. Accommodation review changes the environment. Clinical care protects health and consent. Security review addresses conduct and access risk. The decision panel integrates only the permitted outputs. No lane silently consumes another, and each uses separate personnel, records, permissions, and appeal.

Every consequential conclusion carries a screening-separation record. It states the question presented, allowed data fields, source, owner, uncertainty, support considered, prohibited inference, retention period, applicant access, correction route, expiry, and appeal. Any emergency or lawful transfer across lanes receives a reason, minimum dataset, recipient, time limit, and independent review instead of disappearing into a general file.

An escalation rule handles immediate danger without dissolving the firewall. A clinician may disclose the minimum necessary information to a named safety authority when a genuine emergency requires it, while ordinary treatment detail remains protected. The transfer is logged, time-limited, and reviewable. Clinical disclosures are excluded from comparative pathway

scoring; a separately documented functional safety conclusion may justify a proportionate pause or restriction, with support and appeal. Emergency disclosure cannot become a permanent bridge from care into selection.

The permitted clinical objects are narrow: capacity to consent to the defined decision, foreseeable burden under a stated pathway, support needs, acute safety conditions, and accommodation. Virtue, loyalty, ideological compatibility, courage, honesty, charisma, leadership destiny, and general office fitness remain outside the clinical lane. Professional testing standards likewise require evidence for the intended use rather than validity by association (SIOP, 2018; AERA, APA, and NCME, 2014).

Roles must be disclosed. The applicant should know who is acting as treating clinician, independent evaluator, accommodation professional, security reviewer, or institutional decision maker. A clinician's care duty differs from a panel's decision duty, and clinical trust is corrupted when treatment encounters secretly become admissions surveillance.

Conclusions remain functional, conditional, and time-bounded. A diagnosis does not predict loyalty, treatment history does not establish fragility, and an unusual communication style does not establish deception. Rights-based disability and mental-health guidance directs attention to support, will, preferences, environmental barriers, and equal recognition rather than substituted judgment disguised as expertise (Committee on the Rights of Persons with Disabilities, 2014; World Health Organization, 2022c).

No Artificial Intelligence system may infer mental state from face, voice, gait, writing, social media, or unrelated data; assign a hidden resilience or risk score; or determine admission or pathway. Unvalidated proxies and inaccessible tools can exclude people for reasons unrelated to the actual burden. Named human reviewers must be able to explain the data, method, limits, and reason for any tool-assisted step (European Union, 2024; EEOC, 2022; U.S. Department of Justice, 2022; SIOP, 2023).

Applicants receive the usable basis of consequential conclusions, an opportunity to correct error, review of less exclusionary alternatives, independent appeal, and a date for reassessment. The firewall closes only when the City can show that care was not used against the person, private material did not become public narrative, and no professional judgment borrowed authority it did not possess.

The firewall itself requires audit. Reviewers should sample whether clinical detail leaked into general files, whether decision panels received only functional conclusions, whether accommodation was tried before exclusion, whether emergency transfers expired, whether applicants understood the lane, and whether appeals changed the process. A firewall that exists only in policy language will eventually be crossed by convenience.

14.2.1 — Capacity Review

Graduated exposure can answer some capacity questions more fairly than a final prediction. A person may be ready for education, limited orientation, supported trial, health stabilization, household consultation, or a slower track without

being ready for activation. Review repeats when illness, grief, family change, disability flare, public attack, financial shock, or security threat changes the burden. The City cannot freeze a judgment at entry and later blame the person for changing under conditions the institution helped create.

The construct is role-relevant functional capacity under stated conditions and accommodations, not general competence or personal strength. Evidence may include informed self-report, structured simulations, task samples, orientation, support history, and qualified professional input where necessary. Diagnosis, appearance, prestige, or effortless performance alone is insufficient. The conclusion states essential demands, temporary and enduring limits, support tried, uncertainty, alternatives, appeal, and reassessment.

Capacity remains pathway-specific. Local service, executive crisis authority, legislative deliberation, adjudication, diplomacy, and technical administration demand different functions and rhythms. A person may fit one path and not another. Support, accommodation, stabilized housing, clinical care, language access, family support, schedule change, or delayed activation may alter the answer. The inquiry concerns a safe relation between person, pathway, and institution, not unaided survival.

Some risks require pause, delay, redirection, or refusal: inability to understand the Vow, compromised consent, inability to distinguish active record from ordinary privacy, no practicable exit, intolerable record burden even with support, or immediate unmanaged danger. The protected record states the operational conclusion, support needs, uncertainty, expert trigger, and appeal.

It does not become public proof of weakness, courage, diagnosis, or worth.

Capacity review closes only when the applicant can see the role demand, the evidence, the proposed support, and the remaining uncertainty in one record. The conclusion distinguishes what a protected trial can teach from what should never be tested through exposure. It also names whether the limit lies in the person, the pathway, the timing, or the City's present capacity. A fair gate neither flatters someone into an unmanageable burden nor excludes them because the institution failed to specify the burden.

Capacity review should begin with the burden to be carried, not with a picture of the ideal applicant. The review should name the specific active-period demands: continuous role-bound record, intense learning, public interface, criticism, household adjustment, time discipline, correction, and possible delay. It should then ask what support would make those demands humane. A person who needs structured rest, communication assistance, disability accommodation, clinical care, or family consultation is not thereby disqualified. The question is whether the City can support the person without shifting hidden burden onto staff, family, or the applicant's body (Committee on the Rights of Persons with Disabilities, 2014; WHO, 2021a).

The review should maintain a difference between present capacity, supported capacity, and pathway capacity. Present capacity asks what the applicant can carry now. Supported capacity asks what becomes possible with accommodation and stabilization. Pathway capacity asks whether the chosen public-power route requires a different pace, smaller load, or alternate

track. This distinction protects both rigor and mercy: the City need not pretend that every burden is bearable, but it must not confuse an unsupported person with an unfit one.

14.2.2 — Psychological Support and Safety Review

Psychological review begins with support and safety, not a diagnostic hunt. The relevant questions are whether the applicant understands the burden, whether participation could foreseeably destabilize health or safety, which supports are needed, and whether an acute condition makes consent or immediate entry unreliable. The review does not search for a preferred personality or psychological image of leadership.

Qualified professionals define the method, limits, and relationship to admissions. Competent assessment requires appropriate tools, multiple sources, context, privacy, and cautious interpretation. A treating clinician should not automatically become the admissions evaluator, and an admissions evaluator should not control treatment. Separation protects candor and keeps care from becoming an intelligence-gathering route.

Allowed evidence may include a consent-focused interview, functional information voluntarily and lawfully provided, observed response to structured burden, and validated measures used only for their supported purpose. Prohibited inferences include virtue, honesty, loyalty, ideology, courage, general office performance, or moral danger. Raw clinical notes, intimate history, and treatment records stay outside the general admissions file.

Predictive language must be disciplined by base rates and incremental value. A measure may add little once structured observation, role-specific work, accommodation response, and support history are known; low-base-rate predictions of severe failure can produce many false positives. The assessor should identify the comparison population, explain the method's added information, distinguish false-positive and false-negative harms, and show why a less intrusive source is insufficient. Culture, trauma, neurodivergence, disability, medication, language, and distrust can alter presentation without revealing civic capacity (AERA, APA, and NCME, 2014; Schmidt and Hunter, 1998; SIOP, 2018).

The purpose, scope, and consequences of review must be explained, including what information will travel, which decision it can influence, and what happens under uncertainty. Where law and safety permit, the applicant receives the conclusion, can correct factual error, may offer another qualified opinion, and can appeal without making private history public.

A responsible conclusion uses bounded language: support available, further review needed, temporary delay advised, defined condition required, or no adequate assessment. It does not pronounce the applicant healthy enough for power, psychologically unfit for citizenship, or destined to fail. The result guides care and pathway design while leaving dignity and life outside the file's reach.

Psychological review can appear scientific while importing cultural, charisma, or emotional-style preference. It may identify support needs, crisis vulnerability, coercion risk, overload,

immediate contraindications, or protective conditions. It may not declare a person good, loyal, sincere, brave, safe for office, or morally transparent.

Clinical information travels in the narrowest functional form. A clinician or disability specialist may describe constraints, supports, crisis arrangements, or load limits without exposing diagnosis, therapy detail, trauma narrative, medication, intimate history, or family secrets unless a higher lawful review establishes necessity. The applicant can inspect the usable conclusion and challenge misinterpretation.

Consider a hypothetical applicant who experiences panic during a high-stimulation simulation. The treating clinician recommends a quieter recovery setting and shorter sessions; the pathway assessor reviews performance after accommodation; the decision panel receives only a functional conclusion; and the applicant can challenge any claim that one episode establishes general unfitness. The case tests whether the City can learn about burden without converting care into disqualification.

14.2.3 — Relational Review

Relational review should include consent boundaries for the people around the applicant. A partner, child, dependent, roommate, professional confidant, or family member should not be turned into admissions evidence without protection. The City must learn enough to understand collateral burden while refusing to conscript the household into public-power formation. Relational review should also ask whether entry would make hidden care labor visible enough to support. The applicant may

depend on someone whose work is unpaid, private, and already strained. If the City ignores that person, visible public-power formation may become possible only by shifting burden into the household.

Relational review asks about collateral load, coercion, support, and the practical effect of participation on people near the applicant. It does not require family approval, authorize surveillance of a household, or treat an unconventional relationship as risk. Evidence should be applicant-led and purpose-limited, with separate consent for any third party and protected routes when consultation could increase danger. Reviewers need competence in coercive control, care burden, confidentiality, and cultural variation. The likely errors run in both directions: ignoring household harm and granting others a veto over the applicant. Support, safety planning, redirection, and appeal must remain available without creating a family dossier.

Where coercive control, stalking, domestic abuse, or custody conflict may be present, ordinary family consultation can create danger. The City needs a protected route that allows the applicant or collateral person to seek advice without automatic joint meetings, notice to the other party, or disclosure through the general file. Safety planning may require separate counsel, clinical support, secure communication, and postponement of admissions questions. Relational review is fair only when the process does not strengthen the person whose control it is trying to understand.

Relational review counts collateral burden without giving a household ownership over the applicant. An adult may choose

public-power formation despite uncertainty or opposition, but childcare disruption, dependent care, partner exposure, housing change, financial dependency, safety, professional duties, and collateral record risk still require attention. The review also looks for pressure in both directions: status-seeking relatives, controlling partners, parties using family as leverage, donors rescuing a spouse, or a household presenting the City as the only escape. The governing question is who gains or loses practical freedom if the applicant enters or refuses.

The process should protect privacy. Household members should not be forced into public confession or exposure. Consultations should be confidential, role-specific, and minimal. The City may need to know that a dependent exists, that care arrangements are stable, or that a partner refuses exposure. It does not need to turn household life into an admissions drama. Relational review can also reveal needed accommodations. A participant may require scheduled family contact, dependent support, travel limitation, housing design, privacy safeguards, safety planning, or activation delay. These are not favors. They are ways of preventing the participant's chosen burden from being displaced onto others.

Household members' standing should include notice, shielding, consultation where appropriate, and complaint routes if the participant's role burden begins to fall on them.

This review should also catch coercive or exploitative entry. An applicant may be pushed by a family expectation, patron, movement, spouse, employer, party, or public audience that wants the prestige of the City without carrying its burden. Reviewers should ask whether entry would endanger a dependent person,

trap a household in exposure, or convert private conflict into public spectacle. Because nominal consent can be shaped by dependence, recruitment pressure, and the practical cost of refusal, delay or redirection may be the fair result when household burden is real but not yet understood (Mackenzie and Stoljar, 2000; ILO, 2019a).

14.2.4 — Disability-Aware Accommodation Review

Disability-aware fit begins with the human-rights model of disability: barriers arise from the interaction between a person and an environment, not from impairment alone. The Convention on the Rights of Persons with Disabilities, especially its equality, accessibility, and work provisions, provides a strong orientation even where it is not directly controlling law. The first question is therefore what the City has designed badly or failed to provide.

Accommodation should be developed through an accessible, confidential, and collaborative process. Possible changes include schedule, pacing, communication format, sensory environment, assistive technology, staffing, transportation, remote participation for defined tasks, recovery time, or a different sequence of training. The applicant should not have to disclose more diagnosis than is necessary to establish the functional need.

Some limits will remain real. An accommodation may not eliminate a specific safety risk or may fundamentally alter an essential function. Even then, the conclusion must identify the function, evidence, alternatives considered, uncertainty, and whether the limit belongs to the present pathway, the timing, or

the City's current capacity. General statements that the environment is demanding are not enough.

Disparate burden should be reviewed with disabled people and relevant experts, not only measured after exclusion occurs. The City should examine completion rates, delays, accommodation requests, assessor disagreement, appeal outcomes, and reasons for withdrawal. Denial of accommodation, inaccessible forms, or excessive proof demands can create exclusion even when no reviewer intends discrimination.

A disability-aware decision should leave a clear institutional account. It should say what function matters, what barrier was identified, what accommodation was tried or considered, what remained unresolved, and when the decision will be reviewed. That record prevents ableism from hiding inside vague language about fit and makes the City's own unreadiness visible.

Disability-aware fit should be written from the premise that disability is not a proxy for incapacity, unreliability, danger, or lesser public worth. The City may need to evaluate whether a specific pathway and support structure can work, but it must first ask what barriers the City itself has created. Architecture, schedule, sensory load, communication speed, visitor rules, record interfaces, emergency protocols, and staff assumptions can disable a person before the role burden ever begins. The fit review must therefore assess institutional accommodation before it assesses personal exclusion.

The accommodation record should remain private, practical, and revisable. It names support needs, responsible offices, review

intervals, emergency arrangements, and any burden that cannot be removed without compromising rights or an essential function. Failure occurs when it publicly explains the applicant, denies necessary support without reasons and appeal, or shifts the cost invisibly to staff and family.

14.2.5 — Load Accommodation

A serious load plan needs review dates and failure signs. Sleep, family stress, public attention, study load, medical need, sensory burden, and shame exposure may change after entry. The plan should identify which fatigue, withdrawal, agitation, shutdown, sleep loss, family strain, performance drift, or health deterioration triggers adjustment or pause before strain becomes collapse.

Load accommodation also needs an anti-resentment rule for staff. If a support plan silently overworks clinicians, mentors, security, accessibility staff, translators, or residential workers, the burden has moved rather than disappeared. Schedule, recovery time, staff ratios, public-interface windows, care, and pathway pacing must be staffed, funded, and reviewable.

Load fit concerns cumulative feasibility across schedule, sensory exposure, care duties, health, travel, public contact, recovery, and record demands. It is not a contest in endurance. Schedule simulation, supported trial, applicant preference, household impact, and professional advice may inform the decision without becoming continuous monitoring. The human review team must name what can change, what cannot, and what remains uncertain; graduated activation, reduced load, pause, alternatives, and reassessment should precede total exclusion where possible.

Accommodation protects public judgment by refusing to train people through exhaustion and denial. Sleep, health, care duties, sensory load, disability, household strain, and staff distress are public facts when poor design turns them into hidden risk. The record describes the process adjustment rather than the private diagnosis: a shorter interface window, a de-loaded simulation, delayed release, or another protected condition. Accountability can remain visible while sensitive explanation stays private. The applicant should be able to check that an agreed adjustment appears correctly in the schedule actually issued.

Load accommodation turns screening from selection into design. The City should alter pace, sequence, public-interface windows, recovery blocks, mentor load, documentation assistance, household consultation, and de-loading thresholds before deciding that a person cannot enter. This protects applicants who can carry responsibility under a sane rhythm and staff who would otherwise be forced into heroic rescue (Kristof-Brown et al., 2005; Champion et al., 2011). Trial weeks should include handovers between support teams, where an otherwise workable plan may lose continuity.

Load decisions must remain conditional. One person may begin lightly and increase burden; another may need pause. The file should use current support plan, current pathway, review date, contraindications, and load ceiling rather than permanent labels such as fragile, high risk, elite track, or not leader material. Capacity and load are relational, support-dependent, and revisable rather than permanent judgments about a person. A fair pathway must leave room for accommodation, reassessment,

pause, and changing circumstances without converting temporary need into civic rank. When a plan changes, the file should identify which earlier limit was superseded rather than accumulate conflicting instructions. Accommodation review should compare the agreed plan with the schedule actually issued so support does not disappear during implementation.

14.3 — Role Pathways and Office-Track Matching

The City does not form one generic leader. Public roles differ in the kind of consequence they carry, the time available for judgment, the forms of law and evidence they use, the people they burden, and the kinds of pressure they attract. Role pathways translate those differences into preparation rather than forcing every applicant through the same prestige model (Campion et al., 2011; Levashina et al., 2014).

Each pathway should begin with role analysis. The City should identify essential tasks, consequence routes, knowledge demands, public interfaces, confidentiality boundaries, recovery needs, and likely failure modes before choosing any assessment. Work samples, deliberative exercises, writing, supervised trials, and review of relevant conduct are stronger when they resemble the burden to be learned rather than the style of current elites.

Matching remains provisional because both people and pathways change. An applicant may discover a better route, reviewers may identify a support need, or experience may show that the City's original model was wrong. Trial periods and reassessment reduce the cost of early error. Redirection is legitimate only when it preserves dignity, gives reasons, and does not create a hierarchy in which one public function is treated as a lesser human destination.

No pathway confers candidacy, appointment, election, professional licensure, security clearance, judicial qualification, or public authority. Those decisions belong to lawful institutions and democratic processes outside the City. The City may offer

formation and a reviewable account of participation. It cannot convert pathway matching into a private constitution of who may govern.

14.3.1 — Local Office Pathway

Local pathways also teach humility to the City. The smallest office can reveal the largest hidden burdens: a permit delayed, a streetlight unrepaired, a housing inspection ignored, a school-board choice misunderstood, a local contract written poorly. Formation for local office should therefore be concrete, not condescending. It should make ordinary administration morally visible. Local pathways also test whether the applicant respects maintenance. The person who wants grand reform but has contempt for permits, drainage, sidewalks, noise complaints, sanitation, or local budgeting may misunderstand the moral weight of ordinary administration. Local public power is often fairness at street level.

Local-pathway assessment concerns proximity, service navigation, municipal law, public meetings, neighborhood conflict, constituency contact, and the practical consequences of small-scale authority. It should test learnable contextual competence through structured exercises and local engagement, not require inherited networks, a preferred accent, or social familiarity. Reviewers should include relevant municipal and community knowledge while disclosing conflicts and avoiding a local popularity contest. Language access, disability accommodation, and supervised trial can reveal capacity more fairly than résumé prestige. Matching remains provisional and

gives no presumption of nomination, election, appointment, or fitness for any actual office.

Evidence for local preparation can be concrete. Applicants might analyze a service queue, explain a land-use dispute to people with competing interests, trace a maintenance failure through departments, or design a public meeting that includes residents with limited time and access. The exercise should be evaluated for factual care, respect, feasible follow-through, and recognition of who carries delay. Such work reveals more about municipal judgment than a generic speech on community.

Local office is neither a beginner tier nor a consolation path. Municipal decisions shape housing stability, street safety, business access, flood protection, schools, transit, public health, permits, and the everyday experience of government. Formation for local responsibility therefore emphasizes place literacy, service delivery, budgets, staff respect, neighborhood conflict, infrastructure, land-use tradeoffs, emergency response, and host-community humility. National eloquence cannot substitute for understanding how a local backlog reaches an ordinary household.

The local pathway also tests proximity. Local officials meet people they burden. They may see anger in person. They may be confronted by ordinary residents rather than abstract constituencies. The City should prepare applicants to hear local complaints without contempt, defensiveness, or theatrical empathy. Record bundles for local readiness should show practical responsiveness: service-delivery understanding, local conflict handling, staff treatment, capacity to explain constraints,

respect for local law, and ability to choose between imperfect options. They should not turn local public life into sentimental authenticity theater.

The local pathway should end with evidence of proximity competence: whether the applicant can understand ordinary services, explain constraints, work with staff, hear neighborhood conflict, and repair small failures before they become chronic contempt. Local office is not a preliminary rung. It is one of the clearest places to see whether public power can remain close to the burden it creates.

Local matching should also guard against imported glamour. The City may attract applicants who see local office as a small stage on the way to higher office. That ambition is not automatically wrong, but the pathway should test whether the applicant can treat local burdens as real rather than as training scenery. A local pathway record should show contact with local institutions, host-community understanding, and attention to the particular costs that residents already carry.

14.3.2 — Legislative Pathway

Legislative matching should examine whether the applicant can survive disagreement without turning dissent into betrayal. Coalitions, amendments, committee work, minority reports, constituent pressure, and public explanation all require a person who can bargain without selling the public and oppose without performing purity. Visible burden should deepen deliberation, not freeze it. Legislative pathway review should also ask whether the applicant can represent without possessing. Constituents are not a

brand, a tribe, a market, or a moral weapon. The applicant must learn to carry public grievance into law without reducing people to proof of the applicant's righteousness.

The legislative pathway should include exposure to unpopular evidence. A future legislator must hear data, testimony, and lived burden that complicate their tribe's story. The City should test whether the applicant can remain faithful to public reason when the record inconveniences their side. The legislative pathway forms people for shared lawmaking, deliberation, coalition, amendment, procedure, committee work, public hearing, constituent pressure, and the slow discipline of building rules with others. Legislative power is not the power of solitary command. It is the power to argue, compromise, revise, count votes, hear evidence, protect rights, and place public burdens through law.

The legislative construct is disciplined deliberation under disagreement: reading proposals, hearing evidence, drafting and amending language, explaining reasons, negotiating without hidden ownership, and revising after criticism. Structured writing, amendment exercises, hearing simulations, and relevant prior conduct can supply evidence. Ideological agreement, rhetorical polish, party loyalty, or resemblance to current legislators may not substitute for the construct. A diverse, trained panel should monitor scoring consistency and accommodation, preserve minority viewpoints, and identify uncertainty. The applicant may challenge factual error or biased interpretation, and successful formation confers no nomination, preferential ballot access, entitlement to office, or legal presumption of fitness.

A useful legislative work sample should preserve disagreement rather than stage a debate with an obvious winner. The applicant may be asked to revise a proposal after testimony, draft an amendment that protects a minority concern, identify an implementation burden, and explain which compromise was rejected and why. Reviewers should examine the reasoning trail, use of staff, treatment of evidence, and capacity to acknowledge loss. The purpose is to observe lawmaking under constraint, not rhetorical dominance (Kristof-Brown et al., 2005).

Legislative readiness is especially dependent on disagreement behavior. The participant must show whether they can hear serious opponents, credit minority concerns, revise language, resist donor or party pressure, and explain compromise without hiding burden. A person may be eloquent in debate and still be dangerous if they cannot handle procedural responsibility. Record evidence for the legislative pathway should include draft histories, source notes, committee simulations, minority-report engagement, lobbying boundary logs, coalition exercises, public hearing conduct, and correction after error. The record should make visible how the person thinks when law is not a slogan but a tool that will affect ordinary lives.

A legislative pathway should test patience with pluralism. Legislators do not merely express conviction; they negotiate text, hear testimony, amend language, compromise without vanishing, resist capture, and explain tradeoffs to people who will bear different costs. The City should therefore evaluate deliberative stamina, source integrity, committee behavior, constituent translation, and the capacity to revise without treating revision as

humiliation. The burden is not only making a strong argument. It is remaining answerable when an argument imposes costs on others.

The matching record should avoid ideology as a hidden gate. A legislative applicant may hold views that reviewers dislike and still deserve a fair pathway if the person can reason publicly, respect rights, disclose influence, engage opposition, and accept lawful limits. The City should test conduct under disagreement, not conformity of belief. Refusal belongs where the applicant cannot bear democratic contest, hides dependencies, threatens protected persons, or treats lawmaking as private revenge.

14.3.3 — Executive Pathway

Executive pathways should carry the heaviest ordinary test of consequence. Executives decide under time pressure, delegate through staff, manage agencies, prioritize budgets, respond to emergencies, and sign orders whose burdens arrive in households long before they become theory. The City should not treat executive readiness as charisma plus policy knowledge. It is burden coordination under record. Executive matching also needs a delegation test. A future executive must be able to use staff without hiding behind staff, accept briefing without surrendering judgment, and make decisions without turning every subordinate into a blame shield. The City's record should show how authority travels through meetings, memos, orders, advice, dissent, and after-action review before the person is trusted with machinery that can move burden at scale.

Executive formation should include the ethics of delegation. A leader who becomes visible while pushing hidden burden onto chiefs of staff, agency heads, security teams, contractors, or assistants has not actually moved burden upward. The executive pathway must treat staff load as public evidence of governing character. The executive pathway should also examine crisis appetite. Some applicants are drawn to command because emergency simplifies moral identity. The City should ask whether the applicant can return from crisis mode to ordinary administration, maintenance, consultation, and repair after the dramatic moment passes.

Executive matching concerns administration, delegation, priority setting, crisis judgment, staff treatment, conflict disclosure, and the ability to explain consequential choices. Evidence may include simulations, work samples, documented conduct, and supervised exercises, but charisma, dominance, speed, or confidence are not reliable proxies. Reviewers must test how the applicant uses expertise, corrects error, handles dissent, and recognizes limits, while accounting for team design and accommodation. Overprediction can place others at risk; underprediction can exclude unconventional but capable leaders. Trial, reassessment, appeal, and pathway change are therefore more credible than a single final personality verdict.

Executive scenarios should test sequence and delegation. A credible exercise might combine an urgent service failure, incomplete evidence, conflicting legal advice, staff dissent, media pressure, and a vulnerable population that cannot wait for perfect certainty. The applicant should identify immediate care, lawful

authority, delegated tasks, decision checkpoints, public explanation, and conditions for reversal. The quality of the response lies partly in knowing what not to centralize in the executive.

An executive pathway should train the burden of administration rather than vision alone: budget execution, appointments, procurement, service delivery, staffing ethics, emergency delegation, data limits, interagency coordination, public explanation, maintenance, and correction under pressure. Screening should ask whether the applicant can work with technical expertise, delegate without evading responsibility, protect dissent, record decisions, resist retaliation, and recognize when legal review, legislative authorization, professional expertise, or public consultation must constrain executive speed.

The executive pathway should also detect command fantasy. Some applicants will enjoy the idea of decisive authority while avoiding the slow obligations of implementation. The City should test them with service failures, staffing constraints, fiscal scarcity, crisis ambiguity, and public explanation. Readiness for executive formation is not charisma under pressure. It is the ability to keep the record, staff, law, affected public, and operational reality in view when power tempts the person to become the shortcut.

14.3.4 — Judicial or Quasi-Judicial Pathway

Judicial or quasi-judicial pathways require the City to respect protected deliberation. Not every thought in adjudication should become public spectacle, and not every private vulnerability of parties before a tribunal can be exposed for transparency. The

formation question is how to make reasons, conflicts, recusal, ethics, and institutional integrity visible without breaking lawful independence. For adjudicative roles, the City should guard against virtue performance. A person who wants to be seen as fair may become more dangerous than a person who quietly follows procedure. Judicial burden requires enough visibility to make reasons answerable and enough restraint to keep judgment from becoming theater.

The City therefore proposes the same restraint across adjudication, administrative hearings, disciplinary panels, regulatory decisions, licensing, and appeals: applicable legal doctrine and professional standards remain controlling, and public visibility must not become a channel for popular pressure on a decision.

The relevant construct is disciplined adjudicative formation: evidence handling, legal reasoning, impartial procedure, recusal, protected deliberation, reason giving, and awareness of jurisdictional limits. Where law requires qualifications, those requirements control; the City cannot invent substitutes. Written problems, conflict analysis, and structured reasoning may be reviewed by qualified legal experts, but political belief cannot be equated with bias and a calm manner cannot be equated with impartiality. Confidentiality, disability access, cultural caution, and appeal remain necessary. Completion of the pathway is not judicial certification, appointment, licensure, or a private verdict of office fitness.

Assessment in this pathway should guard protected deliberation even during training. Simulations can test hearing conduct,

recusal analysis, evidence handling, reasons, and treatment of unrepresented parties without demanding disclosure of actual confidential matters or private judicial thought. Reviewers should distinguish independence from isolation and restraint from indifference. A person who produces the preferred outcome for the City is not thereby a better adjudicator.

Legal training, professional qualification, judicial ethics, and lawful appointment remain with their proper institutions; City exercises can test role-relevant conduct but do not confer adjudicative authority.

Quasi-judicial pathways include regulatory boards, administrative judges, licensing panels, ethics bodies, school discipline panels, immigration or benefits review, and other roles in which public power decides cases. Formation can strengthen case sensitivity, humility, procedural fairness, language access, disability access, appeal awareness, conflict-recusal practice, explanation of legal limits, response to pressure, and visible correction. Readiness evidence stays narrow and role-bound; it never becomes a popularity contest over whether an applicant appears harsh, lenient, or pleasing to an audience.

This pathway should also protect against public-record distortion. A person preparing for adjudicative work may have to discuss hypothetical cases, legal philosophy, bias, error, and uncertainty. Public bundles should not turn these exercises into campaign clips that imply prejudgment of real disputes. The screening record should require controlled context, expert legal review where needed, and a clear handoff to *The Constitution of Fairness* and applicable law for actual validity questions.

14.3.5 — Diplomatic and Technical Pathways

Diplomatic and technical pathways belong together only because both can hide public power behind specialized language. Diplomacy carries negotiation, representation, confidentiality, cultural interpretation, and the danger of speaking for people who are not present. Technical public work carries model choice, procurement, infrastructure, data, maintenance, and the danger of presenting value judgments as neutral expertise.

The pathways should therefore use different evidence. Diplomatic formation may include negotiation exercises, treaty or agreement analysis, language work, conflict scenarios, protocol judgment, and public explanation after protected deliberation. Technical formation may include system design, failure analysis, accessibility review, data-limit statements, vendor evaluation, lifecycle cost, and explanation to non-specialists.

Contextual competence is essential in both. A diplomat cannot treat culture as a technique for persuasion, and a technical specialist cannot assume that expertise cancels democratic accountability. Reviewers should examine whether the applicant can identify affected people, disclose uncertainty, distinguish evidence from preference, and explain who carries the cost when a recommendation is wrong.

Artificial Intelligence may assist technical analysis, translation, simulation, or document review within lawful limits and a disclosed human workflow. It does not select specialists, author advice invisibly, or turn model output into public judgment. The applicant and later reviewer must be able to identify what the

system did, which data it used, where uncertainty remains, and who owns the recommendation. Challengeability is part of competence, not an optional courtesy.

Specialization must not become a hidden aristocracy. Diplomatic and technical roles may require language, regional knowledge, negotiation discipline, security awareness, licensing, technical competence, professional ethics, scientific literacy, or crisis communication, but prestige institutions and jargon cannot substitute for public-consequence literacy. The City should pair expert review with translation duties, conflict disclosure, affected-community scrutiny, maintenance and failure analysis, and a clear route by which ordinary people can challenge the work.

14.4 — Security, Manipulation, and Capture Risk

Security review should answer a narrow question: is there specific, supportable evidence of conduct, access, deception, coercion, sabotage, material conflict, credible threat, or dependency that could compromise the declared role pathway? Review should not become personality screening or speculative loyalty testing.

The decision record should identify the alleged risk, the protected interest, the evidence source, source reliability, access involved, alternative explanations, uncertainty, and available mitigation. The reviewer must also state the cost of being wrong in both directions. Missing a real threat can endanger people and records; treating dissent or difference as threat can corrupt the threshold itself.

Security information often arrives through confidential channels, which increases the need for independent scrutiny. Confidentiality cannot convert rumor into fact or make an adverse conclusion permanently unanswerable. Where disclosure would create a specific lawful danger, the City should provide the usable substance, log what is withheld, permit independent review, and revisit the restriction on a defined clock.

Temporary controls may sometimes be more proportionate than refusal. Limited access, supervised participation, conflict divestment, stabilization, changed duties, or delay can reduce risk while evidence develops. Any control must be reasoned, time-limited, reviewable, and no broader than the conduct or access at

issue. Security architecture should preserve the possibility that uncertainty resolves in the applicant's favor.

No Artificial Intelligence system may predict threat, infer ideology, assemble a secret loyalty score, or determine admission from unrelated data. NIST's AI Risk Management Framework and SIOP's AI-assessment guidance reinforce the need to define context, limits, human oversight, and negative impact, but the City does not rely on oversight alone. Consequential security judgment remains a named human responsibility with notice, recusal, audit, and appeal.

14.4.1 — Infiltration Risk

Infiltration risk concerns deceptive entry for unauthorized access, sabotage, intelligence gathering, manipulation, or concealed control. It does not mean that every organized applicant, critic, foreign national, dissenter, or person with unusual associations is suspect. The construct is conduct directed toward an improper purpose, joined to a relevant access route or material deception.

Allowed evidence may include corroborated identity falsehoods, concealed organizational instructions, unauthorized access attempts, relevant funding or communication records, credible threat information, or coordinated conduct that cannot be explained by ordinary advocacy. Protected belief, religion, nationality, political opinion, race, class, disability, or lawful association may not be used as proxies. Reviewers should distinguish whistleblowing, protest, curiosity, error, and criticism from hostile entry.

Source quality is decisive. Anonymous reporting may initiate inquiry but should not ordinarily sustain an adverse conclusion without corroboration. Reviewers should examine motive, access to knowledge, consistency, independent support, and whether the source benefits from exclusion. Classified or protected information, where lawfully used, needs a separate reviewer capable of testing reliability without unnecessary disclosure.

Security review must also account for the base-rate problem. When genuinely hostile entry is rare, broad indicators can generate more innocent flags than accurate detections, especially if political dissent, foreign ties, unusual travel, or protected association are allowed to stand in for conduct. Reviewers should state the threat model, consider both missed threats and false accusations, and test whether a narrower access control can manage uncertainty. The legitimacy of the gate depends on resisting both infiltration and the institutional temptation to manufacture enemies.

Uncertain security concerns call for the least restrictive effective control. Supervised trial access, narrower permissions, protected-device rules, delayed archive access, or independent monitoring may resolve a defined exposure more fairly than immediate refusal. Each control needs a reason, owner, review date, and removal condition so that suspicion does not harden into permanent status.

Whenever safety permits, the usable basis of concern must be disclosed and the applicant given a meaningful chance to answer. Public accusation is a separate and much higher threshold because a false infiltration label can destroy reputation and chill legitimate

dissent. Even a justified refusal should disclose no more than the lawful operational reason required, with protected appeal and correction if later evidence changes the conclusion.

An infiltration process succeeds when it can protect access without manufacturing enemies. The City must be difficult to exploit and equally difficult to weaponize against critics. Independent audit should therefore review both missed threats and patterns of overclassification, political selectivity, or security claims used to shield insiders.

The remedy path should include restricted review, applicant response, independent security assessment, and proportional outcome. Some risks require denial or delayed entry; others require access limitation, monitoring of a specific pathway, or separation from particular systems. The record should state the threat model without exposing sensitive sources unnecessarily. A security conclusion that says only trust us is too close to hidden sovereignty to govern a Transparent City.

14.4.2 — Donor Leverage

Donor leverage is practical power created through money, rescue, access, employment, housing, legal support, media promotion, family benefit, or promised opportunity. It can exist without an explicit bargain. The relevant question is whether a private actor has made refusal materially dangerous or gratitude politically binding.

The review should map the dependency rather than moralize the relationship. Who supplied what, under which terms, through which intermediaries, and what would happen if the applicant

later said no? Indirect support through relatives, businesses, nonprofits, scholarships, litigation, consulting, or reputation management can matter when it creates control over speech, access, or future conduct.

Allowed evidence should be limited to relevant financial and relational facts, disclosed terms, communications, conflicts, and the consequences of refusal. Wealth is not corruption and poverty is not vulnerability by definition. A reviewer should not demand a total account of every gift or friendship. The inquiry must remain tied to a plausible route by which private support could steer public-power formation (UNODC, 2009; World Bank, 2020).

Beneficial ownership and intermediary structures may matter when support travels through companies, trusts, charities, consultancies, or family arrangements. The review should trace control only as far as necessary to understand the relevant dependency, using qualified financial and legal expertise where needed. It should not convert complexity into guilt. The decisive question remains whether an identifiable private actor can impose a material cost for independent judgment.

Dependency audit must not mistake visible scarcity for greater capture. Applicants with fewer resources may have transparent needs, while affluent applicants can carry subtler leverage through family firms, professional networks, philanthropy, social standing, future employment, or access to reputational rescue. The review should ask whose dependencies are scrutinized and whose are normalized as respectable connection. Anti-capture becomes class-biased when it exposes only the support

relationships of people who needed help (OECD, 2003; OECD, 2026c).

A donor-leverage finding should end with a concrete dependency plan. It should state what private power exists, what has been disclosed, what remedy is required, and how future contact will be reviewed. The City protects independence by making refusal materially possible, not by pretending that applicants arrive without histories of help.

This review must be careful with dignity. Applicants who needed help to survive should not be treated as corrupt for having received support. The City should distinguish survival support, disclosed assistance, ordinary employment, and coercive leverage. Where leverage exists, the response may be disclosure, debt restructuring, independent support, divestment, recusal, cooling-off periods, or refusal if the dependency cannot be made answerable. The burden should move from the vulnerable applicant to the institution built to remove hidden capture.

14.4.3 — Party Capture

Party affiliation and political organization are ordinary parts of democratic life. Party capture begins when an organization can secretly direct entry, pathway choice, speech, voting commitments, staffing, access, or later conduct through obligations the applicant cannot openly explain or refuse. The construct is concealed control, not partisan identity.

Evidence may include undisclosed instructions, contractual or financial dependence, coordinated deception, promises of future office, demands to bypass review, controlled messaging, or

retaliation for independent judgment. Membership, ideology, volunteer history, lawful campaigning, or strong belief cannot substitute for those facts. A plural City should expect political conviction rather than screen it out.

Reviewers must disclose their own political conflicts and recuse where affiliation, rivalry, or personal history could distort judgment. A cross-partisan or otherwise plural panel may be useful, but diversity of affiliation does not cure unclear constructs. The decision still needs evidence, relevance, uncertainty, and an applicant response.

Mitigation may include disclosure of obligations, ending an operational role, conflict rules, recusal from certain activities, transparent communication boundaries, or a delay while the applicant establishes independent support. The City should not demand political isolation. It should require that no external organization holds an undisclosed veto over formation or future public judgment.

Party capture review should not punish political association. Parties, movements, unions, civic groups, advocacy networks, and ideological communities can form people for public service. The risk begins when an organization controls the applicant's speech, finances, access, record interpretation, staff relationships, or future obligations in ways the public cannot see. Screening should ask what commitments exist, who can sanction the applicant, what incentives are attached, and whether the City can make those dependencies visible without turning ordinary political belonging into suspicion.

An applicant may remain partisan without being institutionally owned. A fair pathway can require disclosure of relevant roles, temporary separation from campaign apparatus, limits on coordinated messaging, independent mentoring, and explicit logs when an outside organization shapes arguments or strategy. Failure occurs when party alignment becomes a loyalty test, when dissent is treated as betrayal, or when a private network can steer the applicant while the City presents the formation process as independent.

14.4.4 — Fame Manipulation

Fame can widen public communication and expose an applicant to perspectives the City would otherwise miss. It can also distort motives, feedback, privacy, security, and reviewer judgment. Fame manipulation concerns the use of attention, audience pressure, platform incentives, or reputation management to control the process, not the mere fact that an applicant is known.

Observable conduct, not prestige proxies, belongs in the review. Relevant facts may include undisclosed promotional arrangements, coordinated fan pressure, purchased amplification, pressure on staff, attempts to bypass ordinary procedure, concealment of commercial interests, or dependence on constant public approval. Follower counts, charisma, appearance, media fluency, and controversy are not validated constructs for this purpose and should neither advantage nor condemn an applicant. Any consequential indicator requires a defined use, evidence of validity, error analysis, and review for subgroup effects (AERA, APA, and NCME, 2014; SIOP, 2018; Levashina et al., 2014).

Social-media scraping and sentiment analysis are especially unreliable routes. Context collapse, bots, coordinated attacks, platform demographics, language difference, and selective visibility make popularity data poor evidence of role fit. The City should not build personality or risk profiles from online traces, nor ask applicants to surrender unrelated accounts as proof of seriousness.

Support may be needed because public attention creates real load. Security planning, communication boundaries, reduced exposure, independent mental-health care, staff protection, and family shielding can make participation possible without rewarding spectacle. Seeking that support is not evidence that the applicant cannot serve.

Fame manipulation review recognizes that public attention is now a power source in itself. An applicant may enter the City with a following, a media persona, a controversy, a platform audience, or a brand that rewards conflict and performance. The gate should ask whether the person can accept slower evidence over instant applause, corrections over narrative control, ordinary work over content production, and privacy protections for others over audience demand. Fame is not disqualifying, but it is load-bearing.

The admissions record should also protect the applicant from being recruited by their own audience. If entry is driven by public pressure, humiliation, monetized controversy, fan expectation, or fear of losing relevance, the City should pause rather than exploit the moment. A famous applicant may need a cooling period, communications plan, anti-harassment protections, and rules

against turning the City into a live stage. Public attention should not be allowed to decide what public power needs.

14.4.5 — Coercion Signals

Coercion signals indicate that an applicant's choice may be controlled by threat, dependency, intimidation, exploitation, domestic abuse, blackmail, trafficking, organizational command, or fear of losing essential support. Coercion may push a person toward entry, away from entry, or toward concealment. The primary purpose of review is safety and restored agency, not fault finding.

Possible signals include inconsistent instructions from another person, inability to speak privately, monitored communications, unexplained urgency, threats tied to family or livelihood, sudden control of travel or documents, and fear of consequences for refusal. No single signal proves coercion. Reviewers need trauma-informed training, cultural caution, and a protected route to ask about safety without escalating danger.

Disclosure procedures must be designed so that seeking help does not automatically expose the applicant to the coercive actor. Separate communication channels, safe timing, independent advocates, and limited information sharing may be necessary. The City should not demand confrontation, police reporting, family notification, or public explanation as the price of support unless applicable law and immediate safety require a specific action.

The application process should prearrange relationships with independent services rather than improvising after a disclosure. Emergency housing, legal advice, domestic-violence expertise,

trafficking support, secure transportation, clinical care, and digital-safety assistance may be needed in different cases. Availability will vary by jurisdiction, and referral must not be portrayed as guaranteed rescue. The institution's duty is to know its limits, maintain safe routes, and avoid leaving a person more exposed because they answered honestly.

Clinical, legal, safeguarding, and security roles must remain distinct. A safety professional may coordinate urgent protection, a clinician may support the applicant, counsel may explain rights, and security staff may control access. Their records should not merge by convenience. Only the information necessary for the relevant protection or decision should travel between them.

Coercion signals may appear as urgency, scripted answers, fear of disappointing a patron, unusual financial promises, threats, family pressure, ideological discipline, immigration vulnerability, employment dependence, intimate control, or public shaming. Screening needs private channels where an applicant can disclose pressure without converting the disclosure into public exposure. Fair-recruitment evidence shows how fees, intermediaries, dependency, and vulnerability can make nominal choice materially coercive, even though the City threshold is not ordinary employment recruitment. Reviewers should therefore ask who benefits from the entry, who controls the applicant's alternatives, and whether refusal remains practically safe (ILO, 2019a; ILO, 2024).

When coercion is suspected, the fair response is protective pause, not accusation theater. The applicant may need independent counsel, safety planning, separate contact from controlling

persons, delayed status, or referral to outside support. A refusal may protect the applicant from being used. A delay may protect dependents from fallout. The record should never convert coercion into weakness or shame. The burden belongs on the coercive environment and on the institution's duty to detect it. Capture review must follow leverage through money, reputation, relationships, security threats, and institutional dependency before those pressures become hidden conditions of entry. After a coercive contact is removed, reviewers should test whether refusal and alternative pathways are genuinely usable without that person's permission.

14.5 — Global Discovery and Local Legitimacy

Global discovery matters because public capacity is not distributed according to prestige. Capable people may stand outside dominant parties, universities, professions, cities, languages, donor networks, and media circuits. Search must widen without forgetting that recruitment itself can extract time, money, hope, data, care labor, and family sacrifice from applicants (Fox and Lawless, 2014; Kim et al., 2013).

The ILO's fair-recruitment principles offer a useful comparative reference. Transparency, freedom from coercion, non-discrimination, due diligence, accessible information, and the rule that workers should not bear recruitment fees translate into a City obligation: applicants should not buy access, hire insiders, or assume hidden debt to become visible (ILO, 2019a).

Discovery does not settle legitimacy. A person may have remarkable ability and still lack the lawful, linguistic, cultural, or democratic relationship required for a particular pathway. The City should distinguish learnable contextual competence from inherited belonging, and it should never use local fit as coded exclusion. The question is how authority would become accountable to the people who may carry its effects.

A fair recruitment system should publish where it looks, who remains absent, which burdens cause withdrawal, and how outreach changes. It should audit whether the same elite institutions dominate despite formally open applications. Global branding does not prove broad reach; accessibility is shown by

who can understand the invitation, afford the process, obtain accommodation, challenge error, and decline without cost.

14.5.1 — Broad Talent Discovery

Broad talent discovery means building multiple lawful routes into awareness of the City. Public notices, community organizations, professional associations, disability networks, labor groups, educational institutions, local civic bodies, diaspora organizations, and ordinary referral may all play a role. No single recruiter, donor, party, or platform should control who becomes visible to the threshold.

The invitation should explain the burden as clearly as the opportunity. Applicants need to know that the City is voluntary, adult-only, full-record within the active role, demanding, reviewable, and not a shortcut to office. Recruitment that sells prestige while hiding exposure, workload, uncertainty, or the possibility of refusal would reproduce the very managed surface the City is meant to challenge.

Before release, the invitation and inquiry process should be tested with people from different regions, languages, disability communities, educational histories, work schedules, digital-access conditions, and levels of institutional familiarity. Reviewers should record where readers misunderstand the burden, abandon the process, or infer prestige and office access that the City does not promise. Correction belongs upstream: rewrite the notice, change the channel, add interpretation or accommodation, and reduce unnecessary proof before blaming

applicants for failing to navigate a gate designed around insiders (EEOC, 2007; ILO, 2019a; ISO, 2023b).

Financial and practical barriers must be counted. Application fees, travel, document procurement, unpaid preparation, inaccessible interviews, language services, child care, time away from work, and relocation assumptions can turn formal openness into class selection. Where support is offered, it should follow public rules and create no debt of loyalty to a recruiter, sponsor, or institution.

Recruiters need conflict rules and training. They should not promise admission, imply office access, coach favored candidates around the process, collect private dossiers, or use vulnerable communities as evidence of diversity. Their task is to make the pathway understandable and reachable, then withdraw from the decision unless a transparent role has been assigned.

Discovery is successful when overlooked people can enter the same answerable process without being remade into symbols. The City should be able to widen opportunity while keeping the burden, standards, and right to refuse equally clear. Recruitment becomes fair when access expands without creating a new patronage route.

Broad discovery should reach beyond elite schools, donor circles, party internships, media visibility, think tanks, family names, and urban prestige networks. It should create routes through local service, labor leadership, disability advocacy, caregiving, rural institutions, community conflict work, technical competence, disaster response, youth mentorship, and other forms of

responsibility that existing pipelines often overlook. The point is not to romanticize outsider status. It is to stop confusing proximity to existing power with evidence of public burden capacity.

Discovery mechanisms should be audited for who pays the cost of being seen. Application fees, travel, unpaid preparation, language barriers, digital access, childcare, documentation requirements, and public exposure can exclude people before screening begins. The City should publish the burdens of discovery itself and repair them through assistance, remote inquiry, protected preliminary review, translation, stipends where appropriate, and refusal privacy. A wide door that only the already-supported can walk through is not wide.

14.5.2 — Local Democratic Fit

Local democratic fit should be revisited as formation deepens. An applicant may begin with weak local knowledge and develop real public relation through study, service, language, consultation, and repair. Another may begin with deep local identity and still refuse accountability. Fit is not ancestry. It is a reviewable relation to the people whose burdens the role will touch. Local fit must be tested by people who understand the place, not only by central reviewers reading files. A community's burdens often live in informal knowledge, historical memory, local service patterns, and trust wounds. The City should build listening structures that respect that knowledge without allowing local prejudice to become law.

Local democratic fit concerns the applicant's ability to understand, learn, and respond to the lawful setting of a proposed

public role. Relevant evidence may include local law, institutions, public-service realities, language access, field exercises, listening, and demonstrated correction. Birthplace, inherited network, accent, wealth, or public popularity cannot substitute for competence. Reviewers with local knowledge must disclose conflicts and resist gatekeeping by familiarity. Training and supervised experience may cure a gap, while appeal can address biased interpretation. The City's conclusion remains about a formation pathway and never replaces voters, appointing bodies, or lawful eligibility rules (OECD, 2020a; OECD, 2022b).

Local democratic fit also protects against parachute ambition. A person may use the City to gain legitimacy in a jurisdiction where they have little accountability. They may be imported by a party, donor, or movement because they look promising. The City must ask whether local people are being asked to carry a candidate formed elsewhere for someone else's strategy. This review should include legal and public-context analysis, not mere sentiment. Residency, eligibility, language, service history, issue knowledge, public trust, community harm, and local institutional relation may all matter. Some gaps may be remediable through formation. Others may require redirection.

Local democratic fit should produce a learning plan, not an inherited-belonging test. The record should identify the constituency, institutions, language, history, and public burdens the applicant must understand, together with how that understanding can be demonstrated over time. Local authority is respected when competence is earned and answerable, not when outsiders are automatically excluded or admired into relevance.

Local democratic fit should prevent the City from manufacturing candidates for publics that do not recognize the pathway as legitimate. The City may educate, test, and record formation; it may not replace the lawful relationship between public authority and the people who bear it. A candidate formed far from the affected community must show language, legal, cultural, geographic, and institutional relevance before the pathway is treated as credible. Otherwise the City becomes a polished export machine for power.

This review should also protect minority, migrant, and dissident applicants from being excluded by narrow localism. Local fit is not a license for xenophobia, sectarian gatekeeping, or class protection. The fair question is whether the applicant can become answerable to the public burden they seek, not whether they resemble the dominant group. The route may include local mentorship, community listening, legal review, language development, and a slower pathway rather than rejection.

14.5.3 — Language and Cultural Fit

A valid review system should treat translation as public infrastructure, not as courtesy. If the relevant public cannot understand the applicant's record, the public carries the burden of interpretation. If the applicant cannot hear criticism in the public's language or cultural idiom, the public carries the burden of being misunderstood. Language access is therefore part of civic fairness. Language and culture review should also protect applicants from forced assimilation into the City's preferred voice. A person may reason publicly in another idiom, class register, disability style, rural style, religious vocabulary, or

multilingual pattern. Formation should make public meaning legible without making every applicant sound institutionally identical.

Cultural fit should never become comfort for reviewers. A person who unsettles the dominant civic style may still be highly fit to carry public burden. The question is whether they can communicate, listen, and be answerable across difference, not whether they mirror the City's preferred manners. Language and cultural fit shape whether public-power formation can be understood, challenged, and later used by the people it concerns. A record that cannot be read by the relevant public is weaker than it appears. A participant who cannot hear burden in the language of the people affected may carry public power through translation gaps that become hidden distance.

This construct is role-relevant communication and interpretive competence, not assimilation to a preferred manner. Evidence may include accessible language tasks, use of interpretation, cultural scenario analysis, and the ability to recognize uncertainty or seek help. Accent, code-switching, disability-related communication, religious practice, or unfamiliar social style may not be treated as incompetence. Qualified language and cultural reviewers should distinguish essential communication from aesthetic preference and offer training or accommodation where feasible. Applicants must be able to challenge biased assessment. Audit should examine whether the process rewards dominant-class fluency rather than public understanding.

Language fit is not a demand for monolingual purity. It asks what languages are needed for the pathway, what translation support is

required, how public record bundles will be accessible, how hearings or interfaces will function, and whether the applicant can communicate with relevant publics without relying entirely on curated intermediaries. Translation can help, but it also introduces interpretive power. Cultural fit does not mean conformity to local prejudice or tradition without critique. It means understanding public meaning, historical burden, institutions, symbols, trust patterns, religious and secular contexts, conflict memories, family structures, and ways people experience authority. A participant who misunderstands these may impose burden unknowingly even while intending reform.

A lawful screening system must avoid using cultural fit as exclusionary code. A person from outside a dominant culture may still serve lawfully and well. A critic of local injustice may be precisely what a public needs. Cultural fit should not protect comfortable insiders from challenge. It should identify the formation needed for public meaning to be intelligible and fair. Language and cultural review should create support plans where possible: translation, cultural advisors, local mentors, public-interface design, reading lists, hearings, immersion, and explanation practices. It should also identify where gaps are too severe for a current pathway. Redirection may be wiser than forcing symbolic diversity into unready role burden.

The review should name the context in which language or cultural competence matters. A multilingual technical regulator, a local council member, a diplomat, and an emergency executive may need different capacities. The gate should not turn accent, communication disability, neurodivergent style, class-coded

speech, religious vocabulary, or unfamiliar manners into a false sign of unfitness. The fair measure is whether communication can carry public consequence with dignity and correction.

14.5.4 — Host Legitimacy

Host legitimacy should also consider symbolic burden. A host community may be asked to carry tourists, protests, security changes, reputational association, housing pressure, traffic, labor demand, and political conflict. The City cannot say it protects public burden while treating its own footprint as background scenery. Host legitimacy should include staff and service workers as part of the host burden. The City's presence will affect cleaners, cooks, drivers, maintenance crews, clinicians, local businesses, emergency responders, and neighbors. A host review that listens only to officials may miss the people who carry daily consequence.

Host legitimacy should include mechanisms for host correction after admissions begin. If applicant cohorts create unanticipated burdens for local workers, neighborhoods, transit, policing, housing, media attention, or protest management, the host must have a route to say so before resentment hardens. Host legitimacy concerns the relation between the City, the applicant pathway, and the place that bears the institution's presence. The host community does not own admissions, but it carries real burdens: traffic, housing pressure, political attention, media presence, protest, public services load, symbolic association, and local disruption. Screening cannot ignore the place where formation happens (Fishkin, 2018; Landemore, 2020).

Host legitimacy concerns the institution's lawful and social relationship with the place that carries its burden, not a popularity vote on each applicant. Evidence includes authorized host processes, community concerns, service load, language practice, recruitment effects, and the standing of affected groups. Applicants should not become proxies for unresolved disputes about the City, nor should local opposition be reframed as hostility to fairness. Independent host review, grievance, monitoring, and remedy may condition institutional practice without producing a personal stigma file. The City must distinguish a problem with its own presence from a claim about the person seeking entry.

An applicant cohort may affect the host community differently depending on role pathways, public controversy, media attention, security risk, public interface demand, and political symbolism. A City that admits a high-profile group without host review may transform local life overnight. The host should not be treated as a stage set for public-power formation. Host legitimacy also asks whether the City is recruiting in a way that benefits or burdens the local community. Does the City offer local hiring, accessible public learning, complaint routes, infrastructure support, and meaningful recourse? Or does it import prestige, extract attention, strain services, and leave local residents with the cost? Admissions scale is part of this question.

The host should not have a veto over every applicant, because that could become local prejudice, political capture, or fear of controversy. But host review should inform admissions capacity, cohort timing, public interface design, security planning, media

handling, and community burden mitigation. The host's burden must be visible even where it does not decide the applicant's worth. A fair host-legitimacy process should publish aggregate burdens and safeguards without exposing applicants prematurely. It should include complaint channels, public meetings where appropriate, local service review, traffic and housing assessment, and routes for correcting unexpected impacts. Host feedback should be treated as burden evidence, not annoyance.

The host-review boundary must be exact. Local institutions may raise capacity, safety, infrastructure, cultural, and public-trust concerns; they should not receive a veto over individual applicants based on prejudice, rumor, political dislike, religion, disability, nationality, or media controversy. The City should translate host burden into institutional capacity decisions and pathway design, not into neighborhood permission to shame a person at the gate.

14.5.5 — Anti-Elite Access

Anti-elite access begins by recognizing that prestige is an efficient but biased shortcut. Famous universities, senior employers, political families, donor networks, polished speech, and prior media access may signal opportunity more reliably than ability. The City should never treat absence from those institutions as absence of public capacity.

Selection methods should therefore rely on pathway-relevant evidence that applicants can reasonably produce. Structured work samples, supported writing, deliberative exercises, service navigation, problem analysis, supervised trials, and learning over

time can reveal more than institutional pedigree. Reviewers should know when they are using a credential because it is legally necessary and when they are using it because it feels familiar.

Access support must be rule-based and independent. Travel, interpretation, technology, child care, document help, preparation materials, and stipends may be necessary for meaningful equality, but they cannot arrive through personal sponsorship that later claims gratitude. Fair-recruitment guidance provides the right analogy: the applicant does not finance the gate's fairness, and recruiters or intermediaries may not create debt as the price of being considered (ILO, 2019a; ISO, 2023b).

A recruitment-cost ledger should follow the applicant from first inquiry to final outcome. Although the ILO's evidence concerns labor recruitment, its second global study across 110 countries shows why formal fee prohibitions do not exhaust the problem: travel, documents, tests, intermediaries, and other related costs can still decide who is able to enter (ILO, 2024). The City should therefore count fees, travel, unpaid preparation, interpretation, technology, child care, relocation, lost work, and repeated disclosure. Any assistance must be rule-based, privately administered in personal detail, and unavailable for later leverage.

Anti-elite access should follow the full attrition funnel, not only the final cohort. The City needs to know who saw the invitation, who inquired, who began, who could not afford documents or time, who withdrew after repeated disclosure, who received accommodation, who was redirected, and who appealed. Demographic patterns require careful interpretation rather than automatic quotas, but unexplained loss at one stage is evidence

about the gate itself. A diverse final photograph cannot excuse an inaccessible path (Fox and Lawless, 2014; Hausknecht et al., 2004).
